114,157.—LUBRICATING RAILWAY JOURNAL. Carrie R. Laman, Painted Post, N. Y.

Claim.—The oiling-roller B, composed of a perforated cylinder packed with sponge or other absorbent material, substantially as set forth.

114,158.—TUYERE FOR CUPOLA-FURNACES. Franklin Lawrence, Philadelphia, Pa.

Claim.—A cast-iron tuyere having an enlarged hole below and contracted hole or holes above, and having an exterior shape, substantially as shown and described.

114,159.—BAND-CUTTING ATTACHMENT FOR THRASHING-MACHINES.—John Lee, Jr., and John Lee, Sr., Duquoin, Ill.

Claim.—In a band-cutter, when attached to a thrashing-machine, the combination of the frame A, spring platform B with side guards *b*, saw E, bearings C, guards G and F, and levers and catch D and *f*, substantially as described and operating as set forth.

114,160.—COOKING-STOVE.—William D. C. Lloyd, Louisville, Ky.

Claim.—The air-chamber D with its holes G G G and L L L L, and corrugated plate E with ribs F F F to hold up the wood, in combination with the cover H, pipe I, air-holes J J J in recess K, and vent-holes P P in the oven, when arranged, constructed, and operating substantially as and for the purpose herein set forth.

114,161. — ENVELOPE.— Philo Lockwood, Auburn, Ind.

Claim.—The herein-described double envelope, constructed substantially in the manner and for the purpose set forth.

114,162, antedated April 19, 1871.—BALANCE-VALVE—Kellogg H. Loomis, New York, N. Y., assignor to James M. Boyd, same place.

Claim.—1. The loose springs *k k*, placed between the ears *e e* on the piston, for the purpose of pressing outward the packing-rings *f f* by means of the cams *h h*, which are operated from the center of the piston and held in position by the jam-nut H, substantially as herein set forth.

2. The combination of the conical valve B, stem D, piston E, bonnet G, and cap J, constructed and arranged substantially as and for the purposes herein set forth.

114,163.—BLAST BY STEAM-JETS FOR FURNACES, &c.—Philip W. Mackenzie, Blauveltville, N. Y.

Claim.—The gas or vapor-generating apparatus

A, in combination with the condenser E, when so connected or combined as to produce a current or jet from the generator A, which jet or current is formed by the combined action of steam, gas, or other vapor with atmospheric air, as herein shown and described.

114,164.—MOLD FOR SEWER-PIPES.—Thomas Madeley, Rochester, N. Y.

Claim.—1. In combination with a pipe-mold made in two or more sections, the hinged and folding leaves E E′ at the top and the removable pins D D′ at the bottom, as and for the purpose specified.

2. The arrangement with the sectional mold of the folding levers E E′, removable pins D D′, and core G with screw H, as herein described.

114,165. — HARVESTER-RAKE. — John P. Manny, Rockford, Ill.

Claim.—The combination of the finger-beam, the concave sector-shaped platform, the rake-post, the hub revolving on a shaft inclined backward and upward relatively to the finger-beam, and the rake and reel-arms, all rigidly secured upon the hub revolving in a uniform path and with uniform speed, all these members being constructed, arranged, and operating in combination as hereinbefore described.

114,166. — HARVESTER-RAKE. — John P. Manny, Rockford, Ill.

Claim.—1. The combination of the inclined driving-shaft with the reel-shaft, intersecting it at an acute angle thereto, and radially adjustable around the joint which connects it with the driving-shaft, these members being constructed to operate in combination, substantially as hereinbefore set forth.

2. The combination of a reel-shaft, supported at both ends and adjustable radially around its driving-shaft, with reel-beaters supported at their divider ends only, and radially adjustable around their point of connection with the reel-arms, these parts being constructed to operate in combination, substantially as set forth.

3. The combination of the rotating rake, with the reel supported at one end by and driven from the rake-shaft, these members being constructed to operate in combination, substantially as set forth.

114,167.—SHUTTLE FOR LOOMS.—Ezra W. Marble, Sutton, Mass.

Claim.—1. The spindle-head B′ having the flange D, in combination with the bobbin-holder F, all constructed and arranged substantially as and for the purposes herein set forth.

2. In combination with the spring H and spindle-head B′ D, of the bobbin-holder F *f b* and spring *a*, arranged substantially as and for the purposes herein set forth.

114,168.—HORSE-POWER.—Daniel G. Marden, Memphis, Tenn.

Claim.—1. The cup-boxes N, constructed with shoulders *n* and with screw-shanks *n′*, for the reception of nuts S, as described and shown, for the purposes set forth.

2. The improved spur-wheel horse-power herein described, having both ends of each secondary vertical shaft stepped in cup-boxes N and thus rendered reversible, as set forth.

3. The coupling-box X of the vertical sweep-shaft U, constructed with a removable side, *x′*, as and for the purpose set forth.

114,169. — MACHINERY FOR DRESSING WHEEL-FELLIES. — Dudley Jefferson Marston, Amesbury, Mass.

Claim.—1. The combination of the cutter-wheels C D, the curved guide E′, and the presser feed-wheels E F, all arranged, and the cutter and feed-wheels being provided with mechanism for supporting and operating them, substantially as explained.

2. The combination of the recessed cutter-wheel K, the guide-roller *m′*, the feed-wheel O, the adjustable carriage L, the vibratory adjustable plate M, and segment N, all being arranged and to operate, and provided with operative mechanism, substantially as explained and represented.

114,170.—MACHINE FOR FORMING PLOW-HANDLES.—Elbridge G. Matthews, Oakham, Mass.

Claim.—1. The combination, with the sliding frame F and work-supporting carriage B, of the irregular way G, substantially as and for the purposes set forth.

2. The combination, with the carriage B, of the gauge L and groove *f*, substantially as and for the purposes set forth.

3. The combination, with the grooved cutter-heads C E arranged in relation to each other, as shown and described, of the work-supporting spindle K, substantially as and for the purposes set forth.

114,171. — WOOD-BENDING MACHINE.—Elbridge G. Matthews, Oakham, Mass.

Claim.—1. The combination, with the grooved bending-lever B, segment B′, and pinion D, of the head-frame H, provided with guiding and pressing-rolls J, former C, and chain I, substantially as and for the purposes set forth.

2. The combination, with the compressing-chain I, of the draft device, consisting of the bolt L, shoe K, nuts *d d′*, spring M, links N, and set-screw *f*, substantially as and for the purposes set forth.

3. The combination, with the frame O, of the guiding-rolls P P′, and supporting-bar R, substantially as and for the purposes set forth.

114,172.—COMPOSITION FOR PAVEMENTS.—Frederick E. Matthews, Chicago, Ill.

Claim.—The composition herein described, consisting of Trinidad asphaltum, residuum of petroleum, broken or crushed stone, or gravel, or both stone and gravel, and bichromate of potash, combined and prepared substantially as and for the purposes specified.

114,173. — DUMPING-WAGON.—Samuel D. McCaleb and William McCaleb, Louisville, Ky.

Claim.—In a four-wheeled dumping-wagon, the cranked rear axle C, but only when its cranked portion is turned forward to stand about midway between a horisontal and vertical position, in the manner and for the purpose shown and described.

114,174.—APPARATUS FOR MAKING ROOFING FABRICS.—David W. McConnell and William W. Pierce, Buffalo, N. Y.

Claim.—The arrangement of the bed M, rollers D E, belt L, regulator O, spreader G with slide A, and steam-box *b*, and the sand-box F, all substantially as and for the purposes herein set forth.

114,175. — EXTRACTING METALS FROM ORES.—William P. McConnell, Washington, D. C.

Claim.—1. A combination of potash, or its equivalent, unslaked lime, and common salt, in about equal proportions, as a flux for the purposes described and operating as set forth.

2. The process described of separating metals of different specific gravity by pouring them into a conical mold with a flux of sulphur, substantially as described.

114,176. — WATER-ELEVATOR.—Archibald A. McPheeters and Robert P. McPheeters, Arbor Hill, Va.

Claim.—1. The combination of the carrier E, chain-wheel B, and rollers C, as specified.

2. The combination of the carrier E, cross-bar D, and spring-bolts F, as described.

114,177. — GATE. — Job Lewis Meredith, Bloomingsburg, Ind.

Claim.—1. The arrangement of the lever G′, bar G, cap F, hinge *a*, post D, gate A, and post B C, substantially as and for the purpose specified.

2. The pin *c″*, in combination with the post D, awl E, and gate A, as and for the purpose set forth.

114,178.—FENCE.—Levi Moore, Baraboo, Wis.

Claim.—A fence composed of the top rails A A, stakes B B, and braces C C, with or without the barbs *b b*, all constructed and arranged substantially as herein set forth.

114,179. — WRENCH. — Francis B. Morse, Plantsville, Conn., assignor to H. D. Smith & Co., same place.

Claim.—The cylindrical bar A, provided with a flat or web portion, B, and fixed jaw C, in combination with the movable jaw D, divided sleeve E, and clamping device, constructed and arranged to operate substantially as specified.

114,180. — SCROLL-SAWING MACHINE.—Jerome S. Moseley, Syracuse, N. Y.

Claim.—1. The arrangement of the springs E E, as herein shown and described, in connection with the shaft F′, from opposite sides by means of cams *e e* and flexible bands, all operating as and for the purposes set forth.

2. The combination of the movable wheel F *g* and fixed collar G with the shaft F′ and tension-strap *f*, for adjusting the length of said strap to the several sizes of saws, substantially as specified.

3. The shafts K K′, adjustable arms *k k*, rod L, and adjustable arms *l*, and saw-driving devices I *i*, all constructed and arranged as shown in fig. 5, and for the purpose specified.

4. The double pedal J *j*, spring connections M a, shafts K K′, arms R *n k*, connections N *p* L *r*, brake h, and sleeve or catch *o*, all arranged and operating as and for the purpose specified.

5. The sliding block *t*, interposed between the saw and the cam S, in connection with the opposite flat bearing surface T, cam S, lever *s*, rack *u*, and cross-head D, substantially as and for the purpose specified.

6. The forked spring W, saw-clamping jaws *w w*, and releasing-lever *v*, in connection with the plate U and tension-strap *f*, substantially as and for the purpose specified.

7. The combination of the catch Y Z and adjustable stop-rod X with the guide-plate C and standard B, substantially as and for the purpose specified.

114,181.—STOVE-PIPE CLEANER. — Daniel Murphy, Richmond, Va.

Claim.—1. The combination of the extension-rod, composed of the shaft C, joint D, and threaded sleeve E, with the concavo-convex disk B, provided with the standard A and curved lips L, as shown at fig. 3.

2. The above, in combination with a stove-pipe provided with a wire passed across its chimney end, and having a transverse section of said end removed, as shown and described.

3. A stove-pipe provided with the cleaner herein described, when a transverse section of the chimney end of the pipe is cut out, and the extremity of said pipe provided with a wire passed across its opening, as shown, and for the purposes described.

114,182.—CORN-HARVESTER. — Richard L. Nelson, Orange Court House, Va.

Claim.—1. The combination of the conical roller or conical wheels for guiding the machine between the rows of stalks, the reels driven directly therefrom, and the cutters when arranged and operating as and for the purpose described and represented.

2. In combination with the cutters made adjustable in the blocks *c*, the hinged connection between said blocks and frame A, so that the driver in his seat, by means of the connections therewith, may raise said cutters to pass any obstruction, and lower them again, as described and represented.

114,183.—MACHINE FOR BORING AND MORTISING.—Richard L. Nelson, Orange Court House, Va.

Claim.—In combination with the main frame, having the movable adjustable clamping or holding-rest D and the recess and ways for receiving and guiding either of the removable and interchangeable sliding frame B and F, with their appliances for boring and mortising, when combined, arranged, and operating in the manner and for the purpose herein described and represented.

114,184.—TRACE-BUCKLE.—George Oldham, Jr., Cuba, N. Y.

Claim.—1. The buckle-frame A A, provided with the inclined slide-ways a^2 a^2, the tongue-stays a^3 a^3, and recesses a^1 a^1, communicating with the slots *a a*, all arranged in connection with a suitable tongue-plate, substantially as described and set forth.

2. The wedge-shaped slide or tongue-plate B, provided with ears or luge *c c* and flanges *d d*, and operating in connection with the frame A having slots a^1 a^1 and inclined side-ways a^3 a^3, substantially as herein set forth and described.

114,185.—EARTH-AUGER.—Thomas Orchard, Sacramento, Cal.

Claim.—The valve H, in combination with the rods *z z* and ring *y*, all arranged in the cylinder A, substantially as and for the purpose set forth.

114,186. — PHOTOGRAPHER'S STEEPING-TANK.—John Walter Osborne, Brooklyn, N. Y.

Claim.—1. The combination of the rack for holding the plates with the tank for holding the cleaning or steeping liquids, substantially as described and for the purposes set forth.

2. The combination of the rack with the roller or windlass and brake, when used for steeping photographic plates, as described.

114,187.—PILE FOR NUT-BLANKS, TUBES, &c.—Jonathan Ostrander, Manchester, Va.

Claim.—A pile made up of halves, the dividing plane between which runs diagonally of the pile, substantially as specified.

114,188.—PILE FOR NUT-BLANKS, TUBES, &c.—Jonathan Ostrander, Manchester, Va.

Claim.—A pile made up of the top and bottom pieces *a b*, grooved and ribbed as shown, side pieces *c*, and rails *d*, as specified.

114,189.—FENCE-POST.—Joel A. Otis, Watertown, N. Y.

Claim.—The combination and arrangement, relatively with each other, of the supplementary oblique braces F F′, the main oblique braces D D′, the uprights B B, the lower brace A, and upper brace E, substantially as shown and described.

114,190.—WOOD PAVEMENT.—Halbert E. Paine, Milwaukee, Wis.

Claim.—1. A wooden pavement consisting of blocks and of connecting and separating pieces crossing each other substantially as and for the purpose described.

2. A wooden pavement, in which the blocks are provided, at their contiguous edges, with openings to receive connecting-pieces, and are separated, at their sides, by separating-pieces lying below and in contact with the connecting-pieces; and the spaces between the sides of the blocks are filled with gravel and tar, concrete, or other equivalent substance.

114,191.—ELECTROPLATING THE INTERIOR OF PIPES AND TUBES WITH SILVER, NICKEL, &c.–Dubois D. Parmelee, New York, N. Y.

Claim.—1. In the process of electroplating the interior of tubes by means of a movable anode, substantially as herein described, the employment of an anode placed within and extending the length or nearly the length of the pipe, and provided at intervals with non-conducting washers which insulate it therefrom, substantially as and for the purposes set forth.

2. A jointed anode composed of sections, each surrounded at or near its top and bottom by a non-conducting washer or ring, and connected with the sections adjoining by means of insulated links or wires, substantially as and for the purposes herein shown and described.

3. The general arrangement of apparatus for electroplating the interior of pipes and tubes, substantially as herein shown and described.

114,192, antedated April 22, 1871.—REFINING SUGARS.—August F. W. Partz, Oakland, Cal.

Claim.—1. The process substantially as herein described of molding, draining, and drying boiled sugar in large masses.

2. The apparatus herein described for executing the above-claimed process, consisting principally of a mold, A *a*, surrounded by a case B *a*, and provided with a chamber, *a i e*, underneath its bottom, which chamber communicates, by means of a pipe, with a compression-pump, and by means of another pipe, *p*, with a receiving-vessel, E, which connects with an exhaust-pump, all so combined and arranged as to operate substantially as set forth.

3. The incasing-vessel B *a*, in connection with the mold A *a*, substantially as and for the purpose herein specified.

4. In combination with the mold A *a*, the receiving-vessel E, when provided with a valve, *v*, for limiting adjustably the degree of exhaustion, arranged to operate substantially as herein described.

5. In combination with the mold A *a*, the rod *t*, provided at its upper end with an eye or hook and at its lower end with the nut or flange *x*, or some equivalent device, substantially as and for the purpose herein set forth.

6. In combination with the mold A *a*, the bottom piece *e*, provided with apertures through which the plugs *e* may be inserted in and withdrawn from their respective holes in the bottom of the said mold, and which apertures, after the removal of the said plugs, can be tightly closed by plugs like *z*, or some equivalent means, substantially as and for the purpose herein specified.

7. The cylinder C, in combination with the cover *h* and the mold A *a*, substantially as and for the purpose herein described.

8. The vessel *q* and the pipes *s* and *r*, or their equivalents, in combination with the vessel B *a*, substantially as and for the purpose herein set forth.

114,193. — DRILL-CYLINDER. — Charles S. Pattison, North Adams, assignor to Burleigh Rock-Drill Company, Fitchburg, Mass.

Claim.—In a cylinder, in which works the piston of a drill-carrying piston-rod, the re-enforcing connections, substantially as shown and described.

114,194. — LUBRICATOR. — William Eaton Phillips, Silver City, Idaho Ter.

Claim.—1. The oil-cup *c*, having the tapering adjustable tube *d*, or equivalent, when constructed and operating substantially as herein described.

2. In combination with the regulating-cup *c*, the open globe or standard *e*, substantially for the purpose described.

3. The curved feed-pipe *n*, together with the arm *f* and the hollow pin *m*, or an equivalent device, when constructed to operate substantially as and for the purpose above herein described.

114,195.—TRUNK-FASTENING.—Louis Ransom, Lansingburg, N. Y.

Claim.—1. The double-hinged plates *a b c* and the tongue *d*, forming a toggle-joint, in combination with the cam-button *g* provided with a keyed screw or other suitable locking device.

2. The slotted plate *c*, double-hinged to the part *a* by the intervening plate *b*, the tongue *d*, and slotted plate *f* carrying the cam-button *g*, all arranged and operating substantially as described.

3. The combination of the cam-button *g* and hinged latch *k*, provided with a key-hole, *m*, and a suitable spring, with the tongue *n* and slotted plate *f*, to form a locking device for the single or double toggle-joints herein described.

114,196.—RAILWAY-SWITCH.—Peter V. M. Raymond, Charles City, Iowa.

Claim.—The combination, with the double-shifting tongues A of the pairs B and C, of frogs conversely arranged, and connected by the intermediate short track D having two or more parallel rails on a side, substantially as specified.

114,197.—SEWING-MACHINE.—George Rehfuss, Philadelphia, Pa., assignor to American Button-Hole, Overseaming, and Sewing-Machine Company, same place.

Claim.—1. A segmental shuttle-race, composed of the fixed plate A and segmental plate D, constructed substantially as described, and rendered movable on the said plate A, as set forth.

2. The shuttle-driver G and segmental plate D, constructed and arranged with relation to each other substantially as described, and for the purpose specified.

3. The movable segmental plate D, constructed as described, for supporting and guiding the shuttle, in combination with the spring *n*.

114,198.—ADVERTISING DEVICE.—William Henry Reiff, Philadelphia, Pa.

Claim.—A revolving cylinder, or its equivalent, in combination with a show-case, with the door of which it is so connected as to be operated on the opening or closing of the same.

114,199. — FOLDING-CHAIR. — Frederic W. Richardson, New York, N. Y., assignor to Christian A. Walcheid, Union, N. J.

Claim.—A folding chair composed of the sections A B C connected together by strap-hinges *a a* made as shown, said sections being provided with hinged supports E, braces *d d*, holders *t*, the arms F composed of the parts *g h*, with notches *e*, and the pawls *b*, all constructed, arranged, and operating substantially as described.

114,200.—BUTTON-FASTENER. — Archibald M. Richmond, New York, N. Y.

Claim.—A button-fastener made of wire, and so shaped that it can be entered into the eye of the button with the folded end 1 foremost and be withdrawn either end foremost, as described and represented.

114,201.—TRACE-BUCKLE.—William G. Riley, Sullivan, Ind.

Claim.—The within-described trace-loop, consisting of the frame A, loops B D D, and cross-bars C E, constructed and arranged as described, and used in connection with the screw I and washer *a*, substantially as and for the purposes herein set forth.

114,202.—ADMISSION OF FEED-WATER TO STEAM-BOILERS.—Thomas Roberts, Baltimore, Md., assignor to himself and Edward F. Folger, same place.

Claim.—1. The feed-water pipe or pipes F', passing through the water-space of the steam-generator into the smoke-box or flue and returning into the water-space, substantially as and for the purpose set forth.

2. The combination of the generator A, the check-valve F, pipe F', and check-valve F², substantially as and for the purpose set forth.

114,203.—TONGUE FOR HARVESTER.—Martin Rohrer, Polo, Ill.

Claim.—1. The parts *b c* of the tongue, in combination with the plates *d f o*, pin *e*, and head *r*, as specified.

2. The parts *b c* of the tongue, in combination with the plate *d*, pin *e*, latch-bar *g*, and lifting arrangement *h i m*, as described.

114,204. — WIRE THREAD FOR SEWING LEATHER.—Charles Rowland, Washington, D. C., and Nathan F. English, Hartland, Vt.

Claim. — As a new article of manufacture, a thread composed of the central core of wire, with the various coatings of wax and fibrous material arranged as described, and to be used as and for the purposes herein set forth.

114,205. — POLE-ADJUSTER FOR HORSE-CARS.—Albert Gallatin Safford, Boston, Mass.

Claim.—The arrangement and combination of the adjuster D, as described, with the forked brace *b* and eye-piece *a* of the pole A, and with or for use with the supporter B, in manner and for the purpose as explained.

114,206.—GAS-REGULATOR.–Henry Schutte, Kansas City, Mo.

Claim.—The combination of the gasometer A A', cross-bar D², links D' D'', lever D, valve C, and chest C', all constructed and arranged in relation to each other, as shown and described.

114,207.—RAILWAY-SWITCH CHAIR.–George H. Scougale, Carson City, Nev.

Claim.—The switch-chair, constructed as described and shown, and consisting of the sides A A and center piece B, in combination with the blocks D, E, and F, formed to correspond with the ends of the double rails, and the whole arranged and operating substantially as and for the purpose set forth.

114,208. — COOKING-STOVE.—John Segondy and Michel Ravolo, St. Louis, Mo.

Claim.—1. In a cooking-stove provided with rear and bottom oven-flues a combustion-chamber, extended outward beyond the front of said stove, substantially as and for the purpose shown.

2. The arrangement of the fuel-chamber Q within the oven and with relation to the boiler-holes, substantially as shown, and for the purpose specified.

3. The relative arrangement of the oven M, the fuel-chamber Q, and the flues L', N, T, and U, substantially as shown, and for the purpose specified.

114,209.–SLAT FOR WINDOW-SHADES.–John Shorey and William D. Butler, Lowell, Mass.

Claim.—The slat A, with slot *h* and holes *s s s* filled with lead or other composition, the whole arranged and combined as and for the purpose described.

114,210. — PORCELAIN-KNOB MACHINE.—Thomas J. Sloan, Bronxville, N. Y.

Claim.—1. The adjustable throat B of the hopper, in combination with the charge-carrier C and bed D, over which the receiving-chamber of the carrier travels, substantially as specified.

2. The combination, with the die-case F, of the upper and lower dies G I and plunger H, operating together to lift the molded article out of the die-case and to retain a yielding pressure on said article while being so lifted, essentially as herein set forth.

3. The combination in the one machine, with the charge-carrier C and molding devices F G H I, of the rotary dressing device T V W for trimming the edge of the molded article as it comes from the dies, substantially as specified.

4. The combination, with the molding-dies G I and rotary dressing device T V W, of an automatic device, S, for transferring the molded article to the dressing device, essentially as described.

5. The combination, with the molding-dies G I, rotary dressing device T V W, and automatic transferring device S, of an automatic discharging device, S', for removing the dressed article, substantially as specified.

114,211. — WATER-WHEEL. — Ephraim L. Small, Urbana, Ohio.

Claim.—1. The chutes *b*, having their longer sides tangential to the wheel and the parallel parts of their shorter sides at a distance from the longer sides equal to the width of the front flanges *d*, and their narrowest parts or points of compression next to the wheel, as specified.

2. The bucket, composed of the vertical flanges *d e* standing at angles to each other, the former standing in lines radial to the wheel, and the bottom flange *f* inclined downward and outward, both longitudinally and transversely, as described.

3. The gate *h*, provided with the tapering opening *i*, and placed between the blocks *a*, as explained.

114,212. — SWIVEL CLEVIS FOR PLOWS.—Josiah B. Small and Franklin F. Holbrook, Boston, and Elbridge G. Matthews, Oakham, Mass.

Claim.—1. The combination, with the arm G and face-plate B, of the hook L, substantially as and for the purposes set forth.

2. The combination, with the beam A, face-place B, and disk F, of a spring-catch device, for the purposes stated.

3. The combination, with each face-plate B, disk F, and arm G, of the swivel-loop K and catch-bolt O, substantially as and for the purposes set forth.

114,213.—STORE-TRUCK.–Andrew V. Smith, San Francisco, Cal.

Claim.—1. The self-acting brake for a store-truck while loading, consisting of the pawls L and ratchet G, substantially as herein described.

2. Breaking a truck or other vehicle by means of the rocking-beam C and the stationary brake-blocks F F, or equivalent device, substantially as described.

3. The curved handle N and straight bar P, when employed as a hand-hold on a store-truck, substantially as and for the purpose specified.

114,214.—BUCKLE. — Earle A. Smith and Dwight L. Smith, Waterbury, Conn.

Claim.—The combination of the frame A and lever B, constructed as herein described, and arranged relatively to each other to operate in the manner specified.

114,215.—COMBINED GRIST-MILL AND COTTON-SEED HULLER.—James W. Smith, Columbus, Ga.

Claim.—The combination of the agitator *a b c*, separator E, and fan F, when arranged to be used in connection with the mill herein described, substantially as set forth.

114,216.—LOW-WATER ALARM.—John Stanton, Philadelphia, Pa.

Claim.—The tube P', arranged to project into a boiler below the water-line of the same, and containing a plug of fusible metal projecting in front of the boiler, and arranged to support a weighted

lever connected to a whistle or other alarm, all as set forth.

114,217.—TRUNK-LOCK.—Joseph Stanton, Buffalo, N. Y., assignor to John Kihlberg and Lewis P. Kirchmyer, same place, assignors to said Kihlberg and Michael Mesmer, same place.

Claim.—The construction and arrangement of the plate E with wedge-shaped lugs and hasps F H, and correspondingly wedge-shaped recesses G and hasp-aperture D in the lock proper, as and for the purposes set forth.

114,218.—RUBBER-VENEER.—Benjamin D. Stevens, Prairie du Chien, Wis., assignor to himself, Nathan A. Wright, and John Conant, same place.

Claim.—A veneer made by the application of plastic rubber or gutta-percha, colored in any desired manner, to one surface of cloth, and the subsequent vulcanization of the gum, as specified.

114,219.—FIRE-KINDLING.—John W. Still, San Francisco, assignor to Franklin Pancoast, Alameda, Cal.

Claim.—1. Cocoa fiber or red-wood bark, prepared as above described, for the purpose specified.

2. As a new article of manufacture, a fire-kindler composed of cocoa fiber or red-wood bark, prepared as above described.

114,220.—PLOW-COLTER.—Warren H. Stone, Lebanon, Mich.

Claim.—The combination of the wheel A, sheave B, pronged sheave-wheel C, clasp and axle D and F, with endless chain E, or their equivalents, all for the purposes and substantially as herein described.

114,221, antedated April 19, 1871.—PLOW.—Archibald L. W. Stroud, Munford, Ala.

Claim.—The side beams D D, with their feet E E, plows H or I, and braces G G, when attached to the center beam A by means of three bolts, *a a*, at equal distances apart, so that the side beams may be placed one in advance of the other or side by side, as may be desired, and the distance of said side beams from the center beam is regulated by the slotted washers *b b*, all as herein set forth.

114,222.—BOILER.—Daniel Sullivan, Bangor, Me.

Claim.—The hinged face and back plates of a boiler as herein described, in combination with the grooved flange *c* and rod A, as herein set forth.

114,223.—HAIR-DRESSING.—Franklin R. Taylor, Waverly, N. Y.

Claim.—The compound herein described, compounded in the manner and proportions and for the purpose herein set forth.

114,224.—ASH-SIFTER.—George W. Taylor, Baltimore, Md.

Claim.—The improved ash-sifter herein described, consisting of the part *a*, having the cover *b*, flange *h*, and deflected perforated bottom *c* with an inclined or bevel edge, and the ash-pan *d*, said parts *a* and *d* being provided respectively with the handles *f* and *g*, all as and for the purpose specified.

114,225.—SPRING BED-BOTTOM.—Austin E. Thayer, Philadelphia, Pa.

Claim.—The combination and arrangement of the rail C P, the plate P with its arm *p*, and rubber loop I R, bracket B, and slat S, as and for the purpose specified.

114,226.—SEED-DRILL.—John H. Thomas, Springfield, Ohio.

Claim.—In a seed-drill, with hoes so arranged that they may be disposed either in a row or in a zigzag line, the arrangement of the lift-bar with reference to the hoes, substantially as set forth.

114,227.—FEED-ROLLER FOR GRAIN-DRILLS.—John H. Thomas, Springfield, Ohio.

Claim.—A feed-roll or wheel for grain-drills made in two parts, one of which is arranged to remain stationary while the other part rotates, substantially as described.

114,228.—ENVELOPE.—J. Patton Thompson, Philadelphia, Pa.

Claim.—The cutters C, C^1, and C^2, provided with slips S, S^1, and S^2, arranged in conjunction with the envelopes A, D, and E, so as to operate as and for the purpose specified.

114,229.—PORTABLE DRILLING-MACHINE.—William H. Thorne, Philadelphia, Pa., assignor to Thorne & De Haven, same place.

Claim.—The frame A, having the ball-shaped journal B, in combination with the socket-clamp C *e*, the drill-spindle, and the supporting bracket or table, substantially as and for the purposes specified.

114,230.—BREECH-LOADING FIRE-ARM.—Frank Tiesing and Charles Gerner, New Haven, Conn., assignors to Eli Whitney, same place.

Claim.—1. The plate D connected to the extractor-stem C by the arm *i*, and having the arm *e* with spring *n* acting thereon, and the shoulder *e*, in combination with the spring pawl A and inclined *o*, on the frame, all constructed and operating substantially as described.

2. The joint of the frame E, having its opposing shoulders *r* beveled, substantially as described, to prevent pinching the hand when opening the breech.

114,231.—CLOTHES-WRINGER.—William H. Towers, Boston, Mass.

Claim.—The combination of the springs *f f*, cross-bar G, spring *g*, and cross-piece D, substantially as set forth.

114,232.—SEEDER AND CULTIVATOR.—James T. Trowbridge, Akron, Ohio.

Claim.—1. The metallic end piece A, when cast with a flange, *a*, and lugs *c c* on the top to receive the axle D, and with a socket for the end of the front cross-bar B, all constructed and arranged substantially as and for the purpose set forth.

2. The socket *k*, on the arm *g*, for securing the tooth *h*, as described.

114,233.—BLASTING-FUSE.—Richard Uren, Santa Cruz, Cal.

Claim.—The combination of the inner yarns B and covering-tapes A with suitable filling in the manufacture of safety-fuses, substantially as described.

114,234.—PREPARING AN EXTRACT OF MEAT.—Mann S. Valentine, Richmond, Va.

Claim.—1. The method described for obtaining the juices of meat or other matter in a condition ready for assimilation and nutrition by expressing the said juices after the material has been subjected to a moderate heat so as to avoid coagulating the albumen.

2. The new article of food above described, consisting of the juice of meat expressed after the application of moderate heat, such as will not coagulate the albumen.

114,235.—GUIDE FOR CIRCULAR-SAWS.—David W. Washburn, Brewer, Me.

Claim.—The within-described adjustable guide for saws, as specified, for the purposes set forth.

114,236.—BALE-TIE.—Francis Watkins, London Works, Birmingham, England.

Claim.—In combination with the hoop A B, provided at its free end with the loop *a*, the hook-plate C, having the curved projection *d*, slot *c*, and inclined opening *e*, all constructed as described, and for the purpose specified.

114,237.—PLOW.—Adam Weaber, Lebanon, assignor to himself and L. L. Heiks, Clear Springs, Pa.

Claim.—The projection F on the mold-board B, and the corresponding opening E in the plate D, as and for the purposes specified and set forth.

114,238.—WATER-CLOSET.—Darius Wellington, Boston, Mass.

Claim.—1. In combination with the container *a*, the rim d^1, having the flanges *d e* which embrace the edge of the container, the rim being fastened to the container, substantially as described.

2. The combination of the pan with the carrier, to which it is attached by means of the arms *l l*, fingers *n*, and screw-pin *o*, substantially as described.

3. The weighted slide *u*, arranged to operate the pan and valve, substantially as described.

4. In combination with the vertically-reciprocating slide, the horizontal arm *w'*, adjustable in position upon the slide, substantially as and for the purpose described.

5. The cup a^2, arranged to receive the knob *z* and spindle *y*, when provided with the wings or buttons b^2 for fastening it to the seat of a water-closet.

6. The valve h^2, when operated by the weighted lever c^2 acting upon the spindle l^2, substantially as described.

7. In combination with the valve h^2 and valve-case c^2, the trap p^2 q^2 and waste-pipe r^2, substantially as described.

8. The screw-bearing *k*, constructed with the groove f^2 and aperture u^2, substantially as described.

114,239.—MAIL-BAG FASTENING, &c.—Martin V. B. White, Fort Edwards, N. Y.

Claim.—1. The rib or vertebra B, composed of overlapping sections C provided with the tongues *c* and corresponding notches *c''*, substantially as and for the purpose specified.

2. In combination with the vertebra B, constructed as described, the slotted tube E, substantially as and for the purpose shown.

114,240.—BALANCE-WHEEL.—Frederick W. Wild, Baltimore, Md.

Claim.—1. The construction of the pin C, with its adjustable device E, with reference to the hub A of the balance-wheel, substantially as herein set forth.

2. The construction of the adjustable cone B with its adjusting-screw E, when combined with the pin C, as herein described.

3. The construction of the pin C, with its adjustable cone B, adjusting screw E, all arranged with reference to and for operation with the balance-wheels of sewing-machines, substantially as herein described.

114,241.—HORSE-STALL.—John Wilkinson, Baltimore, Md.

Claim.—1. The combination of the hay-tube *a*, apertures *b*, cover *d*, and lattice-work *n*, constructed in the manner and for the purpose substantially as set forth.

2. The slot *g*, undercut as shown, in combination with the flanged conduit *i* and the slot-cover *f*, substantially in the manner and for the purposes set forth.

3. The platform *m* and slobber-board *k*, when combined for the purposes set forth.

114,242.—PREPARATION AND APPLICATION OF PROXYLINE FOR DENTAL-PLATES.—Richard H. Winsborough, St. Louis, Mo.

Claim.—1. Proxyline for dental purposes bleached by the application of chlorine or other suitable bleaching agent in order to render it more highly translucent or semi-transparent, as and for the purpose set forth.

2. Artificial gums or dental plates formed by the introduction of plastic camphorated proxyline into plaster or porous molds, and, while said material remains in the molds, expelling the camphor or other solvent by artificial heat or natural evaporation, or extracting it by chemical means, as specified.

114,243.—MIRROR-REFLECTOR.—Henry S. Wood and James W. Morrison, Chicago, Ill., assignors of one-third their right to Jacob P. Pfanner, same place.

Claim.—1. The combination of the reflector A, universal joint B B', jointed arms C C^1 C^2, friction-joint E, and bracket G, constructed and operating substantially as specified.

2. The friction-joint E, consisting of the central corrugated limb *b* and the two outer corrugated limbs *i i'*, substantially as and for the purpose specified.

114,244.—COMBINED HARROW.—Cornelius Wyckoff, Jr., Fairview, Ill.

Claim.—The combination and construction of the bars A A, with their adjustment-holes *h h h h a a g g* and their handles F F, with the cross-bar B, with its adjustment-holes *h h h h h h h h*, *d d*, *f f*, and *e e*, and its block E, the cross-bar C, all adjustable to convert the harrow into either a corn-harrow or cultivator, or into a harrow for harrowing small grain, &c., as described.

114,245.—CONDENSER FOR STILLS.—John Yates and Edgar Denell, Brooklyn, N. Y.

Claim.—A condenser for distilled vapor, composed of a series of corrugated leaves, in the manner and for the purpose herein described.

114,246.—COMPOSITION BLACKBOARD.—Robert W. Young, Rising Sun, Ind.

Claim.—The composition blackboard, of the ingredients in the proportions and for the purposes substantially as set forth.

114,247.—HOT-AIR REGISTER.—William Young, Easton, Pa.

Claim.—A hot-air register composed of a cast-iron frame, a detachable rim with hinged face and register-valves, all substantially as and for the purposes herein set forth.

REISSUES.

4,349.—FLUTING-MACHINE.—Henrietta H. Cole, New York, N. Y.—Patent No. 55,469, dated June 12, 1866.

Claim.—1. A fluting-machine having the journal-boxes of one of its rollers stationary and those of the other movable, with elastic mechanism interposed between the boxes, and with an adjustable and removable pressure on the outer side of the movable box, substantially as herein described.

2. In a fluting-machine, the combination of the fluted rollers with elastic mechanism, when constructed and arranged to operate, as herein described, for the purpose of separating the rollers on the removal of the pressure, as set forth.

3. In combination with the fluted rollers, operated substantially as herein described, the weighted lever K for applying the pressure, whether the weights thereon be adjustable or stationary.

4. The arrangement of the fluting-rollers B, as herein described, in order that they may be detach-

ed and others provided with larger or smaller corrugations substituted, as set forth.

4,350. — PISTON-PACKING. — Orrin Collier, Sacramento, Cal.—Patent No. 98,232, dated December 28, 1869.

Claim.—1. The ring C, grooved on its periphery, combined with an expansible centering-ring, I, working in said groove, for the purpose specified.

2. The combination of the centering-ring I, packing-rings H H, disks A B, and groove ring C, substantially as and for the purposes described.

4,351. — FALL-LEAF EXTENSION-TABLE. — Jacob Dourson, Columbus, Ohio.—Patent No. 87,829, dated March 16, 1869.

Claim.—1. The drop-leaf table, provided with an extension leg and rails which can be drawn out to support the opened leaves, as set forth.

2. The slide E, in combination with the parts *e f*, substantially as and for the purpose described.

3. The grooved bars F F, pivoted to the rails D, and combined with the dowel-pins *h* on the fixed table top, as set forth.

4,352.—DISINFECTANT OR CARBOLIC-ACID SOAP.—Charles J. Eames and Charles A. Seely, New York, N. Y.; Charles J. Eames assignor to Isabella Eames.—Patent No. 65,186, dated May 28, 1867.

Claim.—1. A disinfectant soap, made by incorporating carbolic acid, or its equivalent, with soap, substantially as above specified.

2. The combination of the carbolic acid, or other equivalent disinfectant acid, with the oils and fats to be used in the manufacture of soap.

3. The combination of carbolic acid, or its equivalent, with the alkaline solutions to be used in the manufacture of soap.

4,353.—STANCHION. — Walter C. Gifford, Jamestown, N. Y.—Patent No. 105,445, dated July 19, 1870.

Claim.—1. A swinging stanchion-bar, H, having notch *x* on one side and incline *y* on the other, acting in combination with the pins O P to form an automatic lock, as described.

2. The arrangement of notched lever K *m*, pivoted at L, in combination with a pin, J, for the purpose of unlocking, raising, and opening, in the manner described.

3. The arrangement of the hinged scraper G upon the swinging stanchion, as and for the purpose described.

4,354. — LOCK-NUT. — James H. Gridley, Washington, D. C., assignor to H. L. Purdie.—Patent No. 62,483, dated February 26, 1867.

Claim.—1. In combination with a threaded nut working on a screw or bolt, a hinged plate whose edge or edges fall close to and parallel with one or more of the sides of said nut, as and for the purpose specified.

2. In the same plate for locking-nuts, a straight edge falling parallel to one side of the nut, and an angular recess shaped to correspond with the corners of the nut, for the purpose specified.

3. A hinged nut-lock, combined with the washer of the nut, as and for the purpose specified.

4. The combination of the washer C and hinged flap C′ with the talons *b* on the back of the washer, substantially as described.

4,355. — LIGHTNING-ROD. — Lewis King, East Cleveland, Ohio, assignor of two-thirds interest to Newell E. Smith.—Patent No. 49,633, dated August 29, 1865.

Claim.—1. The connection of branch pipes or tubular lightning-rods by means of the pin *g*, head *e*, collar *f*, and dowel *d*, substantially as and for the purpose set forth.

2. The dowel or tenon *d*, in combination with straight or main sections of tubular lightning rods, substantially as and for the purpose set forth.

4,356.—PUMP-VALVE.—William H. Pollard, Seneca Falls, N. Y., assignor to The Goulds' Manufacturing Company.—Patent No. 73,038, dated January 7, 1868.

Claim.—1. The elevated convex valve-seat *a*, constructed or formed with the rounded or similarly-shaped top described, when combined with a valve acting above and striking upon said seat, as herein specified.

2. The combination of the concave disk *g* of the valve with the elevated convex seat *a* arranged as described, and operating in the manner and for the purpose specified.

4,357.—MACHINE FOR BENDING WOOD.—Condit Prudden, Philadelphia, Pa.—Patent No. 54,012, dated April 17, 1866.

Claim.—A mold, M, formed and recessed, substantially as described.

4,358.—SADDLE OR SWEAT-CLOTH.—Robert Spencer, Newark, N. J.—Patent No. 41,944, dated March 15, 1864.

Claim.—1. As a new article of manufacture, a graduated saddle-cloth in which the varying thicknesses of the different parts is produced in the process of manufacture either by felting or weaving, substantially as described, as distinguished from a saddle-cloth in which the varying thicknesses is produced by sewing or stitching on pads or thickening, as was formerly done.

2. As a new article of manufacture, a graduated saddle-cloth in which the two similar sides are practically united in the process of manufacture by felting or weaving, substantially as described, as distinguished from one in which the two similar sides were separately made, and then united with each other by stitching or sewing.

DESIGNS.

4,836.—INKSTAND.—Fred. D. Alling, Rochester, N. Y.

Claim.—The design for inkstand herein shown and described.

4,837.—LARD-PAIL.—John J. Bockeé, New York, N. Y.

Claim.—The design for a metal can as described, and as represented in the drawing.

4,838.—SIDE OF A RAILWAY CAR.—Madison Buell and William Wood Lesley, New Castle, Del.

Claim.—The design for the side of a railroad car, as described and shown.

4,839.—ENVELOPE BLANK.—George Cade, Long Branch, N. J.

Claim.—The design for an envelope, substantially as herein described and represented in the accompanying drawing.

4,840.—MOSQUITO-NETTING.—Thomas Carmichael, Newark, N. J.

Claim. — The design for mosquito-netting, as herein shown and described.

4,841.—SHOW-CASE AND DRAWERS.—George Penrice Farmer, Brooklyn, N. Y., assignor to E. C. Pratt, Brother & Co., New York city.

Claim.—The design for combined show-case and drawers, substantially as described, and as illustrated in and by the accompanying drawing.

4,842.—SHOW-CASE FOR NEEDLE PACKAGES. George Penrice Farmer, Brooklyn, N. Y., assignor to E. C. Pratt, Brother & Co., New York city.

Claim.—The design for a partitioned case, substantially as described and as illustrated in and by the accompanying drawing.

4,843. — COTTAGE FRONT.—Chauncy Graham, Elizabeth, N. J.

Claim.—The design for a cottage front, as herein shown and described.

4,844.—FRONT OF A COUNTRY HOUSE.—Chauncy Graham, Elizabeth, N. J.

Claim.—1. The arcs G on the sides of the main attic windows D, as shown.

2. The gable-shaped cornice F over the attic windows D, as shown.

3. The combination of the arcs G and gable-shaped cornice F, as shown.

4,845.—END OF SCHOOL-DESKS AND SEATS. George H. Grant, Richmond, Ind.

Claim. — The design for school-furniture, as shown and described.

4,846.—CLOCK-FRONT. — Jonathan Moore, Jr., Brooklyn, N. Y.

Claim.—The design for a clock-front, as herein set forth and described.

4,847.—SCHOOL-DESK AND SEAT.—Cyrus F. Palmer, Utica, N. Y.

Claim.—The application of this design, "made of cast-iron," to school-seats and desks.

4,848.—SAW-FILING VISE.—William A. Perkins, Salem, Mass.

Claim.—The design and configuration of the vise for filing saws, as represented.

4,849.—TOY STEAM-ENGINE. — Edward P. Ryder, New York, N. Y.

Claim.—The design for a toy steam-engine, as shown.

4,850.—SASH-WEIGHT.—William H. Short, Brooklyn, N. Y.

Claim.—The design for a sash-weight, as shown and described.

4,851. — GAS-FITTING. — Francis Ernest Thomas, New York, N. Y., assignor to Fellows, Hoffman & Co., same place.

Claim.—1. The ornamental shields *a* applied to the barrels *b* and handles *f* of gas-fittings, as set forth.

2. The grooved pipes *d* and elbows *e*, combined with the ornamental barrels *d* of gas-fittings, as set forth.

4,852.—FAUCET-HOLDER.—Carl Tielenius, New York, N. Y.

Claim.—The design for a faucet-holder herein described.

TRADE-MARKS.

227.—STOVE-POLISH.—Robert E. Cherrington, South Boston, Mass.

228.—PRINTERS' INK.—Charles Eneu Johnson, Philadelphia, Pa.

229.—PIGMENT.—James H. Nason, Boston, Mass.

230.—CIGARS.—John C. Smith & Son, Baltimore, Md.

EXTENSIONS.

E. D. BUCKMAN, of Philadephia, Pa., and Samuel A. Sisson, of Queensburg, Vt., executors of S. S. ALLEN, deceased.—Letters Patent No. 16,957, dated April 7, 1857.

"Improvement in Harvesters."

Claim.—The combination of the upper platform Q and sliding pole V with the main frame C and inclined draft-rod or chain, when the same are constructed and arranged for joint operation, substantially in the manner and for the purpose herein set forth.

DANIEL S. NIPPES, Upper Merion township, Pa., administrator of ALBERT S. NIPPES, deceased.—Letters Patent No. 17,110, dated April 21, 1857.

"Improvement in Grinding Saws."

Claim.—1. Placing the roller R within a frame, S, which is pivoted to a bar, T, which has its journals *f′* fitted in oblong slots or bearings *j′*, substantially as shown, so that said roller may be elevated or raised up free from the saw, and also be adjusted more or less angularly with the face of the grindstone H, for the purpose set forth.

2. Operating or moving the stone H and roller R toward and from the saw, by connecting the bearings *d* of the shaft of the stone and the journals *f′* of the bar T to the disk D and ratchet C, by means of the arms *h′* and the rods E, substantially as described.

WILLIAM L. WILLIAMS, of New York, N. Y. Letters Patent No. 17,061, dated April 14, 1857; reissue No. 2,132, dated December 19, 1865.

"Improvement in Machines for Splitting Wood."

Claim.—1. The combination of the feeding chains, arranged as set forth, with the stationary conveying floor, for effecting the feeding up of the sticks in a fire-wood splitting machine, substantially as described herein.

2. In a machine for splitting fire-wood, the combination of a yielding lateral support to the wood with diagonal knives, substantially as set forth, whereby the wood confined between the said knives is allowed to move laterally as the knives enter the same, for the purpose set forth.

3. Communicating to said yielding lateral supports a positive motion governed by the movement of the knives, substantially as and for the purposes specified.

4. In a wood-splitting machine, two separate knives at an angle or diagonally to each other, and each extending across the feeding floor so as to split up the wood, in the manner specified.

CORNELIUS MARTRATT, of Waterford, N. Y. Letters Patent No. 17,108, dated April 21, 1857.

"Improvement in Method of Securing the Doors of Hay-Presses, &c.

Claim.—The form of the crank or loop E, the elliptic or eccentric form of the ends of the battens C C, and the combination of the one with the other, for the purpose of securing a door or hatch, and for the purpose of preventing a sudden and dangerous start of the door in opening, by means of the gradual movement of the battens outward as the loop is turned off from them, substantially as described in the within specification.

HORACE VANSANDS, of Middletown, Conn. Letters Patent No. 17,243, dated May 5, 1857; reissue No. 3,392, dated April 20, 1869.

"Improved Blind-Fastening."

Claim.—1. The two-part case, having a screw-surface, in combination with the hook A, as a new and useful improvement in the manufacture of blind or shutter-fastenings, substantially as described.

2. The recess or slots C D, formed in a two-part shell of a blind or shutter-fastener case, substantially as and for the purpose described.

3. In a blind or shutter-fastener a two-part cylindrical case, in combination with an actuating spring and hook, A, substantially as and for the purpose described.

4. In a blind or shutter-fastener, a cylindrical case, in combination with a hook-fastening which oscillates upon an axis-pin with an actuating spring.

DISCLAIMER.

WILLIAM L. WILLIAMS, of New York, N. Y. Letters Patent No. 17,061, dated April 14, 1857; reissue No. 2,132, dated December 19, 1865.

"Improvement in Machines for Splitting Wood."

(Filed April 14, 1871.)

Disclaims fourth Claim, which is in the following words, to wit:

In a wood-splitting machine, two separate knives, at an angle or diagonally to each other, and each extending across the feeding-floor so as to split up the wood in the manner specified.

ISSUE OF MAY 2.

PATENTS.

114,248, antedated April 27,1871.—WEIGHING-SCALE.—Darwin D. Allen, Adams, Mass.

Claim.—The balance-beam B, graduated as described, forked to connect with the platform C, and sliding in the bed A, provided with the price-scale F, all arranged as shown and described, to operate in the manner specified.

114,249. — MILLSTONE-BALANCE.—John A. Althouse, New Harmony, Ind.

Claim.—The horizontal slotted bar B, vertical slotted plates C C, bolts E E, and weight D, provided with bolts F, all arranged as and for the purpose specified.

114,250.—WASHING-MACHINE.—Albert Assmann, Rahway, N. J.

Claim.—The two cylindrical brushes B C, having a differential velocity and the one resting upon the other, combined with a superincumbent loose and yielding roller, *b*, for the purpose specified.

114,251. — GRAIN-SEPARATOR.—Sidney K. Ayres, Dellton, Wis., assignor to himself and Peter Flickner, same place.

Claim.—1. The combination of the shoe H, the spring strap J, the plates K, the strap I, and the hook I', when the several parts are constructed, arranged, and operated substantially as described and shown, for the purposes set forth.

2. The combination of the screen-frame Q with the shoe H, when the same is adjustably suspended to said shoe by means of the stirrup *e* and screw *d*, as and for the purpose set forth.

3. The arrangement of the shoe H of the sieves N^1, O^1, and P^1, and screens S', grain-boards N, O, P, and S, tail-boards N^2 O^2 P^2, and the deflector U, substantially as and for the purposes specified.

4. The bell-crank M provided with the groove *a*, in combination with the pitman L provided with the stud *b*, all constructed, arranged, and operated substantially as described and shown, for the purposes set forth.

114,252. — STALK-CUTTER. — Josiah Babcock, John F. Stilson, and James C. Leidy, Galesburg, Ill.

Claim.—1. The adjustable bearing cylinders G G, and ball-journals L, constructed and arranged to operate in combination with the cylinder of the cutters I and frame A, substantially as and for the purpose set forth.

2. The frame M, pendants N, bearing cylinders G, shaft J, lever S, catch T, and frame A, combined and arranged to operate substantially as described, and for the purpose set forth.

114,253.—SASH-HOLDER.—William Bachelier, West Newbury, assignor to himself and George P. Kimball, Boston, Mass.

Claim.—The spring C, provided with frictional bearing surface D, protruding through an opening in plate A, in combination with plate A, pin F, and set-screw E, all arranged and operating substantially as described.

114,254.—CORDING ATTACHMENT FOR SEWING-MACHINES. — Nelson Barnum, La Porte, Ind., and Russel S. Barnum, Chicago, Ill.

Claim.—1. The spring *d*, provided with plate *d'*, when so arranged as to form a longitudinal groove to receive the cord, in combination with arm B, whereby the cord is retained in position, substantially as and for the purpose described.

2. In combination with arm B, the spring *d*, plate *d'*, and presser-foot A, the whole arranged to operate substantially as and for the purpose described.

114,255. — AUTOMATIC BOILER-FEEDER.—Robert Berryman, Hartford, Conn., and Rufus Nutting Pratt, Philadelphia, Pa.

Claim.—1. The combination of the condenser G and the cock I with the weighted lever C and globe D, (combined with the boiler by pipes *b c*, as described,) and with the tank or vessel E, its water-induction and eduction-conduits *i H k*, and the pipe *d* and its cock F, all being applied together and with the boiler, substantially in manner and to operate as described.

2. In combination therewith, means of heating the tank E by the exhaust steam, such means as represented and described, consisting of the two chambers *h h* and the stack of pipes *i*.

3. The combination and arrangement of the chambers *h h* and the stack of pipes *i* with the vessel E.

4. The combination of the check-valves *u l*, arranged in the pipes *i* and *k* with the condenser G, the tank E, the vessel D, and lever C, all arranged and combined together in manner substantially as described, and with or for use with a boiler, as set forth.

114,256. — FIRE-EXTINGUISHER.—Christopher Blake, Boston, Mass.

Claim.—1. The receptacles A B, for holding apart in solution the gas-producing ingredients, in combination with the pipes C D and branch pipes *a b*, provided with stop-cocks, the whole constructed, arranged, and operating substantially in the manner and for the purpose set forth.

2. In combination with the above, the feed-pipes *e h*, with their stop-cocks 5 5, operating substantially in the manner and for the purpose set forth.

114,257. — STEAM-TRAP.—James H. Blessing, Albany, N. Y., assignor to himself and Frederick Townsend, same place.

Claim.—1. The non-conducting diaphragm S, or its equivalent, working in a case, A, in combination with inlet and outlet-valves applied to said case on opposite sides of said diaphragm, and operating, substantially as described, and for the purpose set forth.

2. The combination, with the case A or its equivalent, of the hot-water valve-box C, containing inlet-valve V and outlet-valve V', and communicating by way of passage *a*, with the hot-water apartment T, substantially as described.

3. In combination with the diaphragm-case A, the receiving and discharging-valve box B, the diaphragm-rod D, and suitable valve-lifting devices, operating automatically on the valves in said box, substantially as described.

4. The non-conducting diaphragm S, made flexible, substantially as described.

114,258.—THILL-COUPLING.—George I. Bradley, Boston, Mass., assignor to himself and Everett W. Bigelow, same place.

Claim.—A "clip," B, provided with a split socket, D, and set-screw *k*, in combination with a thill-iron, E, provided with a ball, *d*, substantially as and for the purpose set forth.

114,259. — BREECH-LOADING FIRE-ARM.—Heinrich Büchner, New York, N. Y.

Claim.—1. The slide I, combined with the vertically-reciprocating cartridge-block C and with the horizontally-reciprocating needle-head or plug F, to operate the same simultaneously, as specified.

2. The crank-shaft J, connected with the slide I, and combined with the slotted guide-plate *l* to operate the same, substantially as herein shown and described.

3. The notches O P on the needle-plug, combined with sliding hook *n* and trigger L, to operate, as described, in successively withdrawing, holding, and discharging the needle-plug F.

114,260. — BASE-BURNING STOVE.—Esek Bussey and Charles A. Hamlin, Troy, N. Y., assignors to Bussey, McLeod & Co., same place.

Claim.—1. The coking-chamber B, placed above and disconnected from the fire-pot A, and connected with the lower end of the fuel-reservoir by means of the open grate C, substantially as and for the purposes herein set forth.

2. The fuel-reservoir H, provided with perforations J, which are covered on the outside by the tubes I, for the purpose of conducting the gases from said reservoir through the grate C and into the coking-chamber B, substantially as herein set forth.

3. The arrangement of the coking-chamber B, grate C, reservoir H with its perforations J and tubes I, chamber Q, and draught-door D, all substantially as shown and described.

4. The combination of the hinged or pivoted cover M with opening O, cap P, connecting-strip N, and cover L, all substantially as and for the purposes herein set forth.

114,261. — INFANT'S SHOE. — Willard M. Carpenter, Rowley, Mass.

Claim.—The method of attaching elastic cord B by means of balls C, as applied to infant's shoes, substantially as described.

114,262.—INKSTAND.—Seth C. Catlin, Cleveland, Ohio.

Claim.—1. The combination of the adjustable air-vessel M, annular chamber E, air-chamber F, reservoir I, and cup J, arranged and operating substantially as specified.

2. The combination of the sponge-cup D, annular liquid-chamber E, and air-vessel M, constructed and arranged substantially as shown and described.

114,263. — CHEESE-HOOP FLANGE.—Azor Chandler, Rome, N. Y.

Claim.—The metallic flange B, formed substantially as described, to co-operate with a cheese-hoop and follower for the purpose of rounding and finishing the angles of cheese in the press, as specified.

114,264.—CITRATES OF IRON AND MANGANESE FOR MEDICAL PURPOSES.—Albion R. Clapp, Boston, Mass., assignor to James R. Nichols & Co., same place.

Claim.—The substance formed by the combination of the citrates of the oxides of iron and manganese, essentially as herein set forth.

114,265. — NEEDLE-SHARPENING ATTACHMENT FOR SEWING-MACHINES.—Celia P. Clark, Lock Haven, Pa.

Claim.—The within-described grinding or polishing-wheel C, binding-plate D, revolving shaft B, and interposed rod F, all arranged and combined substantially in the manner and for the purpose herein set forth.

114,266.—HOE.—Isaac Cook and John T. Bever, Haynesville, Mo.

Claim.—The hoe-blade B, when provided with a square or angular eye, and corrugation *b b*, in combination with a handle, A, having a corresponding depression in the ferrule *a* for the corrugation *b b* of the blade, and a square or angular tang, *c*, made permanent in handle A by screw or bolt *f*, with screw and nut for securing the parts together, as specified.

114,267.—METER.—Thomas Cook, Old Kent Road, and John Watson, Victoria Chambers, Westminster, assignors to Fluid-Meter Company, London, England.

Claim.—The improved apparatus herein described, consisting of the horizontal wheel A, provided with cavities or cells on its under side, the reversely-inclined ports *e* and *g*, plate *h*, and casing D, substantially as shown and described.

114,268. — PRINTING-PRESS. — Calvert B. Cottrell, Westerly, R. I.

Claim.—1. The combination, with the cylinders employed in connection with the reciprocating bed G of a printing-press, for arresting it by compressing the air in said cylinders, of the auxiliary air-chambers for increasing the elasticity of the cushion, substantially as specified.

2. The employment of the cylinders and pistons used for arresting the bed by an air-spring, of the valves I for admitting air behind the pistons, substantially as specified.

3. The arrangement of the cylinders and pistons whereby they are supported independently of the bed and not separated from each other in the back stroke, and whereby they are operated by the contact of a projection from the bed with the connections of the pistons, substantially as specified.

114,269.—WHIFFLETREE-COUPLING.—Hyde Crocker, Jr., Montrose, Pa.

Claim.—The centrally-apertured and rabbeted plate B, and the flanged plate D E F, combined as described, with the eyener A and whiffletree G, for the purpose specified.

114,270.—RECEIVER AND STENCH-TRAP FOR STREET-SEWERS.—Thomas Dark, Buffalo, N. Y.

Claim.—The construction and arrangement of the iron receiver A with slanting ends *a a'*, and outside frost-flanges *g g'*, and trap B, all formed in one piece, and having the hinged valve-trap C resting on packed seats or grooves *e e'*, and held in place by rods *c c'*, as hereinbefore set forth.

114,271, antedated April 26, 1871.—COTTON-PRESS.—Henry J. Davis, Wetumpka, Ala.

Claim.—The series of vibratory eccentrics S ap-

plied to the side *r*, in combination with the operative mechanism shown and described, to loosen the pressed bale preparatory to its discharge from the machine.

114,272. — GAS-REGULATOR. — Otis Dean, Richmond, Va.

Claim.—The pendent pivoted valve E, combined with a valve-seat located in partition B of a vessel, A, arranged between the gas-supply pipe and burners, as and for the purpose specified.

114,273.—PRINTERS' CASE.—Alexander T. De Puy, New York, N. Y.

Claim.—The combination, with the filling of a type-case, of any number of metal clamps, when constructed and operating substantially as and for the purposes set forth.

114,274. — SELF-ACTING MULE FOR SPINNING.—John Dodd, Oldham, England.

Claim.—The combination of a winding-on drum with decreasing diameters with apparatus substantially such as herein described, connected to the radial arm, for removing lengths of chain from the said drum.

114,275. — DRY-GAS PURIFIER. — Edward Duffee, Haverhill, Mass., assignor to American Gas-Screen Manufacturing Company, same place.

Claim.—In a dry-gas purifier constructed as above described, the arrangement of an intercepting partition, E, below the lower series of lime-screens, in manner and for the purpose set forth.

114,276.—TUCK-MARKER FOR SEWING-MACHINES.–George L. Du Laney, New York, N. Y.

Claim.—The combination, with a laterally-adjustable perforator attached to and moving with the needle-arm, of a laterally adjustable plate, E, having a perforation therein to permit the point of the perforator to enter it and puncture the cloth without reaching down to and coming in contact with the bed-plate of the sewing-machine.

114,277. — MANUFACTURE OF IRON AND STEEL.—Zobette S. Durfee, New York, N. Y.

Claim.—1. The manufacture of iron and steel, and of various metallic alloys, by the combined apparatus and processes substantially as herein described.

2. The annular trough and feeding-hopper combined together, and operated either with an ingot-mold or a furnace, substantially as described herein.

114,278.—EVAPORATOR.—Stephen P. Dyer, Ankney Town, Ohio.

Claim.—The evaporating apparatus, consisting of the heater and pans, the one being grooved in the bottom and provided with the dividing plates, the valves, and filter, and the other arranged to receive the liquid from the first, and for being readily removed for emptying, all substantially as specified.

114,279.—STOVE-PIPE SHELF. — James P. Elliott, Bridgeport, Conn.

Claim.—The combination, with pipe A, of band C, shank F, shoulders 1 1, shelf G, hooks G G, plate D with opening J and recesses 2 2, lever E reinforced to provide for cam H, constructed and operated substantially as set forth.

114,280.—TUBULAR GRATE-BAR.—William H. Farris, Cairo, Ill.

Claim.—1. The fire-back A, chambered at *s* and *f*, and provided with a hollow bar, B, and internal tube G, substantially as described.

2. The cap D, applied to the end of the hollow bar B, in combination with the internal tube G, terminating near said cap and communicating with the inlet-passage *s*, substantially as described.

3. A series of chambered fire-backs, A, communicating above and below with one another, in combination with grate-bars B, internal tubes G, and caps D, so constructed and arranged that the inlet and discharge of water shall be through each fire-back and grate-bar, substantially as described.

114,281.—NIPPLE-SHIELD.—Samuel C. Foster, New York, N. Y., assignor to The Monitor Shield Company.

Claim.—The combination of the circular disk, with elevated rim upon its under side, near the nipple opening, the concave under surface, and the nipple turret, with the smallest diameter of its conical orifice at the point of union of the disk and turret, all arranged to form a nipple-shield, as described.

114,282.—INVALID-CHAIR.—George T. Fowler, East Somerville, Mass.

Claim.—1. The sliding foot-rest frame mounted in ways or grooves, and combined with suitable springs for permitting the extension or sliding movement of said frame, substantially as and for the purposes set forth.

2. The combination, with the body of an invalid-chair, of a removable wheel-frame D N carrying the side and rear wheels, and secured to the chair substantially in the manner and for the purposes shown and described.

114,283.—HYDRANT.—Joseph P. Gallagher, St. Louis, Mo.

Claim.—1. The hollow nut a^2 and its bushing *a*, the spring c^3, tappet c^2, and rod C′ when arranged and operated substantially as set forth.

2. In combination with the parts mentioned in the first clause, the lever F *g* and fulcrum-plate G, all constructed, arranged, and operating substantially as described.

3. The hemispherical valve-chamber B, constructed with an annular water-way, B^2, the tubular portion B^3, and provided with the adjustable valve-seat, substantially as described.

114,284.—PUMP.—Joseph P. Gallagher, St. Louis, Mo.

Claim.—1. The air-pump B, constructed as described, in combination with the elastic air-receiver D, constructed as described, for the purpose set forth.

2. The slide X, consisting of the upper cross-head E, rods *e*, lower cross-heads E^1 E^2, secured to piston C, said slide, as described, having end rollers e^1 e^2, and arranged substantially as and for the purpose set forth.

3. The shaft F, cam-device G, as described, arranged to operate between anti-friction rollers f^2 g^2, cross-head E, in combination with the slide X and piston C, to operate substantially as set forth.

4. The gearing devices J J′ *k m*, ratchet and pawl *j j′*, shafts I K M, bevel-gears L L′, when arranged substantially as and for the purpose set forth.

5. The air-pump B, piston-slide X, as described, counterpoise H′, shaft F, right-and-left cam device G, when arranged in combination with the air-receiver D and clock-work gearing, to operate as and for the purpose described.

114,285.—PRINTING-PRESS. — Merritt Gally, Rochester, N. Y.

Claim.—1. In connection with the platen of a printing-press, the combined tympan and pilingfly J, or equivalent, substantially as and for the purpose specified.

2. The crank *g* and chase-clamp *c*, combined, substantially as and for the purpose specified.

114,286.—BOOK-BINDING MACHINE.—John Glass, Green Point, assignor to George H. Sanborn, Brooklyn, N. Y.

Claim.—1. The combination of the needles, shanks having spiral grooves cut upon them, movable cross-head I, boxes *c* and Q, and connections M and cross-brace L, when the same shall be constructed and operate substantially as described, for the purpose set forth.

2. In combination with the needles of a book-stabbing machine, an apron of felt, W, as and for the purposes fully set forth.

114,287. — MANUFACTURE OF RUBBER.—John Greacen, Jr., New York, N. Y.

Claim.—The India-rubber compound herein described, composed of wood pulp and rubber, in the manner and for the purposes hereinbefore described.

114,288.—SPINNING-MULE, &c.—Peter William Greenwood, Landenburg, near Avondale, Pa.

Claim.—The gears D H and D′ I, the pulleys F J J′ N, inclines L M, pulley R T, and band K, combined with the shaft C, for the purpose of lessening the revolutions of the spindles during the delivery of the roping, as set forth.

114,289.—SLATE-FRAME.—Wesley W. Hamilton, Flushing township, N. Y.

Claim.—A slate-frame provided with the slotted openings *c* B, in combination with rings or endless bands A, as and for the purpose described.

114,290.—STOVE-GRATE.—Charles R. Harvey and James H. Foote, New York, N. Y., assignors to Charles R. Harvey.

Claim.—1. In combination with a grate, free to oscillate upon a center, an axle supporting the grate, and a rod attached to and projecting from the axis, substantially as described, the combination being and acting substantially as set forth.

2. In combination with a grate, an axle, and a rod projecting therefrom, a catch or latch, the combination being and operating substantially as herein described.

114,291.—DRAUGHT-PROMOTER.—Benjamin A. Haycock, Richmond, Iowa.

Claim.—The pipe C, constructed as described, with the lip at one side of the longitudinal orifice projecting over and beyond the other lip on the opposite side of said orifice, as represented at D, whereby the matter falling over the edges E will be caused to roll down the sides of the pipe, substantially as described.

114,292.—CRIB OR CRADLE. — William T. Hazard, Randolph, Mass.

Claim.—1. The arrangement of rocking bedstead A B C A B C, constructed as described, and provided with hooks *d d d d* at its corners, in detachable combination with guard G, to be used when detached as a fence or pen, substantially as described.

2. The arrangement of the cross-bars C C of the bed-bottom with the standards B B of the pedestal by means of pivots, when there is further arranged therewith the spring *a*, acting against the cross-bar C and standard B, to restore their normal relations when disturbed, and the further arrangement therewith of lock *f*, substantially as described.

114,293.—DISTILLING HYDROCARBON OIL.—Samuel A. Hill and Charles F. Thumm, Oil City, assignors to themselves and Oliver P. Scaife, Pittsburg, Pa.

Claim.—The method and means hereinbefore described for displacing or expelling air from stills prior to charging them with hot oil, as and for the purpose set forth.

114,294. — SEWING-MACHINE. — James A. House and Henry A. House, Bridgeport, Conn., assignors to "Wheeler & Wilson Manufacturing Company," same place.

Claim.—1. A rotating hook, so formed, substantially as described, as to seize, expand, and cast off loops of needle-thread, as specified, and in its action causing a round turn of thread around the seizing part of the hook.

2. The relative arrangement of a reciprocating eye, pointed needle, and a revolving hook, substantially such as specified, so that the seizing portion of the latter revolves in planes perpendicular to that in which the former reciprocates, the arrangement being substantially such as specified, and both the needle and hook operating substantially as described.

3. The combination of a reciprocating eye-pointed needle with a revolving hook, substantially such as is specified, and a bobbin, when the axes of the two latter are in planes parallel to that in which the needle reciprocates, the relative arrangement being as described.

4. In combination with a revolving hook, a non-revolving bobbin-supporter, provided with a ring or annular elevation, substantially such as described, on which a bobbin or a bobbin-case may rest, as described.

5. A non-revolving bobbin-supporter, provided with a ring or annular elevation having a gap or opening in the periphery thereof, the construction being substantially such as described, when arranged and operating in combination with a revolving hook, substantially as described.

6. A bobbin, in combination with a bobbin-case and a horizontally-revolving hook, all constructed and operating substantially as described.

7. A bobbin, in combination with a bobbin-case, having peripheral eyes or holes, and a central standard, with a guide-eye or hook located at the axis of the bobbin, through which bobbin-thread may be led, as described.

8. A take-up lever, mounted upon a shaft and operated in one direction by a pin or arm upon the shaft, and in the other by the pull or draft of the thread, the combination of lever, pin, and shaft being substantially such as set forth.

9. The take-up lever, provided at its end with the double hook and tongue between the two parts thereof, the construction and combination being as set forth.

10. The combination of two irregular eccentric or over screw-gears, the one mounted upon a shaft lying in a plane at right angles to the plane in which the shaft of the other gear is located, the combination being substantially such as set forth.

11. The combination of two sets of cams, one set upon each side of a cog-wheel, with two legs or pendants attached to a feed-bar, whereby the feeding surface may be properly actuated when located above the cog-wheel, substantially as set forth.

12. In combination with a revolving hook, substantially such as specified, and mounted upon a vertical axis, an adjustable support, substantially such as described, for the lower end of the hook-shaft.

114,295, antedated April 15, 1871.—APPARATUS FOR EVAPORATING LIQUIDS.–John Howarth, Salem, Mass.

Claim.—1. The cover *d*, communicating with space *k* by flexible pipe or tube *g*, and operating substantially as and for the purpose described.

2. The cover *d* having tube *g*, in combination with space *k* and kettle C, substantially as described.

114,296.—ENGINE-GOVERNOR.—Reuben K. Huntoon, Boston, Mass.

Claim.—1. The combination of the main and auxiliary oblique-winged propellers, the ribbed

plied to the side r, in combination with the operative mechanism shown and described, to loosen the pressed bale preparatory to its discharge from the machine.

114,272. — GAS-REGULATOR. — Otis Dean, Richmond, Va.

Claim.—The pendent pivoted valve E, combined with a valve-seat located in partition B of a vessel, A, arranged between the gas-supply pipe and burners, as and for the purpose specified.

114,273.—PRINTERS' CASE.—Alexander T. De Puy, New York, N. Y.

Claim.—The combination, with the filling of a type-case, of any number of metal clamps, when constructed and operating substantially as and for the purposes set forth.

114,274. — SELF-ACTING MULE FOR SPINNING.—John Dodd, Oldham, England.

Claim.—The combination of a winding-on drum with decreasing diameters with apparatus substantially such as herein described, connected to the radial arm, for removing lengths of chain from the said drum.

114,275. — DRY-GAS PURIFIER. — Edward Duffee, Haverhill, Mass., assignor to American Gas-Screen Manufacturing Company, same place.

Claim.—In a dry-gas purifier constructed as above described, the arrangement of an intercepting partition, E, below the lower series of lime-screens, in manner and for the purpose set forth.

114,276.—TUCK-MARKER FOR SEWING-MACHINES.—George L. Du Laney, New York, N. Y.

Claim.—The combination, with a laterally-adjustable perforator attached to and moving with the needle-arm, of a laterally adjustable plate, E, having a perforation therein to permit the point of the perforator to enter it and puncture the cloth without reaching down to and coming in contact with the bed-plate of the sewing-machine.

114,277. — MANUFACTURE OF IRON AND STEEL.—Zohette S. Durfee, New York, N. Y.

Claim.—1. The manufacture of iron and steel, and of various metallic alloys, by the combined apparatus and processes substantially as herein described.

2. The annular trough and feeding-hopper combined together, and operated either with an ingot-mold or a furnace, substantially as described herein.

114,278.—EVAPORATOR.—Stephen P. Dyer, Ankney Town, Ohio.

Claim.—The evaporating apparatus, consisting of the heater and pans, the one being grooved in the bottom and provided with the dividing plates, the valves, and filter, and the other arranged to receive the liquid from the first, and for being readily removed for emptying, all substantially as specified.

114,279.—STOVE-PIPE SHELF. — James P. Elliott, Bridgeport, Conn.

Claim.—The combination, with pipe A, of band C, shank F, shoulders J 1, shelf G, hooks G G, plate D with opening 3 and recesses 2 2, lever E reinforced to provide for cam H, constructed and operated substantially as set forth.

114,280.—TUBULAR GRATE-BAR.—William H. Farris, Cairo, Ill.

Claim.—1. The fire-back A, chambered at *s* and *f*, and provided with a hollow bar, B, and internal tube G, substantially as described.

2. The cap D, applied to the end of the hollow bar B, in combination with the internal tube G, terminating near said cap and communicating with the inlet-passage *s*, substantially as described.

3. A series of chambered fire-backs, A, communicating above and below with one another, in combination with grate-bars B, internal tubes G, and caps D, so constructed and arranged that the inlet and discharge of water shall be through each fire-back and grate-bar, substantially as described.

114,281.—NIPPLE-SHIELD.—Samuel C. Foster, New York, N. Y., assignor to The Monitor Shield Company.

Claim.—The combination of the circular disk, with elevated rim upon its under side, near the nipple opening, the concave under surface, and the nipple turret, with the smallest diameter of its conical orifice at the point of union of the disk and turret, all arranged to form a nipple-shield, as described.

114,282.—INVALID-CHAIR.—George T. Fowler, East Somerville, Mass.

Claim.—1. The sliding foot-rest frame mounted in ways or grooves, and combined with suitable springs for permitting the extension or sliding movement of said frame, substantially as and for the purposes set forth.

2. The combination, with the body of an invalid-chair, of a removable wheel-frame D N carrying the side and rear wheels, and secured to the chair substantially in the manner and for the purposes shown and described.

114,283.—HYDRANT.—Joseph P. Gallagher, St. Louis, Mo.

Claim.—1. The hollow nut a^2 and its bushing *a*, the spring c^2, tappet c^3, and rod C′ when arranged and operated substantially as set forth.

2. In combination with the parts mentioned in the first clause, the lever F *g* and fulcrum-plate G, all constructed, arranged, and operating substantially as described.

3. The hemispherical valve-chamber B, constructed with an annular water-way, B^2, the tubular portion B^3, and provided with the adjustable valve-seat, substantially as described.

114,284.—PUMP.—Joseph P. Gallagher, St. Louis, Mo.

Claim.—1. The air-pump B, constructed as described, in combination with the elastic air-receiver D, constructed as described, for the purpose set forth.

2. The slide X, consisting of the upper cross-head E, rods *e*, lower cross-heads E^1 E^2, secured to piston C, said slide, as described, having end rollers e^1 e^2, and arranged substantially as and for the purpose set forth.

3. The shaft F, cam-device G, as described, arranged to operate between anti-friction rollers g^2 g^3, cross-head E, in combination with the slide X and piston C, to operate substantially as set forth.

4. The gearing devices J J′ *k* *m*, ratchet and pawl *j* *j′*, shafts I K M, bevel-gears L L′, when arranged substantially as and for the purpose set forth.

5. The air-pump B, piston-slide X, as described, counterpoise H′, shaft F, right-and-left cam device G, when arranged in combination with the air-receiver D and clock-work gearing, to operate as and for the purpose described.

114,285.—PRINTING-PRESS. — Merritt Gally, Rochester, N. Y.

Claim.—1. In connection with the platen of a printing-press, the combined tympan and pilingfly J, or equivalent, substantially as and for the purpose specified.

2. The crank *g* and chase-clamp *c*, combined, substantially as and for the purpose specified.

114,286.—BOOK-BINDING MACHINE.—John Glass, Green Point, assignor to George H. Sanborn, Brooklyn, N. Y.

Claim.—1. The combination of the needles, shanks having spiral grooves cut upon them, movable cross-head I, boxes *a* and Q, and connections M and cross-brace L, when the same shall be constructed and operate substantially as described, for the purpose set forth.

2. In combination with the needles of a book-stabbing machine, an apron of felt, W, as and for the purposes fully set forth.

114,287. — MANUFACTURE OF RUBBER.—John Greacen, Jr., New York, N. Y.

Claim.—The India-rubber compound herein described, composed of wood pulp and rubber, in the manner and for the purposes hereinbefore described.

114,288.—SPINNING-MULE, &c.—Peter William Greenwood, Landenburg, near Avondale, Pa.

Claim.—The gears D H and D′ I, the pulleys F J J′ N, inclines L M, pulley R T, and band K, combined with the shaft C, for the purpose of lessening the revolutions of the spindles during the delivery of the roping, as set forth.

114,289.—SLATE-FRAME.—Wesley W. Hamilton, Flushing township, N. Y.

Claim.—A slate-frame provided with the slotted openings c B, in combination with rings or endless bands A, as and for the purpose described.

114,290.—STOVE-GRATE.—Charles R. Harvey and James H. Foote, New York, N. Y., assignors to Charles R. Harvey.

Claim.—1. In combination with a grate, free to oscillate upon a center, an axle supporting the grate, and a rod attached to and projecting from the axis, substantially as described, the combination being and acting substantially as set forth.

2. In combination with a grate, an axle, and a rod projecting therefrom, a catch or latch, the combination being and operating substantially as herein described.

114,291.—DRAUGHT-PROMOTER.—Benjamin A. Haycock, Richmond, Iowa.

Claim.—The pipe C, constructed as described, with the lip at one side of the longitudinal orifice projecting over and beyond the other lip on the opposite side of said orifice, as represented at D, whereby the matter falling over the edges E will be caused to roll down the sides of the pipe, substantially as described.

114,292.—CRIB OR CRADLE. — William T. Hazard, Randolph, Mass.

Claim.—1. The arrangement of rocking bedstead A B C A B C, constructed as described, and provided with hooks *d d d d* at its corners, in detachable combination with guard G, to be used when detached as a fence or pen, substantially as described.

2. The arrangement of the cross-bars C C of the bed-bottom with the standards B B of the pedestal by means of pivots, when there is further arranged therewith the spring *a*, acting against the cross-bar C and standard B, to restore their normal relations when disturbed, and the further arrangement therewith of lock *f*, substantially as described.

114,293.—DISTILLING HYDROCARBON OIL.—Samuel A. Hill and Charles F. Thumm, Oil City, assignors to themselves and Oliver P. Scaife, Pittsburg, Pa.

Claim.—The method and means hereinbefore described for displacing or expelling air from stills prior to charging them with hot oil, as and for the purpose set forth.

114,294. — SEWING-MACHINE. — James A. House and Henry A. House, Bridgeport, Conn., assignors to "Wheeler & Wilson Manufacturing Company," same place.

Claim.—1. A rotating hook, so formed, substantially as described, as to seize, expand, and cast off loops of needle-thread, as specified, and in its action causing a round turn of thread around the seizing part of the hook.

2. The relative arrangement of a reciprocating eye, pointed needle, and a revolving hook, substantially such as specified, so that the seizing portion of the latter revolves in planes perpendicular to that in which the former reciprocates, the arrangement being substantially such as specified, and both the needle and hook operating substantially as described.

3. The combination of a reciprocating eye-pointed needle with a revolving hook, substantially such as is specified, and a bobbin, when the axes of the two latter are in planes parallel to that in which the needle reciprocates, the relative arrangement being as described.

4. In combination with a revolving hook, a non-revolving bobbin-supporter, provided with a ring or annular elevation, substantially such as described, on which a bobbin or a bobbin-case may rest, as described.

5. A non-revolving bobbin-supporter, provided with a ring or annular elevation having a gap or opening in the periphery thereof, the construction being substantially such as described, when arranged and operating in combination with a revolving hook, substantially as described.

6. A bobbin, in combination with a bobbin-case and a horizontally-revolving hook, all constructed and operating substantially as described.

7. A bobbin, in combination with a bobbin-case, having peripheral eyes or holes, and a central standard, with a guide-eye or hook located at the axis of the bobbin, through which bobbin-thread may be led, as described.

8. A take-up lever, mounted upon a shaft and operated in one direction by a pin or arm upon the shaft, and in the other by the pull or draft of the thread, the combination of lever, pin, and shaft being substantially such as set forth.

9. The take-up lever, provided at its end with the double hook and tongue between the two parts thereof, the construction and combination being as set forth.

10. The combination of two irregular eccentric or over screw-gears, the one mounted upon a shaft lying in a plane at right angles to the plane in which the shaft of the other gear is located, the combination being substantially such as set forth.

11. The combination of two sets of cams, one set upon each side of a cog-wheel, with two legs or pendants attached to a feed-bar, whereby the feeding surface may be properly actuated when located above the cog-wheel, substantially as set forth.

12. In combination with a revolving hook, substantially such as specified, and mounted upon a vertical axis, an adjustable support, substantially such as described, for the lower end of the hook-shaft.

114,295, antedated April 15, 1871.—APPARATUS FOR EVAPORATING LIQUIDS.—John Howarth, Salem, Mass.

Claim.—1. The cover *d*, communicating with space *k* by flexible pipe or tube *g*, and operating substantially as and for the purpose described.

2. The cover *d* having tube *g*, in combination with space *k* and kettle C, substantially as described.

114,296.—ENGINE-GOVERNOR.—Reuben K. Huntoon, Boston, Mass.

Claim.—1. The combination of the main and auxiliary oblique-winged propellers, the ribbed

cylinder F and their separate shafts, with the case A to hold a liquid, as described, all being substantially as set forth.

2. The engine-governor, as composed of the instrumentalities as described, arranged, and combined together and with the valve and its case, as set forth, such consisting of the closed case, the main and auxiliary oblique-winged propellers, the ribbed hollow cylinder F, the separate shafts of the propellers, the pinion, the toothed sector, the arm, and counterbalance weight, all as explained.

114,297.—COMBINED PUNCHING AND SHEARING-MACHINE.—William H. Ivens and William E. Brooke, Trenton, N. J.

Claim.—1. The combination and arrangement of the three elliptic gears E E^1 E^2, shafts G^1 G^2, clutches H^1 H^2, eccentrics *b*, links *l*, and heads I^1 I^2, substantially as set forth.

2. The clutch F^2, constructed with a web, *a*, on one part, and cavity *a'* on the other part for operation, in combination with the eccentric elliptic gears E^1 or E^2, to insure the interlocking of the clutch with said gears when in position specified, for the purpose set forth.

3. The combination of the links I^1 I^2, eccentric shafts m^3 m^4, worm-wheels p^2 p^4, and worm q^3 with the head I^1 for adjusting the elevation of the latter, substantially as specified.

4. The frame A B, of the form and construction substantially as set forth.

5. Jointly with the frame A B the head or heads I^1 I^2, lower shearing-jaws *t w*, and links *s*, for the purpose set forth.

6. The wedge *u*, made curvilinear on its upper edge, in combination with the cutter *r* and its plunger *t*, for varying the angle of said cutter, essentially as set forth.

7. The arrangement of the foot-levers e^1 or e^2, rock-shafts f^1 f^2, springs A^1 A^2, clutch yokes c^1 c^2, and levers d^1 d^2 on either side of a double machine, so that the operation of one side is rendered independent of the other, substantially as shown and described.

114,298.—MODE OF LUBRICATING AXLES.—James Ives, Mount Carmel, Conn.

Claim.—1. The ordinary axle-skein or box improved without changing the form of the axle or materially changing the construction of the skein or box, by constructing one of the ears or lugs *a* with an extension, *a'*, and perforating said ear obliquely so as to form the conduit *b*, and terminating said conduit in the form of a flaring or expanded chamber, *d*, which chamber is formed within the inner circumference of the axle-box, all in the manner substantially as described and shown.

2. The combination of the combined plug and piston, partly screw-threaded, with the inclined conduit *b* and the expanded chamber *d*, all in the manner described and shown.

114,299.—MANUFACTURE OF CAST-STEEL.—Pierre Eymard Jay and John Augustin Rafter, Montreal, Canada.

Claim.—The process herein specified of refining cast-iron and making steel by nitrate of soda and oxide of manganese, both in the proportion of from eight to ten per cent., and of oxide of iron in the proportion of six per cent., and three per cent. of iron ore, and to be dipped and put into the melted iron in a puddling-furnace, as set forth and substantially stated.

114,300.—STEAM-ENGINE.—Asa Johnson, Brooklyn, N. Y., assignor to himself and William H. Johnson, same place.

Claim.—The combination of the toothed wheels R R' and the casing S with the adjustable triangular block m^1, placed between the wheels, all constructed, arranged, and operating substantially as set forth.

114,301.—APPARATUS FOR MANUFACTURE OF PAPER-PULP.—Morris L. Keen, Jersey City, N. J., assignor to himself and Samuel A. Walsh, New York city.

Claim.—1. The charging-drum A, arranged as represented relatively to the pulp-boiler C and to suitable connections, and capable of holding more than one complete charge and maintaining it at a high temperature, ready for immediate use in the pulp-boiler C, as specified.

2. In combination with the elevated capacious reservoir or charging-drum A and pulp-boiler C, with their connections and controlling means C^1 C^2, as represented, the heating-coil B and furnace, with the connections B^1 B^2, adapted to maintain an independent circulation between the charging-drum A and the heating-coil, as specified.

114,302.—LAMP-COLLAR.—Henry Kelley and William H. Locke, Boston, Mass.

Claim.—A lamp-collar formed with a drip-cup, and with a groove or receptacle on its under side for the reception of a rubber or other suitable packing, substantially as and for the purpose set forth.

114,303.—MACHINE FOR CRUSHING AND GRINDING ROCK-PHOSPHATES, &c.—Frederick J. Kimball, Philadelphia, Pa.

Claim.—One or more pairs of reversely-grooved or threaded rollers, arranged, substantially as shown and described, for the purpose of crushing, reducing, or grinding rock-phosphate or other material.

114,304.—APPARATUS FOR DRYING PHOSPHATES.—Frederick J. Kimball, Philadelphia, Pa.

Claim.—1. The furnace C and dry-chamber F, arranged substantially as described, for the purpose set forth.

2. In combination with a furnace for heating and drying phosphate, the inclined apron or plate G, arranged substantially as and for the purposes described.

3. Introducing a current or currents of air beneath the feed apron and so as to mingle with the products of combustion, substantially as shown and described.

4. The conveyer J, substantially as and for the purposes described.

114,305.—WASHING-MACHINE.—James Munroe Kimball, Woodstock, Ill.

Claim.—1. The slotted or mortised bars or paddles H and cross-arms G, in combination with the vertical shaft E to which they are attached, and with the tub A in which they work, substantially as herein shown and described, and for the purpose set forth.

2. An improved washing-machine formed by the combination of the tub A B, cover D^1 D^2 D^3, short vertical central shaft E, collar-box F, cross-arms G, slotted or mortised arms or paddles H, gear-wheels I J, vertical shaft K, three-armed plate L, brace M, and adjustable bar or lever N with each other, substantially as herein shown and described, and for the purpose set forth.

114,306.—CHURN.—John J. Kimball, Naperville, Ill.

Claim.—The vertically-adjustable rotary dasher, provided with agitators *c c f f* placed perpendicularly at different distances from the center, each pair having its faces parallel and diagonally inclined, to operate substantially as herein shown and described.

114,307.—WEFT-FORK FOR LOOMS.—Jacob Haskell Knowles, Lawrence, Mass.

Claim.—The stop-motion fork, made of a single piece of wire bent substantially in manner, and

soldered or connected as described, all being as represented in the accompanying drawing.

114,308.—STALK-CUTTER.—Miles K. Lewis and Joseph Munger, Malcom, Iowa.

Claim.—The bent levers L L, in combination with the wheels P P, substantially as described, for the purpose specified.

114,309.—WINDMILL.—Giles Mabie and Thomas C. Little, Dixon, Ill.; said Mabie assigns his right to said Little.

Claim.—1. The arrangement of the elbow-lever M with its standards N and connecting-rods *l l' o o'*, by means of which the adjusting-lever is connected to the slide-head, as described.

2. The irons I, constructed as described, in combination with the connecting-rods J, as set forth.

114,310.—BELT-SHIPPING DEVICE FOR SELF-ACTING MULES.—Hezekiah Macon, Providence, R. I., assignor to Joshua Hunt, same place.

Claim.—The combination, with the long lever B, of the spindle X provided with the adjustable ring and arm Y, the levers W Z, latch-lever L, belt-guide H, and spring S, all arranged and operating as described to instantaneously shift the driving-belt, as and for the purpose specified.

114,311.—MACHINE FOR CUTTING AND BENDING SHEET METAL.—Jones R. Maitland, Little Rock, Ark.

Claim.—1. The sliding carriage B, containing the lid C for holding the sheet to be cut, and bent substantially as herein shown and described.

2. The vertically-adjustable guard *d*, applied as set forth, so as to admit and lock the carriage, as specified.

3. The spring-lock E, combined with the adjustable guard *d*, substantially as and for the purpose herein shown and described.

4. The rollers I L L', hung to pivoted frames, which have projecting ears for guiding them along curved tracks, substantially as herein shown and described.

5. The combination of the carriage B with the cutter F, rollers I L L', and treadles D, H, M, and M', all arranged to operate substatially as herein shown and described.

114,312.—COAL AND WOOD-BOX.—John Mallin, Chicago, Ill.

Claim.—The herein-described coal, wood, shovel and tongs-box combined, when constructed with compartments B, C, D, and E, inclined-plane bottom *b*, opening F, and covers G G', in the manner substantially as described, and for the purposes specified.

114,313.—THRASHING-MACHINE.—Martin H. Mansfield, Ashland, Ohio.

Claim.—The arrangement of the thrashing-frame A, provided with the thrashing-cylinder B, endless belt D, and recess X, in the manner and for the purposes specified.

114,314.—BIT-STOCK.—Charles Manson, Boston, Mass.

Claim.—The arrangement of the ratchet *b c* with the pawls H and H', and the adjusting-rods *h* and *h'*, when constructed as shown and described, and for the purpose set forth.

114,315.—CORPSE-PRESERVER.—Mahlon R. Margerum, Trenton, N. J., assignor to Benjamin L. Disbrow and James G. Van Cleeve, same place.

Claim.—The supporting frame B, the rollers C C, the tongue D, the ratchet E, trip F, lug G, and the plates I I and K K, when arranged, constructed, and combined, substantially as herein shown and described, in and for the purposes set forth.

114,316.—CARBURETER FOR AIR AND GAS.—Louis Marks, San Francisco, Cal.

Claim.—The tank A, in combination with a zigzag series of inclined troughs, B C, provided with the screen *f*, and placed below and outside of the tank, and connected at their lower ends, substantially as and for the purpose described.

114,317.—LUBRICATOR.—Cotton Mather, Steubenville, Ohio.

Claim.—The chamber A, tube D, and weighted centrifugal piston G H, combined and applied as and for the purpose specified.

114,318.—HAME.—Asa McCracken, South Byron, N. Y.

Claim.—In combination with the back-strap, hip-strap, and crupper, constructed substantially as described, the regulator E and strap D, constructed and operated substantially as and for the purpose specified.

114,319.—EXTENSION-TABLE.—Frederick Menzer, Flint, Mich., assignor to himself and William Tracey, same place.

Claim.—The spring-actuated hinged legs *a b* and *d e*, in combination with the frame-work and the leaves *m m* and *p p* of my improved extension-tables, substantially as and for the purpose herein set forth.

114,320.—Canceled.

114,321.—BARREL-MACHINE.—William R. Middleton and Edward Middleton, Cleveland, Ohio.

Claim.—1. The slides G G' provided with cutters, spring Q, and revolving head D, having blades attached to or near the periphery and extending therefrom, in combination with the truncated wedge H and rod I, arranged and operating substantially as and for the purpose set forth.

2. The slide L connected with the crank-shaft, in combination with the cone-shaped head K, rod I, spring R, and wedge H, constructed and operating in the manner substantially as and for the purpose set forth.

3. The wheel E', racks D', vibrating arms A', rods or links W, and clamping-hoops U, all combined and arranged to operate substantially as described, and for the purpose set forth.

4. The wheel J', racks L', and levers M', as arranged, in combination with the shafts B, substantially in the manner as described, and for the purpose specified.

114,322.—SHINGLE-MACHINE.—Uriah D. Mihills, Fond du Lac, Wis.

Claim.—In combination with the saw B and frame A, the adjustable ways E, carriage or slide K, rollers L L and R, guides I I, and shield J, when the same are constructed and arranged to operate as herein shown and described, for the purposes set forth.

114,323.—SHEET-METAL MATCH-SAFE.—Joseph Musgrove, Newark, N. J.

Claim.—A match-safe, constructed substantially as herein shown and described.

114,324.—SAND-CAP FOR HUBS OF VEHICLES.—George H. Nevens, Livermore, Cal., assignor to himself and R. N. Caughell, same place.

Claim.—The conical cap D with the ring E, in combination with the grooved hub A, substantially as and for the purpose set forth.

114,325. — Roofing Composition.—Elinkim P. Newton, Clintonville, Pa.

Claim.—The combination of resin, tar, salt, alum, and sand, when treated in the manner set forth, for the purpose described.

114,326. — Millstone Dressing-Guide.—John North, New York, N. Y.

Claim.—1. The combination of the box-frame sectors 2 and 3, pinion-gear 4, spring R, catch-spring K, circular ratchet N, links 5 5, and beveled rule S, when operated by the hand-wheel *y*, for the purposes specified.

2. The diamond-handle with a round stem, in combination with the adjustable protector B^2, having a round hole, with the adjustable guide, for the purposes described.

114,327.—Implement for Alluring Hat-Bodies.—Jay Northrop and James F. Emmons, Bridgeport, Conn.

Claim.—In an implement for alluring hat-bodies, consisting of the handle A, bow-spring B, shank and screw G, nut D, yoke and screw E, clamp F F, tension-strap G G, and felt-pad H, constructed as specified and shown.

114,328.—Apparatus for Lifting Locomotives, Trucks, and Railroad Cars.—Grafton T. Nutter, Jersey City, N. J.

Claim.—The combination of four or more shafts with cog-wheels and pinions operated upon by a driving-shaft which sets in motion a central wheel, from which motion and power are delivered to four or more lifting-screws perpendicularly set at points more or less remote from the center, for the purpose of lifting locomotives and cars from a railway track and effecting a speedy change or adaptation of trucks or running-gear to the altered gauge of the track in the manner and by the means above specified.

114,329.—Protector for Gas or Vapor-Burners.—Rufus Nutting, Randolph, Vt.

Claim.—The corrugated or uneven surface deflecting protector, in combination with lamp, gas, or vapor-burners, substantially as described, and for the purposes herein set forth.

114,330. — Coffee-Roaster. — Augustin Obst, Cambridgeport, Mass.

Claim.—The combination of frame or plate B, cover C, clamp J, and cylinder A, as and for the purpose set forth.

114,331.—Hand Corn-Sheller.—Charles Melsom O'Hara, Cincinnati, Ohio.

Claim.—The combination of the three toothed or roughened hinged plates, A A′ A″, and the loops B and C, when said loops are pivoted to the plates and all the parts constructed and arranged for operation in the manner described.

114,332. — Manufacture of Split Needles.—Charles H. Palmer, New York, N. Y.

Claim.—The within-described method of forming the crooked split—that is to say, the bending of the blank, sawing a straight kerf, and the subsequent straightening of the blank so as to give the proper bend or crook to the split, all substantially as herein set forth.

114,333, antedated April 22, 1871.—Tackle-Block.—Isaac E. Palmer, Hackensack, N. J.

Claim. — The combination, with the grooved guide or pulley B, of one or more independent cams or eccentrics D, hung free to turn, and arranged on one or both sides of said grooved guide for operation with and relatively to gripping surfaces *e* in or on the head of the block, substantially as specified.

114,334.—Plow.—William F. Parker, Troy, Ala., assignor to himself, John B. Goldthwaite, and William H. Fryer, same place.

Claim.—The arrangement of the bar *e*, forked stock *c* jointed thereto and carrying the share or shovel *f*, and the grooved plate *h* and bolt *g*, with the rigid standard *b* and beam *a*, as herein shown and described, for the purpose specified.

114,335. — Coal-Scuttle. — James Cas Parrish, Petersburg, Va.

Claim.—The ash-pit door *d* and scuttle-handle *e* combined, as set forth.

114,336.—Cooking-Stove and Range.—John S. Peckham, Utica, N. Y.

Claim.—1. The sections B, formed substantially as described, and for the purposes set forth.

2. The connecting-bar C, in combination with the sections B B B, &c., substantially as described, and for the purposes set forth.

3. The sectional fire-plate B B B, &c., constructed substantially as described.

4. The sectional fire-plate B, in combination with a stove, range, or the like, substantially as and for the purposes specified.

5. In combination with a stove or range or the like, the fire-plate B and folding shelf D, substantially as and for the purposes set forth.

6. In combination with a stove or range or the like having a front fire-plate or plates, a folding shelf provided with a draught-door or doors above, in connection with a draught-opening in the stove below, so that when the shelf is closed up the draught may pass through said doors and opening, but when the shelf is let down the draught is cut off automatically by the bottom edge of said shelf, substantially as described.

114,337.—Rubber Play-Pipe for Hose.—Edward L. Perry, New York, N. Y., assignor to Combination Rubber Company, same place.

Claim.—A molded rubber play-pipe or nozzle for hose, as and for the purpose hereinbefore described.

114,338.—Stop-Cock Valve.—George Pierce, Boston, Mass.

Claim.—The arrangement of the valve-disk G, connected, by the link H, to vertically-sliding plate F, and held in a vertical position by the stop *e*, substantially as described.

114,339.—Hydraulic Apparatus.—Phineas Franklin Powers, Genoa, Nev.

Claim.—The slide E, carrying the quadruple rack for setting simultaneously the inlet and outlet-valves of two cylinders, substantially as herein shown and described.

114,340.—Boots and Shoes.—William F. Prusha and Elisha L. Wales, Marlborough, Mass., assignors to themselves and Lewis A. Howe, same place.

Claim.—1. A leather sole, with a projecting portion struck up, having a crease or indentation, *c*, and to which the upper is secured, substantially in the manner and for the purpose described.

2. A leather toe-tip or projection, struck up in one and the same piece with the outer sole, and with a crease or indentation, *c*, substantially as set forth.

3. A leather-heel shell, struck up in one and the same piece with the outer sole, substantially as set forth.

114,341. — Polishing-Machine.—Peter F. Randolph, Jerseyville, Ill.

Claim.—The combination of an elastic belt with a polishing-belt, the former being arranged to run independently within the latter, as described.

114,342. — Chimney-Top.—William Richards, London, England.

Claim.—The conical cap C D E, combined, as described, with the slotted stand A, for the purpose described.

114,343.—Animal and Game-Trap.—James H. Richardson, Westport, Mo.

Claim.—1. The arrangement of the lever O, upper trigger or lever S, cord T, lower trigger or lever R, curved wire C′ and weight-box or sack B′, in connection with the bar P, wheel Q, bars L M K, and trip-board U, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

2. The arrangement of the drop or step-board X *x*′ and bolt-box Y, in connection with the trip-board U u^1 and projecting-plate or arm W for tripping the lever or trigger B to spring the trap, substantially as herein shown and described.

3. The gate Z, passage-way A′, and block P′, constructed and arranged in connection with the trip-board U, substantially as herein shown and described, and for the purpose set forth.

4. The wheels D′ I′ and E′ J′, washers F′ G′, (one or more,) and nut H′, in combination with the shaft E and weight-cord K′, substantially as herein shown and described, and for the purpose set forth.

5. The trip-board U and its attachments u^1 u^2 P′, in combination with the other parts of the trap, substantially as herein shown and described, and for the purpose set forth.

114,344.—Slide-Valve.—Alexander K. Rider, New York, N. Y., assignor to himself, Cornelius H. Delamater, and George H. Reynolds, same place.

Claim.—1. The ports *g*, arranged to serve, as represented, in a main valve, G, when the latter is fitted to move in the steam-chest, or equivalent casing, so as to complete its stroke by the action of steam received through the ports *g* after the commencement of the stroke has been initiated by other means, all substantially as herein specified.

2. The pieces I J, fixed firmly on the valve-stem C, and arranged to operate relatively to cavities in a main valve, G, interposed between them so as to receive the action of steam in the small space between themselves and the main valve, to complete the throw of the main valve with a small quantity of steam, as herein specified.

114,345.— Clothes-Line Protector and Stretcher.—William J. Ripley, Cincinnati, Ohio.

Claim.—1. The combination of the clutch D *d*, lever C, and pawl and ratchet E F with the shaft G, as described, and armed wheel H, of a clothes-line reel, all arranged and operating substantially as and for the purposes described.

2. The shaft G of a clothes-line reel, when protected by an inner covering, I, of metal, and an outer one, J, of India rubber, substantially as and for the purposes described.

114,346, antedated April 28, 1871.—Saw-Guide.—Aaron Rittenhouse, Smithville, Ohio.

Claim.—The saw-guide, constructed as herein shown and described, having the pivot A upon one side of the guide, as and for the purpose specified.

114,347. — Plumber's Water-Boiler.—Alexander R. Bobb, Brooklyn, N. Y.

Claim.—1. The arrangement of the valve-box H and valve J in the inlet-pipe F of a plumber's water-boiler, substantially in the manner and for the purpose described.

2. The arrangement of the holes *m* and *n*, substantially as and for the purpose hereinbefore set forth.

3. In combination with the inlet-pipe F, the valve-box H provided with a valve, J, the chamber E and pipe G, arranged as a plumber's water-boiler, substantially as and for the purpose specified.

114,348.—Pipe-Wrench.—Eugene H. Robbins, Pittsfield, Mass.

Claim.—The combination, with the lever, of the chain and claw for connecting the chain, all arranged substantially as specified.

114,349.—Railroad-Car Heater.—Henry R. Robbins, Baltimore, Md.

Claim.—1. The arrangement of the springs *k k* on the pins projecting from the bell-mouthed sleeve *i* and socket *f*, as and for the purpose specified.

2. The arrangement of parts for supporting the steam coupling or pipes, consisting of the device *l l m m*, the springs *o o* attached to the curved stays *p p* of the draft-coupling, and the chain *n*, all as herein shown and described.

3. The arrangement of the three ball-and-socket joints *e a*, *e a*, and *k f*, with their connecting parts, as shown and described, whereby the coupling is enabled to adapt itself to the sway or lateral movement of the cars to which its parts are respectively connected.

4. The arrangement of the pipe *e*, rings *l*, and bars *m*, as set forth.

114,350. — Paper-Cutting Machine.—Thomas C. Robinson, Boston, Mass., assignor to George H. Sanborn, Brooklyn, N. Y.

Claim.—In combination with the pinion H, clutch L, forked piece M, hooked lever O, slotted lever P, slotted plate Q, spring R, the pin W secured in the connection V, when the same shall be constructed and operate substantially as and for the purposes set forth.

114,351.—Dust-Pan.—Thomas F. Rooney, Chicago, Ill.

Claim.—1. The rest or point C and points F when applied to the back and front ends, respectively, of a dust-pan, for the purpose of holding it in position to secure the dust or dirt, as herein described.

2. In a dust-pan, provided with a rest, C, and points F, arranged as described, the ribs D and E, as and for the purpose set forth.

114,352. — Smoking-Tobacco. — Albert S. Rosenbaum, New York, N. Y.

Claim.—The process of applying juniper-berries to smoking-tobacco so as to give it an aroma and purify the air where it is smoked.

114,353.—Car-Coupling.—Samuel S. Sartwell, Camden, N. Y.

Claim.—1. The links, connected rigidly to the levers L, and the latter provided with the springs M, arranged to hold the said links in the notches G, substantially as specified.

2. The heads E, made separately from the buffers, and either pivoted to them or connected by the shanks V, inserted in the sockets and the spring hooks engaging the walls thereof, all substantially as specified.

3. The combination, with the buffer and the head pivoted thereto, of the sliding hook Q, having the shanks, all substantially as specified.

4. The combination, with the said pivoted head E and the buffer, of the sliding block U and the hook R, all substantially as specified.

114,354.—Leather-Polish.—Henry A. Sawyer and Ramsom G. Sawyer, Milwaukee, Wis.

Claim.—A leather polish composed of alcohol, gum camphor, gum shellac, sweet-oil, castor-oil, tincture of musk, lamp-black, and molasses, in about the proportions named, and manufactured substantially as described.

114,355. — Bird-Cage Mats. — Charles S. Schenck, New York, N. Y.

Claim.—As a new article of manufacture, a water-proof cage-mat, composed of a series of connected sheets, as set forth.

114,356.—Machine for Charging Iron-Furnaces.—Edward G. Scovil, St. John, Canada.

Claim.—The peel or frame B, provided with rollers, braces, &c., and the end plate M, constructed and operating as above described, for the purposes set forth.

114,357, antedated April 26, 1871.—Sled-Knee.—Calvin Shaw, Milledgeville, Pa.

Claim.—The knee A, fig. 2, constructed as described, in combination with the iron bar E E and beams S S, constructed as described, for the purposes set forth.

114,358. — Gas-Machine. — Warren A. Simonds, Boston, Mass.

Claim.—1. The safety-valve M, consisting of tube *m* communicating with reservoir A, annular mercury-cup *n*, and loaded thimble *o*, all arranged in combination with each other and reservoir A, substantially as described.

2. The arrangement as an atmospheric-valve within the shell H H′ of the diaphragm, and having its central opening 3 surrounded by a raised seat and throttled by the gauze-screen, with its central boss 4, and of flexible disk *z*, screw 2, and yoke 1, all substantially as described.

3. The arrangement for connecting or coupling filler 1, and reservoir A, consisting of pipe *h*, spring valve *k*, and mercury-cup *g*, attached to the reservoir, and nozzle *l*, petticoat-flange *f*, and cock *d* on the filler, the whole operating to close the joint and open the channel or conduit at the same instant, all substantially as described.

4. The air-channels, of determined and constant height, as found by the arrangement of the bottoms of pans *a*, partial partitions *p*, wire-gauze floors *w*, beneath which, in the pans *a*, is fixed and held a sponge for the gasoline, to secure long, transverse, and vertical action of the air, and constant presentation of gasoline to the air-column moving through reservoir A, substantially as described.

5. The gasoline reservoir A, provided with its water-jacket F and safety-valve M, when arranged to work with an air-forcing apparatus, and placed above the burners it is to supply, substantially as described.

114,359.—Machine for Cutting Staves.—William Sisson, Fulton, N. Y.

Claim.—The following combination of the vibratory bed B, the upright extension-standards *a a* of the main-frame C, the driving-shaft D with its cranks mounted in the said standards directly over the vibratory bed, the adjustable bearings *b b* of the driving cranks and vibratory bed, and the connecting-rods H H, adjustable in said bearings, all substantially as and for the purpose herein specified.

114,360.—Grocer's Canister. — William H. Smith, Portland, Conn., assignor to The Heath & Smith Manufacturing Company, same place.

Claim.—The nesting-canister herein described, having the inclined flap or cover B hinged, as usual, and having the additional portion A^1 also hinged, and secured and released at pleasure, so as to serve substantially as and for the purposes herein set forth.

114,361.—Oil-Tank.—Henry F. Snyder and George S. Snyder, Williamsport, and Antes Snyder, Freeport, Pa.

Claim.—1. The head M^2 on the operating shaft M, threaded as represented, and arranged to serve relatively to the valve D and tank A, as represented.

2. The guide *t* in the side of the man-hole casting T, serving relatively to the shaft M, valve D, and tank A, as and for the purposes herein set forth.

3. The wide collar M^3, forged and forming a permanent part of the shaft M, standing with its upper edge a little above the heads of the bolts *d*, and the cap D′ of the valve D applied, and removed by slipping over the whole upper portion of M, combined and arranged to operate together so as to protect the bolt-heads *d*′ from injury, as herein set forth.

114,362, antedated April 27, 1871.—Garden-Sprinkler.—John I. Spear, San Francisco, Cal.

Claim.—A sprinkler provided with an annular perforated discharge, substantially as described, for the purpose set forth.

114,363. — Bridge. — Charles B. Sreeves, Atchison, Kan.

Claim.—1. The end pieces A provided with the sockets and holes as described, and combined with the timbers A E and binding-rods B F, all substantially as specified.

2. The connection of the right-and-left threaded rods and braces with the upper and lower chords, by means of the yokes fitted around the respective parts, all substantially as specified.

3. The connection of the sides by the lateral braces O, having the right-and-left threaded ends screwed into the yokes K or flanges thereon, and the rings Q, all substantially as specified.

114,364.—Carriage-Hub.—Henry W. Stow, New Haven, Conn.

Claim.—In combination with the wooden core and spokes set therein, the flanges F F, and boxpiece C, and point G, united to each other and to the wooden portions, substantially as described and represented.

114,365, antedated April 22, 1871.—Scaffold-Bracket for Roofing.—John W. Tallmadge, Plainville, Conn.

Claim.—The herein-described roofing-bracket, consisting of the upright A, socket-head *b*, and adjustable bracket B, all combined and operating together, substantially as and for the purpose described.

114,366. — Children's Bib. — Adaline L. Thomson, Hudson City, N. J.

Claim.—1. The elastic straps or cords D D combined with the sleeves C C of a bib, as and for the purpose specified.

2. A bib, consisting of the body A, sleeves C C, and turned-up bottom B, as specified.

114,367.—Dish-Washer.—Henry B. Todd, Plymouth, Conn.

Claim.—The dish-washer, composed of the vessel A, dish-support and rack B, and cradle C, the latter having the troughs *c*, as set forth.

114,368.—Horse Hay-Rake. — Robert M. Treat, Morris, Conn.

Claim.—1. The long forked hinging straps *h h*, formed as shown by doubling and bending the metal, in combination with the eyes *j j*, axle B C, and the rake-head G, the combination and arrangement being as shown, so that the prongs or arms of the straps clasp the top and bottom of the rake-head so as to prevent splitting, and are confined to it by vertical bolts, all as and for the purpose described.

2. The forked foot-lever *t*, the vibrating stirrup *l* and the adjusting-rod *r*, combined and arranged in a wheel hay-rake, substantially as described.

3. The foot latch *v* applied to the foot-lever *t*, and combined with the stirrup *l* and rod *r*, substantially as and for the purposes described.

114,369.—Wheel for Traction-Engines. Charles W. Tremain, Chicago, Ill.

Claim.—1. The construction of the fellies of traction-wheels with double flanges, the same being divided into recesses or chambers for the reception of segmental shoes, substantialy as herein set forth.

2. The construction and arrangement of the shoes D and radial bolts E within the double-flanged felly of a traction-wheel, with a suitable spring backing interposed between the inner faces of each segmental shoe and the bottom of its respective recess, substantially as and for the purpose set forth.

114,370. — Lunch-Box. — Daniel Troxell, Newark, N. J.

Claim.—The lunch-box composed of the hinged parts A B, lid C, vessels D E, and foot F, substantially as herein shown and described.

114,371, antedated April 27, 1871.—Mold for Making Cushioned Belting.—Samuel W. Tyler, Troy, N. Y.

Claim.—1. A sectional mold adapted for the production of elastic cushioned belting, constructed substantially as described.

2. The segmental inner ring section C, in combination with detachable mold sections A B D, substantially as and for the purposes described.

3. The ring C, secured to the base-section B, in combination with the movable sections A B D, substantially as and for the purposes described.

114,372. — Pallet of Watches.—Arthur Wadsworth, Newark, N. J.

Claim.—The adjustable pallets C C′, made with through-bored holes, as shown, in combination with the jewels *d d*′ adjustable therein, all substantially as and for the purposes set forth.

114,373.—Fabric from Waste Leather.—Enoch Waite, Franklin, Mass., assignor to himself and Francis B. Ray, same place.

Claim.—The product or material as made of glovers' leather, picked and carded, as set forth.

114,374. — Lock for Double-Barreled Fire-Arms.—Daniel B. Wesson, Springfield, Mass.

Claim.—An independent removable plate, D, to which are secured the two locks of a double gun, when said plate is made of a separate piece from the frame of the gun, and is so arranged as to be attached to and detached from the frame, substantially as described.

114,375. — Mercurial Salve. — Walter Wheelock, Boston, Mass.

Claim.—The salve composed as described, and for the purposes substantially as set forth.

114,376. — Tilting-Chair. — Edwin R. White, Milford, Mass.

Claim.—1. In the improved reclining-chair the seat B, as provided with the auxiliary rigid supports or legs *f f* and the elastic "S-springs" C C, arranged and combined with it and the leg-frame A, as set forth.

2. The improved reclining-chair, the springs C C, the auxiliary legs *f f*, rack *d*, and pawl D, arranged and combined with the seat B and leg-frame A, substantially as specified.

3. The improved reclining-chair as made or provided with the springs C C, the auxiliary legs *f f*, the rack *d*, and pawl D, and the pawl-tripper E, all arranged and combined with the seat B and leg-frame A, substantially in manner as set forth.

114,377.—Roll for Rolling Umbrella-Connections. — Edwin Wight, Philadelphia, Pa.

Claim.—The devices upon the rolls B B′, as indicated by the letters D D′ and E E′, for molding and notching a strip of metal for the purpose herein set forth.

114,378. — Combined Square, Bevel, Plumb, and Gauge.—Milton M. Wilson, Elwood, N. J., assignor to himself and James H. Curl, same place.

Claim.—The above-described combination-tool, embracing a rule, marker, try-square, gauge, bevel, spirit-level, and plumb, constructed and operating substantially as and for the purpose specified.

114,379.—Door-Spring.—Loren R. Witherell, Galesburg, Ill., assignor to Davis A. Dudley and Edward D. Dudley, same place.

Claim.—The plates G and H, when constructed, as described, with cylindrical projections *g*″ and *h*″ and studs *h h*, and combined with the spring D and plate E, substantially as described, and for the purpose specified.

114,380. — Washing-Machine. —Jacob A. Wood, Chemung, Ill.

Claim.—1. The tank B, constructed substantially as described and shown, in combination with the box A, when arranged and operated as and for the purposes set forth.

2. The vertically-adjustable journal-boxes H, constructed substantially as described and shown, in combination with the box A and shaft I, when arranged and operated as and for the purposes set forth.

114,381. — Wind-Wheel.—Horace Woodruff, Sandwich, Ill.

Claim.—1. The two concentric shafts C F, the latter sliding loosely on the former, and rendered relatively adjustable by means of two movable shoulders, *g h*, sliding on opposite ends of the shaft F, in combination with the spring G and connecting-rods *f*′, for the purpose of adjusting the sails B to the wind, as herein described.

2. The primary shaft F, resting in and extending through a hollow concentric shaft, C, and being connected at the front end by rods *f*′ with the sails B, and at the rear end having a swivel or loop, I, for the attachment of a rod or rope, to allow the sails to be opened by hand from the rear of the mill.

3. The eccentric D, adjustable upon its bearing J by means of longitudinal slots *d d*′ *d*″, bolts *j j*, and nuts *i i*, to vary the length of stroke of the pitman E, in combination with the friction-rollers *n n* of the pitman-head E′, as herein set forth.

4. The lateral adjustment of the sails B upon their bearings *b b* of supporting-rods *a* by means of longitudinal slots *c c*, bolts b^1 b^1, and nuts b^2 b^2, in the manner described.

114,382.—Propeller for Canal-Boats.—George G. Wyland and Thomas M. Rathmell, Williamsport, Pa.

Claim.—1. The combination, with a propeller-wheel, of the detachable auxiliary blades or extensions of blades, substantially for the purposes herein set forth.

2. The combination, with a canal-boat, of the for-

ward keel D, constructed to be readily attached and detached in the manner and for the purposes herein set forth.

3. The adjustable rear keel D′, with its bar *d*, constructed and arranged substantially as and for the purposes herein set forth.

4. The combination, with a canal-boat, of a removable keel or section of keel forward, and a vertically-adjustable keel or section of keel at the stern, constructed and arranged substantially as and for the purposes herein set forth.

5. The combination, with propellers C C and keel D′, of an adjustable rudder for canal-boats, made so that it can be raised and lowered at will, for the purposes herein set forth.

6. The combination of the keel D′, bar *d*, shaft E, and rudder G, all constructed and arranged substantially as and for the purposes herein set forth.

114,383.—BOLT-CUTTER.—William E. Yeager, Lawrence, Kansas.

Claim.—The broad support for the cutters F at the end of the shaft D, and the recesses in the cutter-head, conforming in shape to the cutting-edges of the laterally-extended cutters, as and for the purpose set forth.

114,384, antedated April 18, 1871.—CUP FOR GRAIN-DRILLS, &c.—John P. Zeller, South Bend, Ind.

Claim. — The within-described cup for grain-drills, made of metal, with the inclined hopper-bottom B, curved flange D, inclosing the wheel E between it and the hopper-bottom, and the hanger-cup C, all as shown and described.

114,385, antedated April 22, 1871.— MACHINE FOR SHEARING METAL.—William J. Adams, Grand Rapids, Mich.

Claim.—1. The combination of the revolving shaft *d* and fly-wheel C with the cam-wheel G, post E, and spring H, constructed and arranged as described, to operate substantially as and for the purposes herein set forth.

2. The hooked lever I, pivoted on the post E, and operating in combination with the spring *f*, the flat-surfaced rotating journal *w*, and the tooth *k* on the shaft *d*, substantially as and for the purposes herein set forth.

3. The foot-lever J, spring *p*, rod *m*, and cam *n*, arranged and operating with the spring H and post E, substantially as and for the purposes herein set forth.

4. The combination of the base A, frame B, shaft *d*, fly-wheel C, post E, cam-wheel G, springs *f* and H, lever I, the flattened journal *w*, and foot-lever J with the spring cam *n*, all constructed and arranged with their several connections, substantially as and for the purposes herein set forth.

114,386. — PADLOCK.—William H. Akins, Ithaca, and Henry E. Abell, Brooklyn, N. Y.

Claim.—1. The key-hole spring *e*, in combination with the plate-key, tumblers *f*, bolt *c*, and shackle *b*, as and for the purposes set forth.

2. The fences 9 and 10, in combination with the bolt *c*, tumblers *f*, and spring *e*, as and for the purposes specified.

114,387.—BINDER FOR SEWING-MACHINES.—William Allebaugh and Joseph M. Cuffell, Norristown, Pa., assignors to Jacob C. Slemmer, same place.

Claim.—The arrangement of the plates A and C, upright T, lever L, sliding guide S G, rod R, and set-screw D, constructed and operating as and for the purpose specified.

114,388.—KITCHEN-KNIFE.—Jacob W. Androvatt and Truman W. Joline, Tottenville, N. Y.

Claim.—The improved domestic knife herein described and shown as a new article of manufacture, to wit: said knife being made with a smooth cutting-edge, *b b b a*, rounded or corner-sharp scraping-edge *a*, and a hooked end, C, bounded on two sides by scraping-edges, *c d*, which form an obtuse angle, *c*, all as shown and described.

114,389.—SELF-LIGHTING LAMP.—William W. Batchelder, Boston, Mass.

Claim.—1. The combination of the sliding collar *g*, feeding fuse-arms *f f*, spring stop *h*, and operating-lever *j*, arranged substantially as described.

2. The fuse-tube *a b*, made in sections, screwed or otherwise connected together for the convenient insertion of the fuse from time to time, as described.

3. In an automatic device for lighting lamps, the combination of the sectional fuse-receptacle *a b*, the severing-arm *h′*, the notched tube *a*, the fuse-support *i*, the flame-cap *m*, the sliding collar *g*, feeding spring arms *f f*, and the hand-lever *j*, the several parts being constructed, arranged, and operating as described.

114,390.—CORN-PLANTER.—Henry Baughman, Sandusky, Ohio.

Claim.—The combination of the false bottom *b*, provided with the curved opening *d*, the hopper *c*, true bottom *e*, and block *g*, as specified.

114,391.—HORSE HAY-FORK.—Charles Bean, Pawtucket, R. I.

Claim.—The improved horse hay-fork herein described, consisting of the main and auxiliary tines C and E, rigidly attached to the handle and shank, respectively, and connected by a hinged joint, the rigid holding-bar D attached to the handle, the spring sliding latch F and tripping-lever G, all constructed and operating substantially as described.

114,392, antedated April 28, 1871.—STABLE FIXTURE.—Samuel S. Bent, Port Chester, N. Y.

Claim.—1. The blocking piece *i*, introduced in the floor, in combination with the swinging stall partition, for holding the moving end thereof when in position, as specified.

2. The slotted plates *s*, attached to the walls near the angle, in combination with the hooks *o o* upon the manger or trough A, for sustaining said manger in the angle, as set forth.

114,393.—SOAP.—John T. Bever and Pauline S. Bever, Lathrop, Mo.

Claim.—An improved soap, made of the ingredients in the proportions and for the purposes herein set forth.

114,394.—VULCANIZED-RUBBER TUBE FOR GRAIN-DRILLS, &c. — James R. Bird, Brooklyn, N. Y., assignor to The New York Rubber Company, New York city.

Claim.—1. A vulcanized India-rubber tube whose body is made of a comparatively stiff and inelastic compound of India rubber, with one or both ends formed of a distinctively elastic compound, the two being united by vulcanization, substantially as shown and described.

2. A vulcanized India-rubber tube for grain-drills and other purposes, having its body composed of canvas or equivalent textile fabric, coated internally and externally with rubber, and its upper end, or that end which is applied and secured to the drill, of an elastic compound of India rubber, the two being put together in the green or plastic state and then united by the process of vulcanizing, as shown and set forth.

114,395.—DITCHING-MACHINE.—Isaac Bona, New Orleans, La.

Claim.—The combination of the wheel A, the frames *g* and *k*, with lock-frames *l l*, side aprons *s*, shield B, with plow-points *e e*, gauge-wheels *i i* and cutters A A, when all these are constructed, arranged, and operated substantially as described, and for the purposes set forth.

114,396.—MACHINE FOR PREPARING BEEF-STEAK.—Asa M. Bond, Concord, N. H.

Claim.—The combination of the roller A, radial cutters *d*, and feed-roller B, as specified.

114,397.—KNITTED FABRIC.—Henry Boot, Philadelphia, Pa., assignor to Thomas Dolan, same place.

Claim.—A knitted fabric, produced substantially in the manner described.

114,398.—ROLLER-SKATE.—Peter R. Borein, San Leandro, Cal.

Claim.—1. The combination of the roller-frame, consisting of the lugs I hinged to the bridge-piece K, with the stock-plates, the roller-frame being slotted in front to permit an oscillating movement upon the stud F, as described.

2. The elastic block or spring J, in combination with and working in a slot in the rib C, skate-block A, and truck E, substantially as herein shown and described.

114,399.—SAFETY DEVICE FOR HOISTS.—Peter J. Borger, Cincinnati, Ohio.

Claim.—The combination of the detent mechanism S T W with the belt-shifting apparatus through the connections U N, or their equivalent, so that the relaxation of the rope will result in arresting the rotation of both the pulley-shaft H and drum C, as explained.

114,400.—MACHINE FOR THE TREATMENT OF FIBROUS PLANTS.—Adolph Bouchard, New Orleans, La.

Claim.—The combination of the drums D and *d*, supported with their flanges and scrapers as described, the feeding-rollers E E, the lever P, the rollers K K, the roller I, the table F, the cover M, and perforated tube N, for the purpose of fluxuating the ramie and similar fibrous plants by decortication and partial maceration, substantially as described.

114,401.—BRIDGE.—Thomas Charles Boutet, Paris, France.

Claim.—1. The construction of bridges in the manner herein shown and described.

2. The combination of the metallic truss formed of longitudinal cable and tranverse ties, as described, the upper and lower wooden floorings between which said truss is held, the stiffening-stringers and cross-pieces, and the balustrades or side rails, said parts being united together to form a bridge-span supported upon proper abutments, substantially as shown and described.

114,402.—SHAFT-COUPLING.—Sidney Broadbent, Scranton, Pa.

Claim.—1. The combination, with the longitudinally split shaft and sleeve surrounding the same, of the wedges, accessible from the exterior of the sleeve for expanding the split shafts within it, substantially as specified.

2. The combination of the nuts C C′, the sleeve B, and the longitudinally split shafts A A′, with the wedges for expanding the shafts laterally, essentially as herein set forth.

3. The arrangement of the opening *e* in the sleeve, the recesses *d d′* in the ends of the shafts, and the wedges F F′, relatively with the split ends of the shafts A A′, substantially as described.

4. The combination of the keys E E′ with the sleeve B and split ends of the two shafts, the nuts C C′ and the wedges made accessible from the exterior of the sleeve for expanding the split ends of shaft within it, substantially as specified.

114,403.—PUMP.—Addison P. Brown, New York, N. Y.

Claim.—The reversible plate C, in combination with the valve V and supply-pipe, substantially as and for the purpose herein described.

114,404.—SAFETY ATTACHMENT FOR POCKET-BOOKS.—Jefferson Brown, Jr., New York, N. Y.

Claim.—A pocket-book or money-receptacle, provided with a ring and bracelet, (either or both,) and so arranged that it may be carried in the palm of the hand, substantially as and for the purpose set forth.

114,405.—MANUFACTURE OF WHITE-LEAD.—Thomas H. Burridge, St. Louis, Mo.

Claim.—1. The generator F, drawer H, and furnace or fire-place I, in combination with the chamber A, vapor-chamber E, and drawers C, arranged and operating in relation to each other as and for the purpose substantially as set forth.

2. The pump K, pipe I′, and chamber E, in combination with the chamber A and drawers C, arranged and operating as and for the purpose substantially specified.

114,406. — ELECTRO-MAGNETIC BURGLAR-ALARM.—John G. Butler, Glen's Falls, N. Y.

Claim.—The automatic switch, in combination with the spring arms *i* and *f*, and electro-magnet, arranged and operating in the manner and for the purposes set forth.

114,407.—CORPSE-PRESERVER. — Jeremiah T. Carpenter, Downington, Pa.

Claim.—The within-described corpse-preserver, composed of the grooved shallow bottom A, having inner supports, upon which is placed the movable cooling-board B having head and foot-rests, and extending above the sides of the bottom, around which extends the body E, provided with the covers G H I, the various parts being constructed substantially as set forth.

114,408.—REAPING-MACHINE.—George Homer Clark, Cleveland, Ohio, assignor to himself and Peter B. Reid, Lockport, N. Y.

Claim.—1. The combination, with the driving-wheel B, of the cams *e e*, the swinging bars D D, the rack-bars *f f*, pinion *g*, and levers I I, as described, and for the purpose set forth.

2. The combination, with the levers I I, of the table J, clearers *k*, pinion *m*, shaft *n*, thimble *s*, dropper-arms *p* and *q*, shield *r*, and pilot-frame G, when arranged and operating in relation to each other, substantially as and for the purpose set forth.

114,409.—RAILWAY FROG AND RAIL-COUPLING.—John W. Close, Buffalo, N. Y.

Claim.—1. The arrangement of the bolts *g′ g′* with the notches *g g*, point C, rails B B, and base-plate E, as hereinbefore set forth.

2. The wedge-plate F and bolt *f* arranged with the rails B B, point C, and base-plate E, substantially as and for the purpose hereinbefore set forth.

3. The combination and arrangement, with the rails D D D′ D′ of the wrought-iron base-plate J with overlapping edges *j j*, and fish-plates *k k*, secured by bolts, substantially as hereinbefore set forth.

4. The combination and arrangement, with the rails D D D′ D′, base-plate J, flanges *j j*, and fish-plates *k k*, of the wedge-blocks N N and bolts *n n*, as hereinbefore set forth.

114,410.—BILLIARD-TABLE CUSHION.—Hugh W. Collender, New York, N. Y.

Claim.—The combination of two or more paral-

lel wires or cords with India-rubber cushions for billiard-tables, substantially as and for the purpose specified.

114,411. — Liquid-Meter.—Thomas Cook, New York, N. Y.

Claim.—1. The conical valve G, having the recesses or buckets H in its periphery, and provided with the retarding vanes or wings L, substantially as described.

2. In combination with the above, the stationary vanes M, substantially as specified.

3. In combination with the valve G, constructed as described, the valve-seat and the recesses Q, substantially as set forth.

114,412.—Ventilating-Roller Window-Blind.—Arthur Cooper, Twickenham, England.

Claim.—Making flexible rolling window-blinds either with perforations or with one or more large openings therein near the top, or any other part of the blind, for the purpose of admitting fresh air into the room and thereby ventilating it when the blinds are drawn down, substantially as above described.

114,413. — Horseshoe-Nail Machine.—Harley Dwight Cowles and George Stacy, Montreal, Canada.

Claim.—The apparatus in its novel combination of frame *a*, legs *b*, shaft *d*, eccentric *e*, pitman e^1, gate e^2, guides e^3, punch or punches e^4, shoe e^5, keys e^6, holders *f*, bed *g*, dies g^1, key g^2, all working together substantially in the manner and for the purpose described.

114,414.—Bridge-Gate.—Edward Richard Coyne, Chicago, Ill.

Claim.—The sliding gates C having racks *a*, and the bridge A provided with the racks *r r'* and cam *s*, in combination with the shifting operating gear, arranged to operate substantially as described, whereby the gates are opened and closed by the movement of the bridge, as set forth.

114,415.—Water-Meter.—Joseph W. Cremin, New York, N. Y., assignor of one-half his right to George H. Fairchild, Bridgeport, Conn.

Claim.—1. The wheel C, having its buckets or paddles formed with a flat surface for receiving the impact of the water, and a sharp cutting-edge, c^2, formed by the beveled sides c^1, substantially as described.

2. The wheel C, constructed as described, in combination with the tube A and bulb B, as and for the purpose set forth.

114,416.—Fanning-Mill.—Lewis M. Crosby, Ashtabula, Ohio.

Claim.—The shoe C, supported in the frame of the mill by means of the hook-links G, when connected thereto and to the bell-crank H and arm I, substantially in the manner as described, and for the purpose set forth.

114,417. — Raisin-Seeder.—Willis Curtis, Jr., Wolcottville, Conn., assignor to Elisha Turner, same place.

Claim.—1. The slides *g* and *h* in the frame *a*, carrying respectively the holding-jaw *f* and ejecting-pins *k*, in combination with the grating *e* for sustaining the raisin, as and for the purposes set forth.

2. The arrangement of the crank and pin *i*, slides *g* and *h*, with their cam-shaped slots and the sweep *l* for removing the raisin, in the manner specified, whereby these parts are all actuated in proper time by one crank-pin.

3. The scraper *v*, beneath the grating *e*, and actuated by the projection *w* upon the fly-wheel *m* and the cam *x*, projecting from the slide *g*, as and for the purposes set forth.

114,418.—Toilet-Case.—Francis E. Dapron, Davenport, Iowa.

Claim.—A toilet-case, consisting of the body *a d*, having its upper portion provided with a series of compartments, *t*, and sliding doors *l*, and its lower portion underneath said compartments with a towel-roll, all constructed and arranged as herein described.

114,419.—Water-Meter with Stop-Cock Connections. — José F. de Navarro, New York, N. Y.

Claim.—1. A meter provided with cocks at its influx and efflux, substantially as described.

2. In combination with a meter so provided, the flanged portion *e* or *e'* of the cock, forming part of said cock.

114,420.—Liquid-Meter.—José F. de Navarro, New York, N. Y., and Henry C. Sergeant, Newark, N. J., assignors to José F. de Navarro.

Claim.—1. The arrangement of the separate but geared revolving crank-shafts F F' and the cylinders C C' of the meter with their pistons, substantially as shown and described.

2. The arrangement of a revolving valve that controls the movement of both pistons, the separate revolving crank-shafts and the gears that connect the whole to work in concert relatively with each other and the cylinders of the meter, essentially as specified.

3. The tubular revolving valve J, arranged to communicate at its opposite ends with the inlet and exhaust-chambers of the meter, and constructed with opposite side inlet and outlet-ports *e e'* and *f f'* arranged in relation with each other and to a cross-partition or diaphragm, *d*, substantially as specified.

4. The combination and arrangement of the ports *k k'* and *l l'*, in the valve-seat, the passages or chambers *m m'* and B B' connecting with opposite ends of the cylinders, and the revolving valve J, with its inlets *e e'* and outlets *f f'*, essentially as described.

114,421.—Fire-Escape.—William De Pew, Paris, Canada.

Claim.—1. The Jacob's ladder E, supported upon a fixed pivot at the upper ends of the standards G G, when its independently-working arms *c c'* are provided with the stops *r r'*, adapted to operate in the manner herein set forth and shown, for the purpose specified.

2. The combined ladder and shafts C C *c c*, pivoted to a fire-escape car, and constructed to operate substantially as and for the purposes specified.

3. The combination, on the car-body A, of the fire-escape E, constructed and operating substantially as described, and the shield B *h*, as described, for the purpose set forth.

114,422. — Cupola-Furnace. — James Dougherty, Philadelphia, Pa.

Claim.—1. The combination, with the annular blast-chamber I, of a blast-pipe J, arranged tangentially, or nearly so, in respect to the said chamber.

2. The tangential tuyeres *e e*, distended horizontally at their outer ends and vertically at their inner ends, as set forth.

3. The combination of the said tuyeres *e* with the downwardly-inclined tuyere *f*.

4. The combination of the lower set of tuyeres, arranged substantially as described, with the upper set of tuyeres, arranged as set forth.

5. The cast-iron frames K, built in the wall of the furnace, and arranged for the reception of detachable tuyeres and a clay lining, substantially as set forth.

6. An opening in the blast-chamber closed with a fusible plate, arranged in respect to the front tuyere *h*, as specified.

114,423.—Machine for Mixing Paste for Confectionery, &c.—Robert Duff, New York, N. Y., assignor to Ernest Greenfield and Philip Strauss, same place.

Claim.—1. The quadrangular arms G G, having openings within their outer walls or edges, so as to allow the free passage through them of the substances, and revolving in the horizontal drum B B, substantially as described.

2. The **I**-shaped standards H H, attached to the periphery of the stationary drum B B, substantially as set forth and described.

3. The shaft C C, skeleton arms G G, and standards H H, operating within the hollow stationary drum or cylinder B B, with its hinged movable upper portion *a*, all substantially as set forth and described.

114,424. — Sewing-Machine. — George L. Dulaney, New York, N. Y.

Claim. — 1. In combination, the radially slotted disk G, secured upon the driving-shaft, the arm 6 having a journal-bearing not in line with the said shaft, the pin 5, and the shuttle-driving rod H, actuated directly from said pin, substantially as and for the purpose shown and described.

2. In combination, the radially-slotted disk K, adjustably secured upon the driving-shaft, and having a uniform velocity, the disk 9 having a variable velocity, pin 8, eccentric 10, journal F, and needle-arm C, or the described equivalents, substantially as and for the purpose set forth.

3. The combination of the main driving-shaft and its disks G and K with the described means for imparting the proper variable movements both to the shuttle and needle.

4. The main arm, secured to the bed-plate by means of a pivotal center, about which it may be adjusted and secured for the purpose of adapting the position of the needle to the path of the shuttle, substantially as described.

5. The combination, with the needle-bar and a notched needle, of the eccentric piece or lever 17, operating in the manner shown and described, to hold the needle to place in the bar.

6. The combination, with the needle-arm of an adjustable fulcrum-bolt having an eccentric thereon, and a set-screw for securing the bolt in the desired position and regulating the vertical adjustment of the needle, substantially as shown and described.

7. The take-up lever 22, its rock-shaft, and tooth or projection, combined with the shoulder and slot in the needle-bar, the bar operating to positively lock the lever in position, and to release it in the manner shown and described.

114,425.—Machine for Dressing Mill-stones.—Samuel East, Memphis, Mich.

Claim.—1. The combination of cylinder *f f g*, crank *i*, lever h^1, spring n^1, latch c^3, sliding shaft *e*, taper-friction $g^1 f^1$, and gears *n d' n'*, as specified.

2. The combination of vertical sliding frame *d*, horizontal sliding frame *c*, track-frame A, screws c^1, stationary driving-post b^3, screw *j*, and nut *k*, as described.

3. The combination of screw *j*, disks *l* l^1, gears d^1 n^1, connecting-bar *k*, set-screw *m*, pawls *q* q^1, bar *c*, with handle *p*, as set forth.

4. The combination of screw *j*, disk l^1, gear n^1, dog *s*, tooth *z*, arm *v*, spring-arm *u*, spring *r*, and stops a^1 c^1, as explained.

5. The combination of yoke t^1, lever z', eccentric s^1, link a^2, pin c^2, and web b^2, as specified.

6. The combination of block k^2, bolt f^2, pivot l^2, pin c^3, with center eccentric, spring eccentrics p^2, lever q^2, ratchet l^2, rod *c*, and pick-handle *b*, as described.

7. The combination of braces s^2, bolt r^2, spring f^2, plate n^2, rib c^2, and web w^2, as set forth.

8. The combination of pick-handle *b*, plate *h*, web c^2, disk z^2, and worm-groove y^2, as explained.

9. The winged orifice in pick *a*, in combination with the bolt f^2 and pin g^2, substantially as described.

114,426.—Saw-Mill. — Marshal J. Egery, Bangor, Me., and Thomas N. Egery, same place.

Claim.—1. The combination of the guide-rods *d d*, as herein described, screws *j j j' j'*, crank *k*, shafts *q* and *m*, and gears *i*, *n*, *p*, *o*, and *r*, as and for the purposes set forth.

2. The combination of the above-described guide-rods, operating as set forth, with the saw-frames, suspended as described to the slide-boxes by the trunnions *b b b' b'*, as specified.

114,427.—Piston-Packing.—Philip Estes, Leavenworth, Kan.

Claim.—The follower *l* and its screws, the braces A, base *f*, rings *b c*, pins *k*, and packing-rings *a*, arranged as shown and described, whereby, when the follower-screws are tightened, the pins *k* are caused to force the ring *c* inward, for the purpose specified.

114,428.— Division-Plate for Cooking-Stoves.—Selena C. Ewing, Hill's Ferry, Cal.

Claim.—1. The adjustable partition B, substantially as and for the purpose above described.

2. In combination with the adjustable partition B the hooked rods A, substantially as and for the purpose above described.

114,429, antedated April 26, 1871.—Steam-Engine. — Hippolyte Fontaine, Paris, France.

Claim.—1. A steam-boiler and steam-engine combined with devices, substantially as described, so that without replenishing the boiler the entire water in the latter may be consumed in supplying steam to the engine.

2. The generator, consisting of the cylinder C, flanges screwed onto the same, plate F', and cast-metal flue H, constructed and arranged substantially as described.

3. The combination, with the generator Z and its flue or flues, of the tube T extending into the flues, and receiving the steam-pipe B, as set forth.

4. The cast-metal flue H, with its cross-tubes *t t'*, and branch N, arranged as described.

5. A plate F'', having a projection, F''', extending into a chamber, F, in the bed-plate, and recessed to receive pistons *c'*, as set forth.

6. The projection F''', surrounded by a steam-chamber, F, having passages and ports, as described, and provided with valves arranged to slide on one or more of the exposed sides, as set forth.

7. The combination of the plate F', its chamber F, and detachable plate F'', its projection F''', chamber, passages, valves, and pistons, all substantially as set forth.

8. The upright E', with its openings *a'*, and detachable bearing *a''*, in combination with the upright E and crank-shaft *a*, as described.

9. The recess in the uprights, containing springs *n'* and pads *n''*, as set forth.

10. The wheel V, revolving adjacent to a stationary hub, *s*, and carrying a sliding weight, I, connected to a pad, *c'*, and operating the latter and operated by a spring, *r'*, substantially as set forth.

11. The burners *b*, communicating through a tube, *l*, with a casing, G, containing a valve, *o*, operated by the pressure of steam in the gasometer, substantially as set forth.

12. The said burners *b*, communicating with a regulating apparatus, in combination with a burner, B', continuously supplied with gas, as specified.

13. The tube *l*, communicating with a casing, K, containing a valve operated on the descent of water in the boiler, as specified.

114,430.—Counterpoise Gun-Carriage.—John G. Foster, Boston, Mass.

Claim. — The counterpoise-wheels D, having

weights E attached, in combination with the gun-carriage B, said wheels being connected to each other and to the carriage by means of a shaft, G, passing through slots, or by equivalent means, substantially as described.

114,431, antedated April 25, 1871.—Wash-Boiler.—James H. Garner, Pontiac, Ill.

Claim.—1. The combination of the rim A with openings *a a* and *d d* and the guards *b b*, the slats B B, and inclined bottom C, all constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the base A B C with its openings *a d* and guards *b*, and the oblong conductor D with its openings *c c*, all constructed and arranged substantially as and for the purposes herein set forth.

114,432.—Lantern.—Nathaniel Gear, Newark, Ohio.

Claim.—A hand-lantern, composed of flaring perforated sides, a curved or swelled reflecting back, and a curved or swelled glass front, and furnished with a lamp and handle, as and for the purpose substantially as herein described and represented.

114,433.—Rail-Joint.—William F. Grasseler, Muncy, Pa.

Claim.—The plates A, constructed with a hole, *a'*, in each, and reduced ends A^1 A^2, bent substantially as shown and described.

114,434.—Dry-Earth Closet. — William Henry Grove, Philadelphia, Pa.

Claim.—1. An earth-closet, having beneath the seat a vertical casing perforated at the sides, and surrounded by an earth-chamber in which vanes or agitators may be caused to move, substantially as described.

2. The rotating trap *b* arranged below the said casing, as set forth.

114,435.—Sewing-Machine Stand.—William Henry Grove, Philadelphia, Pa.

Claim.—The combination, with a sewing-machine case or stand, of a tray or trays arranged so as to be turned outward from the end of the stand, as described.

114,436. — Support for the Sashes of Carriage-Doors and Windows.—John C. Ham, New York, N. Y.

Claim.—1. A sliding frame or support for supporting the raised sash of a carriage-door or window, as set forth.

2. The combination of the stops *b'* and long notches or slots *a'* with the sliding supporting-frame B and sash A, substantially as herein shown and described, and for the purpose set forth.

3. The beveled flange *c'* of the door-casing or body C of the carriage and the beveled lower edge of the sash A, in combination with each other and with the said casing C and sash A, substantially as herein shown and described, and for the purpose set forth.

4. The cap or cornice D, in combination with the top of the sash A to cover the apertures in which the sash A and sliding supports B work, substantially as herein shown and described.

114,437.—Return-Flue Boiler-Furnace.—Charles J. Harris, Bloomington, Ill.

Claim.—The arrangement, in a horizontal return-flue boiler, of an exhaust steam-pipe at or near the rear end of said boiler to deliver a jet of exhaust steam for the purpose of cleaning the rear end and flues of same, and assisting in creating a draught for the same, substantially as set forth.

114,438. — Manufacture of Candles.—Charles Havard, New York, N. Y.

Claim.—A candle with one or more longitudinal openings running parallel with the wick through the whole length of the candle, to receive any melted matter not consumed by the flame, thereby preventing said melted matter from overrunning on the outside of the candle.

114,439.—Construction of Bedsteads.—John F. Hollister, Plano, Ill.

Claim.—1. The shell A, provided with the heads B B', in combination with the grooved rails D and cotter E, substantially as described.

2. In combination with the shell A, in which the rails D are secured, the socket F, substantially as and for the purpose set forth.

114,440.—Steam-Heater. — Albert L. Ide, Springfield, Ill.

Claim.—The hereinbefore-described waste-water trap, consisting of the discharge-pipe B, connected with and surrounded by the casing A, and closed at its outer end by means of a valve, K, supported by or within the outer end of said casing, substantially as and for the purpose specified.

114,441. — Harvester-Rake. — Benjamin Illingworth, Le Roy, Minn.

Claim.—1. The combination of the within-described parts forming the operating mechanism of a rake attachment for reapers, namely, the carriage *d*, head *h*, shaft *k*, pin *m*, ratchet-wheel *i*, and spring pawl *p*, all constructed and arranged as described, and operating in connection with the rods *e e*, rake O, flange *n*, and stop *x*, substantially as and for the purpose herein set forth.

2. In combination with the mechanism above described for operating the rake O, the pitmen N N', cranks M M', shaft J, slotted arms K K, pulleys I E, chain *b*, and regulator L, all constructed and arranged with a reaper, substantially as and for the purposes herein set forth.

114,442. — Bobbin-Winder for Sewing-Machines. — Thomas Masterson Jenks, New York, N. Y.

Claim.—The bobbin-winder herein described, consisting, essentially, of the supporting-plate B, the hinged bifurcated plate B' having the bearings *b b*, the vertical shaft A supported in said bearings, and having the friction-disk *a*, the tension device E E' *s s'*, the spring D and the spring F, provided with the stop C, all constructed and operating substantially as and for the purpose specified.

114,443. — Shingle-Machine. — Joseph Jimo, Vergennes, Vt., assignor to himself and E. H. Landon, same place.

Claim.—1. The tilting table N and the shaft *s*, having the wheel O attached, in combination with the rotating table C provided with the fingers *y*, all constructed and arranged to operate as set forth.

2. A shingle-machine, consisting of the rotating table C with its dogs K L, the saw G, the tilting table N, and revolving planer P, all constructed and arranged to operate substantially as herein shown and described.

114,444. — Potato-Baking Pan. — Amos Jones, Lebanon, N. H.

Claim.—The potato-baking pan made as described, viz., with perforations in its bottom, ends, and sides, and circumscribing lips to the bottom perforations, to extend from the lower surface of such bottom, all being arranged as specified.

114,445.—Sash-Holder.—George N. Kendall, Wooster, Ohio.

Claim.—The segmental semicircular bolt E and friction-pad F, when the latter is connected to one end of said bolt, and to be operated by means of knob G, the bolt and pad serving respectively as positive and frictional stop, all arranged and combined substantially as and for the purposes set forth.

114,446.—Awl. — Thomas Kenney, Lynn, Mass.

Claim.—An awl, the entering-end of which is formed with two or more points, connected by a cutting-edge, (or edges,) substantially as shown and described.

114,447.—Electrotype-Mold. — Silas P. Knight, Brooklyn, N. Y.

Claim.—1. The preparation of the surface of the wax or molding composition of which an electrotype-mold is made for the reception of the impression by treatment with a mixture of plumbago or other metallic powder and water, substantially as herein described.

2. The metallicizing of electrotype-molds by treatment with a mixture of plumbago or other metallic powder and water, substantially as herein specified.

114,448.—Wagon-Tongue Support.—John Krehbiel, Williamsville, N. Y.

Claim.—The spring *b*, attached at one end to the head A, and extending over the rear end of the tongue as an attachment to the same, and a projection of the spring resting forward under said tongue, the whole arranged as described, and operating in the manner and for the purpose specified.

114,449.—Manufacture of Fire-Bricks.—Balthasar Kreischer, New York, N. Y.

Claim.—1. A fire-brick produced by drying the clay, grinding it, placing it into molds in a dry state, and subjecting it to a pressure from one to two thousand pounds to the square inch, substantially as described.

2. A dry-pressed brick made as described, and treated with a solution of burned and raw clay, substantially as set forth.

114,450. — Self-Extinguishing Safety-Can for Combustible Materials.—William H. Lawrence, Williamsburg, N. Y.

Claim.—1. The safety-can C placed into the closed water vessel A in such manner that the heat of any fire within C will create steam to extinguish the fire, as set forth.

2. The hinged clasps *d d*, applied to the outer vessel A to hold down the can C and prevent it from floating, as specified.

3. The cover B of the vessel A, made conical on the under side, as specified.

114,451.—Match-Hook.—Joseph D. Leach, Penobscot, Me.

Claim.—A match-hook having a recess for the reception of the mousing, as specified.

114,452.—Mechanism for Adjusting and Securing Car-Wheels to Axles.—George Granville, Lobdell, Wilmington, Del.

Claim.—1. The combination, with the keys E and E' and screw-rod F, of a ratchet-wheel, J, or its equivalent, and spring pawl K, secured to the key E, all substantially as set forth.

2. The combination of the beveled or rounded hub of the screw-key L, screw-rod F, and spring pawl K.

114,453. — Stove-Damper.—Ernest Lohsand, La Porte, Ind.

Claim.—1. The combination of the tube A surrounding slotted tube B closed at the outer end, and register C, substantially as and for the purpose set forth.

2. The tube A constructed with an upturned lip, *a*, substantially as and for the purpose set forth.

114,454. — Securing Dental Fillings.—Charles H. Mack, Portland, Oregon.

Claim.—As the connection between a tooth and its filling, a metallic pin inserted firmly in the body of the tooth, the arrangement being substantially as described.

114,455.—Spindle Step-Box.—Lewis Maish, Minneapolis, Minn.

Claim.—1. The plate B, when provided with the notches and perforations, as and for the purpose set forth.

2. The combination of the plate B, constructed as shown, with the reservoir or chamber *a*, as set forth.

3. The combination herein described of the perforated ring C, plate B, and box or body A, the parts being constructed as specified.

4. The combination of parts herein described, whereby the spindle or shaft is lubricated around and at the bottom thereof, as specified.

114,456.—Fruit and Berry-Box or Basket.—Joshua H. Marvil, Laurel, Del.

Claim.—A fruit, vegetable, or berry-box, constructed as described—that is to say, having strips or slats A A arranged at right angles to each other, and their ends *a a* bent up so as to form flaring sides, the whole being secured together in such a manner as to leave openings or interstices *a b d e*, as and for the purpose specified.

114,457.—Wash-Boiler.—David McCleary, Allegheny City, Pa.

Claim.—The combination and arrangement of the false bottom *h*, receiving-chambers *l*, *m*, and *n*, boiling-chamber J, circulating-tubes B, C, and D, all constructed, arranged, and operating with relation to the body A, as hereinbefore described, and for the purpose set forth.

114,458.—Wheel for Vehicles.—Robert W. McClelland, Springfield, Ill., assignor to himself and John McCreery, same place.

Claim.—The carriage-wheel herein described, consisting essentially of the wooden hub A, the straight row of spokes S S, the bolts *c c*, the raised wood flanges *a a* around the center of the hub, and the metal bands *r r'*, bracing the ends and covering the whole convex surface of said flanges, all being arranged substantially as and for the purposes set forth.

114,459.—Sail-Hank.—William E. Meyer, New York, N. Y.

Claim.—1. A hank with a detachable key, constructed substantially in the manner herein shown and described.

2. The dog C with its cam-shaped back *g*, in combination with the detachable key B and hank A, substantially as set forth.

114,460.—Elevator.—Charles E. Moore, Boston, assignor to himself and Martin L. Wyman, Melrose, Mass.

Claim.—1. An elevator, the car of which is held in elevated position in the hoist-way when the engine is stopped by the pressure of the steam in the engine, by means substantially as described.

2. In combination with the engine-cylinder or cylinders and the reversing-valve or valves, the auxiliary valve controlling the exhaust-steam passage, so that the engine is stopped and the movement of the car thereby arrested, by shutting the exhaust, and without movement or independent of the movement of the reversing mechanism, the car being held in stationary position by the pressure of the steam.

3. In combination with the exhaust-valve, operating to stop the engine, the brake automatically operated by the piston-rod of a steam-cylinder con-

nected with the exhaust-pipe, substantially as described.

4. In combination with the hoisting-engine, a brake held out of contact with the drum of a driving-pulley by the pressure of the steam when the engine is working, and which is thrown against the pulley whenever steam is shut off from the engine, substantially as described.

114,461.—BUCKLE.—John H. Morris, Paxton, Ill.

Claim.—The shouldered tongue A^4 of a buckle, constructed substantially as and for the purpose set forth.

114,462. — WASHER AND WRINGER COMBINED. — Jessie H. Murray, Kirkwood, N. Y.

Claim.—The combination of the elliptic spring I, wooden corrugated roller D, rubber-covered roller F, with roller J, head-piece B, thumb-screw K, elastic cross-plate L, and crank H, all being constructed and operating substantially as hereinbefore set forth for the purpose specified.

114,463.—GRAIN-SEPARATING AND CLEANING ATTACHMENT TO THRASHING-MACHINES.—William A. Myers, York, Pa.

Claim.—The separating and cleaning attachment for thrashers herein described, consisting of the frame A, the separator C, the cleaner, the cross-shaft D, the two pitmen F for driving the shaker, the pulley E on the cross-shaft, and the fan, all these parts being combined, constructed, and arranged as described for joint operation.

114,464.—WASHING-FLUID.—Edward Henry Neill, San Francisco, Cal., assignor to himself and Emlen Painter, same place.

Claim.—The manufacture or preparation of the compound herein described, consisting of two parts of ammonia and one part of spirits of turpentine, as and for the purposes set forth.

114,465.—PUDDLING-FURNACE.—John Neville, Brooklyn, N. Y.

Claim.—1. The heating-chamber, formed by the two plates E and F in the bottom of a puddling-hearth, in combination with the double sets of roasting-hearths, as described.

2. The double sets of roasting-hearths, in combination with a puddling-furnace, when provided with stacks and dampers, as described, and for the purposes set forth.

114,466.—SLEIGH-HEATER.—Alfred Norton, Kokomo, Ind.

Claim.—In combination with the body A and the heating-box B, the heating-chamber D, passing under the bottom and back, provided with the cross-plates *d*, having tortuous heat passages heated by the lamp C, with its series of wick-tubes, and placed under the forward end of the body, all substantially as set forth.

114,467.—NOZZLE-STOPPER FOR OIL-CANS.—Josiah H. Noyes, Abington, Mass.

Claim.—The cap C, provided with the runner-slot *a* and with the packing *b*, and cut away on one side, as seen at *c*, all as shown and described.

114,468.—MACHINE FOR ROLLING LOZENGE AND OTHER PASTES.—Charles A. Oehl, New York, N. Y., assignor to Ernest Greenfield and Philip Strauss, same place.

Claim.—1. The combination of both sets of rollers C C C C with endless belt D, sliding boxes *a a a a*, screws *b b b*, and handles *c c c*.

2. The combination of rollers E E, chain G, screws F F, and movable slide bearings or clamps P P, connected with and operated by cog-wheels H H and chain-wheels K K, all substantially as set forth and described.

114,469. — CHILL FOR PLOW-CASTINGS.—James Oliver, South Bend, Ind.

Claim.—1. A metal chill with grooves in its face for the purpose of ventilation, substantially as shown and described.

2. The cooling-frame A, when used in connection with the mold, substantially as and for the purpose shown and described.

114,470. — ENAMELING BOOT AND SHOE-HEELS.—Charles Henry Orcutt, Leominster, Mass.

Claim.—The herein-described process of enameling the heels of boots, the materials employed and the mode of application being as set forth.

114,471.—LANTERN.—John Orphy, Buffalo, N. Y., assignor to Horace Parmelee and William H. Bonnell, same place.

Claim.—The connection and arrangement of the vertical wires B B and upper ring A of a guard-frame of a lantern, when formed by first reducing the end of the vertical wires by shearing and then bending this reduced end around the wire A and soldering it in place, as hereinbefore set forth.

114,472.—COMBINED PLOW AND MARKER.—Orlando M. Pond, Independence, Iowa.

Claim.—1. The iron *f*, constructed as described, and attached, by means of the staple *e* or other suitable means, for the purpose of holding and adjusting the plow-arm I, substantially as herein set forth.

2. The arrangement of the axle A *b*, wheels C C, tongue D, clevises *a a*, arms E E and E′ E′, handles G G, bars *d d*, plows H H, plow-arms I I, irons *f f*, and clamps *e e*, all constructed and arranged substantially as and for the purposes herein set forth.

114,473.—LUBRICATOR FOR CAR-WHEELS.—James M. Porter, Frostburg, Md.

Claim.—1. The arrangement of one or more bent tubes, I J, or their equivalents, in a lubricating-box, in connection with an outlet, through which the oil is delivered to the bearings of the wheel when said tubes are constructed to operate as described, for the purpose specified.

2. The combination of one or more bent tubes, I J, as described, with the central tube B, substantially as and for the purposes set forth.

3. The triangular box A, in combination with the central tube B and the conducting-tubes I J, when said parts are constructed to operate as described, and for the purposes set forth.

4. The combination of the box A, the straight tube B, the bent tubes I J, the stem E, and the plug-valve D, when constructed to operate as herein set forth.

5. The combined air-vent and filling-tube, consisting essentially of the screw-cap L, tube *m*, and valve *n*, all constructed to operate substantially as and for the purposes described.

114,474, antedated April 25, 1871.—NUT-LOCK.—Peter F. Randolph, Jerseyville, Ill.

Claim.—The combination of the hardened-steel nut B, with its sharp-edged notches *b b*, with the bolt A, as described.

114,475. — LIFE-PRESERVING TRUNK.—Lawrence Rebstock, Hollidaysburg, Pa.

Claim.—1. The combination of the trunk *a*, lids *b*, wings *d*, and flaps *e*, as specified.

2. The combination of the trunk *a*, socket *l*, and jointed rod *o*, as described.

114,476.—TIRE-BENDING MACHINE.—George J. Riblet, Bootheville, W. Va.

Claim.—1. The frame A *a a′* and plate *g*, in combination with the compound lever C and guide-arm F, all constructed and arranged substantially as herein shown and described.

2. The right-angled lever E and adjustable stop H, in combination with the lever C, substantially as and for the purpose specified.

3. The feeding-clamps *m* m^1 m^2 N, constructed to operate in connection with the bar D and rod I, substantially as described.

4. The combination of the extension-piece *j* and adjusting-nut *i* with the bar I and feeding-clamp apparatus as described, and for the purpose specified.

5. The combination of the lever E with the lever *d*, rod I, and clamping apparatus *m* m^1 m^2 N, substantially as and for the purpose set forth.

114,477, antedated April 27, 1871.—HAIR-CLIPPING DEVICE. — Frederick Charles Richardson, New York, N. Y., assignor to himself and William Hellins, Hudson City, N. J.

Claim.—1. The plate N, supported by the springs O O against the cross-bar L, arranged upon the shanks of the screws M M, substantially as and for the purpose described.

2. The toothed wheel E mounted upon the bar F and operated by the lever D, in combination with the wheel H, bar I, connected to the arm J of the cutter G by the link K, when said cutter freely slides between the cross-bar F and the plate A, as herein shown and described.

114,478.—CHURN-DASHER.—Julius M. See, Griffin, Ga.

Claim.—The dasher-wings G G′, curved outward and inward in the form shown, and connected to the spindle D and sleeve B, to operate substantially as set forth.

114,479.—BRIDGE.—Jacob Seebold, Kantz, Pa.

Claim.—1. The floor-beam E, cast, as described, with hollow enlargements or boxes *b b*, in combination with the wrought-iron rod *d* and post *e*, all substantially as and for the purposes herein set forth.

2. The combination of the arch C D, floor-beam E, post G with its eyes *i*, rods *f*, block H, and cap I, all constructed and arranged substantially as and for the purposes herein set forth.

3. In combination with the floor-beam E as constructed, the hollow cap I through which passes the rods *g g* and *f*, substantialy as and for the purposes set forth.

4. The combination of the centrally-placed inverted hollow box K with the four rods *k k k k*, which pass entirely through said block and are secured substantially as set forth.

5. The combination of the bars J J, rods *k k*, and central block K for bracing the arches C D, substantially as herein set forth.

6. The combination of the shoes B, arches C D, floor-beams E E, posts G, blocks H K, caps I, rods *f g k k*, and bars J, all constructed and arranged substantially as shown and described, and for the purposes herein set forth

114,480. — LIQUID-METER.—Henry C. Sergeant, Newark, N. J., assignor to José F. de Navarro, New York city.

Claim.—1. The combination of the intermediate gear H with the gear-wheels G G′, crank-shafts F F′, and pistons E E′ of the meter, substantially as specified.

2. The revolving valve I, with its ports *b b′* and exhaust-cavities *c c′*, in combination with the valve-seat J, having its ports *g g′* and *k k′* arranged in relation with each other and with the ends of the cylinders to which they respectively belong, essentially as shown and described.

3. The combination with the separate crank-shafts F F′, having their cranks at right angles, or thereabout, of a valve for controlling the motions of the pistons, by which said shafts are driven, constructed to make but one revolution for each two revolutions of either shaft, substantially as specified.

4. The combination of the gear-wheels G G′, and H with the revolving valve I and its ports and cavities, the valve-seat J with its ports or passages, the independent crank-shafts F F′, and the pistons E E′, essentially as described.

5. The arrangement of the exhaust passage B, the hollow valve-shaft *e*, the cylinders C C′, and the inlet-chamber or valve-box D, substantially as specified.

114,481. — BOTTOM FOR SHEET-METAL WARE.—Henry W. Shepard, Manusville, N. Y.

Claim.—As a new article of manufacture, the can or pail bottom herein described, consisting of the base A, hoop-rim B, and knee or elbow-shaped rests C C, when the latter are so secured to the hoop as to encircle the angle portion *b* of the bottom in order to act both as a support and a brace to the same, substantially as described.

114,482.—APPARATUS FOR ATOMIZING LIQUIDS. — Asahel M. Shurtleff, Boston, Mass.

Claim.—1. An atomizer-bulb, formed or provided with a base or foot, *b*, substantially as described.

2. Atomizing-tubes *c d*, connected with the bulb by a valve-box or tube, *e*, substantially as shown and described.

3. An atomizing apparatus, the bulb of which is provided at one end with an air-inlet and outlet-tube, and with an inlet and outlet controlling-valve.

4. The air-tube *c*, liquid-tube *d*, and valve-tube *e*, formed as one piece, substantially as shown and described.

5. The valve *h*, in combination with the valve-box *e* and air-tube *c*, arranged with relation to the air-inlet and outlet-orifices, substantially as shown and described.

6. The liquid-vessel *l* and atomizer-tube *d*, arranged in axial line with the bulb.

7. The liquid-vessel *l*, arranged in axial line with the bulb, and between the bulb and the atomizing-orifices.

8. The liquid-vessel, connected with the air-inlet and outlet end of the air-supplying bulb by the atomizing-tube or tubes.

9. The liquid-vessel, connected with the liquid-atomizing tube by a screw-cap or connector, *m*.

10. The air-orifice *o* between the liquid-cup and the liquid-atomizer tube *d*, substantially as shown and described.

11. In an atomizing apparatus, an air-orifice for the liquid-vessel, provided with means for graduating or closing it.

12. In combination with an atomizing apparatus, the flexible tube *q*, substantially as described.

13. The arrangement of the air-eduction orifice *g* between the induction-orifice *f* and the bulb *a*, substantially as shown and described.

114,483.—CULTIVATOR.—Matthew P. Simpson, Rosemond, Ill.

Claim.—1. The coupling-ties B C D, each constructed with vertical and horizontal pivots and with slots *k* and perforations *m*, to form a compound adjustment, and in connection the shouldered standards *q*, supported by the struts *w* and braces *p*, as shown and described, for the purposes set forth.

2. The combination, with a double shovel-frame, A, and a narrow mold-board plow, E, of a detachable wing or shoe-extension, G, substantially as shown and described, for the purpose specified.

114,484.—STOVE-PIPE THIMBLE.—Henry G. Smith, Meriden, Conn., assignor of one-half his right to Elijah D. Castelow, same place.

Claim.—1. A stove-pipe thimble provided with

adjustable jaws, actuated by eccentric flanges, substantially as described.

2. The device described, consisting of the thimble A, with collar *a* and flange *a'*, covering-plate B, with eccentric flanges, jaws C C, with slots *c'* and thumb-screws *d*, the parts being combined and arranged as described.

114,485.—TRUNK.—Joseph Stanton, Buffalo, N. Y., assignor to himself and Adolphus Hagelin, same place.

Claim.—1. A traveling trunk, composed of a sheet-steel covering A B A' B', and iron frames C D C' D', constructed and arranged as hereinbefore set forth.

2. The construction and arrangement, with the diaphragm E of a trunk, of the angle-plate F, formed with a knuckle, *f*, and constituting one portion of the hinge of said diaphragm, as hereinbefore set forth.

114,486, antedated April 22, 1871.—ORE-CONCENTRATOR.—William C. Stiles, Nevada City, Cal.

Claim.—1. The sluice C inside the frame A, suspended by means of the cross-pieces D and swinging rods *b*, substantially as and for the purpose above described.

2. The cam F, wedge-shaped recess *d*, springs *f*, and block G, operating as described, for communicating to the sluice a sudden jar or concussion, for the purpose above specified.

3. The endless belt or belts *i*, carrying teeth *l*, either arranged upon cross-pieces *k* or otherwise, substantially as and for the purpose above described.

4. The teeth or stirrers *l*, with their stirring extremities formed similar to the mold-board of a plow, substantially as and for the purpose described.

5. A swinging sluice C, provided with the riffle L, steep incline *o*, and gradual incline *r*, substantially as and for the purpose above set forth.

6. The drip-box P pierced with holes upon its opposite sides, and arranged to feed water upon the two inclines *o* and *r*, substantially as specified.

114,487.—SNAP-HOOK.—Ole O. Storle, North Cape, assignor to himself and Stamm Brothers, Milwaukee, Wis.

Claim.—A snap-hook with body A, opening and closing hook B, spring D, and supporting piece E, when arranged substantially as described.

114,488.—MOLD FOR SADDLE-TREES.—Jacob Straus, St. Louis, Mo.

Claim.—The hereinbefore-described mold, (or its equivalent,) composed of the sections A and B and the cope D, attached together by means of the dowel-pins C and F and locking-rods *e* and G, and provided with the vents I and K, substantially as and for the purpose shown.

114,489.—COMBINED BLOWER AND ROTARY ENGINE.—Hanson P. Tenant, Germantown, Ind.

Claim.—1. The combination of a rotary engine and rotary blower, when both are arranged to operate within a single case or shell, for the purpose described.

2. The general arrangement and combination of the devices A *a* C *c* E F *f* G H *h h'* I J K L *l l'* M N P T T', and one or more chambers, O O', and port or ports U U', for the objects stated.

3. In combination with the described elements of the preceding clause, the ports U U', pipes V V' W, reversing-lever X, and valves *v v'*, as and for the purpose set forth.

114,490.—FABRIC FOR CUFFS.—Hiram Howard Thayer and William Henry Hart, Jr., Philadelphia, Pa.

Claim.—A fabric from which to manufacture cuffs, consisting of a tubular material flattened and cemented so that the folded edges of the fabric form the side edges of the cuff cut therefrom, substantially as described.

114,491.—AUTOMATIC FAN.—Benjamin D. Thompson, New York, N. Y.

Claim.—The train of wheels specified, operated by the spring B, in connection with the crank-shaft *b'*, the pitman *c'*, the arm *d'*, the shaft *e'*, the adjustable arm *f'* carrying and operating the fan D, together with the lever *h'* connected with and operated by the eccentric F, all constructed, combined, and operating substantially as described, and for the purpose specified.

114,492.—PREPARATION FOR CLARIFYING COFFEE.—Charles L. Tucker, Chicago, Ill.

Claim.—1. As a new article of manufacture, the ground gelatinous preparation for clarifying coffee, substantially as specified.

2. As a new article of manufacture, ground gelatine and salt, substantially as and for the purposes specified.

114,493.—HARVESTER.—Benjamin G. Turner, Fremont, Neb.

Claim.—1. The tiller-guide Z, consisting of a segment, with teeth, and foot-rests *n' n*, and an arm made with a hinge-joint near the post of the tiller, and spring *o*, arranged with the joint, as described, in combination with a catch, *p*, and driver's seat, J, all constructed and attached to the front end of the tongue, as shown and described.

2. The spring device, consisting of slide and spring, plate and casting *u*, and lever *a'*, all arranged to connect with the beveled-gear wheel *k*, as described, for throwing the machine in and out of gear, in combination with the rod C* and operating crank-lever *d'*, and the plate provided with notches for holding the latter, all as shown and set forth.

114,494.—CURTAIN-FIXTURE.—Elisha Turner, Wolcottville, Conn.

Claim.—1. The corrugated plate *f* upon the slide of the curtain-rack, and pressed to the corrugated surface of such rack by the action of the wedge, as and for the purposes set forth.

2. The curtain-rack slide, made of sheet-metal, with corrugations at the edges of the slot, which corrugations are upon the inner and outer surfaces and act to hold the rack-pulley, and also to strengthen and ornament the face of the slide, as set forth.

114,495. — CARRÉ ICE-MACHINE. — Albert Vaase and Franz Littmann, Halle, Prussia.

Claim.—1. The cylinder H surrounding the rectifier G, and forming a space for the reception of the solution of ammonia, said cylinder being perforated near its bottom with a large number of holes to inject the solution in the form of a shower, substantially as shown and described.

2. The trap *m'*, in combination with the discharge-pipe *m* of the regulator of efflux M, substantially as set forth.

3. The oval box K, provided with a continuous flange, K*, in combination with the serpentine pipes of liquefier J, as described.

4. The agitator S in the refrigerator P, as described.

114,496.—HAY-ELEVATOR.—James M. Van Demark and Moses Barlow, Phelps, N. Y.

Claim.—1. In combination with a hay-car, B, the rocking-bar C and pulley D, constructed and arranged substantially as and for the purposes herein set forth.

2. In combination with a trip-pawl or lever, E, and pulley, D, the hoisting-rope G provided with the two rings *b d*, which are connected by the hollow tube *c*, all substantially as and for the purposes herein set forth.

114,497. — DRAUGHT-REGULATOR FOR STOVES.—William W. Waddell, Hillsborough, Ohio.

Claim.—The combination of the stove-door handle *c* with the interior attachment *d*, when the latter is provided with lugs *e d*, for the purposes herein described.

114,498. — MACHINE FOR ROLLING HOE-BLANKS. — Hervey Waters, Boston, Mass.

Claim.—In combination with the alternating roller-dies, the mechanism for both automatically introducing the blank between the dies and turning the same so that the dies may act conversely upon it, substantially as described.

114,499.—KILN.—Gustavus A. Wedekind and Helmuth Dueberg, Baltimore, Md.

Claim.—The arrangement within a progressive kiln of the permanent walls F C, one on each side of the fire-chamber, the walls C being open at the top, while the walls F are provided with apertures near their bottoms, said apertures being capable of being opened or closed by slides, thereby compelling the heated air to pass through the several burning-chambers in a zigzag course, passing up from the fire-place and down through the material to be burned, as herein set forth.

114,500. — GRAIN-SEPARATOR. — Henry L. Whitman, St. Louis, Mo.

Claim.—In combination with the pitman G and shoe B or sieves C, the ball-and-socket joint connection H and I', substantially as and for the purpose specified.

114,501. — LAWN-MOWER. — Aaron White Cook Williams, London, England.

Claim.—1. The handle of a lawn-mowing machine, adjusted by means of an eccentric or cam, *b*, arranged at the lower or inner end of the handle, and operating substantially as herein shown and described.

2. The eccentric or cam *b*, the socket *c* with jaws *c'*, the bars *d* and *e*, and pinching-screw *b'*, arranged in combination with the handle *a*, substantially as set forth, for the purpose specified.

3. The main frame A, projecting as described, in combination with the slotted curved spring *i* and set-screw *j*, these parts being constructed and arranged as herein shown and described.

114,502.—COMPOSITION FOR MANUFACTURE OF SODA-WATER. — Jackson B. Wood, Richmond, Va.

Claim.—1. The herein-described compound called condensed soda-water, prepared by mixing together an alkaline carbonate and a solid acid with sugar, flavoring material and albumen, or its equivalent, as set forth.

2. The albumenized sugar, prepared in the manner described.

3. The flavor, made by combining sugar, albumen, and flavoring material, as specified.

114,503.—STEAM-BOILER. — Frederick A. Woodson, Selma, Ala.

Claim.—1. When applied to a horizontal internal flue-boiler, the pipe *c*, connecting the mud-drum E with the boiler A, and forming a continuous passage for mud and sediment together into the mud-drum, with the straight pipe *c* connecting the mud-drum and water-leg of the boiler, all in combination, substantially as and for the purpose set forth.

2. A horizontal projection or flange of the pipe extending into the mud-drum for the purpose of circulating the clear water above the settlings into the hot end of the boiler, substantially as described.

114,504.—PAPER-FILE.—Solomon W. Young, Providence, R. I.

Claim.—The half-way open tubes A, the elastic cord C, and the channeled stay B, all constructed and applied together, as and for the purpose specified.

114,505.—WRENCH.—Aury G. Coes, Worcester, Mass.

Claim.—The combination, with the movable jaw F G and rosette-screw D E in a screw-wrench, of the counter-bore K around the screw-opening, substantially as and for the purposes set forth.

114,506.—STEAM PUMPING-ENGINE.—Lucius J. Knowles, Worcester, Mass.

Claim.—The combination, with the valve-driving piston F and tappet-arm D, of the valve-rod R and tappets T T, substantially as and for the purposes herein set forth.

114,507.—STEAM-PUMP.—Lucius J. Knowles, Worcester, Mass.

Claim.—1. The combination, with the valve-box in a steam-pump, of air-valves, substantially as and for the purposes set forth.

2. The combination, with the shell J of the valve-box in a steam-pump, of hollow projections K, and air-valves, P, substantially as and for the purposes set forth.

3. The combination, with the valve-box J provided with hollow projections K, of the air-valves P, plugs Q, and adjusting-screws R, substantially as shown and described.

114,508.—APPARATUS FOR TREATING ANIMAL MATTER FOR FERTILIZERS.—Hascal A. Hogel, New York, N. Y., assignor to Effingham H. Nichols, same place.

Claim.—1. The vessel A, provided with a jacket, in combination with a tubular agitator for the circulation of steam or heated air, substantially as and for the purpose specified.

2. The scraper *c* in combination with the tubular agitator, substantially as set forth.

114,509.—MEAT-SAW. — Patrick J. Hogan and Adam Sowden, Cincinnati, Ohio.

Claim.—The herein-described hand-saw, composed of the metallic handle-frame A, as constructed, with screw-threaded socket *a* and shank-eye *a'*, curved hollow back B *b*, and adjustable saw C *c* D, the parts being arranged with reference to one another, as shown and set forth.

REISSUES.

4,359. — COMBINED STOVE-LID AND DAMPER. — William Doyle, Albany, N. Y.—Patent No. 89,861, dated May 11, 1869.

Claim.—1 The concentric damper-flange A and ring E, combined and arranged substantially as and for the purpose herein shown.

2. The concentric damper-flange A and cover D, combined and arranged substantially as herein shown and set forth.

3. The combination of ring E or cover D, constructed as described, with flue-strips C C and B, or their equivalents, as herein shown and described.

4. The combination of ring E or cover D with front descending-flues *f f*, in the manner and for the purpose herein shown and set forth.

4,360.—PRESERVING WOOD RAILROAD-TIES, &c.—Benjamin S. Foreman, Morrison, Ill.—Patent No. 43,191, dated June 21, 1864; reissue No. 1,951, dated May 9, 1865.

Claim.—1. The herein-described composition, consisting of salt, corrosive sublimate, and arsenic, substantially as specified.

2. The mode herein described of preserving wood by the application of the composition described, substantially as specified.

4,361.—Oil-Cup.—John Peter Haines, New York, N. Y.—Patent No. 92,820, dated July 20, 1869.

Claim.—1. As an article of manufacture, a pocket oil-can, formed of a round body, A, nozzle B, and cap C, combined as described.

2. In an oil-can adapted to be carried in the pocket, a body, A, formed of thin elastic metal rounded into an oval form, and having its sides held apart by an inner spring, as specified.

4,362.—Sad and Fluting-Iron.—Frederick Myers, New York, N. Y.—Patent No. 112,482, dated March 7, 1871.

Claim.—1. The improved sad and fluting-iron, consisting of the sad-iron plate A, handled plate B, with intervening fluting surfaces sufficiently convex to admit of a free lateral rocking movement of the upper plate, while bearing upon the fluted surface of the lower plate, and a device for rigidly connecting the two, substantially as and for the purposes specified.

2. The vertical capped stud E and wedge M, in combination with the upper and lower plate of a combined sad and fluting-iron, substantially as and for the purposes specified.

4,363. — Process of Obtaining Bright Colors upon Cloth by Printing.—Alfred Paraf, New York, N. Y., assignor to Edward S. Renwick, trustee.—Patent No. 95,040, dated September 21, 1869.

Claim.—The process hereinbefore described of producing printed color upon a textile material by printing it with the coloring material, applying to the textile material a compound of an alkali and acid that is partially decomposable by aging and steaming, and steaming said textile material, substantially as before described.

4,364. — Concrete Pavement. — John J. Schillinger, New York, N. Y.—Patent No. 105,599, dated July 19, 1870.

Claim.—1. A concrete pavement laid in detached blocks or sections, substantially in the manner shown and described.

2. The arrangement of tar-paper or its equivalent between adjoining blocks of concrete, substantially as and for the purpose set forth.

4,365. — Metal Corner-Piece for Protecting the Corners of Wooden Bodies.—Edwin A. Stratton and Charles M. Stratton, Greenfield, Mass.—Patent No. 100,463, dated March 1, 1870.

Claim.—The metal corner-pieces or strips, consisting of the body *e* and the flanges *i*, constructed for use in the manner shown and described.

4,366.—Apparatus and Process of Distilling Petroleum and other Oils.—Augustus H. Tait and Joseph W. Avis, New York, N. Y., assignors, by mesne assignments, to Charles Pratt, same place. Patent No. 53,359, dated March 20, 1866.

Claim.—1. The process of continuous distillation, the same consisting in causing the oil to flow through a series of retorts arranged over an arch or flue, so that the oil enters at the colder portion of the series and leaves at the hottest portion, as set forth.

2. One or more tar-stills so connected with an oil-still or stills that the heavy residue may be removed without interrupting the distillation, as set forth.

3. A series of stills, arranged horizontally over an arch or flue, and connected together, so that oil entering the still furthest removed from the fire is gradually heated as it flows from one still to another and the vapors driven off, as set forth.

4. A series of stills in which the oil is vaporized as it flows through them, in combination with one or more tar-stills, as set forth.

4,367.—Apparatus for Distilling Petroleum and other Hydrocarbons.—Augustus H. Tait and Joseph W. Avis, New York, N. Y., assignors, by mesne assignments, to Charles Pratt, same place.—Patent No. 63,115, dated March 19, 1867.

Claim.—1. The compound still herein described, arranged in divisions, compartments, or separate stills, so that oil of different gravity may be taken from different parts, as described.

2. The combination of still A, tar-stills E E', and condenser F, arranged so as to operate substantially as set forth.

3. The combination of two or more condensers with a divided or multiple still, substantially as set forth.

4. The arrangement of gates or valves at the top and bottom of separate stills or compartments, so that any two or more may be made to operate as one or several stills, as set forth.

5. The pipe *k*, arranged so as to distribute oil from still *b* to the other stills, as set forth.

6. The still A, having partitions *a* with apertures *c* and *d*, arranged and combined as set forth.

4,368. — Railway Cattle-Car.—The National Cattle-Car Company, Salem, Ohio, assignee of John B. Shafer, deceased.—Patent No. 29,409, dated July 31, 1860.

Claim.—1. The combination, with a stock-car, of swinging partitions constructed to fold against the sides of the car, substantially as hereinbefore set forth, so as to leave the car unobstructed.

2. The combination, with a stock-car, of two series of folding partitions hinged to opposite sides and at opposite ends of the car, substantially as set forth, to distribute evenly the weight on the trucks and to leave a passage-way through the car.

3. The sectional folding partitions, constructed substantially as and for the purpose described.

4. Hinging the swinging partitions on opposite sides of the opposite doorways, as described, so that when folded they shall swing away from the doors to give a wider entrance.

5. The combination, with a stock-car, of a movable middle deck, to convert the car from a "double-decker" into an unobstructed "single-decker," or *vice versa*, substantially as set forth.

6. The combination, in a stock-car, of a vertically movable middle deck with folding partitions, to convert the car from a double-decker to a single-decker with stalls, or *vice versa*, substantially as set forth.

7. The combination, in a stock-car, of a movable deck, with guides to control its movement, substantially as set forth.

8. The combination, in a stock-car, of a movable deck, with guides to control its movement and fixed supports to give it a firm bearing when in position to receive its load, substantially as set forth.

9. The combination, in a stock-car, of a movable deck, with cords and a windlass or their equivalents for raising and lowering the deck, substantially as set forth.

10. The combination, in a stock-car, of sliding double doors, with a hinged intermediate bar swinging across the doorway, as set forth.

4,369.—Package for Lard.—Charles L. Tucker, Chicago, Ill.—Patent No. 66,368, dated July 2, 1867; reissue Nos. 3,037 and 3,038, dated July 14, 1868.

Claim.—1. A box made of veneer or pasteboard sides, shaped into a tubular form and secured by a tight lap-joint, with thick top and bottom, both inserted into such tube, substantially as described.

2. A box constructed as described, in combination with a coating, surfacing, saturating, or lining of a material impervious to and not acted upon by the lard, substantially as described.

3. A box constructed as described, and coated, surfaced, saturated, or lined, as described, in combination with a metal-surfaced or foiled-paper covering, substantially as and for the purposes described.

4. The application or use of metal-surfaced or foil-paper for covering oleaginous packages, constructed of wood or wood and paper, substantially as and for the purposes specified.

5. The use of gum arabic for surfacing or saturating lard packages and making them tight and non-absorbing, substantially as set forth.

6. As an improved article of manufacture, a small measured quantity of lard incased in a sealed wood or wood and paper package, substantially as and for the purposes specified.

DESIGNS.

4,853. — Bracket. — John H. Bellamy, Charlestown, Mass., assignor to Elbridge Wolcott and Jonas C. Young, same place.

Claim.—The design for a bracket herein described and set forth.

4,854.—Front of a Catch-All.—John H. Bellamy, Charlestown, Mass., assignor to Elbridge Wolcott and Jonas C. Young, same place.

Claim.—The design for the front of a catch-all, as shown, described, and set forth.

4,855.—Gate-Hinge. — Charles B. Clark, Buffalo, N. Y.

Claim.—The design for a gate-hinge, as herein shown and described.

4,856.—Bottle.—William A. Demuth, New York, N. Y.

Claim.—The design for a bottle, as shown.

4,857.—Chain-Link.—Virgil Draper, Attleborough, Mass., assignor to Oscar M. Draper, same place.

Claim.—The new design for an ornamental chain-link, substantially as herein described.

4,858.—Handle-Cap for Satchels.—George Havell, Newark, N. J.

Claim.—The design for a handle-cap for satchels and carpet-bags, as shown and described.

4,859.—Palm and Back Piece of Gloves. Frederick E. Hotchkiss, Gloversville, N. Y.

Claim.—1. The design for the palm A of a glove, as shown.

2. The design for a back, B, of a glove, as shown.

4,860.—Knitted Trimming.—Martin Landenberger, Philadelphia, Pa.

Claim.—The design for a knitted trimming, as shown and described.

4,861.—Rubber Shoe.—Christopher Meyer, New York, N. Y.

Claim.—The design for India-rubber shoes, as set forth and shown.

4,862.—Rubber Shoe.—Christopher Meyer, New York, N. Y.

Claim.—The design for India-rubber shoes, as set forth and shown.

4,863.—Muff and Collar-Box.—Raphael Moritz Seldis, New York, N. Y.

Claim.—1. A double box, containing separated chambers for the muff and collar, with their own covers *c d*, as described.

2. The design for the cover of a fur-box, as shown.

4,864.—Woven Cloth. — Royal C. Taft, William B. Weeden, and James W. Taft, Providence, R. I.

Claim.—The design for fancy cassimeres, which consists of the mottled stripes A, alternating with the bar-stripes B, and the intervening corded stripes C, substantially as described.

4,865.—Re-enforcing Thumb-Piece for Gloves.—Isaac B. Whipple, Gloversville, N. Y.

Claim.—The design for a re-enforcing thumb-piece, as shown.

4,866.—Bow Instrument.—Lucius Parmalee Wildman, Danbury, Conn.

Claim.—The design for the sounding-board of a bow instrument, as shown.

TRADE-MARKS.

231. — Tobacco. — Louis Lee Armistead, Lynchburg, Va.

232. — Balm. — Demas Barnes, Brooklyn, N. Y.

233.—Liniment.—Demas Barnes, Brooklyn, N. Y.

234. — Insect-Powder. — Demas Barnes, Brooklyn, N. Y.

235.—Preparation for the Hair.—Demas Barnes, Brooklyn, N. Y.

236.—Billiard-Cushion.—Hugh W. Collender, New York, N. Y.

237. — Jewelry. — William M. Elias & Brother, New York, N. Y.

238.—Medicine.—Thomas S. Hodgson & Co., McKeesport, Pa.

239.—Twine, Warp, Yarn, &c.—Ezra W. Keeler, Yardville, N. J.

240.—Tea.—C. Adolphe Low & Co., San Francisco, Cal.

241.—Whisky.—Mills, Johnson & Co., Cincinnati, Ohio.

242.—Billiard-Table.—Phelan & Collender, New York, N. Y.

243.—Wood Pump.—Rich & Burlingham, New York, N. Y.

244.—Cigar.—Smith, Crosby & Co., New York, N. Y.

245.—Fertilizer.—Smith & Harris, Philadelphia, Pa.

246. — Toys and Fancy Goods.—Strasburger, Fritz & Pfeiffer, New York, N. Y.

247. — Medicinal Preparation.—George B. Thurston, Lynn, Mass.

248.—Fertilizer.—J. Augustus Tucker, Boston, Mass.

EXTENSIONS.

ROXANNA RICE, of South Lancaster, Mass., executrix of BENJAMIN F. RICE, deceased.—Letters Patent No. 17,184, dated April 28, 1857; reissue No. 920, dated March 6, 1860.

"Improvement in Machines for Making Paper Bags."

Claims.—1. The machine as a whole, composed of mechanism for forming, feeding, cutting, and pasting the tube or bag, combined, arranged, and operating substantially as described.

2. The use of a supporting-bar, or its equivalent, around which paper may be formed into a tube, and in connection with which the said paper tube may be severed, each and the whole substantially as described.

3. Giving the paper the variable feeding motion, for the purpose and in the manner substantially as described.

4. Cutting the paper, without waste of material, into such a form as shall have suitable projections for the formation of the bottom lap or seam of the bag, and for the convenient opening of the bag at the mouth, substantially as described.

CHARLES CROOK, of New Hope, Pa.—Letters Patent No. 17,205, dated May 5, 1857; reissue No. 548, dated May 4, 1858; reissue No. 3,393, dated April 20, 1869.

"Improvement in Harvesters."

Claim.—1. Two driving-gears of unequal size or diameters for changing the rapidity of vibration of the cutters

2. A concentric arrangement of two driving-gears of unequal size, for changing the rapidity of vibration of the cutters.

CHARLES CROOK, of New Hope, Pa.—Letters Patent No. 17,205, dated May 5, 1857; reissue No. 548, dated May 4, 1858; reissue No. 3,394, dated April 20, 1869.

"Improvement in Harvesters."

Claim.—1. A lifting segment or cam, with lever and chain or cord attached thereto, for raising and lowering the cutting apparatus.

2. A lifting segment or cam, with lever and chain, in combination with ratcheted teeth and a pawl, or its equivalent, for holding the cutting apparatus at any desired height.

DISCLAIMER.

CHARLES CROOK, of New Hope, Pa.—Letters Patent No. 17,205, dated May 5, 1857; reissue No. 548, dated May 4, 1858; reissue No. 3,394, dated April 20, 1869.

(Filed April 20, 1871.)

"Improvement in Harvesters."

Disclaims first Claim of said specification, viz.: "A lifting segment or cam, with lever and chain or cord attached thereto, for raising and lowering the cutting apparatus."

ISSUE OF MAY 9.

PATENTS.

114,510.—PERMUTATION-LOCK.—James T. Adams, Washington, D. C., assignor to Joel R. Leidy, Philadelphia, Pa.

Claim.—1. The combination of the eccentric *f* on the stem *e*, and eccentric *f'* on the sleeve *g*, of the key-hole plug, with the eccentric rings *e* and winged sleeve *g'*, for operation substantially as set forth.

2. The combination of the eccentric ring *p*, made adjustable within the loop *n* of the bolt *k*, with the hidden eccentric *m* on the spindle *l*, substantially as and for the purpose specified.

114,511.—PIPE-COUPLING.—William D. Alford, Cuyahoga Falls, Ohio.

Claim.—The chambered nut G, provided with the shoulder I, in combination with the sectional ring J and pipe-sections A B, constructed and arranged in relation to each other, as and for the purpose substantially set forth.

114,512.—LATHE.—John P. Allen, Springfield, Ohio, assignor to himself and R. M. Dalby, same place.

Claim.—The combination in one machine of the bed A, head B, hollow mandrel C, chuck D, back center G, tool-rest H with its attachments, auger-rod M, blocks P P, and four-armed wheel R, all constructed and arranged to operate substantially as and for the purposes herein set forth.

114,513. — STREET-LAMP AND LANTERN.—Joseph N. Aronson, New York, N. Y.

Claim.—1. The construction of lamps and lanterns with their sides composed of panes or panels of pressed or cast glass, having on their surfaces a series of bosses, substantially as herein described.

2. The combination of the tongues *c c c' c'* on the exteriors of the upper and lower edges of the glass panes or panels, and the grooved bands B B', substantially as and for the purpose herein described.

114,514.—MECHANICAL MOVEMENT.—John Barnes and William F. Barnes, Rockford, Ill.

Claim.—1. The combination of the vibrating bifurcated treadle, the driving-belts passing in opposite directions around the driving-pulley, the pulley actuated by the belts and carrying the locking-lever with its projecting arms that act upon the hub of the pulley, as described, and the balance-wheel with its concentric groove in the face of the hub, all these parts being constructed for joint operation, substantially as and for the purpose described.

2. The composition of the driving-pulley, rotating alternately in opposite directions, the locking-lever extending across the face of the pulley, and having an arm with projecting edges formed upon two of its angles, and the balance-wheel, with a concentric groove formed in the face of its hub, all these parts being constructed substantially as and for the purpose specified.

3. The combination of the axle, the reversible driving-pulley, the grooved wheel, and the locking-lever extending across the face of the wheel, all these parts being constructed and operating as described, so that the axle forms a stop to limit the play of the lever, as set forth.

114,515.—IRONING-BOARD.—Albert G. Beck, Philadelphia, Pa.

Claim.—The combination of the ironing-board, mortised, as shown at E, with the portable stand, consisting of longitudinal pieces A and uprights B C hinged and braced thereto, and constructed with beveled notches to fit the beveled ends of the longitudinal pieces, as shown and described.

114,516.—PORTABLE BUTTER-TRAY.—Levi Beemer, Libertyville, N. J.

Claim.—The combination of the frame F and removable butter-tray A with trough E, waste-gate B, lever C, and fulcrum D, as and for the purpose set forth.

114,517, antedated April 27, 1871.—MANUFACTURE OF ACETATE OF LIME FROM PYROLIGNEOUS ACID.—John Bell, Dover, N. H.

Claim.—The outside cylinder F and the pipes H, G, and E, essentially as described and for the described purpose, viz., keeping the acid vapor at a temperature of from 212° to 400° by means of the heat from a furnace.

114,518. — STREET-LAMP. — John Benson, Yonkers, N. Y., assignor to George McCord, same place.

Claim.—1. The arrangement of an interposed air or non-conducting space or passage, D, between the roof E of the body A, the chimney C, and the head or reservoir B of the lantern, essentially as described.

2. The combination of the glazed body A, the reflecting-roof E, the chimney C, the air-passage D in communication above and below with the external atmosphere, the weather-bonnets *c d*, and the reservoir B, essentially as shown and described.

114,519. — CLOTHES-DRIER. — Horace S. Black, Buchanan, Mich.

Claim.—1. The T-shaped tubular joint-sleeve C provided with the circumferential slot *b*, substantially as and for the purpose set forth.

2. The construction of a clothes-rack wherein the posts A A', cross-bars B, and joint-sleeve C are arranged with relation to each other, and operate as herein described.

114,520.—PIANO-VIOLIN.—Elisha D. Blakeman, Mount Lebanon, N. Y.

Claim.—1. The musical instrument composed of the box A, string B, bridge *d*, and keys C C, the string to be played by a bow and regulated by the keys, as set forth.

2. The guide-pin *e*, secured to the neck of the box instrument for guiding the bow, as set forth.

114,521.—ALARM-BELL.—Spencer C. Bond, Hainesville, Ill.

Claim.—The plate A, provided with the diagonal rib C, in combination with ratchet-wheel E D, bell B, bell-hammer J K, spring R, wheel I, crank P, and cord R, as and for the purposes set forth.

114,522. — STEAM-RADIATOR. — Elijah M. Bosley, Baltimore, Md.

Claim.—As an article of manufacture, a steam-radiator constructed with induction-openings *c* and eduction-openings *d* at its ends, and a central diaphragm, *e*, having an orifice, *f*, at its middle, as specified.

114,523.—ATTACHMENT FOR SASH-WEIGHTS.—Freeman Brady, Jr., Washington, Pa.

Claim.—The grooved and apertured cord-holder B *b c*, and the slotted plate D provided with the cross-bar or piece *f*, connected as shown and described.

114,524. — FLIER FOR SPINNING. — James Salisbury Brown, Pawtucket, R. I.

Claim.—The roving-flier, having its neck *b* provided with the notch *a*, in the manner and for the purpose as set forth.

114,525. — WATER-WHEEL. — Nathan F. Burnham, York, Pa.

Claim.—1. The combination of the hub of the dome secured to the casing, the register-gate inclosing the casing, and the devices for adjusting the register-gate on the hub of the dome, all these parts being constructed and operating in combination, substantially as set forth, to allow the register-gate to move freely around the casing without actual contact on its vertical face.

2. The casing, constructed substantially as set forth, with recesses in its outer surface between the chutes, to leave room for the escape of obstructions between the casing and register-gate.

3. The combination of the casing, having chutes constructed as described, with the register-gate, having one of the vertical edges of each of its openings concave and the other convex, to conform to the construction of the chutes, as set forth.

114,526, antedated May 2, 1871.—STALK-PULLER.—Henry Buttenberg and John L. Strong, Memphis, Tenn.

Claim.—1. The rotary stalk-grabbing and pulling and cutting instruments O, mounted on the shaft G of a truck gearing with the axle thereof, all combined and arranged substantially as specified.

2. The stalk-grabbing and pulling and cutting instruments O mounted on the shaft G, so as to be adjusted thereon to or from each other, substantially as specified.

3. The combination, with the grabbing and pulling and cutting-wheels N, of the sliding plates P Q, the elbow-levers S, vibrators P, and the hand-lever U, all substantially as specified.

114,527. — CLOTHES-DRIER. — Thomas H. Chubb and William G. Marston, Post Mills, Vt.

Claim.—An improved clothes-drier or towel-rack, consisting of the main frame A B, the larger drying-frame C D, and the smaller drying-frame E F, said parts being constructed and arranged substantially as herein shown and described, and for the purposes set forth.

114,528. — HOT-AIR FURNACE. — Edwin Clark, Lancaster, Pa.

Claim.—1. Utilizing the heated production of combustion in its passage from the furnace at *i*, through a pipe or flue 1, to an outside arrangement of flues and chambers, in which the cold air becomes heated in its passage to the furnace, substantially in the manner specified.

2. A threefold series of flues, No. 2 to 13, as shown, in combination with the chambers I II III and partitions *s' s* in the cold-air conductor E F G, arranged in the manner and for the purpose specified.

3. In combination with the series of flues within the cold-air-conducting chambers, the arrangement of flue 1, at *i*, within the hot-air chamber in front of the furnace H, and the sides K, and open bottom *v*, all arranged and operating substantially as and for the purpose described.

4. The arrangement of a furnace having a hot-air chamber, *o o'*, from whence the heated air is passed directly through the furnace into a second hot-air chamber, by the front, top, and sides K K, over the fire-box, from whence it is conveyed in the usual manner, as shown and described.

114,529.—CAR-BRAKE AND STARTER. — Joseph A. Cody, Cleveland, Ohio.

Claim.—The combination of the sliding slotted draw-bar B, cross-tree B', hinged rods *d d*, brake D, suspending rods *d'* and *d''*, when constructed and arranged to operate together in the manner and for the purpose substantially as described.

114,530.—TRACE-BUCKLE.—Aaron H. Cole, (deceased,) Adrian, Mich.; Lydia B. Cole and Miner T. Cole, administrators.

Claim.—A trace-buckle, having a bow or rim, *a*, one end of which turns as a pivot in the hame or fixed strap, so that the other end swings as a bail over the trace, in combination with a tongue-pressure plate, *w*, wedge-shaped or otherwise, the whole arranged and operating substantially as and for the purpose herein specified.

114,531.—POTATO-DIGGER.—Clark Cooney, Columbus, Neb.

Claim.—In a potato-digger, the combination of the spiral conveyer Z^1 Z^2 with the elevator X Y and inclined way or apron W, substantially as and for the purpose specified.

114,532.—SEWING-MACHINE CHAIR.—Samuel W. Cozzens, Sheboygan, Wis.

Claim.—The back B C D and seat A, constructed as described, in combination with the rod G, legs L, and spring S J, substantially as described and shown.

114,533.—BASE-BURNING STOVE.—Robert Diven, Williamsburg, N. Y.

Claim.—1. The combination, with the cylinder G, of the fire-pot E and inclosing structure F, constructed and arranged to form downward flues d at the front and sides of the stove, and intermediate hot-air passages e, substantially as specified.

2. The base-flue a, extending entirely around the stove, and arranged in relation to the ash-pan as described, in combination and in communication with the flues d, extending down the front, back, and sides of the latter, substantially as shown.

114,534.—GRAIN-DRYING CAR.—Charles S. Dole, Chicago, Ill.

Claim.—1. The vertical compartments B^1 B^2 B^3 B^4, with sides constructed to hold the grain and allow free admission of air, when separated one from the other by hollow partitions or flues in a car for drying grain, substantially as specified.

2. The car for drying grain, herein described, made with a perforated platform, A, and several compartments, B^1 B^2 B^3 B^4, separated by vertical flues or hollow partitions, the sides of which are constructed to allow the air to circulate through the grain contained in the car, substantially as specified.

114,535. — MACHINE FOR MAKING STRAW ROPE.—Charles E. Donnellan, Indianapolis, Ind., assignor to himself and McCord & Wheatley, same place.

Claim.—1. The relative arrangement of the saws I I, gatherers J J, and strips h h on the rack D—that is to say, the edges of saws above and the strips below the points of the gatherers, substantially as and for the purposes herein set forth.

2. The saws I I attached to the heads of the revolving cylinder E E for the purpose of cutting off the ends of the straws, substantially as herein set forth.

3. The gatherers J J, provided with adjustable wires *f f*, and attached to the revolving cylinder A, substantially as and for the purposes herein set forth.

4. The twister K, composed of the shaft k, point n, lip p, and tube r, and revolving within the recess d of the revolving cylinder H, substantially as and for the purposes herein set forth.

5. The within-described cylinder, composed of the heads E E and body H, one of said heads having a solid journal, a, and the other a hollow journal, b, and the body provided with one or more recesses, d, and passages e, all substantially as and for the purposes herein set forth.

6. The reel N, provided with a spiral, s, and arranged as described for pulling the rope out of the machine, as herein set forth.

7. The arrangement of the wheels P, R, and W and the sliding wheel T, moving on an inclined plane, and provided with a rubber band, spring, or weight, substantially for the purposes herein set forth.

8. The within-described machine for making straw rope, when its parts are constructed and arranged substantially as and for the purposes herein set forth.

114,536.—SPINDLE-STEP.—George Draper, Hopedale, Mass.

Claim.—1. The spindle-step as having the spindle-foot bearing a, and the hollow dome D arranged in the oil-reservoir A, and to receive the spindle B and its foot b, as set forth.

2. The spindle-step as provided with the spindle-foot bearing a, and the dome D arranged in the oil-reservoir A, as set forth, and as having the annular cap or cover E applied to the oil-reservoir and extended about the dome and below its top, in manner as explained.

114,537. — COMBINED SPOOL-STAND AND BUTTON-BOX.—John H. Drum, Bethel, Mich.

Claim.—The disk a, provided with pins c and tension-coils e, and combined with wires f and tension-arms d, as described

114,538.—UTERINE AND PROLAPSUS-ANI SUPPORTER.—Alexander M. Dye, Elkhart City, Ill.

Claim.—The arrangement of the buttoned stem of the pessary, and the sliding double conical rubber anus, supported upon the folded strap B, connected, as shown, to the waistband, for the purpose specified.

114,539.—FIFTH-WHEEL FOR CARRIAGES.—Peter S. Eastman, Washington Mills, N. Y.

Claim.—The top or pivot-plate A, ball B, bottom or socket-plate C, and socket D, in combination with each other, and whether the slides E be used or not, to adapt them for attachment to the woodwork of a vehicle, substantially as herein shown and described, and for the purpose set forth.

114,540. — BREECH-LOADING FIRE-ARM.—William H. Elliot, New York, N. Y.

Claim.—1. A cam, d'', and ratchet c'', in combination with a hammer, d, for giving motion to the breech-block through connecting-link c, operating substantially as described.

2. The stops w and x, the hammer (or operating-lever) and the shoulder r'', when combined for operation, substantially as and for the purpose described.

3. In a breech-loading fire-arm, the ratchet c'' when provided with the irregular revolving notches u and w and regular stop notches v, as described.

4. The ratchet c'' with its regular and irregular notches, in combination with the hammer and its stops w and x, as set forth.

5. The combination of the stop q and the connecting-link with the hammer and breech-block, whereby said stop serves to lock the breech-block in position while firing, and as a rest for the hammer while loading, substantially as set forth.

6. The combination of the stops q and p with the shoulders r and r', and the cam d'', for locking the breech-block, substantially as set forth.

7. In combination with a breech-block pivoted at its rear end, the retractor e having upon it the two points o and o', when operating together, substantially as specified.

8. In combination with a breech-block pivoted at its rear end, the retractor e with its two points o and o', and spring l, all operating substantially as set forth.

114,541.—SASH-HOLDER.—William R. Elliott, Troy, Kan.

Claim.—The sash-lock, consisting of the crank-pin a, fixed ring C, and sliding block D, the contiguous faces of C and D being spiral, as set forth.

114,542.— JOURNAL-BOX.—Seth C. Ellis, Jersey City, N. J.

Claim.—The combination of the oppositely-inclined caps B B and their holding-screws C C with the inclined planes *s s* of the base A, substantially as described.

114,543.—FENCE. — Ellsworth Ely, Lockport, N. Y.

Claim.—1. The arrangement, in a fence and with the stakes C, of the panels composed of the uprights A A', boards L, and cross stay-piece K, the panels being connected together by bolts *l*, as described, for the purpose hereinbefore set forth.

2. The stake or lower portion C of a fence-post, provided with an enlargement, c, at its center, as described, and for the purpose hereinbefore set forth.

114,544.—MEDICAL COMPOUND.—John Fay, Lacon, Ill.

Claim.—The above-described medical compound, substantially as and for the purposes specified.

114,545. — RATCHET-DRILL. — William Frankel, Springfield, Ohio.

Claim.—The arrangement of levers B and B', in combination with stock a, intermediate levers C and D, pins *c c'*, springs *e* and *e'*, pawls *b* and *d*, ratchet-wheel A, and stop *f*.

114,546.—GRAIN-SEPARATOR.—Daniel Garver, Ringgold, Md., assignor to himself and Cyrus Garver, same place.

Claim.—1. In combination with the cylinders *a a*, the endless rake and carrier, consisting of the slats *b*, armed with teeth *c*, and constructed with rabbets, as shown and described, which enable said carrier and rake to present a closed surface toward the thrasher, as specified.

2. The combination and arrangement of the vibrating shelves *f g h*, the two latter being constructed with concave surfaces, as described and shown, the end frames I, the shaft *l*, pitmen *m*, and arms *n*, as specified and set forth.

114,547.—FAN-BLAST REGULATOR.—Daniel Garver, Ringgold, Md., assignor to himself and Cyrus Garver, same place.

Claim.—The combination and arrangement, with the fan B, of the fan-heads *a*, sliding valves W, levers *c*, connecting-rods *g*, bar h, arm *i*, and spring *k*, as and for the purpose specified

114,548.—WINDOW-SCREEN.—Benjamin Giroux, Chicago, Ill.

Claim.—In combination with the window-sash, the screen D passing through the slotted top or sill of the casing, and the spring roller E arranged in the box above or below the casing, substantially as described, for the purpose specified.

114,549. — HORSE-POWER.—Homer Glass, Racine, Wis.

Claim.—1. In combination with a ring-wheel, B, and pinion D, the diagonal shaft C having bevel-wheels *c d* on its opposite ends, and the intermediate wheel *e*, to impart a steady motion to the thrashing or other mechanism operated.

2. The truss-rod H and pinion D, arranged as and for the purpose specified.

3. The draft-levers E F, combined with the sockets *g*, claws h, and projections *i*, and with the draft-bar G, substantially as herein shown and described.

4. The truss-rod H, arranged on the frame A to brace the same and adjust the gear-frames, substantially as herein shown and described.

114,550. — DETACHABLE FLUID-RESERVOIR FOR STREET-LAMPS.—Lyman A. Gouch, Yonkers, N. Y.

Claim.—The detachable external reservoir A, surrounding the head of the lamp and resting on the shoulder thereof, and provided with a tube passing through a hole in the lamp for the attachment of the burner, substantially as herein set forth.

114,551.—SURFACE BLOW-OFF FOR STEAM-BOILERS.—James S. Griffith, St. Louis, Mo.

Claim.—The supernumerary pipe D and its orifice *i* and valve E, combined with pipe C C' and valve G, substantially as described.

114,552. — FLAVORING WHISKY.—Samuel Gross, Dover township, Pa.

Claim.—The improved spirits herein described, produced by flavoring whisky by redistilling it with the flavoring fruit in the still, as set forth.

114,553.—HORSE-DETACHING APPARATUS.—John Linton Hamilton, St. Joseph, Mo.

Claim.—1. The sliding bar H, having the perforated ears G I at one end and the pin L at the other, combined with the whiffletree A, having the stud B in one end and the stud C and slotted guard K in the other, all substantially as specified.

2. The combination, with the sliding bar H, of the spring M, stud N, and tripping-cord or strap P, all substantially as specified.

114,554. — BUCK-SAW FRAME. — Leonard Hancock, Alton, Ill., assignor to James Newman, same place.

Claim.—The saw-straining device, consisting of the elliptical brace *a* and tension-rod *f*, welded together or formed in one piece, as set forth, and provided, respectively, with a tenoned and a screw-threaded end, whereby the same is adapted to be connected with the part *c*, as shown and described.

114,555.—HORSE-POWER.—Theophilus Harrison and William C. Buchanan, Belleville, Ill.

Claim.—1. The vertically-adjustable bevel-wheel frame D, made substantially in the manner herein shown and described, and applied to a horse-power in the manner specified.

2. The suspending-bolts F, with their upper lengths made larger than the lower lengths, so that the threads on the upper lengths will require nuts large enough to pass loose over the lower lengths, as set forth.

3. The bed-plate C of the power, provided with projecting nibs *l* and *m*, that extend downwardly and upwardly, and serve as guides for the bolts F, substantially as and for the purposes set forth.

4. The center pinion h, made with one part of the hole round and the other portion square or notched, to be thrown in or out of gear, as described.

5. The upright shaft *i*, keyed tight to the bevel-wheel *c* in the frame D, and loose in the center pinion h above, and squared at the upper end, substantially as and for the purposes set forth.

6. The adjustable bevel-wheel frame D, in combination with the suspension-bolts F, as described.

7. The combination of the bevel-wheel frame D, suspending-bolts F, and bed-plate C, all arranged as specified.

8. The combination of the bevel-wheel frame D, suspending-bolts F, upright-shaft *i*, and bed-plate C, all arranged as specified.

9. The combination of the bevel-wheel frame D, suspending-bolts F, upright shaft *i*, bed-plate C, and center pinion h, all arranged substantially as herein shown and described.

10. The combination of the bed-plate C, suspending-bolts F, and upper circular brace-plate *n*, by which the whole power is firmly bound together, as set forth.

11. A mounted horse-power so constructed and arranged that the levers, rods, and other devices used for moving it can be transported on the axles under the bed-plates, as set forth.

114,556. — MOSQUITO-BAR.—Robert F. S. Heath, Philadelphia, Pa.

Claim.—1. The central block, consisting of the portion B, openings *a a*, and enlargement C, in combination with the ears D, consisting of the perforated shanks *b*, guides *c*, and shoulders *d*, and with the arms E and wire or cord *e*, all arranged and operated together in the manner and for the purpose described.

2. The ears D, constructed of single pieces of metal and bent or stamped to form shanks *b*, which guide the ears and provide means for attachment to the central block, guides *c* for reception and retention of the arms of the frame, and shoulders *d*, to abut against the block and support the extended frame, all as set forth, for the purpose described.

114,557.—PRINTING-PRESS.—John Henry, Millburn, assignor to himself and Alexander Robertson, Summit, N. J.

Claim.—1. In combination with the cylinder and distributing apparatus, the shaft B and clutch B^6.

so arranged that the distributing apparatus may be operated independently by hand or by the power which revolves the cylinder, substantially as set forth.

2. The roller C^2, when constructed with beveled ends, in combination with the frame carrying the rollers C^4, for communicating a reciprocating longitudinal motion to the latter, substantially as set forth.

3. In combination with the pinion I^3 and guide K revolving around it, the friction-rollers K^3 and ways against which they bear, substantially as set forth.

4. In combination with the pinion I^3 and guide K revolving around it, the system of levers K^3, K^4, K^5, K^6, and K^7, arranged substantially as set forth.

5. In combination with the cylinder L and feed-table frame, the guide-rest Q, when attached to a rod or shaft fastened to the feed-table frame so as to be independent of the table, substantially as set forth.

6. In combination with the cylinder, the brush R, arranged to operate substantially as set forth.

7. In combination with the prick-points S^2 the vertically-oscillating arm S^5 and rack S^6, substantially as set forth.

8. The combination of the prick-point, the vertically-oscillating arm S^5, and horizontally-oscillating arm S^4, substantially as set forth.

9. In combination with the prick-point, and arm upon which it is carried, the set-screw S^3 for regulating the position of the prick-point, substantially as set forth.

10. The arrangement of the cam D^6, friction-rollers D^5 and D^7, arms D^2 and D^4, and rollers C^6 and C^7, substantially as set forth.

11. The fountain-roller, when made of glass with a ground surface, substantially as set forth.

114,558. — Grinding-Mill.—Henry Henley, Elysianfield, Texas.

Claim.—The combination, with the spindles of the upper and lower stones and the pulleys thereon, of the driving-belt F, fast driving-pulley G, loose pulley R, and driving-shaft, all arranged substantially as specified.

114,559.—Manufacture of Illuminating-Gas.—Samuel Hevner, San Francisco, Cal.

Claim.—1. The combination of the closed gasometer 5 with the hydrogen-generator and carbureter, as and for the purpose set forth.

2. The combination of the acid-reservoir 1, escape-pipe 4, and the water-reservoir 2, substantially as described, and for the purpose set forth.

3. The combination of the carbureter 4, supply-pipe *f*, gasometer 5, resister-tube *g*, and water-reservoir 2, as and for the purpose set forth.

114,560.—Curtain-Cord Retainer.—Henry Holcroft, Media, Pa.

Claim.—The combination of the fixed pin D and the movable curtain-cord retainer A, or its equivalent, as shown and described.

114,561.—Propulsion of Canal-Boats.—Julius L. Hornig, Chicago, Ill.

Claim.—1. The endless chain K, constructed with outwardly-projecting flanges *b*, substantially as set forth.

2. The combination of said endless chain K with any proper drums or pulleys and the track A, when operating substantially as and for the purpose set forth.

3. The carriage B, constructed as described, in connection with drums C C′, axle F, and endless chain K, when operating as and for the purpose specified.

4. The combination of the shaft G, rotated by any suitable motor upon a canal-boat, pulley D, chain H, and arm M, carriage B, drums C C′, axle F, endless chain K, and guide-wheel L with the rail A, substantially as described, and for the purposes set forth.

114,562.—Fringe-Twister.—Hiland Howard, Leeds, N. Y., assignor to himself, James Fowks, and George Howard, same place.

Claim.—1. The arrangement of the twisting fingers with the cloth-supports for working through the yarn perpendicularto the plane in which the shawl or other article is stretched, substantially as specified.

2. The arrangement of the fingers of each set with the other, as herein shown, whereby each finger acts on each of two sides and the alternate strands are twisted in opposite directions, substantially as specified.

3. The dividing-bars provided with the shallow notches *a* and the deep notches *b*, and the latter arranged obliquely for holding the upper strands vertically above the lower ones, substantially as specified.

4. The combination of the two sets of fingers N M, bars E F, the right-and-left threaded screws, and the guides B, substantially as specified.

5. The combination, with the twisting-fingers, arranged and operating substantially as described, of the dividing-plates or bars S, substantially as specified.

6. The combination, with the dividing-bars, of the spring *t*, cams U U′, and the spring bars X Z, the said cams being connected together and the spring bars attached to the finger-bars F, all substantially as specified.

7. The twisting-fingers, consisting of the slotted metal bars and the divided India-rubber strips P, substantially as specified.

8. The combination, with the twisting-fingers and the rolls B′, of the whip-rolls H and the yarn-supporting rods A′, substantially as specified.

114,563. — Railway-Track Gauge.—William S. Huntington, Byron, Mich., assignor to himself and Ansel N. Kellogg, Chicago, Ill.

Claim.—1. A railway gauge, provided with the forked plate B, as shown, to rest on the rail, and having downward projections *a a*, the forked arms being arranged to facilitate the adjustment of the gauge, as set forth.

2. The lip *d* on the plate *c*, when made to project below the lower surface of the gauge, as set forth.

114,564.—Revolving and Rocking Chair.—Platt C. Ingersoll, Green Point, N. Y.

Claim.—The brace G and attached stop *d*, in combination with the transom D and spring F, substantially as and for the purpose herein described.

114,565, antedated May 1, 1871.—Wheel-Rim.—Daniel A. Johnson, Boston, Mass.

Claim.—The section D, when interposed between and suitably connected with the extremities of two main pieces of a wheel-rim, and located between two spokes, with its ends so near the ends of the spokes that the latter serve as bearings for the section, substantially as described.

114,566. — Car-Coupling.—William Johnston, Decatur, Mich.

Claim.—1. The vertical forked slide B, provided with the pivoted headed pin C and with the steps *d*, to operate substantially as herein shown and described.

2. The draw-head A, provided with vertical grooves at the sides to receive the vertical slides B, substantially as herein shown and described.

114,567. — Elastic Tackle-Block.—John E. Jones, Waretown, N. J.

Claim.—The plate A, when provided with the turned-in plates *d* and *e* at the outer side to form a double support for the connecting-pins, substantially as herein shown and described.

114,568.—Saw-Mills.—Simon Kemper, Berger, Mo.

Claim.—1. The crank-screw C, sliding and removable dogs C^1 C^2, when arranged in head-blocks B^2 B^3 of a feed-carriage, B, as and for the purpose described.

2. The combination of the horizontal saw K, its frame J having slides k^1 k^2 arranged to slide in grooved slides k^3 k^4 of the adjustable frame F, substantially as set forth.

114,569.—Machine for Operating Glass-Molds.—William C. King, Pittsburg, Pa.

Claim.—1. The revolving block *i*, carrying two or more removable molds, *i′*, operating in connection with the plunger *d*, substantially as and for the purpose set forth.

2. The hinged and counterbalanced drop-pan *s*, made substantially as and for the purpose described.

3. In connection with a series of revolving molds, a hooked lever, *l*, wheel *o*, with pins *o″*, or their equivalents, arranged substantially as and for the purposes described.

4. In connection with a series of revolving molds, a bent lever, *m*, pin *n*, grooves *p p′*, and wheels *o*, having ratchet teeth *o′*, or their equivalents, arranged substantially as and for the purposes described.

5. The block *i*, perforated or chambered out in the direction of the axial line of the molds attached thereto, and provided with drop-weights *x*, substantially as described.

114,570.—Spindle-Step.—George William Knight and George Draper, Hopedale, Mass.

Claim.—1. The combination and arrangement of the hollow dome D with the oil-reservoir B, and with the frustum C disposed in the latter, as set forth.

2. In the bolster, as composed of the oil-reservoir B, and the frustum C, and the dome D, arranged therein, the oil-reservoir and the cone or frustum *c*, as constructed, with their upper edges on a level, or with that of the cone or frustum arranged above that of the reservoir, as described.

3. The dome, as arranged within the oil-reservoir of the bolster and around the spindle-bearing, substantially as described.

4. The combination and arrangement of the oil-reservoir B, the cone or frustum C, the dome D, and the cover or cap E, all being substantially as described.

114,571.—Water-Wheel.—Thomas Leffel, Springfield, Ohio, assignor to Barnett, Herrman & Co., Dayton, Ohio.

Claim.—1. A wheel-case composed substantially of the cylinders B B′, flanges C C′ and G G′, chutes D, and bridge E, adapted to be used upon a horizontal shaft, as set forth.

2. In combination with the above, the detachable draught-tubes T T, constructed and arranged in the pen-stock, substantially as set forth.

114,572.—Valve.—Joseph Lewis, Manchester, England.

Claim.—The rotating core A, provided with the annular groove *a*, axial grooves *d*, diametric passages *e*, and an internal longitudinal passage, *f*, in the connection and substantially as and for the purpose specified.

114,573.—Sewing-Machine. — Halsted W. Little, Muncie, Ind., assignor to himself, John L. Little, and William L. Little, same place.

Claim.—The needle-operating arm H, provided with the adjustable and slotted extension H′, as and for the purpose set forth.

114,574, antedated April 14, 1871.—Device for Operating Cut-off Valves.—Kellogg H. Loomis, New York, N. Y.

Claim.—1. A device for operating cut-off valves in steam-engines, having hinged yielding arms, substantially as and for the purposes herein set forth.

2. The rocking head A, provided with the sliding bar C, arms D D, and springs E E, all substantially as and for the purposes herein set forth.

3. The combination of the sliding bar C with its hinged arms D D and springs E E, the projection *a*, diagonally grooved slide E, and wrist-pin H, all constructed and arranged as described within the rocking head A, substantially as and for the purposes herein set forth.

114,575.—Hose-Coupling.—Joseph J. Lovell, New York, N. Y.

Claim.—The combination of the grooved and recessed band B *b′*, band C, pivoted and grooved curved bar D *d′*, arm E, band F, and part G *g′* with each other, substantially as herein shown and described, and for the purpose set forth.

114,576, antedated April 27, 1871.—Reducing Rubber. — William Newton MacCartney, Glasgow, Scotland, assignor to John Cinnamon, Cincinnati, Ohio.

Claim.—The process herein described of reducing vulcanized India rubber by the employment of petroleum and camphor, as set forth.

114,577.—Artificial Stone.—Thomas Madeley, Rochester, N. Y.

Claim.—The compound for artificial stone herein described—that is to say, gravel or sand, Rosendale cement, water-lime, resin, and sulphur or brimstone, in or about the proportions specified.

114,578. — Knife-and-Fork Scourer.—Eliezer Jewett Marsh, Leominster, Mass.

Claim.—1. The improved machine, constructed as described, or provided with the three rollers A B E only, arranged and combined with the two shafts C D and the connecting-gears, and to operate as set forth.

2. In the knife-scouring machine, as described, the rollers as made of the series of felt and rawhide or leather disks *a b*, arranged together and with the shafts C D and metallic heads *c c*, as set forth.

114,579.—Reversible Hinge.—Frank W. Marston, Philadelphia, Pa.

Claim.—1. A reversible hinge, consisting of two leaves, connected only at their sides, and by means substantially as described, so that the leaves cannot be detached from each other in any position.

2. The combination, operating as described, of the bosses G G′ with the pins I I′, whose transverse section is a circular segment not less than a semicircle.

114,580.—Buckle.—John F. Martin, Harrisburg, Oregon.

Claim.—The plates C D, each apertured at one end, transversely corrugated on their inner faces, and respectively shouldered at *d e*, combined with a screw, E, as and for the purpose described.

114,581.—Machine for Adjusting Cotton-Bale Ties.—Milo Martin, Charlotte, N. C., assignor to himself and Jasper Stowe.

Claim.—The rack-bar A, lever B G, lugged slide C F, weighted pawls D E H, slotted arms I J L N, and eccentric levers K K, all combined, as described, to operate in the manner specified.

114,582.—Paper Box.—Henry Matier, Belfast, Ireland.

Claim.—An improved paper box formed in two

parts, A C and B D, hinged to each other at the side edge of their bottoms by a cloth and paper hinge, E, and connected at their ends by the elastic cords F, substantially as herein shown and described.

114,583. — RAILWAY SWITCH. — James M. Maxwell, Webster, W. Va.

Claim.—In combination with two adjacent converging fixed rails, *g i*, and a pivoted rail, *a*, the wedge *k* and plate *l*, as described.

114,584.— PRISON-GRATING.—Edwin May, Indianapolis, Ind.

Claim.—The clamp-guard A, in combination with the bars B and bolt C, all constructed and arranged substantially as and for the purposes set forth.

114,585.—BELL-YOKE ATTACHMENT.—Clinton H. Meneely, Troy, N. Y.

Claim.—The combination of the shank, secured as shown to the crown-plate, the washer, toothed upon its under side and meshing into teeth upon the crown-plate, the center bolt and its nut, all as and for the purpose described.

114,586.—JAPANNED LEATHER. — Franklin S. Merritt, Boston, Mass.

Claim.—1. The embossed japanned leather made in manner as described.

2. In combination with the process of japanning the leather, the subsequent operation of wetting, embossing, drying, and boarding or softening it, all being essentially as and for the object specified.

114,587. — RAILWAY-CAR AND ENGINE-TRUCK.—George Fred. Morse, Portland, Me.

Claim.—The swaying beam A' A, arranged to rock or roll laterally on the springs or suitable rockers or rollers, in connection with the springs F F' and guides G G, as herein set forth.

114,588.—FLOCK-CUTTING MACHINE.—Monroe Morse and Charles H. Morse, Franklin, Mass.

Claim.—1. The cutter-heads B and C, containing the adjustable radial cutter-blades E and G, whose cutting-edges are set parallel to each other, as set forth.

2. The plates *d* and *e*, made tapering, to constitute flaring spaces between the cutters, as specified.

3. The inwardly-projecting feeders E' G' applied to the cutter-heads B C, substantially as and for the purpose herein shown and described.

4. The vertically-adjustable feed-table I, arranged in the center of the rotary cutter-head C to operate in conjunction with the arms G', as set forth.

5. The plates L, made slightly spiral and yielding, and attached to the shaft so as to project downward to force the material toward the cutters, substantially as shown and described.

6. The projecting arms *i i*, secured to the rotary spindle of a flock-mill to separate threads and strings from the material to be cut, as specified.

114,589.—CHOPPING-MACHINE. — Emanuel Newcomer, Columbia, Pa.

Claim.—1. The arrangement of the fixed rack Q, the pawl P, with its fulcrum on the lever L, in combination with the spring bar T and springs S, for the purpose both of turning them out of the way and for adjusting the pressure on the choppers, in the manner shown and specified.

2. The arrangement of the stem M with its gum-elastic pad *m* on the socket-shaft K, in combination with the chopper-stem N, set-screw *n*, and end J, together with the lifters *h* and drum H with the pulley G, strap-tightener R, all constructed and operating substantially in the manner and for the purpose described.

114,590.—STOP FOR CARPENTERS' PLOWS.—Thomas Nichols, Vicksburg, Miss.

Claim.—The combination, with the thumb-nut E and screw D, of the collar F and stop B, substantially as and for the purpose hereinbefore set forth.

114,591.—HORSE HAY-RAKE.—George Notman, Deerfield, Ohio.

Claim.—1. The lever B combined, as described, with the spring *e*, arm *g*, and teeth-lifting bar C, substantially as and for the purpose set forth.

2. The foot-lever D, in combination with the lever B, rod *g*, bar C, and spring *e*, all arranged and operating substantially in the manner and for the purpose herein specified.

114,592.—CARRIAGE-WINDOW.—Charles M. Oblenis, New York, N. Y.

Claim.—1. The combination of the vertically-adjustable guides and supports K, and the cover M or M O, with the sash and the door, substantially as specified.

2. The combination, with the sash and a door or window-frame having permanent guides and supports for the sash, of the cover M or M O, substantially as specified.

114,593.—CONSTRUCTION OF BIRD-CAGES.—George R. Osborn and Benjamin A. Drayton, New York, N. Y.

Claim.—1. The crimping of the distending or spring tension-ring *d*, substantially as and for the purpose specified.

2. The joining of the pieces forming the base by locking or shutting of one into or over the other, substantially as and for the purpose specified.

114,594.—MEAT AND VEGETABLE-CHOPPER. William H. Peirce, Bangor, Me.

Claim.—1. The angular knife *k*, substantially as and for the purposes specified.

2. The combination of knife *k*, bracket B, elbow *f*, spring *n*, and lever *d*, substantially as described and shown.

3. In combination with stationary vessel A, the cutting-knife rotating upon its own axis, and also traversing the circuit of the vessel, substantially as and for the purposes described and shown.

114,595. — HOT-WATER HEATING APPARATUS.—Alexander C. Pentland, Philadelphia, Pa.

Claim.—The improved heating apparatus herein shown and described, formed of the hollow end walls *b* and *c*, provided respectively with the fuel and flame apertures *f* and *m*, and the double series of horizontal tubes *k l*, and grate-bars *a a*, all constructed and arranged as specified.

114,596.—TANNING.—George Pile, Blountville, Tenn., assignor of one-half his right to W. D. Haynes, same place.

Claim.—The mechanical process of working the hides and skins into the lime, the bate, and the tan-ooze, after having extracted all the water and other foreign substances from the pores thereof, substantially as and for the purpose hereinbefore set forth.

114,597, antedated April 27, 1871.—SMOKE-PIPE AND BASE-PLATE FOR SUGAR-EVAPORATORS.—Charles C. Post, Hinesburg, Vt.

Claim.—1. The above-described base-plate A, provided with the rim or flange *B* for receiving and supporting the smoke-pipe, substantially as set forth.

2. The stiffening-piece D, substantially as set forth.

3. The curved edge E, for stiffening the plate, and for receiving and supporting the evaporating pan, substantially as set forth.

4. The damper C, in combination with the plate A, substantially as set forth.

5. The plate A, in combination with the pipe G, substantially as set forth.

114,598.—BUTTON-HOLE CUTTER.—John G. Powell, Philadelphia, Pa.

Claim.—The corrugated blade A, constructed substantially as described, and in combination therewith the sliding gauge B, so constructed and arranged in relation to the corrugations that one or more of the latter shall guide and hold it in relation to its adjustment, as above set forth.

114,599. — TREADLE. — George K. Proctor and Franklin K. Hamilton, Salem, Mass., assignors to George K. Proctor.

Claim.—The double crank, applied in the manner described to the treadle mechanism of a sewing-machine, for the purpose specified.

114,600.—COTTON-SEED PLANTER AND GUANO-DISTRIBUTER. — James Rafter, Winona, Miss.

Claim.—The ribs K and L, in combination with the movable and stationary parts of the drum H, and with the shaft I, substantially as herein shown and described, and for the purpose set forth.

114,601. — ADJUSTABLE CUT-OFF FOR STEAM-ENGINES.—James Rees, Pittsburg, Pa.

Claim.—1. A pair of pawls, *s*, loosely hung to the stem s^1, the ends of such pawls alternately engaging shoulders *s'*, or other equivalent device of the sleeve *d'*, when combined with suitable tripping devices for disengaging the pawls before the end of stroke, substantially as and for the purposes set forth.

2. A pair of trippers, *r r*, adjustably arranged on a reciprocating frame, in combination with the pawls *s s*, and engaging lugs, substantially as and for the purposes set forth.

3. In combination with the trippers *r r*, the screws *y y* geared together, whereby by a single motion the trippers will be simultaneously adjusted by any desired length of movement, substantially as described.

114,602. — OBTAINING GELATINE FROM BONES, HORN-PITH, &c.—Nathaniel B. Rice, East Saginaw, Mich.

Claim.—1. The process of treating bone, horn-pith, or equivalent substances by means of phosphoric acid, with or without other acid or acids, for the purpose of obtaining the gelatine, as set forth.

2. The herein-described method of separating and reclaiming the phosphoric acid from the solution of earthy matter by the addition of sulphurous or sulphuric acid, as set forth.

3. The process of separating the phosphoric acid added to the bone, together with that originally contained in the bone, from the earthy matter at the operation, as set forth.

114,603.—APPARATUS FOR GENERATING HYDROCARBON-VAPORS. — William R. Roberts, Philadelphia, Pa.

Claim.—1. The combination, in a hydrocarbon vapor-generator, of the plunger of the injector with the injection-pump and its automatic mechanism, or its equivalent, so as quickly to lift the plunger to fill the injector and gradually to force the oil into the generator, these members being constructed to operate in combination, substantially as hereinbefore set forth.

2. The combination, in a hydrocarbon vapor-generator, of the injector, its surrounding steam-chamber, the injection-pump, its automatic mechanism, and the steam-pipe leading from the steam-chamber to the injection-pump, all these members being constructed to operate in combination, substantially as hereinbefore set forth, to operate the injector by its own waste-steam.

3. The combination, in a hydrocarbon vapor-generator, of a tank, a supply-pipe leading from the tank to the injector, an injection-pipe leading from the injector to the generator, and the heating-chamber enveloping the injector, all these members being constructed to operate in combination, substantially as hereinbefore set forth, to heat the oil before reaching the generator.

4. The combined generator and receiver, constructed, as hereinbefore described, of two cylindrical sections arranged one above the other, without vertical tubes or an oil-reservoir.

5. The combination, in a hydrocarbon vapor-generator, of the steam-chamber, its steam-pipes, the diaphragm, and the generator, all these members being constructed to operate in combination, substantially as hereinbefore set forth, so as to heat both the generator and injector.

6. The combination of the generator, its diaphragm, and the slotted oil-supply pipe encircling the interior of the generator, these members being constructed to operate in combination, substantially as described, to inject oil upon the heated diaphragm.

7. The combination of the generator, its diaphragm, the oil-supply pipe, and the steam-jet pipe, all these members being constructed to operate in combination, substantially as hereinbefore set forth.

8. The combination of the injection-pump, the injector, and the generator, all these members being constructed to operate in combination, substantially as hereinbefore set forth, automatically to inject oil in regulated quantities into a vaporising-chamber.

9. The combination of the injection-pump, the injector, the oil-supply pipe, the steam-jet, the generator, its heating-chamber, and the series of steam-pipes, all these members being constructed to operate, substantially as hereinbefore set forth, automatically to inject, vaporise, and mingle heated oil with steam in a generator, unobstructed by oil-reservoirs or nests of tubes.

114,604.—TUCK-CREASER FOR SEWING-MACHINES.—Charles E. Robinson, Boston, Mass.

Claim.—1. The base-plate A B and its arm G with the adjustable wheel and edge-carrying devices, the edge and axle of the wheel being inclined to the face of the guide, and all combined and operating as and for the purpose set forth.

2. The tuck-creasing apparatus above described, the same consisting of the base-plate A B, head-block D, cam-lever K, guide C'', arm E, arm M, wheel N, slide D, male die-creaser *d*, and swinging apron E, combined and arranged together substantially as above set forth.

114,605.—CONVEYER OF SMOKE AND CINDERS FOR LOCOMOTIVES.—Augusta M. Rodgers, Brooklyn, N. Y.

Claim.—The combination of the smoke-stack B, chamber F, opening E, hinged cover C, provided with screen G, and conveying-pipes D, perforated at their forward sides, all constructed and arranged as herein shown and described.

114,606.—LOOM TAKE-UP.—Wanton Rouse, Taunton, assignor to George Draper & Son, Hopedale, Mass.

Claim.—The lever L and its pressure-pawl *c*, the stud *e*, and the slotted standard *g*, as arranged and combined with the ratchet B of the take-up motion, substantially as shown and described, such ratchet being provided with the pawls C I and with the lifter K to be operated by the stop motion, the whole being essentially as and for the purpose or purposes as explained.

114,607.—AUTOMATIC LIQUOR-DISCHARGE. Arthur C. Rowe, Chicago, Ill.

Claim.—The arrangement of the discharge D, with its compartments *d d* on the opposite sides of the central axis E, the upright rod *f*, and adjusta-

ble weight F, the whole constructed and operating, in reference to the perforated head *a*, substantially in the manner herein shown and described.

114,608, antedated May 2, 1871.—Door-Latch.—Henry Sanders, Utica, N. Y.

Claim.—The lever T, with outwardly-curved handle A, slot B, and arm C, extending under pivoted latch K, to which latter is attached a spring, P, all arranged and operating as herein set forth.

114,609.—Lamp.—William Scarlett, Aurora, Ill.

Claim.—The wick-stiffener G fixed to and moving with the burner or threaded part C, and adapted to support the wick against twisting and other entanglements, in combination with, and arranged as shown relatively to the internal reservoir B and the main reservoir A, formed and connected as shown, and supported on the hollow shank A^1 with a smooth spread base A^2 mounted on legs A^3, so as to form the improved lamp adapted for burning kerosene by natural draught, as herein shown and described.

114,610.—Combined Rectifier and Filter.—John C. Schnell, Cincinnati, Ohio, assignor to himself and Eberhard Cammerer, same place.

Claim.—1. A combined rectifier and filter, with the annular filtering-chambers, as seen at L N, and with arch-plate J, valve R, and removable perforated bottom O, arranged to operate substantially as and for the purposes herein shown and described.

2. In combination with the filter, the levers V V, and mode of raising and dumping or inverting the filter, substantially as and for the purposes described.

3. The hinged clamp C, substantially as shown and described, and for the purposes set forth.

114,611.—Plow.—Moses R. Shalters, Alliance, Ohio.

Claim.—The arrangement of the plow-beam A, provided with the seat a''' having a corrugated upper surface, the cross-bar a', provided with the enlargement or body a'' having a corrugated lower side, and the screw-bolt a^4, when the cross-bar is placed upon the beam, the two corrugated surfaces being in contact, as specified.

114,612. — Car-Coupling.—John Shepler, Lambertville, N. J., assignor to William H. Slack for one-half.

Claim.—The coupling-bar, as described, with shoulders A A, hooks *a a*, lifting bar B, slot C, bolt *e*, and tapering slot *f f*, when combined, constructed, and operated substantially as and for the purposes herein set forth.

114,613.—Plane.—James K. P. Smith, Jeffersonville, Ind., assignor to himself and L. S. Shuler, same place.

Claim.—1. The combination, with the plane-bit and the wood stock, of the casting A B C, yoke P, clamps N, and clamping-screw Q, all substantially as specified.

2. The combination with the above of the adjusting-screw K, substantially as specified.

114,614.—Heating-Stove.—Samuel Smith, Philadelphia, Pa., assignor to Charles Noble & Co., same place.

Claim.—1. The divided annular molding C C, in combination with the flange a^1 of the body A, and the annular plate b^1 of the base B, substantially as and for the purpose hereinbefore set forth.

2. The divided clamping-ring F F, in combination with the flange a^2 of the body A, and the lower end of the illuminating-chamber E, substantially as and for the purpose hereinbefore set forth.

3. The divided annular molding H, in combination with the upper end of the illuminating-chamber E and the flange g' of the upper cylinder G, substantially as and for the purpose hereinbefore set forth.

4. In combination with the base B of a stove, the sliding doors D D having the respective lips 7 7, the slots 4 4 in the top plate b^3, and the groove 9 in the bottom plate b^2, all constructed and arranged to operate substantially as and for the purpose hereinbefore set forth and described.

114,615.—Surgical Bandage.—John Smitley, White Cottage, Ohio.

Claim.—The collar-bone bandage, consisting of the breast-plate, pad, bow, lever, and straps or belts, all arranged substantially as and for the purposes herein shown and described.

114,616.—Tumbling-Shaft.—Daniel Snell, Clark county, Ohio.

Claim.—1. Spring catch *c*, or its equivalent, slot *c'*, and notch *e*, in combination with knuckle-piece A and rod B, substantially as shown, for the purposes set forth.

2. Bevel *b'* and groove *c'*, in combination with spring catch *c*, notch *e*, rod B, and knuckle-piece A, substantially as shown, for the purpose set forth.

3. Screw-bolt *a*, in combination with knuckle A, substantially as shown, for the purpose set forth.

4. Constructing a tumbling-shaft with permanently-joined knuckle-couplings, presenting an even surface, as shown, in combination with the detachable parts, substantially as described, for the purpose set forth.

114,617. — Rock-Drilling Machine.—Jacob W. Spangler, Jackson township, and William L. Boyd, York, Pa.

Claim.—1. The combination of the shaft *c*, disk *f*, frame *h*, rack *i*, collar *l*, wheel *m*, worm *o*, and drill *a*, as specified.

2. The combination of the frame *h*, rod *r*, spring *q*, and disk *f*, as described.

3. The frame *d*, lug *s*, spring *t*, and set-screw *u*, in combination with the standard A, as set forth.

4. The prop *v*, provided with flanges *w*, as explained.

114,618, antedated May 6, 1871.—Spring Bed-Bottom.—George Speckner, Madison, Wis.

Claim.—In combination with the spiral springs F, constructed in pairs, the connecting-loops H, I, J, K, and N, all arranged as described, for the purpose specified.

114,619. — Self-Acting Mule for Spinning.—Isaac Stead, Philadelphia, Henry Holcroft, Media, and Francis R. Pearson, Germantown, Pa.

Claim.—1. The combination and arrangement of catch *r*, ratchet-wheel W, disk V, pin *v*, and slotted disk I, for working the cam-shaft, as and for the above-described purpose.

2. The combination of the lever *w*, lug b', arm *s* on catch *r*, for the purpose of holding the catch *r* up and disengaging it from the ratchet-wheel W, as shown and described.

3. The combination of bar f', levers *w* b''', and c''', as shown and described, for operating catch *r* by the outward movement of the carriage, for the above-described purpose.

4. The combination of cam *e* on faller-shaft, lever a', lug c', bar f', and lever *w*, for the purpose of operating catch *r* and producing the movement to run the carriage in, as described.

5. The combination of levers d' and *w*, lug c'', and catch *r*, as described, and for the above purpose.

6. The combination of twist-wheel G, lever *y*, rod *z*, lever *w*, and catch *r*, as described, for the above purpose.

7. The ratchet-wheel *b*, collars *c n*, and quadrant *d*, in combination with the screw-threaded faller-shaft, as shown and described, for the above purpose.

114,620.—Shank-Marking Tool.—Samuel Stone, Lynn, Mass., assignor to himself and Frederick S. Hunt, same place.

Claim.—1. The combination and arrangement of the marking-plate S and its frame P P Q with the frame-bearers U U, axle-shaft N, and standard L, whether the same be used with or without the head-block, all substantially as described.

2. In combination with the standard L, the frame-bearers U U, the axle-shaft N, the frame P P Q, and marking-plate S, the ring or arm-sleeve I and its set-screw J or its equivalent, all substantially as shown and described.

3. In shank-marking tools, the combination and arrangement of the marking-plate S and the frame P P Q with the elastic connections or plate-springs T T, all substantially as shown and described.

114,621. — Treadle-Bearing and Oil-Shield.—Nesbitt D. Stoops, Philadelphia, Pa.

Claim.—1. The shield or dripping-trough C, in combination with the treadle A and fulcrum-rod B, arranged and operating substantially in the manner and for the purpose above set forth.

2. The combination and arrangement of the conical plugs D and D' with the shield C, treadle A, and fulcrum-rod B, substantially as described, and for the purpose set forth.

114,622.—Railway Switch.—Hiram Strait, Cincinnati, Ohio.

Claim.—1. The vibrating turn-tables D D for switching the rails and limiting their motion either way.

2. The combination of the turn-tables D D and disks E E, constructed and operating as described.

3. The combination of the turn-tables D D, disks E E, rods F F F F, posts G G G G, and levers H H H H, all substantially as herein specified.

114,623.—Snow-Plow.—Alexander Stutzman, Somerset, Pa.

Claim.—1. The snow-plow, composed of the laterally-movable side wings D D and of the movable wedging-wings C C, substantially as herein shown and described.

2. The sliding post *m*, levers *h h*, loops *i i*, rods *j j*, and levers K K, combined with the wings C D to operate the same, substantially as herein shown and described.

114,624.—Tournure.—Amos W. Thomas, Philadelphia, Pa.

Claim.—The series of standards C C C, in combination with the waistband A and bows B B^1 B^2 B^3 B^4, constructed and arranged to operate substantially as and for the purpose hereinbefore set forth.

114,625. —Combined Corn and Cotton-Planter.—William B. Townes, Grenada, Miss.

Claim.—The arrangement of the seed-box C, dropper *a*, shaft *b*, pins *c*, drum B, and pins *d*, as specified.

114,626. — Adjustable Bevel. — Justus A. Traut, New Britain, Conn., assignor to The Stanley Rule and Level Company, same place.

Claim.—1. As an improved article of manufacture, a carpenter's bevel, the conical-shaped orifice, with a conical shaped bolt-head, *d*, and hub *f*, stock and blade *a h*, substantially as and for the purpose set forth.

2. In combination with the conical-shaped head *d* and stock *a*, the indicating-characters *n*, substantially as and for the purpose set forth.

114,627.—Fire-Extinguisher.—Jacob B. Van Dyne, Covington, Ky., assignor to The Northwestern Fire-Extinguisher Company, Chicago, Ill.

Claim.—1. The combination of the screw *m*, disk *d*, guide-rods *f*, cross-bar *p*, and cutter *r* with the disk *g*, acid-jar *k*, and ring *i*, substantially as described.

2. The combination of a soft-metal cap for the cartridge with a perforative instrument, substantially as and for the purpose specified.

114,628.—Car-Wheel.—Peter H. Watson, Ashtabula, Ohio.

Claim.—A car-wheel fitted with elastic panels under tension, constructed, arranged, and operating substantially as described.

114,629.—Mouse-Trap.—Henry S. Weller, Watertown, Conn.

Claim.—In combination with a block mouse-trap, the spring D, with the arm F G, arranged and operating substantially as shown and described.

114,630.—Clothes-Drier.—Lorin M. Whitman, Sterling, Ill., assignor to himself and Taylor Williams, same place.

Claim.—1. A clothes-rack composed of the sills A A having casters *a a*, the bars B B, and rounds E E, in combination with the swinging wings composed of the bars C G and rounds E' E', with the connecting-bars D D, all constructed and arranged substantially as and for the purposes herein set forth.

2. The frames H H and rod I, in combination with the rounds of a clothes-rack, substantially as and for the purposes herein set forth.

3. The combination of the clothes-rack A B E, wings C G E', and frames H with rod I, all constructed and arranged substantially as and for the purposes herein set forth.

114,631. — Buckle. — Henry S. Wilkin, Brooklyn, N. Y.

Claim.—The T-shaped button upon the suspender-buckle, and the elongated slot *h* in the metallic loop, the parts being made, as specified, with the head of the T-shaped button transversely to the suspender-strap and the slot *h* longitudinally of the same, for the purposes specified.

114,632.—Manufacture of Wall-Papers. William Wilson, Edgewater, N. J., assignor to Howell & Brothers, Philadelphia, Pa.

Claim.—The grounding-roller, for first receiving and then directly applying the tint to the paper, and thereby dispense with the subsequent employment of brushes, as herein set forth.

114,633.—Snow-Plow and Rail-Cleaner. Luther J. Woodruff, Mohawk, N. Y., assignor of one-half his right to Francis S. Wilcox.

Claim. — The combination of the scraper H, spring arm G rigidly attached to the rock-shaft, short lever E, connecting-rod D, lever B, spring J, and the slotted and notched arm I, when arranged in the manner and for the purpose set forth.

114,634.—Adjustable Try-Square.—Leonard Bailey, New Britain, Conn.

Claim.—In combination with a recessed stock, A, with its cover and walls or partitions *a b*, and the blade C fitted therein, the set-screws *e e*, passing loosely through the wall *b* and then through the screw-nuts *i i* and against the edge of the blade C, by which said blade may be adjusted and then firmly held to said stock in its adjusted position, as described and represented.

114,635.—Pipe Attachment in Plumbing. Arad Barrows, Philadelphia, Pa.

Claim.—The hollow projection B on the outside of a bath-tub or other article of plumbers' ware, when provided with the notched lugs *a a* to receive the coupling-bolts G G for connecting pipes thereto, substantially as herein specified.

114,636. — Tea-Tray. — Henry B. Beach, West Meriden, Conn.

Claim.—As a new article of manufacture, a tray composed of a hard-metal plate or bottom with a soft-metal edge or border, substantially as herein described.

114,637.—Propulsion of Vessels.-George A. Beidler, Philadelphia, Pa.

Claim.—1. The elongated tube or cylinder B surrounding the propeller-screw or wheel and extending in rear beyond the same, substantially as and for the purposes herein set forth.

2. A jointed or flexible tube or cylinder extending toward the rear from the stern of a canal or other boat, the front section surrounding the propeller-screw or wheel, substantially as and for the purposes herein set forth.

3. In combination with a tube or cylinder, whole or jointed, extending toward the rear from the stern of a canal or other boat, and surrounding the propeller-screw or wheel, a grate, tubes, or other suitable device inserted in the rear end of said tube or cylinder for checking the water, substantially as herein set forth.

4. The extended tube B, surrounding the propeller-screw or wheel C, provided with one or more inlets, and attached to the rear end of a canal or other boat, substantially as and for the purpose herein set forth.

114,638.—Tree-Tub.—Jesse Booher, Dayton, Ohio.

Claim.—In combination with the wooden sides A formed with dovetailed joint edges cut against the grain of the wood, the metallic dovetail corner fastenings B, substantially as described, and for the purpose specified.

114,639. — Machine for Heading Cartridge-Shells.—Theodore V. Boyden, Bridgeport, Conn.

Claim.—1. The combination of the die-holder or frame B, the die *c*, and the sliding block C, all constructed and arranged to operate substantially as described.

2. In combination with the die *c*, the adjustable hopper H, constructed and arranged to operate substantially as set forth.

114,640.—Straw-Cutter.-Joseph H. Bradley, Hillsborough, Ohio.

Claim.—The combination of the cutter-shaft *b* with the feeding-rollers *a d*, through the medium of the fly-wheel D, the connecting-pitman *f*, the curved and slotted arm *k*, the rock-shaft *i*, the pushing-pawl *n*, the pulling-pawl *m*, and the ratchet-wheels *a'* and *d'*, when arranged and operating with each other, and with the detents *w v*, and the rotating cutter-blade *c*, substantially as and for the purpose herein set forth.

114,641. — Puddling-Furnace. — Simeon Bunn, Belleville, Ill.

Claim.—1. The combination, with the bottom plate A of the furnace, of the air-conducting flanges B C, arranged relatively to the air-holes D and escape-passage E, substantially as specified.

2. The forked hollow chill, having the branches made in two parts jointed together, and arranged relatively to the air-openings M and escape-passage E, substantially as specified.

3. The arrangement, with the escape-passage E and K, and the chimney F, of the tube P and flange Q, substantially as specified.

114,642.—Manufacture of Illuminating-Gas.—Adam S. Cameron, New York, and William E. Everett, Rye, N. Y.

Claim.—1. The combination, with one or more benches of retorts, of a direct-acting pumping-engine, substantially as shown and described.

2. The branch pipes *d e* with an intervening cock, *f*, in combination with the suction-pipe of a pumping-cylinder and with the gas-discharge pipe C, substantially as described.

3. The elastic diaphragm A exposed to the pressure of the gas in the retorts or hydraulic main, and communicating with the throttle-valve, substantially as set forth.

114,643.—Washing-Machine.—Edward R. Chamberlin, Bellefontaine, Ohio.

Claim.—The combination and arrangement of the vibrating frame E, pivoted arms G G, presser-boards H H, central partition I, tub A, and standards C, all substantially as herein represented, and for the purposes set forth.

114,644.—Compensating Watch-Regulator.—Jedediah P. Clark, Philadelphia, Pa.

Claim.—The combination and arrangement of the compound compensating-curb or strip E F with the regulating-arm or index B, and with the pivoted arm G carrying the pins for adjusting the hair-spring, whereby the compensating-curb is caused to expand and contract laterally, as described.

114,645.—Spring for Railway-Cars.-Edward Cliff, Oswego, N. Y.

Claim.—The parallel > -shaped sectional springs A D made of equal length, in combination with the vertical coupling-plates *c c* and the bolts *d d*, substantially as specified.

114,646.—Whisk Broom. — Eli P. Cooley, New York, N. Y.

Claim.—A brush made with a sheet of flexible material around the handle, extending from the broom-corn fibers to near the end of the handle, and secured by a winding of wire, as set forth.

114,647.—Tassel-Head.—George A. Cooper and Consider Southworth, Stoughton, Mass.

Claim.—A tassel-head made of wire, either with or without fibrous covering, substantially in the manner described, without confining ourselves to any particular shape, form, or manner of shaping.

114,648.—Spring Mattress.—Richard P. Cornell, Poughkeepsie, N. Y., assignor to Edwin L. Bushnell and Robert R. Cornell, same place.

Claim.—1. A mattress, composed of a series of springs, A, in combination with the series of intervening rings B, constructed and arranged to operate substantially as described.

2. The rings B, provided with the holes, and having the springs connected thereto by means of the straps *b* inserted therein, substantially as set forth.

114,649.—School-Desk Joint. — Cyprian U. Crandall, Sterling, Ill.

Claim.—1. In a hinge-joint for school-seats, the internal stops *u' F'*, in combination with the external stops C E and *t* D, so arranged that said internal stops shall act a little in advance of the external stops, substantially as specified.

2. The pedestal A, provided with the rubber packing H, journal *e*, inclined projection K, recess *c*, and tapering bore L, in combination with the bolt *d* and the arm B, provided with the recess *m* L and projection T, substantially as specified.

114,650.—Water-Wheel Gate.—Perry W. Davis and Dennis D. Bunnell, Portland, Oregon.

Claim.—The gate, arranged within the frame T, as described, so as to open at the acute angle formed by it and the wall of the flume, in combination with the rack and pinion located as described, and frame T, constructed substantially as and for the purpose specified.

114,651.—Clamp for Holding Packages, &c.—Dundas Dick, New York, N. Y., assignor to Maria A. Mauger, same place.

Claim.—The self-closing jaws A B, provided with the swivel-buttons, substantially as and for the purpose herein shown and described.

114,652.-Producing the Electric Light. Eardley Louis Charles d'Ivernois, Paris, France.

Claim.—1. The division of the electric current or currents to be made use of for this purpose into two or more partial or smaller currents.

2. Causing the current or currents to pass through any suitable number of electrodes in such manner as to give rise to two or more voltaic arcs only crossing or intersecting each other, substantially as described, and for the purposes set down.

114,653. — Breech-loading Fire-Arm.—William C. Dodge, Washington, D. C.

Claim.—1. The combination of a rebounding hammer with the cylinder of a revolving fire-arm, substantially as described, whereby the possibility of a premature explosion is prevented, as set forth.

2. The combination of a rebounding hammer, having its point arranged to ignite the charge by a direct blow, with a chamber for said charge arranged to tip or move in the line of motion of the hammer, substantially as herein described, whereby the liability of a premature explosion, by closing the arm, is prevented, as herein set forth.

3. The swinging stirrup 1, in combination with the breech-piece B and the swinging end or projection *i*, arranged to operate substantially as described.

114,654.—Trace-Fastener.—Asa B. Dowell, Vinton, Iowa.

Claim.—In a trace-hook fastening, the combination of the sliding locking-block B, the fixed crossbar F, and the coil spring *e*, with the inclosing covering flexible tube G, as and for the purpose described.

114,655.—Cigar-Mold.—Napoleon Dubrul, Joliet, Ill.

Claim. — 1. The employment of the stamped sheet-metal matrices C in a cigar-mold, substantially as and for the purposes specified.

2. The combination of the part D and the matrix C of the upper half of the mold when joined to form a sharp edge, as specified and shown.

3. The combination of the bracing-bridges H and strips E with a sheet-metal cigar-mold, substantially as and for the purpose specified.

114,656.—Telegraphic Transmitting Instrument. — Thomas A. Edison, Newark, N. J.

Claim.—A circuit-closer operated by the movement of the perforated paper in a telegraph transmitting instrument to throw a reverse circuit on the line, substantially as set forth.

114,657.—Relay-Magnet for Telegraph Instruments.—Thomas A. Edison, Newark, N. J., assignor to himself and Marshall Lefferts, New York city.

Claim.—1. A permanent magnet, an electro-magnet, and a vibrating tongue, arranged substantially as set forth, so that the tongue will be repelled from its contact with the core of the electro-magnet by the electric pulsation, substantially as specified.

2. An electro-magnet of less than an inch in length, with a permanent magnet and swinging tongue to make and break the circuit in an automatic telegraph, substantially as and for the purposes set forth.

3. The electro-magnet, permanent magnet, and a tongue that swings toward and from the end of the core of the electro-magnet upon an axis at right angles to such core, as and for the purposes set forth.

114,658. — Electro-Magnet for Telegraph Instruments.—Thomas A. Edison, Newark, N. J., assignor to himself and Marshall Lefferts, New York city.

Claim.—1. A finger or stop operated by electro-magnetism, and arranged so as to block or release the armature according to the polarity of the electrical current passing through the magnet, substantially as specified.

2. The double electro-magnet, armatures, and stops, arranged substantially as specified, so that a current of one polarity shall allow one armature to vibrate and block the other, and the reverse, as set forth.

114,659. — Water-Wheel.—Mark Flanigan, Detroit, Mich.

Claim.—1. The combination of the direct-action wheel and the reaction-wheel within the case, said wheels carrying gear-wheels of diameters proportioned to their respective powers, said gear-wheels meshing with and impelling a common pinion or pinions upon a common shaft, all substantially as shown and described.

2. The wheel-case A, constructed and arranged for the reception of independent, direct, and reaction-wheels, substantially as described.

114,660.—Suspended.

114,661. — Grain-Door for Cars.—Laurence F. Frazee, Jersey City, N. J.

Claim.—The door C, fitted with a gate, D, and arranged on pivot-hinges and sliding rods, as described, when combined with the body of a car suitable for the transportation of grain or other similar substance in bulk.

114,662.—Iron Culvert.-Moody G. Freeman, Bloomington, Ill.

Claim.—An iron tunnel, culvert, or sewer, made in sections, and each section composed of any desired number of individual sections A A, constructed as described, with tongues *a*, grooves *b*, loops *d*, projections *e*, and flanges *f*, said individual section and also the main sections being arranged and connected together, substantially in the manner and for the purposes herein set forth.

114,663.—Sleigh-Brake.—George C. Fuller, Marcy, N. Y.

Claim.—A sleigh-brake, operated by the lever D, or its equivalent, and latch F, in combination, substantially as and for the purposes hereinbefore set forth.

114,664.—Nut-Machine.—George H. Fuller, Unionville, assignor to himself, Augustus J. Fuller, same place, and Roswell A. Neale and Amzi P. Plant, Southington, Conn.

Claim.—1. In combination with the punch D^1 and crowner D^2, the hammers *e f* and the movable anvil *a*, when arranged to operate upon the nut in the manner described, after it has been removed from the crowner, substantially as set forth.

2. In combination with the subject-matter of the first clause of claim, the punch *n*, operating to pierce the nut, as set forth.

3. In combination with the subject-matter of the second clause of claim, the finishing-hammer S and the slide R, as and for the purpose set forth.

114,665.—Household Implement.—Thomas Garrick, Providence, R. I.

Claim.—The improved implement, containing

the several tools enumerated in combination, as shown and described, as a new article of manufacture.

114,666.—STEAM-BOILER.—Frederick William Gordon, Ironton, Ohio.

Claim.—1. The combination of funnel-mouthed circulation-inducing diaphragm K *k* and diaphragm L, substantially as described, and for the purpose specified.

2. The combination of circular feed-tube N *a*, diaphragm K *k*, and diaphragm L, substantially as and for the purpose specified.

3. In the described combination with the tubes H, shell A, and diaphragm K, the inner shell B, elastic head C, and tube-sheet D, constructed and located in the described relation to each other, as and for the purpose specified.

4. In the described combination with the elements of the second clause of claim, the bent blow-off pipe P R, as and for the purpose described.

114,667.—LET-OFF MECHANISM FOR LOOMS. Thomas Gorrell, Warren, R. I.

Claim.—1. The picker-staff A, the part A^1 of which is constructed substantially as set forth, in combination with the cylindrical rollers B.

2. The combination of the warp-beam, ratchet, escapement, and lever H with the yielding bar I arranged on the breast-beam, and governed by the tension of the passing cloth, and adapted substantially as described to let off the warp.

114,668. — PUMP.— Thomas B. Goulding, Columbus, Ga.

Claim.—1. The combination and arrangement of the rod E' with the rods E E, rod *k*, and piston *b'*, in the manner and for the purpose herein described.

2. The piston *b'*, having its vertical movement controlled and regulated by means of the cross-bar *e*, rods *i i*, and flanges *i' i'*, in the manner and for the purpose herein described.

3. In combination with the foregoing elements, the movable piston-valve *b''* and fixed valve *b'''*, for the purposes herein set forth.

4. The construction and operation of a pump, in the manner and for the purpose herein described.

114,669.—SURGICAL INSTRUMENT FOR THE TREATMENT OF CLUB-FOOT.—Emory A. Grant, Louisville, Ky.

Claim.—1. The rigid laterally-curved sole A, provided with the heel-band C and the rigid convex resistance-plate D, substantially as and for the purpose specified.

2. The plate E, constructed as described, pivoted to the under side of the plate A, and arranged with relation to the convex resistance-plate, *d*, as shown and described.

3. The leg-braces F, provided with key-hole slots, and with the pads I I extending backward to form braces for the shoe or plate A, as shown and described.

114,670. — RAILROAD-CAR-AXLE LATHE.— George A. Gray, Jr., Cincinnati, Ohio.

Claim.—1. In the described combination with the sliding tool-rest F or F', the plate U, pad V, side rods W, cross-head X, springs *a a'*, and central screw Z, connected and operating substantially as and for the purpose specified.

2. In combination with the hollow shaft J and dog M of the axle, the slotted dog-plate or driver L P N, secured and operated substantially in the manner and for the purpose specified.

114,671. — MANUFACTURE OF YEAST AND THE APPLICATION OF THE SAME IN MASHING AND BREWING.—Duby Green, New York, N. Y.

Claim.—1. The process herein described in the manufacture and manipulation of yeast.

2. The process herein described of preparing and manipulation of the mash.

3. The process of applying carbonate of ammonia to the yeast to strengthen the same, in the manner herein described.

4. The process herein described to prevent too great fermentation of the yeast.

5. The process herein described to determine when the mash is dissolved.

6. The process and means herein employed to promote uniform fermentation of the yeast.

7. The within-described process of removing acid of vinegar from the yeast.

8. The within-described process of determining and ascertaining if the yeast is sour.

9. The construction and arrangement of the mash and yeast-tubs in all and each of their parts, in the manner and for the purpose herein described.

10. The combination, in a yeast-tub, of the main vessel A', jacket B' with the coiled pipes C, water-pipe inlet H, steam-pipe K, and outlet-pipes I and L, in the manner and for the purpose herein described.

11. The combination, in a mash-tub, of the vessel A, jacket B with the coiled pipes C, perforated bottom G, steam-pipe E, and outlet-pipe D, in the manner and for the purpose herein described.

114,672. — ENVELOPE. — Henry K. Gregg, Baltimore, Md.

Claim.—In an envelope made with a cord embedded wholly in the inside of the end or side thereof, providing the cord B with one or more knots on either or both ends thereof, substantially as and for the purpose described.

114,673.—FOLDING STEP FOR CARRIAGES.— George Gregory, New Haven, Conn., assignor to William H. Bradley, same place.

Claim.—1. The arrangement of the transverse sliding step D, combined with a slide, *e*, and its connection G, for operating the said step, substantially as described.

2. The combination of the transverse sliding step D and the folding step C, arranged in the frame A, with a slide, *e*, and connecting-rod F, substantially in the manner described.

114,674.—STOCK-MARKER.—Daniel A. Griffith, St. Charles, Mo.

Claim.—The stock-marker herein described, consisting of a pair of shears provided with the horizontal plate-blade B, of angular or other irregular form, and the vertical ribbon-blade C, fitted around and arranged to cut against the edge of the plate-blade in such a manner as to take a piece out of the ear of an animal at a single cut, substantially as specified.

114,675.—RAILROAD CAR.—John W. Griffiths, East Boston, Mass.

Claim.—1. The ribs A, made from one piece of wood, the ends abutting at *a*, bent in the form and secured in the manner described.

2. The frame of a railroad car, when constructed from the wooden bent ribs A, transverse sills B, rails C, D, and E, caps F, and sills G, the several parts formed, arranged, and secured together in the manner described.

114,676.—METHOD OF ATTACHING SPRINGS TO CARRIAGES.—Uriah S. Hall, Chemung, N. Y., assignor of one-half his right to Jesse Owen, same place.

Claim.—1. The combination and arrangement of the springs *a* attached to the rear axle and the vehicle-bed, and the spring *f* attached to the thills and the vehicle-bed, all constructed and connected substantially as and for the purposes set forth.

2. In combination with the foregoing combination, the center spring *e*, all constructed and arranged substantially as and for the purposes set forth.

114,677.—WINDMILL. — Loren Edwin Hazen, Fond du Lac, Wis.

Claim.—In combination with the wheel C, sails

G, and head d, the lever I, and fan J, substantially as and for the purposes set forth.

114,678.—MILLSTONE-CONDENSER AND VENTILATOR.—Daniel Heffner, Independence, Iowa.

Claim.—1. The conveyer-covering *m n*, in combination with the perpendicular plate *k*, and suitable gutters *p t*, and aperture *r*, all substantially as and for the purposes herein set forth.

2. The inclined covering *w w* over the tube J, in combination with the gutters *t t* and aperture *r*, substantially as and for the purposes herein set forth.

3. The arrangement, under the condenser-box G in the case H, of the plate *s* placed over the gutter *p*, substantially as and for the purposes herein set forth.

4. The combination of the stone B having floats *a*, and the curb C having floats *c a'*, substantially as and for the purposes herein set forth.

5. The combination of the stone B' and the curb C' having floats *a* and *a'*, and ring *f*, substantially as and for the purposes herein set forth.

6. The arrangement of the horizontal tube J provided with gutters *t t*, and the perpendicular tube K with slide *v*, when constructed and operating substantially as set forth.

114,679.—LOUNGE AND CHAIR COMBINED.— Siegmund Herschmann, New York, N. Y.

Claim.—The seat B, provided with a folding leaf, C, in combination with the swinging back and its extension brace, and with the side pieces G and arm-pieces H, all constructed and operating substantially in the manner herein shown and described.

114,680.—CARPET-SWEEPER. — Reuben C. Higgins, Boston, Mass.

Claim.—1. The cap or shield B, in combination with the revolving brush-shaft A of a sweeper, substantially as and for the purpose set forth.

2. The driving-wheels C C, supplied with the isolated teeth *c c*, brush shaft A with a pinion, and adjustable bearing-plates *a' a'* and *c' c'*, all constructed and arranged to operate substantially as and for the purpose set forth.

114,681.—HEAD-BLOCK FOR CARRIAGES.— David Hinman, Southington, Conn.

Claim.—1. The head-block A, when constructed in the manner and for the purposes substantially as specified.

2. The means employed for securing the spring to or upon the head-block, consisting of the band *g* fitting around said springs and over the lugs F, and held in place by the pin *f*, substantially as shown and described.

3. The means employed for connecting together the perch and head-block, consisting of the lug H, the ear I, and bolts L and M, in combination with the forked end of said perch, provided with the eyes *k*, substantially as and for the purpose shown.

114,682.—APPARATUS FOR CHARGING AND DISCHARGING GAS-RETORTS. — James John Holden, Bermondsey, England.

Claim.—1. A system of scoops and rakes, varying in number, for charging and discharging gas-retorts, mounted upon vertical spindles, the spindles passing through hollow or socket ends in said scoops and shovels, and forming an axis whereby they can be turned laterally to any position required, arranged and actuated substantially as set forth.

2. The arrangement and combination of parts constituting the modification of apparatus hereinbefore described, in which one or more scoops on one side of the machine balance one or more rakes on the other side, as and for the purpose substantially as set forth.

3. The herein-described arrangement of parts for transmitting motion to the traveler and the carrier by means of pinions gearing into racks on the rails, trams, or ways, substantially as set forth.

4. The employment of rollers or wheels working on flanged trams or rails, as described, for preventing lateral tipping of the carrier.

5. The compartments U U of the feeder K, provided with floor-valves V, chutes or hoppers T T with the hinged guard-plates X, combined and operating in reference to the scoops S, substantially as herein shown and described.

114,683.—PRESSURE-REGULATOR FOR WATER-WORKS.—Birdsill Holly, Lockport, N. Y.

Claim.—The upright cylinder A, connected with the water-mains by the pipe C, and having a piston, B, loaded with a chain, G, augmenting the weight in the ascent, substantially as and for the purpose above specified and shown.

114,684.—SOFA-BEDSTEAD.—Chancy F. H. Huff, New York, N. Y.

Claim.—The movable arm B' and lever C, when the latter is attached to the sofa-seat in such manner as to allow of the arms being brought together, substantially as described.

114,685.—ROTARY ENGINE.—Robert Hughes, Dangerfield, Texas.

Claim.—1. A double pitman-rod M, as combined with the valve L and piston M^2, and operating as herein described.

2. The valve-cylinders K, when arranged with the valve-box and pitman-rods M, and operating as herein described.

3. The outside pipe N, when connected and combined with the cylinder E and valve-cylinder K, as described, and for the purposes set forth.

114,686. — INSERTABLE SAW-TEETH.—William H. Ivens, Trenton, N. J., assignor to himself and William E. Brooke, same place.

Claim.—1. A saw-tooth of elliptic form for insertion in a corresponding recess in the saw-plate, substantially as described.

2. The tongue or fastening, constructed and operating essentially as shown and described.

114,687. — RAILROAD SWITCH.—James E. Kea, Magnolia, N. C.

Claim.—The slotted arm *b*, arms *c* turning loose on the shaft *a*, rods *d d* having a pin which works in the slot of said arm, links *h h*, and bar *f*, arranged to move and lock the rails *g g*, as shown and described.

114,688.—GRAIN-CLEANER AND SCOURER.— Erastus H. Kellogg, Mukwonago, Wis.

Claim.—1. The combination of the shaft C with disk W, stationary stopper V, revolving cylinders S T, and stationary cylinders R U, feed-collar Q, spouts O and F, and fan Y, all constructed and arranged substantially as shown and described, for the purpose set forth.

2. The arrangement, in the grain-cleaner and scourer herein described, of the shaft C, disk W, stationary stopper V, revolving cylinders S T, stationary cylinders R U, feed-collar Q, spout O, clamp P, lever L, and points Z on spout F, and fan Y, when all these parts are constructed and operated as shown, for the purpose set forth.

114,689.—DEVICE FOR SECURING COLLARS TO LAMPS, &c.—Edward S. Kennedy, Birmingham, (Buchanan Post Office,) Pa.

Claim.—1. The spring catches *b'*, in combination with the collar, cap, or top of a lamp or other article, to adapt it to be secured to the said article, substantially in the manner herein shown and described, and for the purpose set forth.

2. The notches or recesses *d*, formed in the outer

side of the neck of a lamp or other article of glassware to receive the spring catches b' of the collar, cap, or top of said article, substantially as herein shown and described, and for the purpose set forth.

114,690. — Bee-Hive.—William R. King, Shelbyville, Ky.

Claim.—1. The perforated division-boards H H, arranged on either side of the center of the chamber A, and the metallic cut-off I, arranged to operate as and for the purpose set forth.

2. The air-spaces W W, with ventilators Z Z, arranged in one end of the hive, with air-space W' and ventilator Z' of the upper chamber, substantially as herein set forth.

114,691.—Nut-Machine. — Philippe Koch, Manchester, assignor to James Buckingham, London, England.

Claim.—1. The pair of fixed cutters and the double-acting cutter, combined and operating together in such a manner that, without turning the heated iron bar, the blanks are cut off with all their square edges on one side.

2. In a machine for making untapped nuts, the duplex fixed and movable cutters, constructed and arranged as herein described, in combination with the fixed pin and movable cup, and all arranged to operate successively in the formation of the nuts, substantially as set forth.

3. In a machine for making untapped nuts, the duplex fixed and movable cutters, and the fixed pin and movable cup, in combination with the aforesaid two hammers, and all arranged to operate successively in the formation of the nuts, substantially as set forth.

4. In a machine for manufacturing untapped nuts, the duplex and double-acting mechanism, consisting of the aforesaid fixed and moving cutters, the fixed pins and movable cups, and the peculiarly-operating hammers, in combination with the cams, springs, and other devices herein described, or their equivalents, for imparting the required motion to the moving parts of the mechanism, substantially as herein set forth.

114,692.—Chemical Electric Telegraph. Marshall Lefferts, New York, N. Y.

Claim.—1. A derived circuit or shunt in the main circuit, in combination with a chemical decomposing telegraphic apparatus, substantially as set forth.

2. A local battery within the derived circuit, in combination with decomposing chemical telegraphic apparatus, for the purposes substantially as set forth.

3. A series of derived circuits in one main circuit, in combination with chemical decomposing telegraph apparatus, as set forth.

4. An adjustable resistance, placed in the main line, in combination with the derived circuit and chemical decomposing apparatus, substantially as set forth.

114,693. — Grinding Phosphatic Substances. — George T. Lewis, Philadelphia, Pa.

Claim.—The process of grinding phosphatic substances in the presence of water, as above described.

114,694.—Water-Meter.—John P. Lindsay, New York, N. Y.

Claim.—1. A water-meter, containing a circumferential measuring-chamber, D, formed between the case and an oscillating disk, C, into which chamber the water flows alternately on one side or the other of a partition, A^2, to be discharged by the wing C^2 of the oscillating disk at the opposite side of such partition, substantially as set forth.

2. A water-meter, containing the circumferential divided water-chamber D A^2, in which an oscillating wing, C^1, operates, and a valve arranged centrally within the chamber D to induct the water from the center to the circumference and discharge it from the circumference through the center of the meter, substantially in the manner set forth.

3. The valve, composed of the hollow case E and tubular plug F, divided by a partition, F', and containing two sets of induction-ports, *e f* and e' f', and two sets of eduction-ports, *d g* and d' g', to operate substantially as set forth.

4. The combination of the oscillating disk C, valve-case E, and tubular-divided plug F F', arranged relatively to one another, as set forth, so that they will move conjointly during the greater portion of each stroke of the disk, and be released from one another near the end of each stroke, to permit the valve-case to turn on the plug held stationary for the time being to reverse the position of the stroke.

5. In combination with the notches d^1 and e^1 in the arm E' of the valve-case E, and notch f^2 in the plug F, the trigger H and cam-groove H' in the head A^1 of the case, all arranged to operate substantially as set forth.

6. The combination of the oscillating disk C, wing C^2 thereon, and partition A^1 in the water-chamber D, substantially as set forth.

114,695.—Apparatus for Cleaning Tubes, Flues, &c. — Charles Lungley, Greenwich, England.

Claim.—1. The revolving cap, as shown in figs. 3 and 4, in combination with a steam-jet head for cleansing flues, substantially as herein shown and described.

2. The scraping-blades, as shown in figs. 5 and 6, in combination with a steam-jet head for cleansing flues, substantially as herein shown and described.

3. The flexible tube K attached to the rod X, when the same are constructed, arranged, and operate as herein shown and described.

4. The shield, fig. 10, for protecting the operator from the effects of heat while cleansing the tubes, substantially as set forth.

114,696.—Reverberatory Furnace and Heating Rims of Car-Wheels.—Thomas William Lyon, Bennett, Pa.

Claim.—1. The openings *b* and *d* in the upper and lower sides of the flue or chamber A^1, provided with doors b^1 and *f*, and rings *c* and d^1, all constructed and arranged substantially as and for the purposes set forth.

2. In combination with the opening *d* and ring d^1 in the lower side of the chamber or flue A^1, the pipe and perforated ring G' G, substantially as constructed and arranged, and for the purposes set forth.

3. The method herein described of heating the rim or outer portion of a car-wheel and keeping the central or inner portion comparatively cool by means of a furnace having the upper and lower openings *b* and *d*, provided with the rings *c* and d^1, and having a water-pipe and perforated ring, G and G', all constructed and arranged substantially as and for the purposes set forth.

114,697.—Whisk-Broom.—Robert Y. Martin, New York, N. Y., assignor to Eli P. Cooley, same place.

Claim.—A broom or brush made with a wrapping of flexible material, inclosing the head of the broom and extending along the wooden handle, and secured in place by means of a winding of wire, as set forth.

114,698. — Sad-Iron. — Robert McGrath, Philadelphia, Pa.

Claim.—1. The cast frame, composed of slotted bar B and the end bars C C, in combination with handle D and wooden arms *f f*, all arranged substantially as and for the purpose set forth.

2. The combination of the iron A with ear *a*, bar B with ears *b b* and pins *i i*, end bars C C, handle D, arms *f f*, and shield E, all constructed and arranged substantially as and for the purposes herein set forth.

114,699.—Gas-Regulator.—Joseph S. Merriken, Baltimore, Md.

Claim.—The combination of the bowl A, inlet-pipe B, outlet G, passage *h*, receiver C, valves *d i*, stem D, rod *k*, nut *e*, bar *p*, ball *m*, and pin *n*, all constructed and arranged substantially as and for the purposes herein set forth.

114,700.—Lathe-Chuck.—John C. Miller, Danville, Ky.

Claim.—1. The sliding rule C, provided with point *a* and lines *b d*, and sliding in a groove or recess on the face-plate A, substantially as and for the purposes herein set forth.

2. The sliding parallel bars G G, arranged upon one of the angle-plates B, substantially as and for the purposes herein set forth.

3. The flanges E E and parallel bars D D, arranged as herein described upon the face-plate A, in conjunction with the angle-plates B B, correspondingly grooved to insure the true movement of said plates, substantially as described.

4. The combination of the face-plate A, angle-plates B B, sliding rule C, bars D D, flanges E E, and sliding bars G G, all constructed and arranged substantially as and for the purposes herein set forth.

114,701, antedated May 4, 1871.—Lenticular Globe for Lamps.—George W. Morrison, New Albany, Ind.

Claim.—The combination of two multiple lens-segments or shells A B, placed the one within the other, and provided with a water or liquid-space left between them, with a suitable safety-valve, arranged substantially as and for the purposes described.

114,702.—Steam-Generator.—Thomas W. H. Moseley, Hyde Park, Mass.

Claim.—1. The combination of the central main A, radial branches E, vertical circulation-pipes G, couplings F, and the rods I, arranged substantially as and for the purposes set forth.

2. The central water-main A and flue-pipe D within the same, constructed and connected as described.

3. The annular steam-drum H, in combination with the distribution-pipes G and radial branches K, as explained.

4. The suspension devices K L, or their equivalents, in combination with a heater or generator, constructed substantially as herein described, for the purposes set forth.

114,703, antedated April 29, 1871.—Wrench.—Joseph N. Newell, Adrian, Mich.

Claim—1. The sliding jaw D, provided with the lip or tongue *b* and the curved T-shaped groove *d*, substantially as and for the purposes herein set forth.

2. The screw E passing through the pivoted block G, and provided on its front end with the roller *c*, substantially as and for the purposes herein set forth.

3. In combination with the pivoted block G and screw E, the spring H, arranged to operate substantially as and for the purposes herein set forth.

4. The combination of the stem A with handle B and stationary jaw C, the sliding jaw D, screw E, block G, and spring H, all constructed and arranged substantially as and for the purposes herein set forth.

114,704. — Bed-Bottom.—Otis S. Osgood, Burlington, Iowa.

Claim.—The spring C with the triple curves, and the ends fastened to the upper and lower slats and cross-bars B B in parallel lines, as shown and described, for the purposes set forth.

114,705.—Wrought-Iron and Steel Columns.—Charles H. Parker, Boston, Mass.

Claim.—1. An iron or steel column, composed of beams formed each substantially as specified, placed together and united substantially in the manner and by the means shown and described, whereby a column is made not tubular or hollow, but solid throughout, with no interior surfaces liable to oxidation.

2. A wrought-iron or steel column, made substantially as described and shown in figs. 1 and 2—that is to say, composed of two beams, each having a head, web, and flange, and a beam or beams having a head and web but no flange, the flanged beams being arranged at right angles with and on opposite sides of the web or webs of the other beam or beams, and the whole united by bolts passing through the opposite flanges and the web included between them, as set forth.

3. A wrought-iron or steel beam, provided with a head, diamond-shaped, with concave faces in cross-section, substantially as herein shown and described.

4. A wrought-iron or steel beam, composed of a flange, a head, diamond-shaped, with concave faces in cross-section, and an intervening web connecting said flange and head, as shown and set forth.

114,706.—Permutation-Lock.—Oliver E. Pillard, New Britain, Conn., assignor to Frederick H. North, same place.

Claim.—1. The combination of a set of permutation-tumblers, C, dog D, segment and rack *b c*, and slide *d*, all combined and operating together, substantially as described.

2. The combination of a set of permutation-tumblers, C, dog D, segment and rack *b c*, large tooth *h*, and slide *d*, all combined and operating together, substantially as described.

114,707.—Revolving-Disk Harrow.—Joseph F. Pond, Cleveland, Ohio.

Claim.—1. The semicircular bar B, to which thills or pole may be attached, in combination with the disk-bars A A and bar C, or its equivalent, to admit of the described adjustment, substantially as set forth.

2. The disk V, in combination with hub P, box R, and axle U, when placed or running obliquely to the line of motion.

3. In combination with disk V, hub P, box R, axle U, the yielding washer *c*, friction-washer *b*, and packing, substantially as and for the purpose set forth.

114,708.—Handle for Crosscut-Saw.—Robert Reid, Philadelphia, Pa., assignor to Henry Disston & Son, same place.

Claim.—The combination of the blade B having a rounded end, the handle with its socket for the rounded end of the blade, and the bolt D or its equivalent, by which the blade is forced into the socket.

114,709. — Apparatus for Carbureting Air.—George Rex, Philadelphia, Pa.

Claim. — 1. The retaining-power, consisting of the spring D and ratchet-ring E, with the pawls *b c* located within the drum F on the main shaft C of the fan, substantially as described.

2. The carbureter G, having its compartments and its supply and escape-pipes arranged as described, in combination with the blower, having the retaining-power applied as above set forth, the whole constituting a new and improved machine for producing gas from hydrocarbons, as herein described.

114,710. — Band Sawing-Machine.—John Richards, Philadelphia, Pa.

Claim.—A wheel, composed of a metallic hub, spokes, and rim, the latter surrounded by a layer of wood, which is itself covered by an elastic layer of leather, rubber, or similar material, the whole

being constructed as and for the purpose herein shown and described.

114,711. — Composition for Covering Steam-Boilers, &c.—John Riley, Troy, N. Y., assignor to "The United States and Foreign Salamander Felting Company."

Claim.—1. An improved composition for coating the exterior of steam-boilers, pipes, or other heated surfaces, and for filling safes, refrigerators, and similar articles, composed of abestus, lime-putty, charcoal, and pumice-stone, (or their equivalents,) combined and prepared as herein specified.

2. A composition for coating the exterior of steam-boilers, pipes, and other heated surfaces, and for filling safes, refrigerators, and similar articles, composed of abestus and lime-putty combined and prepared as herein specified.

3. The employment of asbestus when crushed to a fiber and mixed with lime-putty as a material for coating the exterior of steam-pipes, boilers, and other heated surfaces, and filling safes, refrigerators, and similar articles, for the purposes herein-before specified.

114,712. — Spring Bed-Bottom. — George W. Robbins, Dubuque, Iowa.

Claim.—1. The attachment of the springs to the bottom slats B by the prongs of the staples C passing through and spanning the cross-bar, and hooking over the bottom of the coil, substantially as specified.

2. The connection of the top slats to the springs and together by the transverse wire E, bent around the slats, and through the top coil, and extending from one slat and spring to another, all substantially as specified.

114,713.—Stove-Leg.—Benjamin F. Roberts, Lacona, Iowa.

Claim.—1. The stove-leg, provided with a wedge-shaped groove and an opening, substantially as herein shown and described.

2. The stove-leg, constructed as described, in combination with the lever B, having a spring, b^1, and tooth b^1, substantially as herein shown and described, and for the purpose set forth.

114,714.—Butter-Pail, &c.—Archie Robertson, East Rupert, Vt.

Claim.—An improved package for butter and similar articles, consisting of the vessel A having the annular top B, provided with the notches o and inclines n, and the cover C provided with the rod e, all constructed and arranged to operate as herein set forth.

114,715.—Washing-Machine.—Job Robinson, Lawrence, Kan.

Claim.—1. The adjustable bearings R, in combination with the rod Q and the rubber O, substantially as and for the purpose shown.

2. The double reservoir, formed of the sides A, the ends B and C, the bottom D, the partition E and strip F, and provided with the covers T supported by means of the rod t, substantially as and for the purpose shown.

114,716.—Lubricator.—Michael G. Ryan, Frostburg, Md., assignor to himself, R. C. Paul, and J. J. Hoblitzell, same place.

Claim.—1. A lubricator, composed of a reservoir for containing oil, secured upon and revolving with a bearing, and provided with a fixed tube which extends radially outward from the bearing surfaces nearly to the outer side of said reservoir, substantially as and for the purpose specified.

2. In combination with the tube D, the means employed for controlling the admission of oil thereto, consisting of the perforated tube E fitting into and made longitudinally adjustable within the same by means of the screw F, substantially as shown and described.

3. The hereinbefore-described lubricator for revolving bearings, consisting of the reservoir C, provided with the stationary tube D, the adjustable perforated tube E, and the supply-opening and plug H, substantially as and for the purpose set forth.

114,717.—Medical Compound for Cure of Rheumatism, &c.—Harvey Sawyer, Wilson, N. C., assignor to C. H. Sawyer.

Claim.—The above medical compound, substantially as described.

114,718. — Fountain.—Lazarus Schoeney, New York, N. Y.

Claim.—1. In a portable fountain, a suitably-arranged frame provided with pulleys, over and under which a cord or chain passes, to which is attached at each end a reservoir which shall serve alternately as a discharging and receiving-reservoir, in the manner and for the purpose described.

2. The hemispherical basin D, having a detachable water-tight base, I, provided with a double-chambered ejecting-tube and suitable valves, in combination with the reservoirs G G′ and their respective flexible connecting-tubes H H′, by means of which a continuous flow of the liquid is established in the manner and for the purpose described.

3. The reservoirs G G′, connected to the base of the hemispherical basin D so that the latter may be raised or lowered in the socket of its stem to raise or lower the jet of the stream when required, as described.

4. The reservoirs G G′, connected to the base of the hemispherical basin so that the flexibility of such connection will allow both of said reservoirs to be carried and secured above the ejecting-tube when it is desired for the purpose of ornamentation, to eject liquids of different colors through the double-chambered ejecting-tube, as described.

5. The frame A, provided with pulleys b b^1 b^2 b^3, with their traversing-cord F, the reservoirs G G′, and connecting-tubes H H′, in combination with the base I of the hemispherical basin D, said base having therein (and communicating with) the double-chambered ejecting-tube J and valves c c', the whole operating in the manner and for the purpose described.

114,719.—Spring Hinge.—Nathaniel Sehner, Hagerstown, Md.

Claim. — The combination, with a hinge, constructed as herein shown, of the spring E, without perforations, and bent at its inner end to allow of its being placed in position and secured after the leaf of the hinge is in position, substantially as herein shown and described, and for the purposes specified.

114,720.— Machine for Tenoning Spokes. Arthur Sherman, Poughkeepsie, N. Y.

Claim. — 1. The vertically-adjustable block F, provided with the projecting serrated rib d, and combined with the sliding wedge E and binding-screw a, substantially as herein shown and described.

2. The vertically-adjustable block G, combined with the sliding wedge H and adjusting-screw I, and plane-bed B, substantially as herein shown and described.

3. The vertical clamp L, provided with the elastic strip k at its lower face, substantially as and for the purpose herein shown and described.

4. The sliding fulcrum-block f, applied to the spoke-clamp L under the lever M, substantially as and for the purpose herein shown and described.

114,721. — Machine for Measuring, Stretching, and Skeining Silk.—Samuel K. Smith, Newark, N. J.

Claim.—1. The swift a, carrying the adjustable arm c, in combination with the swift b, lever e, cam t, and the gear mechanism, substantially as herein shown and described.

2. In combination with the shipping bark k, the gauge-pin j, and the nut h, operating automatically, substantially as and for the purposes set forth.

3. The combination and arrangement of the several parts operating conjointly, substantially as and for the purpose set forth.

114,722.—Extension Table. — Felix Souweine, New York, N. Y.

Claim.—The screw B, plate C, collars d d, bar F, nut J, tube K, slides g, and strips I, all combined as described with an extension table, for the purpose specified.

114,723. — Grain-Registering Device.—William Henry Stinson, Newbern, Iowa.

Claim.—The hinged or pivoted spout A, supplied with the valve or gate C, bail or handle D, semicircular metallic pieces a a, and projection g, in combination with the frame B B b b^1 b^2, mouthpiece B′, grain-register G, guide f, cavities c c, and pivoted sliding bar F, supplied with a semicircular slot, all constructed and arranged to operate substantially as herein described, for the purpose set forth.

114,724.—Balmoral or Laced Boots.—Lyman R. Stockbridge, Haverhill, Mass., assignor to himself and William W. S. Orbeton, same place.

Claim.—My improved balmoral or laced boot, having its upper or parts A and B formed and applied together, substantially in manner as described and represented, the said part A being formed with extensions or tongues b b to extend back of the ankle-point of the boot, and into corresponding openings a a made in the part B, as and for the purpose set forth.

114,725.—Stop-Valve.—Joseph H. Strehli, Cincinnati, Ohio.

Claim.—1. The seats H I and H′ I′, secured in the case by means of molten metal poured around them while they are clamped to the valve, substantially as and for the purpose set forth.

2. In combination with the seats secured as set forth in the preceding claim, the collars a' of the case, and fastening pieces J, substantially as and for the purpose set forth.

114,726.—Cultivator-Plow.—Leonard S. Tewell, Elbinsville, Pa.

Claim.—The curved beams C C and standards D D, with the handles G G attached to the standards and to the side beams, in combination with the straps B B and center beam A, constructed and operated as shown and described.

114,727.—Wood Pavement.—Hiram Howard Thayer, Philadelphia, Pa.

Claim.—1. A wooden pavement in which isolated blocks B, resting on foundation-pieces A, and having tongues extending between said pieces, are separated by transverse strips, also resting on said foundation-pieces, as set forth.

2. The tongued blocks B, adapted to the foundation-pieces, as described, and having shoulders, h h, for bearing on the division-strips C, as specified.

3. In a wooden pavement, the alternate arrangement of isolated blocks of different heights, in combination with a mass of concrete covering the lower blocks, and filling the interstices between all the blocks, substantially as described.

114,728.—Clothes-Line Holder.—Cyrus L. Topliff, Brooklyn, N. Y.

Claim.—The line-holder, composed of the jaws A B, of which one is fixed and the other movable, and of the hook or projection at the end, substantially as herein specified.

114,729. — Sash-Balance. — Casper Van Hoosen, Catskill, N. Y.

Claim.—1. The combination of the perforated metallic strips L L, arranged respectively upon the sash and weight, the wheels K K, and the weight H, when the latter is provided with a friction-roller and guide, all substantially as set forth.

2. The pulley-frames J J, when joined together, as described, in one, and secured to the pulley-stile by one screw, a, substantially as set forth.

3. The combination of the frames J J, pulleys or wheels K K, strips L L, weight H with roller I, knob M, lever N, bolts O O, and spring P, substantially as and for the purposes herein set forth.

114,730. — Elevating-Truck. — Daniel Wagner and William K. Bushnell, Titusville, Pa.

Claim.—The combination of the side beams A A, braced as shown and described, the stationary or movable spurs B B, wheels C C, axles D D, and legs D′ D′, all constructed and arranged substantially as and for the purposes herein set forth.

114,731, antedated April 27, 1871.–Sliding-Door and Sash-Guide. — George L. Waitt, Philadelphia, Pa.

Claim. — As an article of manufacture, the iron grooved traveling shoe, with roller secured in lugs cast on its inner side and passing through slots in its face, to work upon the rail underneath, all as described.

114,732.—Car-Coupling.–William K. Wallace, Crawfordsville, and Edward C. Rutledge, Shannondale, Ind.

Claim.—1. The coupling-pins D D, having beveled shoulders, as shown, blocks E E, and loops C C, constructed and arranged to operate substantially as shown and described.

2. The sliding block B′ and supports C′ C′, having a spring inclosed, in combination with a coupling link, substantially as shown and described.

114,733. — Metallic Roofing.—John C. Wands, Nashville, Tenn.

Claim.—The joint for metal roofing, consisting of the sheets a b, laps c d, and wires e, combined as described.

114,734.—Furnace for Reducing Ores.—Joseph E. Ware, St. Louis, Mo.

Claim.—1. The open-mouthed furnace, or one with lines of given angles up to the vertical, in combination with exhaust or exhaust and pressure-draughts.

2. Feeding fuel, ores, and other materials into a furnace through hoppers and over a jacketed hood, with a central hopper, either separately or mixed, to produce intended arrangement and results, in combination with an open-mouthed furnace, or an open-mouthed furnace combined with exhaust or other draughts.

3. The auxiliary tubes or ducts in the side walls or elsewhere, combined with the above-described furnace and combinations, for the uses specified or other to which applicable.

4. The dependent or wing-furnaces, or anything equivalent, combined with the furnace, parts, and methods already described.

114,735.—Guiding and Gauging Mechanism for Roller-Dies.—Hervey Waters, Boston, Mass.

Claim.—In combination with shaping die-rolls, a movable gauge-bar, arranged with reference to the rolls and to guide the blank, substantially as described, when such movable gauge-bar is provided with a guide or guides for positioning the blank laterally, substantially as described.

114,736. — Churn-Dasher. — Harvey L. Wells, Chillicothe, Mo.

Claim.—A churn-dasher of the configuration described, consisting of the vertical shaft A and con-

tral paddle portion B, carrying the triple fingers *c c c*, beveled as shown, and for the purpose specified.

114,737. — WEIGHING-SCALE.— Harlan P. Wheeler, Rochester, N. Y.

Claim.—1. The sectional and slotted poises 1, 2, 3, 4, constructed to fit each other in a nest form, and to be used either in divisions or jointly upon the principal scale-beam A, according to the standard of the substance to be weighed, substantially as described.

2. The adaptation of the sectional and slotted poises to the seat D of the subordinate scale-beam B, so as to form a constant balance for the scale, accordingly as the several divisions are not in use for weighing, substantially as described.

114,738.—BASE-BURNING STOVE.—Alexander White, Rock Island, Ill.

Claim.—1. A magazine for a base-burning stove formed in two parts, the upper part composed of two sheet-iron shells with a space between them, and the lower part cast whole or in sections, with hollow tubes or passages through the same, and the inner surface grooved, fluted, or corrugated, all substantially as and for the purposes herein set forth.

2. In combination with a magazine, constructed as above, the opening *g*, for the purposes set forth.

3. In combination with the magazine of a reservoir-stove, the bisected cover *k*, with arms n^1 n^2, operated by crank I and segments of cogs, all arranged substantially as and for the purposes herein set forth.

114,739.—TUYERE.—John Wood, Jr., Conshohocken, Pa.

Claim.—A tuyere, consisting of a wrought-iron pipe coiled to form a tube, substantially as described, and combined with an internal thin detachable tube, R, as set forth.

114,740.—TICKET-HOLDER.—E. M. Wright, Castile, N. Y., assignor to himself and Gardner Herrick, Albion, Mich.

Claim.—The case A, provided with the hinged double cover B, between the thicknesses of which the ends of the stamp-strips are held and are drawn out as stamps are required, substantially as herein specified.

114,741.—RAILWAY-CAR SPRINGS. — Silas Yerkes, Jr., Philadelphia, Pa.

Claim.—A centrally-pivoted revolving plate or bearing carrying a coiled or spiral spring, secured at one end thereto, and at the other to any suitable fixed point apart therefrom, in combination with a plate or bearing moving freely in a right line coincident with the axis of said revolving plate, and with levers or links interposed between the two, each in an inclined position in a plane tangential to an arc having said axis as its center, the whole arranged and operating substantially as herein set forth.

114,742. — BREECH-LOADING FIRE-ARM.— Jose Yglesias, New York, N. Y.

Claim.—The swinging breech-block B, having its hub provided with a series of recesses, *a*, in combination with the retractor R having a corresponding set of teeth, *o*, when constructed and arranged to operate as herein described.

REISSUES.

4,370.—DETERGENT COMPOUND.—William Dertrey, Boston, Mass., assignor to Henry B. Richmond, same place.—Patent No. 100,844, dated March 15, 1870.

Claim.—The manufacture or preparation of a compound, which I denominate "improved electric washing-crystal and wool-detergent," of the ingredients, substantially in the proportions, and for the purposes set forth.

4,371. — SHINGLE-MACHINE. — Walter R. Close, Bangor, Me., assignor to himself and Thomas N. Egery, same place.—Patent No. 91,826, dated June 29, 1869.

Claim.—1. The combination, in a shingle-machine, of the gear-wheels *d g*, eccentric guard *i k*, crank K, and pitman J, with a rising-and-falling counterweighted bed or carriage, G, substantially as herein set forth, for the purpose specified.

2. The combination of the pivoted bed G, cord P, and weighted walking-beam I, as and for the purposes set forth.

3. In combination with the above, the shingle-saw D and jointing-saw *b* upon the same shaft, both being driven by the same pulley, as herein described.

4,372.—METHOD OF CONSTRUCTING ARTESIAN WELLS. — Nelson W. Green, Amherst, Mass.—Patent No. 73,425, dated January 14, 1868.

Claim.—The process of constructing wells by driving or forcing an instrument into the ground until it is projected into the water without removing the earth upward as it is in boring, substantially as herein described.

4,373. — SYSTEM OF WATER-SUPPLY FOR CITIES.—Birdsill Holly, Lockport, N. Y. Patent No. 94,746, dated September 14, 1869.

Claim.—1. The above-described combination of contrivances for furnishing a city with water for ordinary purposes without the use of a reservoir, or stand-pipe, or enlarged container of any kind, and which can, by an instantaneous augmentation of pressure in the main, be converted into an efficient apparatus for the extinguishment of fires, substantially as above set forth.

2. The above-described method of supplying a city with water for either domestic uses or for the extinguishment of fires—that is to say, by pumping the water directly into the mains with contrivances by which the pressure on those mains may be readily increased or diminished, or preserved uniform, all at the will of the operator, substantially in the manner above set forth, and by mechanism substantially such as is shown and described.

3. In the above-described apparatus, the use of an auxiliary pump A′, in combination with a connecting-pipe D^3, by which water may be raised to different levels in such a way that the pressure in the mains on the higher level may be kept equal to those on the lower, substantially as described.

4. The use of a main, B^3, with smaller branch pipes, L L, running through the several streets, and terminating in a large main, B^3, in combination with the valves *p p*, substantially as and for the purpose above shown.

4,374. — STEAM-ENGINE. — John Houpt, Springtown, Pa.—Patent No. 90,265, dated May 18, 1869.

Claim.—1. A steam-reservoir, provided with inlet and outlet-pipes h and i, communicating with a cylinder, in which is a weighted piston, H, and surrounded by a casing or jacket, B, through which heated products of combustion are arranged to pass, all substantially as hereinbefore described.

2. A pipe, *r*, arranged in respect to the cylinder F and its piston, as specified.

3. In the described combination of steam-cylinders of high and low pressure, and apparatus for superheating, a supplemental cylinder with piston, in combination with said superheater, whereby a varying amount of steam can be retained at an even pressure, substantially as set forth, to be again used for driving a second engine.

4,375.—PROCESS AND APPARATUS FOR DISTILLING, SEPARATING, AND PURIFYING PETROLEUM. — Edward G. Kelley, New York, N. Y., and Augustus H. Tait, Jersey City, N. J., assignors, by mesne assignments, to Charles Pratt, New York City.—Patent No. 32,568, dated June 18, 1861.

Claim.—1. The process herein described for distilling hydrocarbon-oils, consisting in flowing the oil in a stream through a series of retorts arranged so that the oil enters the retort in the cooler part of the furnace and is subjected to an increasing temperature as it flows, so that vapors of different densities are successively removed, as set forth.

2. The use in a retort or still for distilling hydrocarbons, of steam or superheated steam in connection with fire, so as to assist in heating the oil and removing the vapors as formed.

3. The method herein described for condensing the vapors of petroleum, consisting of injecting into them water or equivalent cold liquid in the form of spray or shower, substantially as described.

4. A series of retorts or stills arranged in a furnace and connected together, so that oil may be distilled continuously by being fed into the retort or still in the colder part of the furnace, and flowing successively through the retorts in the hotter portions of the furnace, and thereby separating the different portions of oil according to the temperature at which they become vapor.

5. The arrangement of pipes and traps, whereby oil and water are automatically separated and removed from the condenser, substantially as set forth.

6. A series of retorts or stills, A, connected together at alternate ends, in combination with a series of draw-off pipes, *h*, so that the vapor generated in each still is immediately drawn off, as set forth.

7. A condenser for oil-vapor, composed of chamber E, in combination with spray-pipe G, or its equivalent, so as to operate substantially as set forth.

8. The process herein described for purifying petroleum, consisting in minging steam with the oily vapors, and condensing them by a jet or spray of water, thereby washing out any offensive odor, as set forth.

9. The combination of one or more stills or retorts, A, steam-pipe D, and one or more condensing-chambers, E E′, substantially as set forth.

10. The arrangement of the pipe e^*, in combination with the range of stills or retorts A, and connecting-pipe, substantially as described.

11. A jet or condenser for treating the vapors which pass off with the non-condensible gases, for the purpose specified.

4,376.—BINDER FOR SEWING-MACHINES.— William Nelson Martin, Boston, Mass.— Patent No. 109,366, dated November 15, 1870.

Claim.—1. The combination of the arms *a a′*, guide *b′*, slide *b*, with the presser-foot provided with the slide *d* and hooked spring *c*.

2. The adjustable curved plate or bar *e′*, in combination with the arms *a a′* and guide *b′*, constructed and arranged substantially as and for the purpose specified.

3. The hooked spring *c* and slide *d*, in combination with and adjustable on the presser-foot, as and for the purpose described.

4,377.—HARVESTER-RAKE.—J. Russell Parsons, Hoosick Falls, assignee, by mesne assignments, of Charles G. Dickinson, Poughkeepsie, N. Y.—Patent No. 22,786, dated February 1, 1859.

Claim.—A gathering, gaveling, and delivering apparatus, substantially as described, connected with and operated by the gears of a harvesting-machine, and which first moves along parallel with the front of the platform to gather the cut grain, and then, compressing it and holding it compressed, carries it in a line oblique to the front of the platform, and delivers the gavel on the ground clear of the harvester.

4,378.—CAR-TRUCK.—Charles D. Tinsdale, Boston, Mass., assignor, through mesne assignments, to Charles Bockus and Samuel Shackell, same place, and Henry Shackell, Montreal, Canada.—Patent No. 44,694, dated October 11, 1864.

Claim.—1. In a car-truck having sliding wheels, a transverse slot or slots in the hub or sleeve, and a corresponding groove or grooves in the axle to permit the wheels to be slid upon the axle and retained in position for either a wide or a narrow gange track, by a suitable chock or bolt driven into either groove in the axle and a corresponding groove or slot in the hub or sleeve.

2. The double catch D, made with the two locking projections *g h*, working in connection with one or two grooves in the axle, substantially as shown and described.

3. A contractile band or encompassing-spring, E, for retaining the locking device in position, substantially as described.

DESIGNS.

4,867.—CARPET-PATTERN.—Joseph Barrett, New York N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,868.—CARPET-PATTERN.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,869.—CARPET-PATTERN.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,870.—CARPET-PATTERN.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,871.—CARPET-PATTERN.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,872.—CARPET-PATTERN.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereun-

to annexed, when made by being inwrought into two or three-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,873.–CARPET-PATTERN.–Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,874.—COUNTER WEIGHING-SCALES.—Pietro Cinquini, Meriden, Conn., assignor to Charles Parker, same place.

Claim.—The design for base of weighing-scale, as shown.

4,875.—PACKAGE.–Dundas Dick, New York, N. Y., assignor to Maria A. Mauger, same place.

Claim.—The design for a package, as set forth.

4,876.—Suspended.

4,877.—CHILD'S TOY.—John T. Duff, Pittsburg, assignor to himself, John F. Greer, same place, and David H. Chambers, Birmingham, Pa.

Claim.—The design for child's toy, known as "pin-wheel," shown and described in the accompanying drawing.

4,878.—CARPET-PATTERN.–John Fisher, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,879. — CARPET-PATTERN.—Alfred Heald, Philadelphia, Pa., assignor to McCallum, Crease & Sloan, same place.

Claim.—The design for a carpet-pattern, substantially as described, and as represented in and by the accompanying drawings.

4,880. — CARPET-PATTERN.—Alfred Heald, Philadelphia, Pa., assignor to McCallum, Crease & Sloan, same place.

Claim.—The design for a carpet-pattern, substantially as described, and as represented in and by the accompanying drawings.

4,881. — CARPET-PATTERN.—Alfred Heald, Philadelphia, Pa., assignor to McCallum, Crease & Sloan, same place.

Claim.—1. The design for the members A, substantially as shown and described.

2. The design for the members B, substantially as described and represented.

3. The design for the space C between the members A and B, with its ornaments *f* and *g*.

4. The design for the whole pattern, including the members A and B and the ornamented space C.

4,882. — CARPET-PATTERN.—Alfred Heald, Philadelphia, Pa., assignor to McCallum, Crease & Sloan, same place.

Claim.—1. The design for the members A, substantially as shown and described.

2. The design for the members B, substantially as described and represented.

3. The design for the border D with its square and diamond-shaped figures H and F.

4. The design for the whole pattern, including the members A and B and border D with its figures.

4,883. — CARPET-PATTERN.—Alfred Heald, Philadelphia, Pa., assignor to McCallum, Crease & Sloan, same place.

Claim. — 1. The design for the tablets A, as shown and described.

2. The design for the entire carpet-pattern, as described and illustrated.

4,884.—HAY-RACK.—James A. Herron, Talley Cavey, Pa.

Claim.—The shape and configuration for a hay or grain-rack herein described, and shown in the accompanying drawing.

4,885.–HEATING-STOVE.–Shubael E. Hewes, Albany, N. Y.

Claim.—The design for heating-stoves, substantially as above set forth.

4,886.—SCREEN FOR A STEAM-HEATER.—Calvin L. Hubbard, New Haven, Conn., assignor to the New Haven Steam-Heating Company, same place.

Claim.—The design for screens, as shown.

4,887.—CARPET-PATTERN.—Hugh S. Kerr, Philadelphia, Pa., assignor to Israel Foster, same place.

Claim.—1. The design for the figures A, substantially as shown and described.

2. The design for the figures B, substantially as described and illustrated.

3. The design for the whole pattern, including the figures A and B.

4,888.–ORNAMENTATION OF PIANO-FRONTS, William Leigh, Bridgeport, Conn.

Claim.—The design executed on glass for a piano-front, as shown.

4,889.—CARPET-PATTERN.—Levi G. Malkin, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,890.—CARPET-PATTERN.—Charles T. Meyer, Newark, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

4,891.—CARPET-PATTERN.—Charles T. Meyer, Newark, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

4,892.—CARPET-PATTERN.—Charles T. Meyer, Newark, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths carpets, or other fabrics, shown and described.

4,893.—CARPET-PATTERN.—Charles T. Meyer, Newark, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

4,894.—CARPET-PATTERN.—Charles T. Meyer, Newark, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

4,895.—PLATE OF A COOKING-STOVE.—Alvin M. Mothershead, Indianapolis, Ind.

Claim.—The design for a plate or plates of a cooking-stove, as herein shown and described.

4,896.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,897.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Pine Valley Company, Milford, N. H.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,898.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Pine Valley Company, Milford, N. H.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain or other carpeting in the form similar to the photographic prints accompanying this specification.

4,899.—FRUIT-BASKET.—Sanford D. Payne, Kasota, Minn.

Claim.—The design for a fruit-basket, as shown.

4,900.—COOKING-STOVE OR RANGE.—Nicholas S. Vedder, Troy, and Tobias S. Heister, Lansingburg, assignors to John A. Goewey, Albany, N. Y.

Claim.—1. The initial letter "G," shaped and arranged upon a plate, panel, or leg of a stove or range, so as to appear as herein set forth.

2. The initial letters "J. A. G.," shaped and arranged upon a plate or panel of a range or stove, as herein described.

3. The ornamental corner-piece and border *b c*, shaped and arranged on a plate or panel of a stove or range, as set forth.

4. The ornamental corner-piece and border *d e*, shaped and arranged on a panel or plate of a stove or range, substantially as described and shown.

5. The ornamental molding *f*, arranged between and in relation to the moldings *g* and *h*, on a plate or door of a range or stove, as described.

6. The row of ornamental figures *i*, arranged along and upon the upper portion of a plate or plates of a stove or range, as set forth.

4,901.—THILL-COUPLING.—Henry Newby, Cincinnati, Ohio.

Claim.—The design for a thill-coupling, as herein represented, the same being formed with elliptic curves A B and a bifurcated end, C C'.

4,902. — PLATE OF A COOKING-STOVE.—John R. Rose and Edward L. Calely, Philadelphia, Pa., assignors to Cox, Whiteman & Cox, same place.

Claim.—The ornamental design for the plates of a cooking-stove, as shown, the same consisting of the following elements, viz.: First, the bass-relief cross D, the convex surface d^1, and the rectangular flat plane d^2, substantially as shown. Second, the border d^4, consisting of base-relief points arranged in rows crossing each other like lattice-work, substantially as shown. Third, the design and configuration of a cook-stove with plates A B C, having respectively the edge-moldings *a' b' c'*, as shown.

TRADE-MARKS.

249.—CHEVIOT SHIRTINGS.—Fisk, Clark & Flagg, New York, N. Y.

250.—BOOT AND SHOE LASTS.—Joel McComber, Chicago, Ill.

251.—PLOWS AND CULTIVATORS.—"Moline Plow Company," Moline, Ill.

252.—DYEING AND COLORING COMPOUNDS. William H. Place & Co., Providence, R. I.

253. — SHIRTS, DRAWERS, &c. — Leopold Sternberger and Samuel Sternberger, Philadelphia, Pa.

ISSUE OF MAY 16.

PATENTS.

114,743. — PAPER-BAG MACHINE.—Alfred Adams, Chagrin Falls, Ohio.

Claim.—1. The combination of the table A, leaf B, and treadle D, or their equivalents, substantially as and for the purpose set forth.

2. The combination of the table A, leaf B, and box C with its adjustable false bottom or support E, or their equivalents, substantially as and for the purpose set forth.

114,744. — APPARATUS FOR CARBURETING HYDROGEN-GAS. — Jacob Ambuhl, Morristown, N. J.

Claim.—1. The elastic neck or connection C of the top B applied to the tank A, as and for the purpose specified.

2. A three-way cock, I, connected with the pipe leading from the tank, combined, as described, with the pipe holding the platinum-sponge and the conveyer-pipe H, for the purpose specified.

3. The granulated charcoal saturated with oil, arranged in a series of connected pans, combined with charcoal and soda, arranged in a preceding pan connected therewith, for the purpose specified.

114,745.—CAR-REPLACER.—Charles C. Ash, Manor Hill, Pa.

Claim.—In combination with a shoe or frog, A, with its appliances as described, and with the switch *e* pivoted thereto, the pivoted support or rest *f* operating in connection therewith, substantially as and for the purpose described.

114,746.—CARRIAGE-HOLDBACK.—William Rondeau Baker, Wellington Square, Canada.

Claim.—1. The arrangement and combination of the double-flanged slotted roller B and hook A, substantially as and for the purpose described, or any other purpose to which it can be applied.

2. The combination of the hook A and socket *i* L, figs. 4 and 5, as shown, for the purposes set forth and specified.

114,747.—HARVESTER.–John Barnes, Rockford, Ill.

Claim.—1. The combination of the continuously-rotating shaft L, the oscillating rake-handle passing through said shaft at an acute angle thereto, the crank arm on the rake-handle, and the cam, all these members being constructed and operating as described.

2. The combination of the double-cranked arm rocking in the lever-handle, its link h^1, spring h^2, and rack H, all constructed and operating as described.

114,748. — SHUTTER-WORKER.—Henry H. Barr, Harrisburg, Pa., assignor of one-half his right to John Kerper, same place.

Claim.—The combination of the shifting-lever W W^1 W^2, provided with enlarged hub about the

screw A, with the bifurcated trip-lever H D, and the pin B, when these parts are constructed as described, and when the handles of the levers are arranged to facilitate operating them in the manner as and for the purpose herein set forth.

114,749. — HARVESTER-BINDER. — Joseph Barta, La Crosse, Wis.

Claim.—1. The combination of the rake C, pivoted arms D, connecting-rod E, pivoted arm F, friction-wheel or roller G, channeled plate H, movable piece A^1, and adjustable catch-bar I with each other and with the reel B and platform A of a harvester, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the plate or bar K, pivoted adjusting-rod L, arm or lever N, rope or chain O, guide-pulley P, lever Q, and cam R with each other and with the platform A, reel B, reel-rake C, and shaft S of a harvester, substantially as herein shown and described, and for the purpose set forth.

3. The gathering-rake X W, elbow-lever V, connecting-rod U, and crank T, in combination with the adjusting guide-rod L, platform A, reel-rake C, and shaft S, substantially as herein shown and described, and for the purpose set forth.

4. The finger A^1, holding-cord C^1, guide-pulley E^1, rubber strap F^1, guide-pulley G, curved fingers D^1 H^1, connecting-bar J^1, lever K^1, projection L^1, cam M^1, projection or pin N^1, lock-bar O^1, spring P^1, projection or pin Q^1, and cam R', in combination with each other, with the gathering-rake X W, shaft S, and with a knot-tying device, substantially as herein shown and described, and for the purpose set forth.

5. The knot-tying device, consisting of the holding-clamp T', twister U', plate V', movable clamp W', pivoted plate X', spring Y', gear-wheel Z', sliding rack-bar A^2, pivoted bar B^2, cutting-blade C^2, guard-plate D^2, curved hook E^2, slitted beveled plate F^2, cam G^2, cam H^2, arm I^2, and lock-bar J^2, said parts being constructed and operating in connection with the finger A^1, substantially as herein shown and described, and for the purpose set forth.

6. The combination of the pivoted lever L^2, connecting-bar M^2, and lever N^2 with the pin K^1 attached to the plate V' of the knot-tying device, and with the cam R attached to the shaft S, substantially as herein shown and described, and for the purpose set forth.

114,750. — STICKING OR ADHESIVE PLASTER.—Jenyns C. Battersby, New York, N. Y.

Claim.—The elastic contractible adhesive plaster, constructed, used, and applied substantially in the manner and for the purposes described.

114,751. — CARRIAGE TOP.—William Bauder, Circleville, Ohio.

Claim.—1. The upright brace E of a carriage top, provided with the projecting tongues *g* and *i*, substantially as and for the purpose herein shown and described.

2. The back-brace G, having the lip *h*, and combined with the upright brace which has the projecting tongues *g* and *i*, as set forth.

114,752.—PAPER BOX.—Peter Beer, Detroit, Mich.

Claim.—The paper box described, consisting of the pieces A and B and the case C, all constructed, arranged, and combined, substantially as and for the purpose set forth.

114,753.—COAL-SCREEN.—Elbridge G. Belknap, Philadelphia, Pa.

Claim.—1. The construction and arrangement of the upright bars, by which an open screen is formed in both angles N N, as shown and described.

2. In combination with the screen, as described, the brakes B B and K, guides *g g*, hopper H, drawers L and M, and screen-box A, all constructed as shown and described.

114,754.—GEARING FOR OPERATING DRILLS. Ambrose Blatchly, San Francisco, Cal.

Claim.—The combination and arrangement of the pulley X, shaft D, gears E and F, shaft G, coupling and universal joint *a*, socket-shaft L, angular bar M with universal joint *c*, shaft *e*, gear *d*, and cross-shaft N, the whole constructed to operate as described, for the purpose set forth.

114,755. — CAR-COUPLING. — Edward Bolman and George Simpson Watson Clarke, Halifax, Nova Scotia.

Claim.—The body *a*, having the pawl *c*, provided with the recess *e* for holding the link *l* in a horizontal position, as described, and for the purpose set forth.

114,756.—LOOM.—Samuel Boorn, Lowell, Mass.

Claim.—The combination of the spring G, the arm I, the two hooked levers L M, the abutments N O, the fingers *b c*, and stud *d*, or the equivalent of such mechanism, with the spring F, shaft D, and arms E E', all being arranged substantially in manner and to operate as and for the object or purposes as hereinbefore specified.

114,757.—TICKET-BOX.—Nathan C. Burson and John W. Robertson, Onarga, Ill.

Claim.—The ticket-box *a* described, consisting of the drawers *b* and *d*, partitions *i*, pegs *c*, and frame *e*, arranged, operating, and constructed as and for the purposes set forth.

114,758.—RAILWAY-CAR COUPLING.—Peter Campbell, Carrolltown, Pa.

Claim.—The combination of the slotted drawhead B *b* and the lever pivoted thereto, and operating substantially as herein described.

114,759. — COMBINED TOOL. — George J. Capewell, Cheshire, Conn.

Claim.—The combination of the handles *d d*, pivot *b*, bolt *j k*, spring *m*, and thumb-nut *e*, the parts *d d* being constructed to form wrenches for round and square bodies, and provided with a screw-driver, the bolt spring and nut forming the implement into a hand-vise, all substantially as herein described.

114,760, antedated May 12, 1871.—COTTON-BALE TIE.—William J. Carroll, Natchez, Miss.

Claim.—The cotton-bale cleat D, herein described, provided with the steps *a b* and the curved hook E, in combination with the band A and slot B, when constructed and arranged as shown, for the purpose set forth.

114,761.—CEMENT FOR COATING AND SEALING COFFINS, &c.—Isaac Charles, Allegheny City, Pa.

Claim.—A cement composed of the hereinbefore-named ingredients, in about the proportions specified, and prepared and used in the manner and for the purpose set forth.

114,762.—GRATE FOR STOVES, &c.—John Churchman, Burlington, N. J., assignor to himself and Carbon Stove Company, same place.

Claim.—The grate described, provided with openings D and A and the removable part *z*, the latter being adapted to close the opening D, as described.

114,763.—ENAMELING GAS-RETORTS, &c.—Decius W. Clark, Chicago, Ill.

Claim.—The process herein described for enameling retorts and other like articles by fusing upon them a coating of clay, substantially as described.

114,764. — WASHING-MACHINE. — Nathan Govo Clary, Northfield, Minn.

Claim.—1. The dashers F^1 F^2, one longer than the other, and both provided with extensions *h h* pivoted in corresponding grooves *f f*, in which they turn up or down to increase or diminish the length of the dashers, and being held in either position by clasps *m*, which enter slots *n*.

2. The rubbers *a a*, when arranged alternately vertically and diagonally, in combination with the dashers F^1 F^2, when the same are constructed and operated substantially in the manner as herein shown and described.

114,765.—MACHINE FOR MORTISING BLIND-STILES. — Laroe M. Collins, Lebanon, N. H.

Claim.—1. The method herein described of feeding the stile by means of the shaft F I, arm E, shaft L, gear-wheel K J, and sides D provided with ratchet-teeth, as shown and described.

2. The method herein described of holding the stiles by means of the binder U, lever V, spring W, and cam X, as shown and described.

114,766.—LAMP-SHADE.—Michael H. Collins, Chelsea, Mass.

Claim.—1. A shade for a lamp or Argand burner made of sheet metal, with flexible springs, constructed in segments which are so shaped and firmly and rigidly united by seaming or riveting as to form the frustum of a cone or pyramid which is neither collapsible, expansible, or contractible, the springs and base of each segment being made of a single piece of metal, and the springs of such length and elastic force as to render the shade applicable to all ordinary lamp-chimneys, substantially as set forth.

2. A shade for a lamp or Argand burner provided with an alternating series of flexible metallic arms or springs of different lengths, when arranged as described, and operating as set forth.

3. In a shade made of thin sheet metal and formed with one or more perforations to receive tablets or transparencies, forming such openings with a serrated bezel, or with a series of teeth, by which such tablets, &c., may be securely affixed to the shade, in manner as set forth.

114,767.—CULTIVATOR.—John H. Conley, Moingona, Iowa.

Claim.—The two transverse iron arches D D, fastened together at each end in a common pair of sockets C C, and diverging upwardly toward the top, combined, as described, with the axles, as and for the purpose specified.

114,768. — SCROLL-SAWING MACHINE.—George Cooke, Napier, Canada.

Claim.—The combination of the frame A, table B, balance-wheel C, crank-pin D, pitman E, crossheads F I, slides G J, saw H, pulleys K L M, air-pump N, crank-pin *b*, rod *c*, and belt O, constructed and operating substantially as described and shown, for the purposes set forth.

114,769.—FIRE-PROOF ROOFING.—John B. Cornell, New York, N. Y.

Claim.—The slates C, corrugated plates A, and plastering E, combined, as described, to form a fire-proof roof.

114,770.—COMBINED TOOL.—John W. Currier, Newbury, Vt.

Claim.—The combination in one instrument of a hammer, nail-puller, pliers, wrench, screw-driver, nest of wrenches, awl, and eyelet maker, as specified.

114,771.—ELECTRIC TELEGRAPH.—Ludovic Charles Adrien Joseph Guyot D'Arlincourt, Paris, France.

Claim.—1. The mode of producing the synchronism or synchronous action of the two apparatus, the manipulator and the receiver, by causing the latter to work faster than the former, and arresting the same mechanically at every turn, when it is again started electrically by a current from the other at the moment when the two apparatus are at the starting points, by the use of two independent sets of gear, substantially as described and represented at figs. 1, 2, 3, and 4.

2. The employment of the circular vibration of a diapason, or the rectilinear vibration of a cord to regulate the clock-work in general telegraphic apparatus, substantially as described and shown at figs. 7, 8, 9, 10, and 11.

3. The gearing systems set forth and represented, figs. 1, 2, and 5, to change the relative speed of the two apparatus so as to transform the manipulator into receptor, and *vice versa*.

4. The combination or union of an inductive-coil or apparatus with an electro-magnet, so as to constitute a transferring relay, as described and shown, fig. 14.

5. The arrangement, substantially as described and represented at figs. 16, 17, 18, 19, 20, 21, 22, for application of my system to flat horizontal messages instead of on a circular rolled-up paper.

114,772.—FEEDER FOR WAX TAPERS.—Samuel G. Dare, New York, N. Y.

Claim.—1. The feed-wheels, having their teeth constructed and arranged substantially as described, to gear with each other and to gripe the wick between them.

2. The combination, substantially as described, with the wheels G I of the false head E having a funnel-shaped central opening.

114,773, antedated May 1, 1871.—ELASTIC TYPE. — Henry J. Davies, New York, N. Y.

Claim.—An elastic-faced type or printing-block having its elastic face composed of two or more layers, one or more of which is attached to the back not only behind the projecting printing surfaces, but to the surrounding portions and to the interstices between said surfaces, substantially as herein described.

114,774. — REVERBERATORY FURNACE. — Joseph Davis, Pittsburg, Pa., assignor, by mesne assignment, to himself, John Rigby, and A. Filson Dalzell.

Claim.—1. A reverberatory furnace having the top or arch resting upon the jamb-wall, and a series of openings in the jamb-wall communicating with the drop-flue, substantially as and for the purposes described.

2. A series of openings in the back wall of a reverberatory furnace, through which to operate devices for opening and closing apertures in the jamb-wall of the furnace, substantially as described.

114,775.—ACID-BOTTLE FOR FIRE-EXTINGUISHERS.—John C. Davison, Chicago, Ill.

Claim.—As a new article of manufacture, the bottle herein shown and described, having one or more grooves or creases, or other indentation, so that it can be more easily broken under pressure, substantially as and for the purpose specified.

114,776.—PURIFYING WATER FOR USE IN STEAM-BOILERS, &c.—George C. Louis Degenhardt, Williamsburg, N. Y.

Claim.—The application, to the feed-water heater of a steam-generator, of diluted sulphuric acid, in the manner and for the purpose specified.

114,777. — RECLINING CHAIR. — Edward Dietz, Philadelphia, Pa.

Claim.—1. The combination of the side frames A A having fixed arms and an immovable seat, of a hinged back, B, a hinged leg-rest, *c*, and rods *m*

extending beneath the seat and connecting the back and leg-rest, as set forth.

2. The bolts *r*, arranged within the back B, in combination with the curved ratchets arranged on the inner sides of the side frames, and with devices, substantially as described, for operating the bolts.

3. The combination, with the back B, of angle-irons, constructed with sockets for the bolts, and adapted to the back, as specified.

114,778.—SCROLL-SAWING MACHINE.—William H. Dobson, Rochester, N. Y.

Claim.—1. The arrangement in a sawing-machine of the guide F, provided with the arm *g*, cross-head *k*, and slotted segment A, as herein shown and described, and for the purposes set forth.

2. As an improvement in saw-strainers, the elastic or yielding cushion *b*, provided with spreaders *s*, in combination with the straining-cords *c*, for the purposes set forth.

114,779.—MOLDING-PLANE.—John E. Donaldson, Montezuma, Ind.

Claim.—The serpentine plane herein described, when constructed, arranged, and used substantially as set forth.

114,780.—KILN FOR REBURNING BONE-BLACK.—Edward P. Eastwick, Baltimore, Md.

Claim.—1. The arrangement, within the retort of the kiln or within the retort and cooler combined, of distributing plates C, operating to intercept the descending mass at its center and to divert the same toward the sides of the retort, or sides of it and the cooler combined, substantially as specified.

2. The distributing plates C, set to occupy an inclined position relatively to the sides of the retort A, so as to direct the mass from one side to the other thereof, essentially as herein set forth.

3. The combination of the rod or rods D and upper support E with the distributing plates C and retort A, substantially as specified.

114,781.—SPINNING-TOP.—Philip Eley, New York, assignor to Isaac Cole, Brooklyn, N. Y.

Claim.—1. A top self-revolving, by the power of steam, applied in the manner of Hero's engine, substantially in the manner herein set forth.

2. The top A, having the pipe T, with its superheating part *f t*, substantially as and for the purpose described.

3. The lamp B, with its gas-chamber M and movable frame L, or its equivalent, in combination with the top A, arranged so as to operate substantially in the manner and for the purpose specified.

114,782.—DOOR-BOLT.—Ferd. Engelbrecht, Memphis, Tenn.

Claim.—The pivoted spring-lever G *g'* J, notched bolt E, and spring lock-bolt H I, combined, as described, with the lock D d^1 d^2, for the purpose specified.

114,783, antedated May 2, 1871.—SLEIGH-VELOCIPEDE.—William Erd, New Ulm, Minn.

Claim.—In combination with a sleigh having the recesses E E for the reception of the upper portions of the wheels, and the levers F F, the adjustable axle D, and the driving-wheels C C, provided with the broad wedge-shaped spikes *d d*, substantially as shown and described.

114,784.—COMPOUND FOR CURE OF CHILLS AND FEVER.—William P. Fennell, Louisville, Ky., assignor to Margaret Fennell, same place.

Claim.—The manufacture or preparation of a compound which is denominated cure for chills and fevers, of the ingredients, in the proportions, and for the purpose set forth.

114,785.—CHURN.—John E. Finley, Memphis, Tenn.

Claim.—The disk-shaped dasher A, with its flanges B and cross-bars or spokes D, when arranged in connection with the slotted shaft H, constructed and operated substantially as herein shown and described.

114,786. — STEREOTYPE - BLOCK. — James Fish, Chicago, Ill.

Claim.—The vertical ribs E E and F F, running laterally and longitudinally the whole length and width of the stereotype or electrotype-block, in the manner and for the purpose herein set forth.

114,787. — APPARATUS FOR CARBURETING AIR.—R. Berkeley Fitts, Philadelphia, Pa., assignor to himself, George W. Waitt, and William Rogers, same place.

Claim.—1. Vaporizing the hydrocarbon by raising chamber D or D', wholly shutting out the atmosphere, and following this by letting in air from cock *j*, and for the purpose set forth.

2. One or more of the apparatus B, constructed and arranged to operate in connection with apparatus A, in manner and for the purposes specified and set forth.

114,788.—COOKING - STOVE.—Benjamin G. Fitzhugh, Frederick, Md.

Claim.—1. The permanent partition D and the removable partitions E F, when arranged to operate in a cook-stove, substantially as shown and for the purposes described.

2. In combination with the above, the dampers I, when arranged to operate substantially as and for the purpose herein set forth.

3. The sad-iron stand J, provided with slots L and removable lid M, when constructed and arranged independent of the stove, as herein described and shown.

114,789, antedated May 11, 1871.—GRAIN-SEPARATOR.—Peter Flickinger, Hanover, Pa.

Claim.—The combination and arrangement of the grain-shield and straw-retainer R with the reciprocating conductor H, constructed as described, and the shoe W of the winnowing apparatus, substantially as and for the purpose herein set forth.

114,790.—PRINTING - TELEGRAPH APPARATUS.—Theodore M. Foote and Charles A. Randall, Brooklyn, E. D., N. Y.

Claim.—1. The key K', in combination with the compound electro-magnet A A' A'', as set forth.

2. A sounder or receiving-instrument, composed of the combination of the compound electro-magnet A A' A'', elongated core B'', and anvil B, or its equivalent, as herein set forth.

3. A sounder or receiving instrument, composed of the combination of the electro-magnet A A' A'', elongated core B'', anvil B and B', or their equivalents, constructed and operating substantially as described.

4. A call or signal-bell, composed of the combination of the compound electro-magnet A A' A'', core B'', hammer *d*, and bell *c''*, constructed and operated as described.

5. In telegraph apparatus, a pole-changer, D D' D'' S S', or equivalents, combined and operating in connection with one or more compound electro-magnets, A A' A''.

6. An automatic local circuit pole-changer, operated automatically at a distant station by means of an alternate open and closed line circuit.

7. An automatic local circuit pole-changer, operated automatically at a distant station by means of alternate negative and positive currents transmitted over the line circuit.

8. The compound electro-magnet A A' A'', arranged and connected as a switch, substantially as and for the purposes herein shown and described.

9. The combination of the compound electro-magnet A A' A'', and adjustable elbow E, and spring S'', and soft-iron core B'', as and for the purpose herein shown and described.

10. A non-adjustable relay, constructed substantially as described.

11. The combination of the pole-changer *a a'*, or its equivalent key K'', electro-magnets 1 1 and 2 2, and compound electro-magnet A A' A'', and circuit or circuits herein shown, as and for the purpose described.

114,791.—PRINTING - TELEGRAPH APPARATUS.—Theodore M. Foote and Charles A. Randall, Brooklyn, E. D., N. Y.

Claim.—1. The compound magnets H, H^1, and H^2, and their vibrating armature B, substantially as and for the purpose hereinbefore set forth.

2. The two oscillating pawls or dogs *d* d^1, attached to the vibrating armature B, and the screw or pivot *e*, and the spring *j*, and pin *z* in the vibrating armature B.

3. The combination of said parts *d* d^1 B *e j z* of the escapement with the ratchet-wheels *c* c^1, when the vibrating armature B moves parallel with the type-wheel shaft.

4. Our devices the rollers *j j*, the ratchet-wheel *k*, the pawl *l*, the screw *m*, the double-acting pawl F, the springs *n n'*, in combination with the printing-lever, substantially as and for the purpose hereinbefore set forth.

5. In combination with the type-wheel shaft, the rigid or adjustable pins *o o'*, arranged and operating in the manner and for the purpose herein set forth.

6. The magnet *s s'* and its armature *g*, the lever a^4, rock-shaft G, the anchor P, in combination with the pins *o o'*, substantially as and for the purpose hereinbefore set forth.

7. The combination of said parts *s s'*, *g*, a^4, G, P, *o o'*, actuated either by a line or local circuit, substantially as and for the purposes hereinbefore set forth.

8. The electro-magnet L L', in combination with the lever K and the vibrating armature B.

9. The combination of a circuit-changer, an electro-magnet excited by alternate positive and negative currents, and a local circuit so connected with the armature of said magnet that when the main current is broken the local circuit will be completed through the printing-magnet, in the manner and for the purpose substantially as set forth.

10. The pole-changer or circuit-breaker, composed of the two metallic circuit-wheels a^2 a^3 and their connections, substantially as and for the purpose hereinbefore set forth.

11. The pole-changer, in combination with a train of wheels moved by a spring or weight, and the governor, substantially as and for the purpose set forth.

12. The modification of the circuit-breaker, the upright piece f^2, the rubber pin g^4, the stop-pin or screw f^1, in combination with the transmitter, substantially as and for the purpose hereinbefore set forth.

13. The extra key *t*, in combination with the pole-changer or any circuit-breaker, substantially as and for the purpose herein set forth.

14. The governor T, composed of the cylinder U, a pinion-shaft, V, a double arm, a spiral spring, friction-pads, an adjuster, in combination with a train of wheels, substantially as and for the purpose hereinbefore set forth.

15. In a telegraph-printing apparatus operated by a single wire, the combination of the circuit-changer, the compound magnet controlling the type-wheel, the unison mechanism, in combination with the type-wheel.

114,792.—PRINTING - TELEGRAPH APPARATUS.—Theodore M. Foote and Charles A. Randall, Brooklyn, E. D., N. Y.

Claim.—1. The combination, with the type-wheel magnets, of an electro-magnet, M', placed in the line circuit, and the printing-lever operated directly thereby, as shown and described.

2. The combination of the type-wheel magnets and an electro-magnet, M, placed in the line circuit, the printing-lever P, and the spring S, when the retractive force of the said spring causes the impression to be effected on the interruption of the circuit, as set forth.

3. The combination of the type-wheel B, printing-lever P, studs *i* and *j*, arm E, dog D, spring S, and catch *w*, provided with the depressions *a* and *a'*, constructed and operating as set forth.

4. The method of feeding or spacing the paper after each impression by the direct action of an electro-magnet, as set forth.

114,793. — PRINTING-TELEGRAPH. — Theodore M. Foote and Charles A. Randall, Brooklyn, E. D., N. Y.

Claim.—1. The combination of the magnet A A' A'' with the circuit-closer L *m m'* S^3 and pole-changer *a a'* and circuit-closer *b b* S'', as set forth.

2. In a printing or dial-telegraph apparatus, an escapement, constructed substantially in the manner herein shown and described.

3. In a printing or dial-telegraph apparatus, an escapement, constructed substantially in the manner herein shown and described, in combination with a train of wheels, as set forth.

4. In a printing-telegraph of this class, using as a motive power to carry the type-wheel a train of wheels and weight or spring, the unison mechanism *o o'* and anchor W, in combination with the printing-lever P and type-wheel B, as set forth.

5. In combination with the type-wheel shaft, the loose pinion *h''* thereon, the spring S^4, and arm *h*, as and for the purpose as described.

114,794. — THRASHING - MACHINE. — John Foreman, Healdsburg, Cal.

Claim.—The thrashing-cylinder E, concave N, endless belt A, spreader G, long crank K, and rod L, all constructed and arranged to operate in the manner shown and described.

114,795. — STOCK-CAR.—George Washington Fox, Laramie, Wyoming Ter.

Claim.—The series of stalls, sliding doors, doorways wider than the stalls, and movable partitions, all relatively arranged in a stock-car, as and for the purpose described.

114,796.—WAGON-SPRING.—Nathaniel Frey, Erie, Pa.

Claim.—The arrangement of two torsion-springs E and F, crossing each other at *o*, secured to the bolster by means of the plates I and H, and operating in combination with the spring-bar B, substantially as described.

114,797. — CAR-COUPLING. — Emanuel M. George, Three Rivers, Mich.

Claim.—The combination with the draw-bars B, constructed as described, of the link C, pins D, and link-supports E, as and for the purpose set forth.

114,798. — COMPOUND FOR PRESERVING FRUIT-TREES.—Leander C. Gifford, Monticello, Ill.

Claim. — The above-described compound, substantially as and for the purposes set forth.

114,799.—MEAT-CHOPPER.—Jacob L. Good, Elizabethtown, Pa., assignor to himself, and Jacob Dyer, same place.

Claim.—1. The vibrating lever H, with its cam-head H' or eccentric groove, in combination with the prolongation L on the side rollers K, by which it is actuated and rotates the blocks by means of the pawl *h'* and ratchet D, in the manner and for the purpose mentioned.

2. The two-legged upright T, when the inner leg is provided with a scraper, *s*, and applied in the manner and for the purpose specified.

3. The combined arrangement of the shaft V,

with its turning handle P at one end and fly-wheel O at the other, when provided with a wheel or wheels, Q, having side rollers K for depressing the chopper-arms M against the springs *g*, said springs secured to the lever-bar G F, together with the prolongations L on the rollers K, grooved cam-lever H, pawl *h'*, all operating jointly, in the manner and for the purpose specified.

114,800. — JOINER'S CLAMP.—William H. Goodchild, Centreville, N. J.

Claim.—The fastening pin M, recessed as specified, in combination with the locking-stop N, spring *n*, confining means N^1, and adjustable tail-block E, and adapted to serve relatively to the clamp-stick A, head-block D D', and operating-screw B, substantially as herein set forth.

114,801. — JOINER'S CLAMP.—William H. Goodchild, Centreville, N. J.

Claim.—1. The cap casting or iron A^2, holding the screw B and head-block D D^1, as shown, and adapted to operate relatively thereto and to the tail-block E, as specified.

2. The lever G and its operating-spring H, adapted to operate, as shown, relatively to the block A^1, and to head-block D D^1 and its operating means, as herein set forth.

114,802. — STILL FOR HYDROCARBONS.—John Gracie, Pittsburg, Pa., assignor to Lockhart, Frew & Co., same place.

Claim.—Surrounding a still for hydrocarbon with an air-chamber, and combining therewith an air-pump, as herein described.

114,803.—STILL FOR OIL.—John Gracie, Pittsburg, Pa.

Claim.—In counter-distinction to a vertical still for hydrocarbon oil, a horizontal still A, the bottom of which is free from the direct application of distilling or decomposing heat, combined with a flue or flues, B, and condensing apparatus, substantialy as described.

114,804. — AUTOMATIC WATER-VALVE.—Joseph Guild, Buffalo, N. Y.

Claim.—1 The arrangement, in the valve-chamber B and with the flexible head D, of the hinged valve G and toggle-bars H and link I, or equivalent connecting mechanism, substantially as hereinbefore set forth.

2. The arrangement, with the cylindrical valve-chamber B and flexible diaphragm D, of the convex plates F F, constructed substantially as hereinbefore described.

3. The arrangement, with the valve-chamber B, valve G, and toggle-bars H H, of the frame K, constructed substantially as hereinbefore set forth.

114,805.—LAMP-BURNER.—Elias J. Hale, Foxcroft, Me.

Claim.—1. The combination and arrangement of the deflecting tongue B with the wick-tube A, as described.

2. The combination and arrangement of the deflecting tongue B with the wick-tube A and the air-cone or deflector C, as set forth.

3. The wick-tube, having in transverse section the bow-shape, substantially as described, and its top beveled, as and for use with a deflecting tongue, as set forth.

114,806. — STOVE-PIPE DAMPER.—Eli R. Hall and Daniel A. Keyes, Norfolk, Conn.

Claim.—A stove or furnace-damper, constructed in segments and governed by adjustable weights, the whole being self-acting, and arranged substantially as herein set forth.

114,807. — PROJECTILE.—Edward Clinton Hancock, New Orleans, La.

Claim.—The perforated projectile A, provided with the recess D, in combination with the sliding spindle or shaft B and rotating screw-button C, as set forth.

114,808.—WAGON-STANDARD.—Josiah Harding, Ainsworth, Iowa.

Claim.—The combination of the hinged brace *g*, thumb-screw *f*, wedge *e*, and standard *a*, having a flange, *b*, as and for the purpose herein recited.

114,809.—MACHINE FOR SCOURING, POLISHING, AND GLASSING LEATHER.—Dennis Harrington, Boston, Mass.

Claim.—1. The circular ways C, having horizontal portions C^2 suspended from springs I, and depressed by means of the cam-lever H, substantially as described.

2. The mortised blocks K, provided with holders L, having manipulators M, standards O, and springs R bearing against cross-bars P, substantially as described.

3. The blocks K, with their attachments, in combination with the ways C and wheel D, substantially as described.

4. The casters U, having rollers V V' at right angles with each other, pivoted to standard Y, and revolving on adjustable nut Z, substantially as described.

114,810. — COMPOUND FOR THE CURE OF CANCER. — James Harrison, Castalia, N. C.

Claim.—A preparation composed of the ingredients hereinbefore mentioned, employed in the proportions and compounded in the manner substantially as set forth, for the purpose specified.

114,811. — SIGN. — James Harrison, New York, N. Y.

Claim.—1. The lugs *c'*, two, more or less, formed upon the side edges of the inner ends of the cups or glasses C, in combination with perforated and notched background A, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the wire D with the cups or glasses C, whether solid or hollow, lugs *c'*, and notches *a'* of the perforated background A, substantially as herein shown and described, and for the purpose set forth.

114,812. — SPRING GUARD FOR LEGS OF FURNITURE.—Daniel F. Hartman, Charles City, Iowa.

Claim.—The two tubes A D, one arranged within the other, upon an ordinary spiral spring, and with a guide, E, in the manner specified, and for the purpose set forth.

114,813.—SPRING HINGE.—David B. Hawkes, Providence, R. I., assignor to George E. Lucas, same place.

Claim.—The combination and arrangement of the spring and the parts of the open butt-hinge, the parts not being riveted together, and being made with the slots to hold the ends of the spring, as described, the whole being constructed and operating substantially as herein set forth.

114,814. — DOVETAILING-MACHINE.—Elander Heath, San Francisco, Cal., assignor to S. W. Shaw, William E. Brown, and Leonard Goss.

Claim.—The adjustable slides B, with their elastic stops G and H, in combination with the cross-piece or guide A, the whole being constructed and operated as herein shown and described.

114,815.—NEEDLE-SETTER, NEEDLE-SHARPENER, NEEDLE-CASE, AND RIPPER.—Eli E. Hendrick, Carbondale, Pa.

Claim.—1. The gauge *k*, the perforation *h*, and sliding point *s*, in combination with the ripping device *e g* on tube B, substantially as explained.

2. The combination of the needle-setter, the case A, and the hone *b*, substantially as described.

3. The combination of the needle-case, the sliding tube B, and the needle-setting device, substantially as described.

114,816.—CARRIAGE-JACK.—David Hiestand, Pughtown, Pa.

Claim.—The combination and arrangement of the frame A, lid L, geared wheel W, bolt or rod D, worm M, shaft S, rack F, and straps *s* and *s'*, so as to operate substantially as and for the purpose specified.

114,817. — VISE.—Frank Higel, Philadelphia, Pa., assignor of one-half his right to James A. Weir, same place.

Claim.—The combination of the jaws E, jointed slide C, pivots D, and the screw-bolt for actuating the movable jaws, substantially as described.

114,818.—BABY'S TRAVELING AND TOILET-CHAIR.—Esther Hoare, Dedham, Mass.

Claim.—1. The bucket C and cover D, constructed and secured to each other and to the seat B, substantially as herein shown and described, and for the purpose set forth.

2. The hinged back and sides F and detachable table G, in combination with the box A, seat B, bucket C, and cover D, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the box A, provided with a hinged end, a^1, and partition a^2, seat B, bucket C, cover D, hinged back and sides or arms E F, detachable table G, and hinged cover H with each other, whether the bag I be used or not, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the box A, provided with a hinged end, a^1, and partition a^2, seat B, bucket C, cover D, hinged back and sides E F, detachable table G, and hinged cover H with a carpet or traveling-bag I, substantially as herein shown and described, and for the purpose set forth.

114,819.—ADJUSTABLE BOLSTER FOR BEDSTEADS.—Jacob Hofmann, Chicago, Ill.

Claim.—1. The adjustable folding bars D and bolt-rods E, arranged and operating as and for the purpose set forth.

2. The construction and arrangement of the frames A and C, studs B, adjustable folding bars D, and rods E and spring F, substantially as herein described.

114,820, antedated May 10, 1871.—COMBINED PUNCH, AWL, AND KNIFE.—H. S. Holmes and D. Williams, South Boston, Mass., assignors to David Williams.

Claim.—In a combined knife and punch, an awl, arranged as described, and provided with a slot, and pivoted and sliding within a groove, H, in one of the jaws J, all arranged, constructed, and operated substantially as and for the purpose described.

114,821.—TRANSIENT-BOLT FOR VEHICLES.—Charl Gustaf Holsten, Orebro, Sweden.

Claim.—The combination of the transient-bolt *d* screwed into the hub *i*, the metallic plates *e* and *l*, hub *i*, and receptacle *k*, and the anti-frictional washer *n*, when all are combined and arranged substantially as herein shown and described.

114,822.—PLOW-COLTER.—Horace S. Hoxie, Raisin Centre, Mich.

Claim.—1. The share *a*, constructed, attached, and operating as and for the purposes specified.

2. The combination of the curved mold-board C with the share *a*, when each is constructed as described and attached to a colter-bar, as and for the purposes set forth.

114,823.—PRESSER-FOOT FOR SEWING-MACHINE.—Thomas Hudson, Troy, N. Y.

Claim.—A sewing-machine presser-foot, having in one side of the foot an oblong transverse needle-slot, *d*, and the edges *b c* on both sides of the slot in substantially one and the same line, when such foot is secured to its supporting stem by the means herein described, or the equivalent thereof, for rendering the foot adjustable laterally on the stem.

114,824.—FILE.—Amasa Hyland, Hingham, Mass.

Claim.—A three-cornered file having a "left-hand cut," substantially as and for the purpose set forth.

114,825. — RACK-PULLEY SHADE-FIXTURE. Willis Johnson, Waterbury, Conn.

Claim.—The arrangement, in combination with the rack *a*, of the tooth *c* on the upper end of the slide B, the bevel *e* on the exterior surface of the upper part of said slide, and the wedge C operating against the exterior of the upper part of the slide, all substantially as herein described.

114,826.—WASHING-MACHINE.—George F. Jordan, Gardiner, Me.

Claim.—1. The cover B, provided with a concave inner surface and side flanges B', when arranged within the boiler and over the cylinder, in the manner and for the purpose specified.

2. The cylinder C, provided with the buckets *b b* and the strips *m m*, arranged in semicircles or arcs of circles, when operating in combination with the boiler, in the manner and for the purpose described.

3. The combination, in a washing-machine, of the boiler A and its cover D, the cylinder C and its bearings, when the several parts are constructed, arranged, and operate substantially as set forth.

114,827. — HARVESTER-RAKE.—Dennis A. Kellogg, Valparaiso, Ind.

Claim.—1. The yoke T, combined with the chain G, pulleys X, and curved arm M, as and for the purpose described.

2. The square shaft F O, combined with the curved arm M, connecting-rod P, and platform E, for discharging a gavel, as specified and shown.

3. The combination of the platform A E, rake H I J, chain C, yoke T, and pulleys, substantially as set forth.

114,828.—UMBRELLA.—Robert P. Knapp, New York, N. Y.

Claim.—The annular flanges F K and India-rubber-ring guards G M, when used in combination with the runner D and stationary holder H of an umbrella, substantially as and for the purpose described and set forth.

114,829.—BOX STEREOSCOPE.—William M. Kohl, Cincinnati, Ohio.

Claim.—1. The application to a stereoscope, in the manner described, of the shifting-cam V (on tilting-bar) and projections *e*, (on carriage,) when combined, for the purpose set forth.

2. The application to a stereoscope, in the manner described, of lifting-bars K, sliding plates M, vibrating arm *q*, and notched spring *r*, when combined, for the purpose set forth.

3. The carriage D, case F, vibrating lift-bars K, slotted plates M, bar S, projection R, and cam V, when combined and applied to a stereoscope in the manner described.

114,830. — TREADLE.—Charles P. Leavitt, New York, N. Y.

Claim.—1. The treadle D, with universal joint, consisting of the revolving tube C upon shaft B and joint *g*, substantially as described.

2. In combination with the above, the pitman P, arranged and operated as described.

114,831.—Apparatus for Evaporating and Concentrating Brine and other Liquids.—Robert Gilmour Leckie, Acton Vale, Canada.

Claim.—1. The combination of the vat *a*, pipe *b*, and other component parts, with or without reservoir *d*, with the evaporating-vessel *g*, pipes *k k*[1] *k*[2], boiler *m*, and air-heating vessel *n*, as and for the purpose described.

2. The arrangement of vat *a* and pipe *b* for precipitating the carbonate of iron and other impurities, as described.

3. The combination of the vat *a*, evaporating-vessel *g*, pan *p*, with or without space *o* and casing *q*, boiler *m*, and air-heating vessel *n*, as described.

4. The arrangement of the pipe *s* and vessel *d* for utilizing the heat of the steam from the evaporating-vessel *g*, as described.

5. The evaporating-vessel *g* and crystallizing-vessel *r*, combined and arranged as described.

114,832.—Marine Locomotive.—Sverre Lee, New York, N. Y., assignor to himself and James D. Reymert, same place.

Claim.—1. The internal bracing D[3] of the floats or caissons D, when the latter are arranged in the series on an endless belt, C, traversed around in the bottom of a structure, A, as specified.

2. The corrugated bottom D[1], in combination with the internal bracing D[3], tending to strengthen the caissons D and enable them to take a better hold on the water to better support the weight of the structure in passing over bare or shallow places, when operated by an endless chain under a vessel or traveling structure, A, as specified.

3. The within-described arrangement of the end drums at such levels that the caissons D shall be immersed, and again lifted gradually, so as to not only avoid the friction of the water, but also involve but a very slight resistance from the inertia thereof, as herein specified.

114,833.—Saw-Mill.—Charles Enos Lewis, Bay City, Mich.

Claim.—A saw having its teeth forming the arc of a circle and arranged on a reciprocating sash, a bar, E, crank-shaft N D L, yoke-rod K, and eccentric I, all combined and arranged as and for the purpose specified.

114,834.—Thrasher and Grain-Separator.—William C. Leyburn, Sparta, Wis.

Claim.—The arrangement, within the frame A of the picker-drum O, the rake K, the carrier N, the cylinder B, the fan D, the shoe E′, and the screen E, all constructed and operating substantially as described and shown, for the purposes set forth.

114,835.—Scroll-Sawing Machine.—Sylvester G. Mason, Rochester, N. Y.

Claim.—1. The lever E and star-wheel or head H, in combination with the fixed socket B and springs *d*, arranged to operate substantially as set forth.

2. In combination with the deflecting cord C, the levers E and spring heads B H, constructed and arranged substantially as and for the purposes set forth.

114,836.—Dairy-Heater for Heating Water.—George W. McCammon, Manheim, and David H. Burrell, Little Falls; said McCammon assigns his right to Rodney S. Whitman, Little Falls, N. Y.

Claim.—1. The arrangement and combination by which a metal vat or tank of water with fine-pipes passing through it is placed immediately above and upon a series of pipes, through which water flows into the vat, by which means the water enters the vat in a partially-heated state.

2. The feed and waste-pipe united in one, placed on an inclination, with the manner of heating, as described in the specification, producing the effect that when the vat is full the flow will be automatically turned outward, thus securing the water in the vat, when full, from being cooled by the inlet of water of a lower temperature.

3. The combination and arrangement of the hot-water vat with a series of smoke-flues through it, the supply-pipes of water placed under the vat and over the fire, the union of the supply and waste-pipes arranged, as described in the specification, to regulate automatically the feed and waste of water, and the hot-air chamber at the base of the chimney heating the smoke after it has passed through the flues in the vat, all combined as described in the specification.

114,837.—Fire-Box for Heating-Stoves.—William L. McDowell, Philadelphia, Pa.

Claim.—For a stove, range, or heater, a cast-iron fire-box, A, having upper part inwardly inclined and its lower end enlarged by a recess, *a′ a″*, cast around in its inner side, and the recess then filled with fire-brick or other suitably-porous refractory material, B, substantially as and for the purposes hereinbefore set forth.

114,838.—Cooking-Stove.—William L. McDowell, Philadelphia, Pa.

Claim.—A removable boiler, B, having a projecting, flat, rectangular chamber, *b′*, made to enter the fire-chamber through the side plate *a*[4] of the fire-chamber thereof, and the supporting oven C, having one side made open and to fit against the said side plate of the fire-chamber, as and for the purposes hereinbefore set forth and described.

114,839.—Apparatus for Aerating Beer-Barrels.—Joseph Metzger, East Cambridge, Mass.

Claim.—1. The combination and arrangement of the bung and the air-forcing and estopping apparatus, as described.

2. The combination of the barrel or cask, the bung, and the air-forcing and estopping apparatus, as described, applied together, as set forth.

114,840.—Washing-Machine.—Laurence R. Mills, Tekonsha, Mich.

Claim.—The arrangement and combination, with each other and with the suds-box A, of the standards B B, cross-bar C, rocking shaft D, lever L, holding device *n p*, connecting-stem F, and corrugated rubber-head E, all constructed, arranged, and operated substantially as and for the purpose specified.

114,841.—Keeper for Bolts.—John M. Mitchell, Cincinnati, Ohio.

Claim.—The bolt-socket or keeper B, sliding freely upon the holder A, which is secured to the door-casing, all arranged as and for the purpose set forth.

114,842.—Sash-Holder.—John H. Morse, Peoria, Ill.

Claim.—The combination of the key E with lug *e* and recessed face-plate, the key E passing through a recessed and shouldered bolt working at right angles to the key, all as shown and described, for the purpose set forth.

114,843.—Curtain-Fixture.—Benjamin Moser, Waltham, Mass.

Claim.—The arm G, having loose wheel H and coiled spring I, in combination with bracket C and curtain-roller B, constructed as and for the purpose described.

114,844, antedated May 15, 1871.—Globe-Valve.—Matthew Murphy, Charlotte, N. C.

Claim.—The collared nut F G, combined, as described, with a cap, B, having the packing-chamber E, arranged as and for the purpose specified.

114,845.—Whip-Socket.—James Nellis, Ypsilanti, Mich.

Claim.—The construction and arrangement of the strap A, socket B, segments C C′, provided with cushions *a a′* and rollers *b b′*, and the torsion-springs D D, substantially as described, for the purpose specified.

114,846.—Spark-Arrester.—Michael O'Connor, Bangor, Mich.

Claim.—1. The fan, composed of the rotating vertical pipe C and wings F, arranged within a smoke-stack, with the pipe B, substantially as and for the purposes set forth.

2. The pipes G, in combination with the pipe C and wings F, when operating as and for the purposes set forth.

3. The arrangement of the brake I, in combination with the vertical pipe C, in a device constructed as above described, substantially as and for the purposes set forth.

4. The combination of the frame A, pipes B C, wings F, short pipes G, spark-arrester H, and brake I, when constructed and arranged to operate as described with a smoke-stack, as set forth.

114,847.—Foot-Brush.—John W. Osborne, Brooklyn, N. Y.

Claim.—The combination of the brush B′, receiver B, and adjustable side for clamping the brush, as described, and for the purposes set forth.

114,848.—Amalgamating the Precious Metals and Preventing the Loss of Mercury.—Josiah S. Phillips, San Francisco, Cal.

Claim.—1. The preparation of mercury in the manner above described, for the purpose of cleansing and increasing its affinity for the precious metals, and also to prevent loss of the mercury during amalgamation, substantially as above specified.

2. The addition to the mercury of chloride of barium, either separately or with other chemicals, during amalgamation, substantially as and for the purposes above described.

114,849.—Hydraulic-Pressure Alarm.—Joseph L. Pillsbury, Columbus, and John S. Shorb, Canton, Ohio.

Claim.—The within-described alarm for indicating certain limits of pressure on liquids or gases, the same consisting of a suitable alarm apparatus and of a hollow spring tube in communication with the liquid or gas, and the said spring tube and alarm apparatus being so connected and combined as that the change of form in the spring tube due to certain limits of pressure on the contained liquid or gas shall act to liberate the alarm apparatus at said limits, as is hereinbefore set forth.

114,850.—Type-Setting Machine.—Thomas J. Plunket, New York, N. Y.

Claim.—1. The use or employment, in a type-setting machine, of one or more electro or permanent magnets for the purpose of collecting and carrying the type or types from the chambers from which they may be fed, substantially as herein set forth.

2. Suspending the operation of the electric current, (when the battery is connected with the machine,) substantially as described, for the purposes set forth.

3. Combining with the type-chamber T the type-deliverer U, provided with an inclined way, 2, a pusher, 4, connected to the key, as shown, and a weight 8[2], when constructed and operating substantially as and for the purpose set forth.

4. The combination, with the delivery-chamber 9, of the slide 10, bent pins 12, spring 13, and foot P of the projecting arm O, when the same shall be constructed and operate substantially as and for the purposes set forth.

114,851. — Girder-Rest for Timbers.—Jonathan Preston, Boston, Mass.

Claim. — In combination with an iron-flanged girder, the rest or bearing B, substantially as and for the purposes herein shown and described.

114,852.—Curtain-Fixture.—L. Corydon Prindle, Chicago, Ill.

Claim.—1. The employment of detachable or open pulleys in a curtain-fixture, which admit of the endless cord being passed over them without being cut, made in the form substantially as shown.

2. The holder D, when so constructed as to be readily attached to or detached from the endless cord E after said cord is in position over the pulleys, substantially as specified and shown

3. The combination of the holder D and pivot *c*, when the holder is made detachable therefrom, in the manner specified and shown.

4. The combination of the endless cord E and detachable adjustable holder D, substantially as and for the purpose specified.

5. The combination of the endless cord G, the roller C, and the endless cord E, for holding the roller at any point, while the cord G turns it, to raise or lower the curtain, as described and shown.

114,853.—Device for Securing Horse-Powers.—Francis W. Randall, Burlington, assignor to George W. White, Grass Lake, Mich.

Claim.—1. The link F and brace H, when constructed substantially as described, in connection with the stays C and stakes G, for the purposes set forth.

2. The stay-rods D, in connection with the sides A and stays C, substantially as described, when the former are held in their engagement with the grooves *a* by means of the hooks E, for the purposes set forth.

3. The device for securing horse-powers to the ground, wherein the stays C, stay-rods D, hooks E, links F, rings *e*, stakes G, and braces H are arranged relative to each other and to the sides A of the frame, substantially as and for the purposes set forth.

114,854.—"Fix" for Puddling and other Furnaces.—Abram Reese, Pittsburg, Pa.

Claim.—1. The utilization of heating-furnace slag, substantially as hereinbefore set forth.

2. A furnace bottom made of heating-furnace slag treated with a suitable alkaline substance while in a molten state, substantially as set forth.

114,855.—Plow.—Thomas H. Reynolds, Rome, Ga.

Claim.—1. The slotted plate E, provided with the shoe *d*, and combined with the plowshare and standard, substantially as and for the purpose herein shown and described.

2. The suspended slide G, arranged on the plate E to constitute the land-side of the plow, substantially as herein shown and described.

114,856.—Finger-Ring.—Henry P. Richmond and Thomas E. Carpenter, Providence, R. I.

Claim.—A jointless finger-ring, constructed in the manner substantially as described.

114,857.—Toggle-Pin for Nail-Machines.—William H. Ridley, Pittsburg, Pa.

Claim.—A toggle-pin, constructed substantially as hereinbefore described, and for the purpose set forth.

114,858.—Housing for Rolls.—John Rigby, Pittsburg, Pa., assignor, by mesne assignments, to himself, Joseph Davis, and A. Filson Dalzell.

Claim.—The housings *f*, slotted and boxed, as at

g g, for the separate and independent adjustment and seating therein of the roller, substantially as described.

114,859. — DOVETAILING-MACHINE.—John B. Ritchey, Pomeroy, Ohio.

Claim.—1. The combination, with the reciprocating table P and the vertically-moving rotary cutter, of the gauge-stops S, bars T, V, and W, and adjusting-screw X, all substantially as specified.

2. The combination of the adjustable stops D′, wedges F′, adjusting-plate H′, and adjusting-screws I′ and *k*′, all substantially as specified.

3. The combination, with the table P and adjustable stops D′, of the spring-bar M, provided with projection L′ and trip-lever O.

4. The combination, with the gauge-bar T, gauges S S′, and the slotted bars V, of the clamp-screws *y y*, substantially as specified.

114,860. — KETTLE-HANDLE. — Horace T. Robbins, Hyde Park, Mass.

Claim.—An adjustable kettle-handle, in combination with a kettle arranged substantially in the manner and for the purpose of emptying a kettle, as specified.

114,861, antedated May 12, 1871.—REGULATING CUT-OFF VALVE-GEAR.—Stillman W. Robinson, Champaign, Ill.

Claim.—The combination of the valves, as described, with their operating-gear, the trip J, arms I H, and points O O, the latter being operated by the governor, all arranged as shown and set forth.

114,862. — SEWING-MACHINE FOR BOOTS AND SHOES.—Nathan M. Rosinsky, New York, N. Y.

Claim.—1. The boot or shoe-holder, consisting of the plates B F, connected together by the bolt G, hinged to one and passing through the other, all substantially as specified.

2. The jointed links M, boot-holder, and the vertically-adjustable post or stand, combined, substantially as specified.

3. The arrangement of the thread-guide stock *f*, grooved cam *l m*, crank *n*, and spring *p*, substantially as specified.

4. The presser N, constructed as described, arranged on the slotted shank *a*′ mounted in plate K, and operated by the slide *g* and spring *b*′, substantially as specified.

5. The feed-plate carrying-bar *q*, made in two parts, having beveled ends connected together by the screw and spring, substantially as specified.

6. The bar *q*, arm *r*, shaft *s*, spring *y*, crank *x*, and the slotted cam *u w*, all combined and arranged substantially as specified.

7. The arrangement of the needle-bar Q, presser and discharger-bar *g*, connecting-rods *h b*, crank W X′, wheel X, and the driving-wheel Y, all substantially as specified.

114,863. — STEAM-MANGLE. — Peter Rundquist, New York, N. Y.

Claim.—The hollow rolls C D, stirrups F F, rods H H, springs I I, and pipes J J′, all combined and arranged on frame A, as and for the purpose specified.

114,864.—NON-CORROSIVE METAL-COATED PLATE-HOLDER.—James F. Ryder, Cleveland, Ohio.

Claim.—A plate-holder, with the frame thereof made in part or in whole of base metal, and coated in whole or in part with gold, silver, nickel, or other non-corrodible metallic covering, for the purpose set forth.

114,865.—STEAM-VALVE AND GOVERNOR.—Robert Sanderson, Cleveland, Ohio.

Claim.—1. The slides E, E′, and F, as constructed and arranged to operate in relation to each other and in combination with the valve-rod C, substantially in the manner as and for the purpose set forth.

2. The combination of the bell-crank H, slide E, and governor-stem or rod J, in the manner as and for the purpose specified.

3. The adjustable collar M, provided with a lip, N, in combination with the valve-stem C and friction-wheel or roller L, substantially in the manner as described, and for the purpose set forth.

4. The thimble or sleeve A′ and nut F′, as arranged in combination with the governor-stem J and governor, in the manner as described, and for the purpose set forth.

5. The springs H, when constructed with an eye or hook, G, at each end, and a friction-roller, K, in combination with the collars L, in the manner as and for the purpose specified.

114,866. — MODE OF APPLYING MOTIVE POWER.—John Schley, Savannah, Ga.

Claim.—1. The arrangement of the right-and-left-hand screws D E, pinions F F, and wheels H H for conveying power and motion, substantially as described.

2. The revolving cog G′, in combination with a perpetual-screw gear, substantially as and for the purposes described.

3. In combination with the screws D E and wheels F F, the system of gearing represented by the bevel-wheels K′ M and O O, and spur-wheel and pinion K P, when the same are arranged to operate substantially as and for the purposes described.

114,867.—FRUIT-PARER.—Robert P. Scott, Cadiz, Ohio.

Claim.—1. The revolving knife J in a fruit-paring machine, constructed substantially as and for the purpose set forth.

2. The fork G, constructed as shown and described, as and for the purpose herein specified.

3. The spring L, in combination with the knife-support K and bracket *k*, constructed and operating in the manner set forth.

4. The arrangement of the frame A, the gearing *b c* I a D E H, bar C, fork G, knife J, when all constructed and operating substantially as and for the purpose herein described.

114,868.—MANUFACTURE OF PAPER BOARD.—Edmund A. Seeley, Scotch Plains, N. J.

Claim.—1. The metal lay-boards, as and for the purpose specified and shown.

2. The metal lay-boards, covered with cloth or other suitable material, as and for the purpose set forth.

3. The guide-board *c*, in combination with the metal lay-boards, as and for the purpose specified.

114,869.—SCHOOL-DESK AND SEAT.—Henry G. Sellman, North Newburg, Mich.

Claim.—The combination of the radius-bar D with the seat-arm C and the ledge *d* of the upper section A′ of the standard, being pivoted thereto, as and for the purposes herein set forth.

114,870.—MECHANICAL MOVEMENT.—Abram Shear, Plymouth, Mich.

Claim.—The combination of the spring J, the pitman F, cross-head H, and weight I, when constructed, arranged, and operated substantially as described and shown, for the purposes set forth.

114,871.—ENVELOPE.—Eldridge J. Smith, Washington, D. C.

Claim.—The sectional envelope A, consisting of one or more pieces, as above described, substantially as and for the purpose hereinbefore set forth.

114,872.—GAS-RETORT.—James H. Smith, Newark, Ohio.

Claim.—The combination, with a gas-retort, of any desired number of plates, C, attached alternately, and by any convenient means, to the top and bottom of the retort, near its rear or outlet end, substantially in the manner and for the purpose described.

114,873.—CHURN.—Ben H. Steele, Barnesville, Ohio.

Claim.—The method of forming butter by the successive application to cream, confined in a close vessel, of dashers J M, constructed to operate on the same at the times and in the manner specified.

114,874.—HORSE-POWER.—Henry B. Stevens, Buffalo, N. Y., assignor to George L. Squier, same place.

Claim.—1. The arrangement of the main frame-timbers A B C, in combination with the cross-trees D, hub 14, and corner-bolts O, substantially as set forth.

2. The metallic hub 14, in combination with the adjustable bushings 9, and set-screws 3 and 4, substantially as set forth.

3. The metallic pedestals 8, bolt O, and caps 7, in combination with the cross-trees D, substantially as described.

4. The metallic step-box 15, when cast in one piece with the bearing of the counter-shaft 16, substantially as described,

5. The eccentric pin 10, in combination with the guide-roller 11 for the purpose of adjusting the roller on the master-wheel, substantially as set forth.

6. The sweep-shaft 17, in combination with the master-wheel 20 and pinion 19, when said master-wheel and pinion are constructed with a rim or track, L and L′, cast upon their peripheries, as and for the purposes described,

7. The sweep-cap 18, constructed with one or more lead-pole sockets, 1 1, substantially as set forth.

114,875. — SHUTTER-WORKER. — Fredrick Strattner, Wilmington, Del.

Claim.—An improved device for opening and closing blinds and shutters, consisting of the bracket or slide D, bent and pivoted or hinged bar E, arm F, notched bar G, keeper H, and locking-pin J, said parts being constructed and arranged substantially as herein shown and described.

114,876. — STEAM-BOILER. — Daniel Sullivan, Bangor, Me.

Claim.—The within-described arrangement, in a steam-boiler, of the straight water-tubes, running the entire length of the boiler and through the intense heat of the fire, the double cylinders forming the water-space, as described, the broad removable front and back plates, and the smoke-stack, riveted to the inner and outer cylinder, all arranged with reference to each other, as herein set forth, for the purposes specified.

114,877.—RAILWAY-AXLE BOX.—John B. Sutherland, Detroit, Mich.

Claim.—In an axle-box, the door B, provided with beveled sides *c* and groove *d*, in combination with the wedge-shaped guide *a*, provided with offset *b* and the stop C, all constructed, arranged, and operating substantially as described and shown.

114,878.—EXCAVATOR.—Thomas Symonds, Portland, Me.

Claim.—The combination of the pivoted arm *b*, chain *d*, arm *e* with pivot and pin *j*, arm *h*, with spring *g* and shoulder *m*, arranged and applied as herein set forth.

114,879.—HAND-STAMP.—Charles G. Taft, Jr., Norton, Mass.

Claim.—The combination of the cylinder A, the piston B, and the double lever E, the whole constructed, arranged, and operating in the manner substantially as described.

114,880.—TREATMENT OF PAPER AND PAPER-PULP.—Thomas Taylor, Grove End Road, England, assignor to Edmund S. Hanna and Waldimer A. Schmidt, Pittsburg, Pa.

Claim.—The employment of a concentrated solution of chloride of zinc, either alone or mixed with other substances, to sized or unsized paper, and afterward washing the paper in water, substantially in manner and for the purposes herein-before described.

114,881.—SEEDING-CULTIVATOR.—Nelson S. Thompson, Richmond, Ind.

Claim.—The arrangement of the trash-cleaner A, adjustable clamps *a b c d*, and guide-frame D, in combination with the convertible wheel C, so that the latter may be used to propel the trash-cleaner *h* or serve for a fender, in the manner and for the purposes specified.

114,882.—MACHINE FOR BRUISING MALT.—James Flower Tibble, Detroit, Mich.

Claim.—1. The combination, with an air-tight case, A, of the rolls I I′, arranged to operate as and for the purposes herein set forth.

2. The slide D and spout or chute C, in combination with the governor P and the necessary connections, as and for the purposes set forth.

3. The combination of the case A, rolls I I′, boxes H, spring K, set-screw L, spout C, slide D, hopper E, connections N O, and governor P, when the parts are constructed and arranged and operate substantially as and for the purpose herein set forth.

114,883.—SMOKE-STACK.—Wenzel Toepfer, Milwaukee, Wis., assignor to Toepfer & Son, same place.

Claim.—A portable smoke-stack, composed of vertical sections, which are made in separate pieces and held together by rings, as set forth.

114,884. — BRICK-MACHINE. — James V. Tompkins, Canandaigua, assignor to himself and John Cavender, Adrian, Mich.

Claim.—In brick-making machines, the arrangement of the rock-shaft N, lever O, cranks P, arms Q, levers R, links S, pressure-bar T, and plungers U, when constructed and combined to operate substantially as and for the purposes herein set forth.

114,885.—COMBINED CARRIAGE-BOW COVER AND SLAT-IRON.—Isaac N. Topliff, Elyria, Ohio.

Claim.—1. The combination of the metallic carriage-bow cover and slat-iron.

2. The locking of the metallic carriage-bow covers.

3. The tapering piece of sheet-steel E, for the purpose shown and described.

114,886.—PAPER-RULING MACHINE.—James Tregurtha, Charlestown, Mass., assignor to George H. Sanborn, Brooklyn, N. Y.

Claim.—1. The combination of the standards T, hollow adjusting-screws X, supports Z, and spindles 2, supporting the pen-beam, constructed and operating substantially as and for the purposes set forth.

2. The combination of clamp 11, provided with set-screw 12, and the strip of metal 10 secured upon the pen-beam, as and for the purposes specified.

3. In combination with the curved arm 16, the block 23, hinged at one end and connected to the standard T, substantially as and for the purposes described.

4. The wheel 33, provided with the permanent stop 38, in combination with levers 36, 39, 40, and 42, springs 37 and 47, and toe 45, when the same

shall be constructed and operate substantially as and for the purposes set forth.

3. The clamp 9, provided with the sliding plate 49 and set-screw 50, when constructed and operating substantially as described, for the purposes set forth.

114,887. — Wrapper-Cutter. — John R. Tunnicliff, Van Hornesville, N. Y.

Claim.—A rotary drum, A, and annular knives C C at the ends thereof, combined, as described, with the rubber cylinder *b* moving over the leaf under elastic pressure to smooth it, as specified.

114,888.—Machine for Stripping and Booking Tobacco.—John R. Tunnicliff, Van Hornesville, N. Y.

Claim.—1. The two unwinding drums G G, and the two aprons H H, combined with two unwinding drums, E E, arranged with a common supporting drum, C, for the purpose of forming an improved "booking" device.

2. The rolls E E, having aprons H H, combined with revolving cutters placed between the said aproned rolls, for the purpose of taking out the stem and smoothing each side of the leaf immediately thereafter.

114,889. — Cotton-Chopper. — Edward Berriam Turnipseed, Columbia, S. C.

Claim.—The combination of the cutter B, constructed as described, with carving front edges, laterally-expanding sides, rearwardly-tapering form, and inclined bottom blade with the beam A, the parts being relatively arranged as described.

114,890. — Millstone-Balance. — George Thomas Clark, Kalamazoo, Mich., administrator of William A. Vance, deceased.

Claim.—The adjustable box C, divided into separate compartments by partitions *e*, and provided with the hook *d*, in combination with the clamping-band B, all constructed, arranged, and operating substantially in the manner described.

114,891. — Roasted Wheat.—George W. Watt, Philadelphia, Pa., assignor to himself and Robert B. Fitts, same place.

Claim.—1. The within-described process of treating wheat to air-currents and dry heat, as and for the purposes specified.

2. As a new commercial article, wheat, when treated as hereinbefore described, furnished to the public either as the whole kernel or more or less comminuted.

114,892.—Apparatus for Rolling Metal.—Charles While, William Lewis, Thomas Strickland, and Samuel Caddick, Spuyten Duyvil, N. Y.

Claim.—The combination of the frame comprehending the hollow journals and heads and bars D, E, and F, mechanism to impart to said frame a revolving movement upon its axis, the three conical rolls arranged on said frame, and mechanism to impart to each of said rolls a movement of rotation on its own axis, substantially as hereinbefore described.

114,893. — Pencil-Holder. — Horace J. Wickham, Manchester, assignor to Jeremy W. Bliss, Hartford, Conn.

Claim.—1. As an improved article of manufacture, a pencil, the stock of which has a chamber for an adjustable lead, an exterior screw-thread, a conical-shaped end, and with a longitudinal slit therein, all formed in one piece composing the stock, combined with a screw-threaded cap, having a conical end formed from sheet metal, and serving to clamp the stock to the lead, constructed, as described, so as to fit the conical end of the stock and give support to its extreme point, all substantially as set forth.

2. In combination with a finishing cap or socket of the pencil, the watch-key *k* affixed thereto on the line of its axis, substantially as and for the purpose set forth.

114,894. — Measuring-Pail. — John B. Wightman, Brooklyn, N. Y.

Claim.—A pail or can, A, having the measuring device *a b* protected by a close cover, B, hinged at the side of the glass, in connection with the spring *c*, arranged as shown, and operating to keep the cover in either an open or closed position, substantially as described.

114,895.—Wood Pavement.—Richard H. Willet, Washington, D. C.

Claim.—The blocks A, formed of a double wedge-shape, with the widest part at the middle, to be embedded in a concrete composed of sand and asphalt or tar, and placed upon a foundation of sand, substantially as and for the purpose described.

114,896. — Millstone-Dress. — James Wilson, Davis' Mills, Va.

Claim.—The arrangement of the tangential deep furrows B C C and outer furrows D D, when constructed substantially as herein shown and for the purpose described.

114,897.—Lumber-Rack.—Robert B. Woodcock, Grand Rapids, Mich.

Claim.—1. The arrangement of the rollers B and B^1, in connection with the levers C and C′, and the corresponding levers, the chains *x* and *x′*, and pulleys P and P′, chain *t*, and the corresponding chains and pulleys on the other side of the rack, and the shaft L, when constructed and arranged so as to press the rollers B B^1 simultaneously against the load, substantially as described.

2. The arrangement of the binding-chain, in connection with the chains *t* and *t′* and shaft L, substantially as described.

3. The combination of the rollers B B^1, pivoted levers *z z′*, pulleys P P′, chain T, and crank-shaft L, all arranged to operate substantially as described.

114,898. — Fanning-Mill.—Peter Young, Austin, Minn.

Claim.—1. The upper inclined step-sieve B, with the steps thereof inclined from their outer edges *r* to their inner joints *s*, and provided with inclined perforations *v*, all constructed substantially in the manner and for the purpose hereinbefore set forth.

2. The combination of the upper inclined step-sieve B, constructed as described, with the sieve C and the metallic case *i* and spout *k* attached, as shown, and the lower sieve D, all constructed and arranged substantially in the manner and for the purposes hereinbefore set forth.

114,899, antedated May 5, 1871. — Windmill.—Samuel M. Abbott, Wilmington, Ill.

Claim.—1. The rudders or vanes B C, placed at right angles with each other, and constructed so as to be capable of turning one-quarter around on their axles, and connected together by any suitable means, substantially as and for the purposes herein set forth.

2. In combination with the vanes B C, the wind-disk D, pivoted lever *b*, connecting-rod *e*, substantially as and for the purposes herein set forth.

3. In combination with the wind-disk D and lever *b*, operating the vanes B C, as described, the elbow *d*, rod *f*, and weight E, substantially as and for the purposes herein set forth.

114,900.—Molding-Machine.—Joseph Albright, Midway, Tenn.

Claim.—1. The combination of the carriage B, sliding block *p*, fixed block *t*, rack *s*, lever *r*, and connecting-rod, as specified.

2. The shaft *z*, pinion *y*, spur-gear *c′*, sliding frame *a′*, button *f′*, and lever *b′*, as described.

3. The serrated bar F, slotted plate *o′*, lever *q′*, notched arm *s′*, and cross-piece G, combined as set forth.

4. The bar F, combined with the plates *t′* v^1, tongue *w′*, block *w′*, and screw *x′*, as explained.

114,901.—Preparation of Tobacco for Chewing.—David Alonzo Alden, Malden, Mass.

Claim.—The improved process herein described of manufacturing tobacco-lozenges or wafers for chewing, the same consisting in mixing finely-divided tobacco with a suitable mucilaginous or adhesive substance and then molding said mixture into lozenges or wafers, as set forth.

114,902. — Steam-Radiator.—Valerius D. Anderson, Kewanee, Ill.

Claim.—A radiator, consisting of a steam-chamber or chambers, and an air-heating space or spaces filled with heat-conducting material, for warming the air as it passes through or among this material, substantially as set forth.

114,903.—Pipe-Coupling.—Valerius D. Anderson, Kewanee, Ill.

Claim.—The coupling, consisting of the pipe A with the flange *l*, and the pipe B with its ears *e*, and the collar C, constructed and arranged to operate therewith, substantially as described.

114,904.—Water and Drain-Pipe.—Thomas J. Barron, Brooklyn, N. Y.

Claim.—1. A water-pipe or other article, the body of which is formed of the materials and by the means described and afterward coated with asphaltum or its equivalent, substantially as specified.

2. The process herein described of manufacturing useful articles of the materials mentioned.

114,905. — Mold. — Thomas J. Barron, Brooklyn, N. Y.

Claim.—1. In combination with the case H, the tubes D and E, arranged substantially as and for the purpose specified.

2. The sectional core C, with its wedge *a*, in combination with the tubes D, E, and H, constructed and arranged to operate as described.

114,906.—Wick-Regulator for Lamps.—Henry Beebe, Jersey City Heights, N. J.

Claim.—The regulating-screw *a*, in combination with a flange, *d*, carrying the wick-tube *e* and spring prongs *h*, and with a spring, *g*, and guide-tubes *f*, all constructed and operating substantially as herein shown and described.

114,907.—Table for Making Wainscoting.—John W. Boughton and Elisha Chas. Hussey, New York, N. Y.

Claim.—1. A table constructed as herein described, with longitudinal and transverse grooves to receive the lifting-bars *d d k k*, and provided with the clamps *b b b b* and clamping side rails B B, combined and arranged substantially as and for the purposes herein set forth.

2. In a table for manufacturing portable wainscoting, the transversely-curved surface of the table A with or without the rebate *e*, combined and operating in connection with the side rails B B′, substantialy as herein shown and described.

114,908. — Corn-Planter. — William C. Bowman, Clarksburg District, Md.

Claim.—1. The jointed lever K′ carrying the plows L L′ arranged, respectively, in front and rear of the hopper, and operating in connection with the dropping mechanism, substantially as herein shown and described.

2. The hopper G and spring seed-slides J, when made adjustable upon the frame with relation to the tripping mechanism, substantially as described, for the purpose specified.

3. In combination with the hopper and seed-slides, the pivoted connecting-bars, and the operating-lever S, substantially as described, for the purpose specified.

114,909.—Top-Prop for Carriages.—Frederick A. Bradley, New Haven, Conn., assignor to O. B. North & Co., same place.

Claim.—In top-props for carriages, the arrangement, between the nut and joint end, of the washer *a* provided with the tongue or tongues *f*, and the bolt constructed with corresponding grooves *d*, as and for the purpose specified.

114,910.—Door-Latch.—Elias K. Breckenridge, West Meriden, Conn.

Claim.—1. The arrangement of the latch D constructed with shoulders *s s*, upon the plate A constructed with lugs *a a*, and combined with the two armed springs, B C, setting between the lugs and shoulders, operating substantially as described.

2. In combination with the subject-matter of the first clause of claim, the handle L, constructed and applied to the said latch-plate, as and for the purpose described.

114,911. — Galvanic Battery. — David Brooks, Philadelphia, Pa.

Claim.—The application to galvanic batteries of paraffine or its equivalent, substantially as and for the purpose set forth.

114,912. — Bee-Hive.—James F. Broomfield, Richmond, Ky.

Claim.—The boxes A A^1, supplied with the ventilating-tubes *b b*, having cut-offs *b′ b′*, when arranged and connected together in sections upon a central standard, substantially as herein shown and described.

114,913. — Whiffletree. — William S. Brown, Thorntown, Ind.

Claim.—In a safety-whiffletree, the arrangement of the sections *a a*, hinge *b*, connecting-band B, projections *d d*, recessed cap *e*, spring *s*, and loop *h*, substantially as and for the purpose specified.

114,914.—Propulsion of Vessels.—Patrick Burke, Boston, assignor to Willard M. Harding, Chelsea, Mass.

Claim.—1. The tapering pipes *c d*, arranged so as to incline downward, in connection with the piston-cylinders *c*, substantially as described, and to produce the effect set forth.

2. In connection with the piston-cylinders *c* and ejection-pipes *c d*, the two-way cocks or cut-offs *i*, coupled and moved simultaneously, substantially as described.

114,915.—Window-Sash.—Albert Gibbons Buzby, Philadelphia, Pa.

Claim.—1. A sash arranged to slide in the frame as usual, and divided vertically, in combination with devices whereby the two sections may be separated so as to wedge the sash in the frame and thereby secure it in any position to which it has been adjusted.

2. The combination, with the vertically-divided sash, of a flattened rod, which may be turned to separate the sections of the sash, as described.

114,916.—Cooler for Liquids.—John W. Campbell, Sr., New York, N. Y.

Claim.—1. The cooler B, constructed with cast-metal frames B^1 B^1 and sheets of metal which are soldered thereto, the parts being constructed and arranged substantially as and for the purpose set forth.

2. The drip-pan D, constructed with apertures in its sides and ends, and with the flange or cup G for forming the water-joint, substantially as and for the purpose set forth.

3. The combination of the cooler B and drip-pan D, substantially as and for the purpose set forth.

4. The combination of the caps D^1 and D^2 and the drip-pan D, substantially as and for the purpose set forth.

5. The combination and arrangement of the plate or slab A^1, the funnel-ended pipe F, and bowl F', substantially as and for the purpose set forth.

114,917, antedated May 12, 1871.—Curtain-Fixture.—Nathan Campbell, Rochester, N. Y.

Claim.—1. The combination of the spring locking-lever *a* and spool B with the cord *c*, for the purposes set forth.

2. The stop *n* upon the bracket C, in combination with the locking lever *a* and elevating-cord *c*, arranged to operate substantially as and for the purposes set forth.

3. The bracket D, provided with the recess *h* and stop *o*, with the enlargement *p*, substantially as set forth.

114,918, antedated May 12, 1871.—Curtain-Fixture.—Nathan Campbell, Rochester, N. Y.

Claim.—The arrangement of the cord-opening *c* in the lower end of the lever, with relation to the center of the curtain-roller and to the pivoting point of said lever, whereby the ratchet is unlocked by a direct downward pull upon the elevating-cord, in the manner set forth.

114,919.—Wheel for Tempering Clay.—Franklin L. Carnell, Philadelphia, Pa., assignor to himself and David R. Carnell.

Claim.—1. The double-flanged triangular sheave D for operating the endless chain *d*, substantially as herein set forth.

2. The combination of the double-flanged triangular sheave D, chain *d*, roller *e*, pins *i m*, and rod H, substantially as and for the purposes herein set forth.

3. The combination of the beam B, rib *f*, sleeve G with collars *h h* and wheel E, pins *m i*, roller *e*, chain *d*, double-flanged triangular sheave D, cog-wheel C, and pinion *b*, all substantially as and for the purposes herein set forth.

114,920.—Machine for Pointing Horse-shoe-Nails.—Alexander H. Caryl, Groton, Mass.

Claim.—The combination of the rotary bur-ring and the nail-supporting rest and groove, the ring overhanging the nail-rest, and the supporting face of the rest projecting up to the angle of the bur-teeth, substantially as shown and described.

114,921.—Saw-Filing Machine.—Charles P. Case, Troy, Pa.

Claim.—1. The L-shaped standard or guide H, having its front end curved and slotted, as described, and provided with set-screws *b b*, adjustable arm *d*, and pin *e*, substantially as and for the purposes herein set forth.

2. The bars K K', constructed and connected to the carriage J, as shown and described, and provided with arms *f* and *f'* for holding the files to be operated by the motion of the pitman C, substantially as herein set forth.

3. The adjustable guide R, provided with slotted segmental brace *k*, in combination with the rack-bar S, clamps *k k*, and pinion *m*, substantially as and for the purposes herein set forth.

4. The arrangement of the slotted standard M, adjustable platform N, carriage P, sliding stop *g*, and screws O O', all as shown and described, and for the purposes set forth.

5. In combination with the pitman of a saw-filing machine, the bars K K', provided with the other oblique slots *z z* and the bolts *x x* moving with and parallel with the pitman, substantially as specified.

6. The file-carrier described, or its equivalent, provided with files L L', and adapted automatically to produce a reciprocal and alternate action of said files on their respective sides of a saw-tooth, and whether used in combination with machinery for moving the same or not.

114,922.—Churn.—Schuyler S. Case, Marion, N. Y.

Claim.—1. The clip K, constructed as described, and provided with a vent-tube, L, to regulate the quantity of air forced into the churn, substantially as and for the purpose set forth.

2. The clips K, with vent-tube L, in combination with the conductor D, dasher O, connecting-bar H, tube C, plunger F, piston E, the whole arranged substantially as herein shown and described.

114,923.—Bed and Seat-Spring.—James P. Chamberlin, North Abington, Mass.

Claim.—Wire springs *a*, formed substantially as herein described and shown in the drawing, in combination with a slat or slats, D, when connected thereto and to a suitable frame for action, substantially as described, for the purpose specified.

114,924. — Telegraph-Insulator. — Stephen Chester, Elizabeth, N. J.

Claim.—1. The application of a metal ring, with three or more interior pointed projections, to attaching wire to telegraph-insulators, substantially in the manner and for the purpose as above set forth.

2. The application of hooks, turned in opposite directions, to the exterior edge of a metal ring surrounding directly a glass, porcelain, or ebonite insulator, for the purpose of holding telegraph-wire, and thus attaching it to said insulator, substantially in the manner and for the purpose as above set forth.

3. The combination of points B B and C and hooks D^1 D^2 D^3 with a movable ring surrounding a telegraph-insulator, substantially for the purpose, and in the manner as above set forth.

114,925. — Breeching-Holder for Harness.—Fredric L. Churchill and Robert C. Beach, Minneapolis, Minn.

Claim.—1. The spring holder, constructed substantially as represented, and employed in connection with the back-strap and hip-strap to secure the latter on the former, as explained.

2. In combination with the hip-strap holder represented, the shell, shown in fig. 1, for securing it to the back-strap, as explained.

114,926.—Method of Attaching Saws to their Arbors. — George W. Colborn, Gardiner, Me.

Claim.—A saw having the recessed flanged collar *b* attached thereto, receiving and partially inclosing the collar *a* formed on the saw-shaft, the saw being secured by means of the nut D screwed onto the threaded end of the shaft, all constructed and arranged as herein described, for the purpose specified.

114,927.—Metallic Sign.—Samuel Charles Collis, Philadelphia, Pa.

Claim.—A sign, consisting of a perforated metal plate permanently united throughout to a non-perforated metal backing-plate, and having the recesses thus formed packed with composition.

114,928. — Base-burning Stove.—Albert C. Corse, Troy, N. Y., assignor to Eddy, Corse & Co., same place.

Claim.—In combination with the magazine A, the forked sections C and D attached to its lower end in the manner and by the means substantially as and for the purpose specified.

114,929.—Loom.—Jeremiah Francis Crowley, Philadelphia, Pa.

Claim.—1. The side lever P, hung to the stationary frame at either of the points *l* or l^2, operating the sliding cam-shaft or Jacquard, or either, as set forth, and arranged to be operated by the stop-motion of the loom, substantially in the manner described.

2. The adjustable block *q* of the said lever, with its inclined edge q^1, in combination with the projection q^2 of the sliding bar S.

3. The said lever P, in combination with the fixed pin l^3, for withdrawing the pawl k^2 from between the teeth of the ratchet-wheel *m*, and thus stopping the motion of the take-up rollers.

4. The said lever P, arranged and operating substantially in the manner described, so as to simultaneously stop the motion of the cams, the Jacquard apparatus, and the take-up rollers.

5. The combination and arrangement, substantially as herein described, of the cams E and E', the feathered sleeve F on the cam-shaft, and the clutch F', operated by the stop motion of the loom, as specified.

114,930. — Bread-Slicer.—John W. Currier, Springfield, Mass., assignor to himself and John W. Labaree, same place.

Claim.—In an improved bread-slicer, the fixed horizontal knife A, and the movable platform D operated and adjusted to its position by means of the incline or wedge-shaped piece N, secured to the piece *c*, and actuated by the screw J, substantially as described.

114,931. — Can Top.—Charles E. Dayton, Meriden, Conn.

Claim.—An improved can top, consisting of the cover *b*, having the cork or other similar elastic material, *d*, and pivoted to the flange *c* having the bent projection *a'* thereon, all constructed and operating substantially as described.

114,932.—Cigar-Mold.—Napoleon Dubrul, Joliet, Ill.

Claim.—1. The novel joint E in a cigar-mold, as and for the purpose specified and shown.

2. The combination of the sections A A^1 A^2, having projections C and recesses *g*, with the bars D, as and for the purpose specified and shown.

3. The cigar-mold described, constructed in sections, said sections being provided with clamping projections C and bars D, the division between the sections being made so as to avoid the matrices in order to obviate an additional crease or creases in the cigar, substantially as specified and shown.

114,933. — Dasher for Wheeled Vehicles.—Willet Fisher, Marathon, N. Y., assignor to himself, Jerry C. Gray, and Jessie L. Judd, same place.

Claim.—A dash-board in which the wooden rail C is so bent or formed as to both form the shape of the board and the corner posts to the front end of the box, as shown and described.

114,934.—Clothes-Drier. — Marvin Flanders, Kendall, N. Y.

Claim.—The combination, in a clothes-rack, of the arms *a b* and clasps *c c* with the legs B B and standard C, constructed and arranged so that each wing can be folded vertically, and spread and expanded in opposite directions, in the manner described.

114,935. — Screw-Tap. — George H. Fox, Boston, Mass.

Claim.—A screw-tap, each bit-holding groove *c* of which is wider at bottom than its bit *b*, the bit or bit-blank being confined in one position in its groove to have its teeth cut concentrically to the axis of the tap-spindle, and being forced toward or confined against the opposite wall of the groove to bring its teeth into eccentric working position.

114,936. — Railroad Switch. — Samuel French, Boston, assignor to Sidney Allen, Newtonville, Mass.

Claim.—The switch as provided with the longitudinal and transverse slopes *a b d* and the guide or extension *c*, all arranged substantially as described and represented.

114,937.—Wagon-Jack. — Abner R. Giles, Adams, N. Y.

Claim.—The construction and arrangement of the bed-plate A, box B, standard C with notches *a a*, piece E with bail *b*, and lever D, with semicircle G, all substantially as and for the purposes herein set forth.

114,938. — Telegraph-Repeater.—Elisha Gray, Chicago, Ill.

Claim.—1. The relay armature-levers G and G', arranged to shunt the magnets, as described, whereby the said levers are closed on the receiving side, substantially as and for the purpose described.

2. The arrangement of the main and local circuits, in combination with the shunting and repeating-points H and I, when said points are arranged on the same relay-armature, substantially as described.

3. In a telegraphic-repeater, the combination of circuits and magnets, arranged substantially as and for the purpose described.

4. The magnets C C D D, so arranged as to jointly or separately operate upon the same side of the same armature, substantially as and for the purpose described.

114,939. — Pipe-Cutter. — Dennis Harrigan, North Somerville, assignor to himself and Joel Gay, Cambridge, Mass.

Claim.—1. The combination of the hollow frame or structure E, as provided with a chisel or cutter, a feed-screw, and angular abutment or recessed jaw, with a screw-wrench, substantially as and for the purpose set forth.

2. In combination with the subject of the foregoing clause, means or mechanism for adjusting the recessed jaw, as and for the purpose set forth.

114,940. — Railway Gate. — Simeon H. Heatwole, Bridgewater, Va.

Claim.—The combination of the levers D D with projections *a a*, arms *b b*, shaft E, weighted arm G, arm *d*, bar H, rod *f*, levers I I', and the gates B B with the track A, all constructed, arranged, and operating substantially as set forth.

144,941. — Tanning Compound. — Allen Hisey, Tama city, Iowa.

Claim.—The tanning compound, composed of the ingredients and compounded in the manner and the proportions substantially as herein set forth.

114,942.—Sash-Holder. — Robert B. Hugunin, New York, N. Y.

Claim.—1. The sliding lever B, in combination with the vertical spring C and horizontal spring D, substantially as set forth.

2. The plate A, having the confining-projections K and L and pin E, with the springs C and D, in combination with the lever B and rollers F and G, substantially as described.

114,943. — Base-burning Stove. — Zebulon Hunt, Hudson, N. Y.

Claim.—1. The diaphragm or curtain-plate B, when employed substantially in the manner and for the purpose herein set forth.

2. The combination and arrangement of plate B, chamber A, and ventilator D, substantially as and for the purpose set forth.

114,944.—Flexible Propeller. — Robert Hunter, Cincinnati, Ohio.

Claim.—The propeller herein described, consisting of a number of plates or leaves of different sizes rigidly attached at their inner ends to a common oscillating shaft, disconnected at their outer ends, and arranged, as herein specified, so as to support each other with a yielding pressure.

114,945.—Process of Coating Billiard-Balls, Knife-Handles, and other Articles.—John W. Hyatt, Jr., Albany, N. Y.

Claim.—1. The adjustable pins or set-screws *d d d d*, in combination with the mold D, substantially as described.

2. The vent E, in combination with the mold D, adjustable pins *d d d d*, cylinder A, and plunger B, substantially as described.

114,946.—Artificial Stone for Buildings.—James J. Johnston, Columbiana, Ohio.

Claim.—1. An artificial stone, the outer end or side of which is provided, during its construction, with a metallic surface, substantially as herein described and for the purpose set forth.

2. A new article of manufacture, viz., an artificial stone, constructed as hereinbefore described.

114,947.—Base-Burning Stove.—William M. Jones, Horicon, Wis.

Claim.—1. The fire-pot B, passage C, passage K, chamber L, openings R, and chamber S, for the supply of gas to the fuel, substantially as described.

2. Magazine D, perforations H, gauze partition I, passage K, chamber L, passage C, chamber S, and openings R, substantially as described.

114,948.—Bird-Cage Bracket.—Albert D. Judd, New Haven, Conn.

Claim.—As an article of manufacture, the herein-described bird-cage bracket, consisting of the plate A and hooked arm B, made detachable one from the other, substantially as herein described.

114,949.—Machine for Leveling Boot-Heel Treads.—Arza B. Keith, Braintree, Mass.

Claim.—In combination with a mechanism organized to grasp a boot or shoe and gauge it in position to receive the heel, or with relation to the line between the heel and sole, a leveling-hammer arranged and operated substantially as described, so that the face of the hammer brings the heel-tread to a definite plane with relation to the sole or rear part of the boot or shoe-upper.

114,950.—Apparatus for Igniting Gas and other Lights.—Wilhelm Klinkerfues, Göttingen, Prussia.

Claim.—1. The igniting apparatus, consisting of a vessel that is partly filled with an exciting liquid, and provided with a pair of galvanic plates, and operating in such manner that when the liquid is brought in contact with the plates a piece of platinum connected with the plates will be excited to produce catalytic action and ignite combustible matter with which it is brought in contact, as set forth.

2. The vessel D, provided with the bell E, galvanic plates *j k*, and pipes *m*, *n*, and *o*, to operate substantially as herein shown and described.

114,951.—Breech-loading Fire-Arm.—James Lee, Milwaukee, Wis., assignor to Philo Remington, Ilion, N. Y.

Claim.—1. The combination of the breech-block, hinged at its rear end, and the lever F, so that said lever, in being operated, shall first draw down the breech-block into a loading position, and then, by continuing its motion while the breech-block remains stationary, move the extractor to draw out the empty case, substantially as described.

2. In combination with a breech-block hinged at its rear end, and a lever extractor, the raising or setting of the lever by the act of introducing the cartridge, so that the expansion of the main spring through the hammer may raise the breech-block far enough to catch and hold the cartridge from dropping out of the gun, substantially as described.

3. In combination with a breech-block hinged at its rear, a lever moving around a variable center of motion near the front of and slightly underneath said breech-block, substantially as described.

4. In combination with a breech-block hinged at its rear end, and with a lever for operating it, a cartridge-extractor moving with said lever and around the variable center of motion of said lever, substantially as and for the purpose set forth.

5. In combination with a breech-block hinged at its rear end, and having a firing-pin passing through it and operated by a lever, as described, a projection or shoulder on said lever for driving back the firing-pin, should it, from any cause, fail to return into the breech-block after being driven out by the hammer, substantially as described.

6. The construction and operation of the lever, substantially as described, so as to produce four movements during its descent, namely: depress the breech into a loading position, eject the cartridge-shell or case, push the hammer back to a half-cock, and force back the firing-pin, as described and represented.

7. The combination of a breech-block hinged at its rear end, and a hammer arranged directly in its rear, the devices by which, when the hammer is brought and caught at the half-cock by the downward movement of said breech-block, it can neither be let down from said half-cock nor brought to the full-cock, as described and represented.

8. The arrangement of the hammer and its thumb-piece and a breech-block hinged at its rear end, substantially as described, so that the hammer can be used for operating said block—as, for instance, in closing it as the hammer is drawn back to the full-cock.

114,952.—Grain-Bag Holder.—William P. Leland, Mendon, Mich.

Claim.—1. The hopper D, provided with flanges *d d* and doors *f f*, constructed and arranged to operate substantially as and for the purposes herein set forth.

2. The combination of the bed-frame A, standard B, support C, and hopper D with flanges *d. d* and doors *f f*, all constructed and arranged substantially as and for the purposes herein set forth.

114,953, antedated May 12, 1871.—Boring-Machine.—Robert Little, Freeport, Ill.

Claim.—The combination of the inner fixed tube B with the outer rotating tube A and the air-pumping mechanism herein described, all constructed and arranged to operate substantially as and for the purposes herein set forth.

114,954.—Lamp.—Charles B. Mann and Stephen S. Mann, Baltimore, Md.

Claim.—1. The spring slide *b*, constructed and arranged in connection with the drum *a*, as herein shown and described.

2. The safety-filling attachment for lamps, formed of long wick and filling-tube *c'*, connected with the drum *a* by means of a horizontal flange forming the imperforate bottom thereof, said drum being provided with the lateral opening closed by the slide *b*, substantially as specified.

3. The long wick and filling-tube *c'* and connecting-drum *a*, constructed and arranged, as specified, to form an annular gas-chamber, which is provided with outlets *i* in the bottom, delivering the gas downward, as set forth.

4. The long wick and filling-tube *c'*, connected with the drum *a*, as specified, or so as to leave an annular space between the tube and the screw-neck of the drum.

5. As an article of manufacture, the lamp attachment, consisting of the long wick-tube *c'*, chamber or drum *a*, provided with the spring slide *b*, constructed and arranged to form the annular gas-chamber, provided with outlets *i*, and an annular space for passage of gas or vapor, as described.

114,955.—Spring Bed-Bottom.—Calvin F. Manuel and Daniel M. Leonard, La Crosse, Wis.

Claim.—The coiled-wire springs E, leather straps D, and short round cross-bars F, in combination with the horizontal slats A, short cross-bars B, and levers C, substantially as herein shown and described, and for the purpose set forth.

114,956.—Manufacture of Sheet-Iron and Removing Scale from Iron for Coating with other Metals.—Caleb Marshall, Philadelphia, Pa., assignor to Marshall, Philips & Co., same place.

Claim.—1. The improved process, herein described, for removing scale from the surface of sheet and other iron, the same consisting in treating the iron with a saline bath, and then subjecting it to heat so as to raise the scale, substantially as set forth.

2. The combination of the above process of removing scale from iron, with the after treatment of heating, rolling, and annealing, so as to produce polished sheet-iron, as set forth.

3. The improved article of polished sheet-iron herein described.

114,957, antedated May 6, 1871.—Feeding Mechanism for File-Cutting Machines.—Charles E. Moore, Boston, Mass., assignor to Hiram B. Nickerson, same place.

Claim.—The combination of the swinging piece C, spring Q, concentric shafts D P, and gears E F with the gears L H and eccentrics K K and M N', all arranged substantially in the manner described.

114,958.—Casting Car-Wheels.—James K. Morange and Napoleon B. Morange, Pittsburg, Pa.

Claim.—A car-wheel for railways, with a recess or recesses made in its tread at a point or points which is or are between the flange and outer edge of the wheel, substantially as and for the purpose set forth.

114,959.—Current-Wheel.—Clark Morehouse, Wayland, N. Y., assignor to himself and John W. Doughty, same place.

Claim.—A series of wheels with V-shaped buckets, secured to a shaft so as to be readily adjusted upon said shaft, substantially as and for the purpose described.

114,960.—Earth-Closet.—Henry Moule, Fordington, and James Bannehr, Exeter, England, assignors to Earth-Closet Company, Hartford, Conn.

Claim.—In combination with a commode or closet, in which there is a means provided for deodorizing the excrement, a means for mixing the discharge mass, substantially as set forth.

114,961.—Flour-Sifter.—William B. Nichols, Seymour, assignor to himself and T. B. Carpenter, New Haven, Conn.

Claim.—The arrangement of the hemispherical-shaped sieve *a* within the cylinder A, combined with the revolving circular agitator D, (one or more,) substantially in the manner and for the purpose specified.

114,962, antedated May 6, 1871.—File.—Hiram B. Nickerson, Boston, Mass.

Claim.—As a new article of manufacture, a file whose surface is serrated in two or more series of parallel lines, whose distance apart is increased or diminished in a given ratio, in the manner shown and described.

114,963.—Bank-Check, &c.—Anthony C. Paquet, Philadelphia, Pa.

Claim.—The amount for which a check or other paper of value is drawn produced in the body of the paper by a die of hardened steel, or equivalent, acting against a bed or block, likewise of hardened steel, whereby the fibers of the paper are compressed and the impression rendered translucent, or has the appearance of what is known as "water-line," as herein described.

114,964.—Cultivator and Shovel-Plow.—George W. Parsons and William S. Finney, Harrisburg, Pa.

Claim.—1. The device for securing the front ends of the side beams, consisting of angular ribs *c c*, in combination with grooves *a b* in beams B B', bolt *a*, with a beveled head and triangular washer, W, substantially as described.

2. The clevis C, provided with the angular ribs *c c* and square-shouldered recesses R R, in combination with beams A B B' and standards H, substantially as described.

114,965.—Boiler-Furnace Draught-Regulator.—William Everett Pearson, East Boston, assignor to himself and James C. Wilson, Lynn, Mass.

Claim.—1. The combination of the cylinder G, the piston H, the lever F, the weight I, the case B, the valve *g*, and the blast-pipes C D, all arranged and combined substantially in manner and for the purpose described.

2. The combination of the cylinder G, the piston H, the lever F, the weight I, the case B, the valve *g*, and the two blast-pipes C D with the exhaust-pipe E or passage of a steam-engine, and with a boiler, A, and its furnace or its chimney *a*, all being arranged and combined substantially as and for the purpose described.

3. The combination of the damper *b*, the cylinder G, the piston H, the lever F, the weight I, the case B, the valve *g*, the blast-pipes C D, and the exhaust-pipe, boiler, and furnace of a steam-engine, all being combined and arranged substantially in manner and for operation as and for the purpose as explained.

114,966.—Flour-Bolt.—Dabney N. M. Peregoy, Elizabethtown, Tenn.

Claim.—1. The arrangement of the guard or shell H upon the head of the bolt-reel, herein described, with the breakers *l l* on the strips *g g*, combined and operating in connection with the tube *c*, screw *f*, cylinder C, and chutes F F, with or without the bran-tube E, substantially as set forth.

2. The closed concave cylinder or hopper C, arranged on standards *a*, in combination with an adjustable hinged table, A, when the same is constructed and operates in the manner and for the purpose set forth.

3. The combination of the adjustable hinged table A, concave or cylinder C, bolt D, screw *f*, tube *c*, chute or chutes F, openings *h*, and keys, when operating together in the manner and for the purpose specified.

114,967.—Millstone-Dress.—Dabney N. M. Peregoy, Elizabethtown, Tenn.

Claim.—The millstone-dress herein shown, having the main leading-furrows B B and angle-elbow *c'*, as described, in combination with the parallel grooves C and discharge-furrows *f f*, all constructed and arranged substantially as described.

114,968.—Copying Colored and Defective Drawings, &c.—Isaac Rehn, Washington, D. C., assignor to himself and Norris Peters, same place.

Claim.—The application of a non-actinic transiucent tracing varnish to photographic negatives, substantially as described, and for the purposes set forth.

114,969.—Piston and Piston-Packing.—George H. Reynolds, New York, N. Y., assignor to himself, Cornelius H. Delamater, and Alexander K. Rider, same place.

Claim.—The piston-body A and removable jacket B, adapted to each other as represented, so as to allow of the convenient introduction and removal of the entire periphery of the piston with the packing thereon, as herein specified.

114,970.—Boot-Jack.—Milo A. Richardson, Sherman, N. Y.

Claim.—The boot-jack herein described, consisting of the slotted board A and the projecting pivoted legs D D for attachment to the wall, and so arranged that when raised the center of gravity of the jack will be between the wall and the pivots *d d*, substantially as specified.

114,971.—Lard Package.—John Ring, St. Louis, Mo.

Claim.—1. The described method or process of putting up lard in sheet-metal cans, namely, by coating the surface of the metal, substantially in the manner set forth, to enable the firm attachment of the outer wrapper E and the application of the said wrapper, all substantially as and for the purpose described.

2. The can A, with internal rim or flanges *a a*, in combination with the flanged cover B, secured together with an air-tight joint produced in the manner specified.

3. The combination of the can A, the flanged cover B, the inwardly-projecting flanges *a a*, the insoluble coating D, and the outer wrapping E, as and for the purposes specified.

114,972.—Preserving and Smoking Meats.—Absalom Robertson, Seymour, Ind.

Claim.—1. The within-described meat-house, composed of horizontal sheet-iron sections, the upper ones perforated and provided with suitable doors, and each such horizontal section divided into two or more sub-sections, the whole being arranged and connected together substantially as and for the purposes herein set forth.

2. The inlet-pipe A and ventilation-tube G, with valve *i*, arranged as described in the sectional meat house A B C, substantially as and for the purposes herein set forth.

114,973.—Wagon-Brake.—John J. Rose, Elmwood, Ill.

Claim.—The arrangement of the levers C, provided with ratchet *f*, pawl *g*, and winch A, with its rope *d*, arranged, with pulleys *e* and *e* of clevis B, to connect with brake A, in combination with the frame G of a hay or other wagon, substantially as shown and described.

114,974.—Grain-Separator.—Lewis C. Royer, Royerton, Ind.

Claim.—1. In combination with the cylinder and concave, the grate E, composed of flat pivoted bars, operated by means of the slide A and bars *f f*, substantially as and for the purpose set forth.

2. The combination of cylinder C, concave D, grate E, constructed as described, and straw-director S, all arranged to operate substantially as described.

3. The shaker H, composed of perforated boards *b b'*, inclined slats *d d'* arranged alternately, as shown, and toothed bars I I, substantially as and for the purpose set forth.

4. In combination with the grate E and shaker H, the grain-receiver G, formed of sheet metal, with its edges turned up, and at the rear end provided with grate E, and rake-teeth *e e'*, substantially as and for the purposes set forth.

5. The within-described grain-separator, all the parts constructed and arranged as described.

114,975.—Skinning-Knife.—Morgan Rufe, Doylestown, Pa.

Claim.—The combination of the spear-shaped knife-blade A, one or two plates, B, and one or two pieces of leather, C, all substantially as and for the purposes herein set forth.

114,976.—Sleigh-Brake.—John W. Scott, Broad Top City, Pa.

Claim.—The combination of the shaft D, eye-bolts *a*, arms *b*, bars E, crank *d*, rod G, and lever H, constructed and arranged substantially as and for the purposes herein set forth.

114,977.—Fanning-Mill.—Hurlbert H. Seeley, Hudson, Mich.

Claim.—1. The combination of the lower screen K, frame L, wheat-board M, and adjustable rod *f*, all constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the frame A with drum B and hopper C of the slotted lever G, adjusted as described, the shoe N, screens P P, chess-board R, bar *h*, and blocks O O, all constructed, arranged, and operating substantially as set forth.

114,978.—Metal-Founders' Blacking.—John Carrington Sellars, Birkenhead, England.

Claim.—The manufacture of metal-founders' blacking by adding to and mixing sea-weed, sea-grass, or sea plants with coke, charcoal, coal-dust, or carbonaceous matter, or lime, chalk, or clay, or any two or more of these together, in the manner and in about the proportions herein set forth.

114,979.—Self-Adjusting Car-Wheel Gear.—George Sewell, Brooklyn, N. Y.

Claim.—1. The bar E, having right-and-left screws *o o* and collar *p*, in combination with the wheels A A having the sockets D D, as and for the purpose set forth.

2. The clamps *m m*, with bolt *e*, and recess *w*, in combination with the axle B having the collar *l*, and the bar E having the collar *p*, as and for the purpose set forth.

3. The sockets D D, provided with the packing-boxes *h h* and screw-plugs P P, as and for the purpose set forth.

4. The wheel A, with hub B, and socket D, having screw-threads as described, so as to combine with the axle and bar E E, as set forth.

114,980.—Flour-Bolting Reel.—David Shamp, Perry, N. Y.

Claim.—The arrangement of the double bolting-cloth O and the ribs C, when the latter are inclosed within the former, as shown and described, substantially as and for the purposes described.

114,981.—Faucet or Supply-Cock.—Edwin F. Shoenberger, Philadelphia, Pa.

Claim.—The combination of the casing A, branch B having an annular projection on its inner end, an elastic tube, C, connected to said projection, and devices, substantially as described, for compressing and releasing said tube.

114,982.—Hitching-Post.—Edwin F. Shoenberger, Germantown, Pa., assignor to George K. Shoenberger, Jr., same place.

Claim.—A post having a vertical slot, *g'*, and lateral slot or slots *h*, in combination with an internal weight or block, provided with pin, which projects into the slot in the post, for the purpose specified.

114,983.—Car-Brake.—Calvin A. Smith, Jersey City, N. J.

Claim.—The car-brakes A A', the lever C, the arms *e e'*, and the springs *g g'*, all combined, arranged, and operating substantially as and for the purpose specified.

114,984.—Thrashing-Machine and Grain-Separator.—John Smith, Burlington, Wis.

Claim.—The combination, in the thrashing-machine and grain-separator herein described, of the cylinder A, endless straw-carrier C, endless rake D, the screen G, constructed as described and shown, the sieves I K, fan S, and shaft N, provided with cranks L M, all arranged to operate in the manner and for the purpose set forth.

114,985.—Apparatus for Cooling and Preserving Milk and other Liquids.—Daniel E. Somes and Frank C. Somes, Washington, D. C.

Claim.—1. A railway car or other vehicle constructed with cells in its interior, with surrounding air or packed spaces for the reception of milk-cans and other vessels, substantially as described.

2. Such car in combination with means for cooling and admitting and discharging air, substantially as described.

3. A milk-can, wholly or partially covered with some fibrous or porous substance, with means for keeping it wet, substantially as and for the purpose set forth.

4. A milk-can, with a perforated disk, constructed substantially as and for the purpose set forth.

5. A milk-can, substantially as described, having an electric rod attached thereto, substantially as and for the purpose set forth.

6. An apartment in a building, or ship, or other vessel, constructed as described, with means for keeping it cool, substantially as and for the purpose set forth.

7. A closet or apartment for milk, with the means described and shown in figs. 12 and 13 for cooling and ventilating, and for the exclusion of insects and dust, substantially as set forth.

114,986.—Adjustable Square.—Knud Steen, Rochester, N. Y.

Claim.—1. A combined folding-rule, square, and T-square, consisting of the slotted rule A, bearing-piece *h*, cross-piece B constructed of plates *b b*, and provided with openings *d e*, strip *c*, and thumb-screw *i*, all combined and arranged substantially as described.

2. In combination with the slotted rule A and divided cross-head B and bearing-piece *h*, the adjustable bow-piece *h*, arranged to operate substantially as and for the purpose described.

114,987.—Rule-Joint.—D. H. Stephens, Riverton, Conn.

Claim.—A rule-joint, in which intermediate plate C, reduced as shown and described, is combined with the plates *b* and *b'*, strengthened by disks *c c* coated with anti-friction metal and soldered to the said plates, as specified.

114,988.—Draft-Equalizer.—William Stevenson, Neponset, Ill.

Claim.—The double-chain D, arranged in combination with a draft-bar, when said chain is connected to the bar, substantially in the manner and for the purpose set forth.

114,989, antedated May 12, 1871.—Pump.—Zara T. Sweet, Tiskilwa, Ill.

Claim.—1. The arrangement of the shaft *h*, cam I, wheel H, chain *g*, and lever G, substantially as shown and described, for operating a pump by a passing train of cars, substantially as herein set forth.

2. In combination with the shaft *h*, cam I, wheel H, chain *g*, and lever G, the plunger E, pipe D, and cylinder A with its valves, all constructed to operate substantially as set forth.

114,990.—Washing and Wringing-Machine.—John Taber, South Wolfborough, N. H.

Claim.—The combination of the rollers A B, frame C D E, crank G, stirrups *b b*, springs H H, screw-hooks *d d*, and thumb-nuts *f f*, all constructed and arranged to form a clothes-wringer, and attached to a wash-tub by means of the uprights I I and pin *e*, substantially as herein set forth.

114,991.—Nut-Lock.—Samuel L. Thompson, New Waterford, Ohio.

Claim.—The link E and the forked holder F and *f*, constructed as described, and combined with the nuts E and bolts C, substantially as shown and for the purpose specified.

114,992.—Key-Fastener.—Lyman Tobey, Naples, N. Y.

Claim.—The key-fastener as described, composed of a single spring wire, bent upon itself, and one arm secured to the other by a spring-hook after it has surrounded the knob-shank and passed through the key-bow.

114,993.—Dough-Kneader.—William Tyler, Georgetown, D. C.

Claim.—The combination with the dough-trough A of the kneading-roller and auxiliary draft-rollers D and E, arranged to operate in unison, and to act alternately in such capacities, according to the direction in which they are rotated, substantially as shown and described.

114,994.—Machine for Skiving Soles of Boots and Shoes.—Henry S. Vrooman, Boston, Mass.

Claim.—1. The combination of an upper toothed or serrated feed-wheel, *e*, and a presser-plate, *k*, attached to the arm or part of the frame upon which the shaft of the toothed or serrated feed-wheel is journaled, with a lower smooth-surfaced feed-wheel and a cutter or cutters attached to the arm or part of the frame to which the shaft of the smooth wheel is journaled, but arranged to act upon the upper surface of the sole fed between the wheels.

2. The combination, with an upper and a lower feed-wheel and the presser-bar *k*, of the cutter-block to which the skiving-knife or cutter is attached, made vertically adjustable from the head or frame of the machine, substantially as described.

3. In combination with an upper and a lower feed-wheel, the edge-guide, cutter-block, and cutter, all arranged and combined so that they move vertically as one piece.

4. In combination with the feed-rolls, the cutter or auxiliary cutter-block *u* made adjustable angularly, substantially as described.

114,995.—Wagon-Brake.—Henry Walmer, Lebanon, Pa.

Claim.—1. The combination of the brake-bar C, link *b*, and the sliding bar *c* with the lever E, when arranged substantially as shown and for the purpose specified.

2. The combination of the axle B with the eye-bolt F, sliding bar *c*, semicircular piece G provided with saw-teeth, and the lever E, when all constructed substantially as shown and for the purpose set forth.

114,996.—Hydrant.—James Walsh, Philadelphia, Pa.

Claim.—1. The combination, with the vertical delivery-pipe D, of an inflexible cylinder, J, arranged below and communicating with said pipe and a piston sliding in said cylinder, and operating so as to raise the water into or draw it from the said pipe, as specified.

2. The combination and arrangement, substantially as herein described, of the operating-rod F, cylinder J, and piston K, valve-case H, and the intervening devices, consisting of the lever M, rod *g*, and arm *f*, with its spring *s*.

3. The combination, in a hydrant, of the stationary box B, detachable body A, and a delivery-pipe, D, divided near the point where the body and box are joined, and provided at said point with a slip-joint, as specified.

4. The combination, with the casing h^1, screw-cap h^2, and pipes c c', of a valve, L, having internal threads adapted to threads in the cap and operating as described.

5. The combination of the base H, detachable casing h^1, and intervening chamber c, for the purpose specified.

114,997. — Tobacco-Pipe.—William Francis Warburton, Philadelphia, Pa.

Claim.—1. A sectional pipe, divided on the line a b, as and for the purpose described.

2. The stem or holder made in two parts, the lower of which has a V-shaped channel adapted for the reception of the upper section, as specified.

114,998. — Ice-Creeper.—Mahlon Warne, Philadelphia, Pa.

Claim.—1. A creeper, consisting of a plate, A, having spikes projecting from its lower side, turned-up ends, and one or two clamps, C, with roughened faces, said clamps being arranged adjacent to the turned-up ends and operated by set-screws, as specified.

2. The clamps C, connected to the slotted plate A by screws having spiked heads or ends, as set forth.

114,999.—Machine for Pitching Casks and Barrels.—Albin Warth, Stapleton, N. Y.

Claim.—1. The cradle A, provided with bottom rollers and end rollers to support and retain a barrel or cask, substantially as described.

2. The retaining-ropes or chains F, in combination with the cask-supporting cradle and its rails, substantially as set forth.

3. The retaining hook G, in combination with the cask-supporting cradle and its rails, substantially as described.

115,000.—Lathe for Cutting Grooves in Metal Rollers.—Hervey Waters, Boston, Mass.

Claim.—1. In combination with a roll-lathe and its cutting-tool, and with means for feeding the tool to its work as the cutting progresses, mechanism for automatically moving the tool-rest up and back with its tool by means of two wedges working simultaneously upon the opposite ends of the rest, when such mechanism is constructed and operates substantially as described.

2. The combination, with a roll-lathe and its tool, of a mechanism for automatically swinging the cutting-face of the tool during its cutting action upon the roll, when such mechanism is constructed and operates substantially as described.

115,001.—Safe-Bolt.—Jacob Weimar, New York, N. Y.

Claim.—1. A set of oscillating bolts pivoted to the door of the safe, and actuated by a sliding frame, the arrangement and operation being substantially as shown and described.

2. The oscillating bolts, the actuating frame, and the sliding bolts, in combination, substantially as set forth.

115,002. — Machine for Making Cigars. John Wettstein, Baltimore, Md., assignor to himself and John T. Hennaman, same place.

Claim.—1. In combination with the groove or channel D, for containing the tobacco to be forwarded, an endless band, forming the bottom of the said groove, and a clamp, D', for holding the tobacco near the point where it is to be cut, the knife f so mounted as to move in a plane oblique to the channel D to cut the filling with tapered ends, and provided with a counter-balance to retract said knife automatically, in readiness for a new cut,

2. The combination of the lever U, treadle T, (with its connecting-rod,) and the movable upper roller T', controlled by said lever and treadle, with the fixed rollers, and endless band N, as and for the purposes set forth.

3. The hand-wheel S, constructed with projecting spokes, in combination with the endless band N and rollers P, P, L, and T', the whole being arranged for reversed or alternate movement, as and for the purposes described.

4. The combination of the wheel or drum carrying the movable band, with the recesses or cavities on the surface thereof, whereby the lower rollers are raised or depressed in the manufacture of the cigar, and the frame carrying said rollers.

115,003.—Railway Alarm for Trucks.—Francis E. Whiteside, Oxford, Pa.

Claim.—1. A railway alarm apparatus, consisting of sliding tops suspended from the trucks of the cars, and adapted for connection to the bell-cord or other alarm upon the locomotive, so that when a car gets off the track the stops shall come in contact with the ties of the road and be held stationary, while the car moves forward, to sound the alarm, substantially as herein described.

2. The sliding frame-work C C, with suitable connections, in combination with a railroad car, substantially as described, for the purpose specified.

115,004, antedated May 12, 1871.—Combined Rake and Reel for Harvesters.—John B. Whiting, Ripon, Wis.

Claim.—1. A vertically-revolving serrated or toothed wheel, in combination with the rake and reel-arms, substantially as described, for the purpose specified.

2. The combination of the arms E, serrated or toothed wheel L, and circular guide-tracks, substantially as described, for the purpose specified.

3. The combination, with the rake and reel-arms E, of the revolving guide-disk X, elevating-wheel L, and guide-tracks J, substantially as described, for the purpose specified.

4. The reel-arms E, constructed with the toes f and laterally-projecting pins g, for the purpose specified.

5. The arrangement of the arms E, spring pawl g, the weighted and pivoted cam R, guide p, and support O with relation to each other, for the purpose specified.

6. The arrangement of the shipper S, and its foot-lever and connecting-rod, with the weighted and pivoted cam R, support O, and the toes of the arms E, for the purpose specified.

115,005.—Paper for Bank-Notes, Bonds, &c.—James M. Willcox, Glen Mills, Pa.

Claim.—A combined sensitive and special paper, prepared substantially in the manner herein described, and for the purposes set forth.

115,006.—Shuttle for Looms. — Daniel Wright, Waltham, Mass., assignor to Orlando A. Kneeland, same place.

Claim.—The combination, with the spindle a, of the guide-block e, guides l l, hinge b, and spring i, for the purposes as herein fully set forth and described.

115,007.—Self-Locking Screw-Bolt for Safes.—Charles O. Yale, New York, N. Y.

Claim.—A self-locking screw-bolt for safes, as herein described, constructed, applied, and used, substantially as and for the purpose specified.

115,008.—Hammer. — Gottlieb M. Young, El Paso, Ill.

Claim.—The spring clasp or holder B, as constructed and arranged in the dovetail recess C, as herein described, in combination with the projecting face D of the hammer, substantially in the manner and for the purpose as herein shown and set forth.

115,009. — Machine for Cutting Screw-Threads on Bolts.—Orlando P. Briggs and Lewis W. Briggs, Chicago, Ill.; said Orlando P. Briggs assignor to Lewis W. Briggs.

Claim.—1. The combination of the jointed shafts B B', gear-wheels J and P, mechanism to rotate said wheels in opposite directions, pinion n, bolt-holding shafts M, and revolving series of screw-threading dies, substantially as described.

2. In combination with the gear-wheels, pinions, and bolt-holding shafts set forth in first claim, the spring levers N, arm X, and lug l, substantially as described.

3. The combination, with a revolving series of rotating bolt-holding devices, of the revolving disk C, series of screw-threading dies E E', hooks F, pins h, and lugs g g', substantially as described.

4. In combination with the subject-matter of the third claim, the arms p p for supporting the bolt-blank, substantially as described.

5. In combination with disk C, the annular tube W, tubes V u u', and cask T, the whole arranged as described for lubricating the bolt, substantially as specified.

REISSUES.

4,379.—Horse-Power. — Hiram Aldridge, Elizabethtown, N. Mex., assignor, by mesne assignments, to Cornelius Aultman, of Canton, Ohio.—Patent No. 68,829, dated September 17, 1867.

Claim.—1. In combination with the rear axle of a horse-power mounted upon four wheels, the braces or triangular frame P for holding said axle to the ground, applied in such manner that they can be turned up into a vertical or nearly vertical position for transportation, substantially as described.

2. In combination with the transporting wheels of a portable horse-power, locking devices for locking the wheels to the carriage or truck for the purpose of preventing them from turning upon their axles, substantially as described.

3. Locking devices applied to the front axle of a four-wheeled portable horse-power to prevent said axle from turning when the power is in operation, substantially as specified.

4. The construction and arrangement of the pinion-shaft J, whereby it is adapted to receive a coupling-shaft upon either end, as set forth.

5. The ring E, adapted to support the master-wheel, substantially as set forth.

6. In combination with a portable horse-power, an auxiliary transporting frame, which can be moved out of the way of the sweeps when the power is in operation.

7. In combination with a mounted horse-power, a tie or ties arranged at the side of the machine for the purpose of preventing it from being overturned, substantially as set forth.

8. In a mounted horse-power, a tie or ties arranged at the side of the machine for the purpose of preventing it from being overturned, in combination with a brace or braces which support it (the machine) against the thrust or twisting strain imparted by the horses.

9. The combination of the line-shaft J with the frame of the machine by means of open-bottomed hangers, which permit said shaft to be readily removed without disturbing the other parts of the gearing.

4,380.—Grinding and Amalgamating Ores. Thomas Bates, Central City, Colorado Ter.—Patent No. 102,476, dated May 3, 1870.

Claim.—1. The continuous process of pulverizing, scouring, and amalgamating the tailings of an ordinary battery by means of the grinding-mill E F and amalgamator H, connected by suitable spouts to each other and to the battery, substantially as herein set forth.

2. The combination of the table or spout A, grinding-mill E F, table G, amalgamator H, stirrer I, when constructed, arranged, operated, and adapted for application to use with a battery, all substantially as specified.

4,381. — Fabric for Head-Covering. — Charles F. Bosworth, Milford, Conn.—Patent No. 38,806, dated June 9, 1863.

Claim.—As an article of manufacture, a fabric for head-coverings, made of straw or equivalent braid, united by a series of stitches, substantially such as herein described.

4,382.—Pulley Attachment for Raising Weights.—George W. Gregory, New York, N. Y.—Patent No. 57,125, dated August 14, 1866; antedated February 14, 1866; reissue No. 2,784, dated October 22, 1867; reissue No. 2,939, dated May 19, 1868.

Claim.—1. A pulley-supporter so constructed as to be placed in position substantially in the manner described.

2. The said adjustable pulley-supporter, having sockets or their equivalent, for the purpose specified.

4,383.—Cultivator.—Thomas McQuiston, Morning Sun, Ohio.—Patent No. 25,843, dated October 18, 1859.

Claim.—1. The combination, in a walking straddle-row cultivator, of the following instrumentalities, viz., two wheels, E, tongue D, axle B, and two plow-beams, A A, each beam carrying a handle and one or more shovels or plows, and independently connected or hinged by brackets C to the axle, so as to permit of their being raised or lowered independently or moved laterally by the handle, as set forth.

2. The combination, in a walking straddle-row cultivator, of the following instrumentalities, viz., two wheels, E, tongue D, axle B, two plow-beams, hinged as aforesaid, and rear connecting-shackles or links F, all operating in combination, substantially as and for the purpose set forth.

3. The plates H, interposed between the shares G and standards a', for the purpose set forth.

4,384.—Process of Seasoning Lumber.—Henry H. Beach, Rome, N. Y.—Patent No. 107,854, dated October 4, 1870.

Claim.—The process which consists in subjecting wood to the action of confined steam under a pressure, and for a time sufficient to produce the effects substantially as herein set forth, and then withdrawing it from the action of the confined steam before such action perceptibly injures the quality of the wood.

4,385.—Lamp-Wick Feeder.—George Cade, Long Branch, N. J.—Patent No. 101,427, dated April 5, 1870.

Claim.—1. The combination, with a wick-tube, of a toothed sliding wick-feeder and operating-lever, G, substantially as specified.

2. The arrangement of the sliding wick-feeder C within the slotted wick-tube, in combination with the operating-lever G, substantially as described.

4,386.—Base-Burning Stove.—William J. Keep, Troy, N. Y.—Patent No. 101,368, dated March 29, 1870.

Claim.—1. A fuel-chamber or fire-pot having grated sides N, a solid ring, M, at its lower end, and a horizontal grate, O, placed within or immediately beneath the latter, when said chamber is capable of being shaken independent of said grate O, substantially as and for the purpose specified.

2. A fuel-chamber or fire-pot having its sides composed of a series of bars so pivoted at their ends as to permit the sides of said chamber to move in a horizontal plane, substantially as and for the purpose set forth.

3. A circular basket-grate having its rear side closed or occupied by a fine, so as thereby to cause a greater consumption of fuel and radiation of heat

from the front side than from its rear side, substantially as set forth.

4. A fuel-chamber, composed of a basket-grate, N, a horizontal grate, O, and a solid ring, M, when the latter is arranged with reference to said grate O, substantially as and for the purpose specified.

5. In combination with the bars N, the ring M, attached to and connecting together their lower ends, substantially as shown and described.

6. The means employed for giving to the bars N a reciprocating lateral movement, consisting of the ring M, connected with the lower ends of said bars, and resting within or upon suitable supports so as to be capable of a semi-rotary motion-horizontally, substantially as specified.

7. In combination with the horizontally-moving ring M, the vertically-revolving grate O, substantially as and for the purpose set forth.

8. In combination with the shaking-grate N, the stationary ring N', substantially as and for the purpose described.

9. In combination with the shaking-grate N, constructed as described, the mica section P and the chamber P', substantially as and for the purpose shown.

10. The air-passage P', in combination with the fuel-chamber, composed of the shaking side grate N, the rings M and N', and the grate O, substantially as and for the purpose specified.

11. In combination with the magazine E, the horizontally-shaking grate N and the stationary grate O, substantially as shown and for the purpose set forth.

12. The descending-flue L, situated at the rear of the fuel-chamber within the casing, and with its upper end above the lower end of the magazine, the side bottom flues G connected with said flue L, and inclosing the sides of the ash-pit, and the ascending-flue I placed parallel with but separate from said flue L, when constructed and combined substantially as and for the purpose specified.

13. The straight upper section A, inclosed at its upper end by the top plate D, the mica sections P and Q separated by the solid strip p, the solid cylinder A', the projecting upper and lower plates B and B', respectively, and the side C, when inclosing and combined with the fire-chamber, exit, and base flues, substantially as and for the purpose specified.

14. A downward flue having its upper end above the mica windows placed opposite or above the fire, so as to cause the heated escaping products of combustion to take the same upward direction whether the direct or downward draught is used, substantially as shown and for the purpose described.

15. The handle T, pivoted within the end r' of the drawer R, and within the cross-bar S, extending transversely across said drawer, substantially as shown and for the purpose described.

16. The employment of a sliding or swinging end to an ash-drawer, substantially as shown and for the purpose specified.

4,387.—BASE-BURNING FIRE-PLACE HEATER.—David Stuart and Lewis Bridge, Philadelphia, Pa., assignors to David Stuart and Richard Peterson.—Patent No. 79,275, dated June 23, 1868; reissue No. 3,608, dated August 17, 1869.

Claim.—1. The base of the stove inclosing the passages E, F, and G, arranged and communicating with pipes or passages P and P', substantially as described.

2. Two or more pipes or passages, P and P', arranged within the outer casing of a fire-place stove for conveying the products of combustion to the chimney and for heating the air admitted to the space within the said outer casing, all substantially as and for the purpose herein set forth.

3. The said pipes or passages P and P', in combination with the compartments k and k' and the valved partition between the same.

4. The double cover, consisting of plates 2 and 3, one for fitting to the top of the stove and the other to the top of the feeder, and so arranged that the products of combustion can pass between them.

5. In a fire-place stove, a valve or damper, 10, arranged, substantially as described, so as to direct the heated air into the passage leading to an upper room or rooms, or to exclude the heated air from the said passage and direct it across the top of the stove into the room containing the latter, substantially as set forth.

DESIGNS.

4,903.—SASH-HOLDER.—Edwin C. Hiester and Gabril O. Hiester, Reading, Pa.

Claim.—The design for a metallic sash-fastener, as shown.

4,904.—RUBBER ERASER.—Samuel D. Hovey, Brooklyn, N. Y.

Claim.—The design for a rubber eraser, as herein shown and described.

4,905.—CARPET-PATTERN.—Archibald McCallum, Halifax, England, assignor to Joseph Wild, New York city.

Claim.—The design for a carpet, as shown.

4,906.—ORNAMENT FOR FOUNTAIN.—Jonathan Moore and William Wilkinson, Brooklyn, N. Y., assignors to Jonathan Moore and A. Horton, same place.

Claim.—The design herein shown, which we may denominate "ivy superimposed," for ornamentation of fountains and vases.

4,907.—ORNAMENT FOR FOUNTAIN.—Jonathan Moore and William Wilkinson, Brooklyn, N. Y., assignors to Jonathan Moore and A. Horton, same place.

Claim.—The design herein shown, which we may denominate "long-leaf superimposed," for ornamentation of fountains and vases.

4,908.—CARPET-PATTERN.—Edward Perrin, Kidderminster, England, assignor to W. & I. Sloane, New York city.

Claim.—The design for a carpet, as shown.

4,909.—CARPET-PATTERN.—Edward Perrin, Kidderminster, England, assignor to Joseph Wild, New York city.

Claim.—The design for a carpet, as shown.

4,910.—COOKING-STOVE.—John R. Rose and Edward L. Calely, Philadelphia, assignors to Orr, Painter & Co., Reading, Pa.

Claim.—The design for cook-stove, as shown and described.

4,911.—BRACELET.—Daniel H. Smith, Attleborough, Mass.

Claim.—The design or pattern, as shown in cross-section in fig. 4, of the two parts composing each portion A.

4,912.—CLOCK-CASE.—Walter L. Tyler, Bristol, Conn., assignor to the E. N. Welch Manufacturing Company, same place.

Claim.—The design for a clock-case, substantially as shown and described.

4,913.—BEDSTEAD-FASTENING.—Nehemiah C. Whitcomb, Oak Hill, N. Y.

Claim.—The flange a, having the series of cam on its edge, combined with the plate b, projecting therefrom at right angles, and having the tapered dovetail groove upon its face, to form a new design in bedstead-fastenings.

4,914.—CARPET-PATTERN.—George Curtis Wright, New York, N. Y.

Claim.—The design for carpet, as shown.

4,915.—JELLY GLASS.—James S. Atterbury and Thomas B. Atterbury, Pittsburg, Pa.

Claim.—The design for a jelly-glass, as shown.

TRADE-MARKS.

254.—CHURN.—Porter Blanchard's Sons, Concord, N. H.

255.—METALLIC PAINT.—F. G. Bourke & Co., New York, N. Y.

256.—FLOUR, &c.—H. C. Cole & Co., Chester, Ill.

257.—STOMACH-BITTERS.—James Demarest, New York, N. Y.

258.—GENTLEMEN'S FURNISHING GOODS.—Albert W. W. Miller, New York, N. Y.

259.—ALPACA.—William I. Peake, New York, N. Y.

260.—MOHAIR.—William I. Peake, New York, N. Y.

261.—MOHAIR.—William I. Peake, New York, N. Y.

262.—SCISSORS.—Robert J. Roberts, New York, N. Y.

263.—LINIMENT.—John Schember, Bangor, Me.

264.—BOOTS AND SHOES.—Henry Elmer Townsend, Boston, Mass.

265.—BOOTS AND SHOES.—Henry Elmer Townsend, Boston, Mass.

EXTENSIONS.

ARCHIBALD H. ROWAND, of Allegheny City, Pa.—Letters Patent No. 17,299, dated May 12, 1857.

"Improvement in Binding Books."

Claim.—1. The combination of the rollers in the groove or book-carriage, as applied to books to aid in moving them in their racks in a vertical position.

2. The application of the spring as above described and used in compressing the extremities of the arch of the head-band, and thereby causing said head-band to maintain a circular or arch-like form, by means of which the leaves of a folio or book are kept from drooping or sagging when the book is in a vertical position; this spring I use according to convenience or choice, either applied on the outside of the outer back, or next to the head-band, or inclosed between the outer and inner backs.

ANN M. RODEFER, of Springfield, Ohio, administratrix of JOSEPH RODEFER, deceased.—Letters Patent No. 12,693, dated April 10, 1855.

"Improvement in Bedstead-Fastenings."

Claim.—The circular split ring, let into a segmental annular mortise in the rail, from which its upper end projects in the form of a hook, and its lower end in form substantially as described, permitting the passage of the catch pin in the act of insertion, affording an additional lateral bearing, and a means of adjustment, as described.

DISCLAIMERS.

WILLIAM WESTLAKE, JAMES F. DANE, and JOHN P. COVERT, assignees of WILLIAM WESTLAKE, all of Chicago, Ill.—Letters Patent No. 42,520, dated April 26, 1864; reissue No. 3,747, dated November 23, 1869.

"Lantern."

(Filed April 29, 1871.)

Disclaims:

"The lantern-guard a, constructed entire, without hinge or joint, so that, as a whole, it can be readily attached to or removed from the lantern, as set forth."

PLASTIC SLATE ROOFING JOINT STOCK COMPANY, of New York, N. Y., assignee of WILLIAM L. POTTER, of Newark, N. J. Letters Patent No. 46,495, dated February 21, 1865; reissue No. 2,684, dated July 16, 1867.

"Improved Composition for Roofing and for other Purposes."

(Filed May 8, 1871.)

Disclaims:

"Covering the sides of buildings, boat-decks, boat-bottoms." "Any suitable glutinous or viscous material, such as" "oil, paint, &c.," "when used for covering the sides of buildings, boat-decks, boat-bottoms, &c., the mixture should be of the consistency of thick paint, and may be applied with a paint or roofing-brush."

ISSUE OF MAY 23.

PATENTS.

115,010.—FOLDING SETTEE.—William C. Adams and William B. Mayhew, West Tisbury, Mass.

Claim.—The hinged back E F G and flexible straps H, combined with flexible seat A, rails D D', and legs B, constructed and arranged together substantially in the manner described.

115,011.—ANCHOR.—Alfred B. Babbitt, Taunton, Mass.

Claim.—1. An anchor, having a wrought-iron shank and cast-iron flukes, for the purposes specified.

2. The slot e, arcs h and i, and engaging edges j, when combined and arranged substantially as and for the purposes specified.

3. The arc h and stops or fulcrums g, when combined and arranged to operate substantially as and for the purposes specified.

4. The knife-like edges j, when formed to extend beyond the sides of arcs h and i, substantially as and for the purposes specified.

115,012.—DOOR-SECURER.—Benjamin F. Baer, Lancaster, assignor to Samuel S. Weist, Schoeneck, Pa.

Claim.—The combined arrangement of the floor-plate B with its hook end b, wedge-plate A a with its ends D, in combination with the spring-bolt E F S, all constructed and operating jointly, substantially in the manner and for the purpose set forth.

115,013.—ROOT-CUTTER FOR PLOWS.—John W. Baker, Elkton, Md.

Claim.—The sickle-shaped opening I, when combined with the revolving cutters B, when constructed in the manner and for the purposes substantially as set forth.

115,014. — HEATING-STOVE. — Frank Barclay, Aurora, Ill.

Claim.—1. The revolving sleeve *d* provided with one or more slots, *e*, in combination with the pipe D provided with one or more inclined slots or openings, *e*, substantially as and for the purposes specified.

2. The combination of the revolving sleeve *d* provided with one or more slots, with the pipe D provided with one or more inclined slots or openings, *e*, the radiating-chamber C, flame-chamber B, and fire-grate A, substantially as specified.

3. The combination of the corrugated back *a* and lining *b*, constructed as described, with the chamber B, radiating-chamber C, and slotted pipe D, substantially as and for the purposes specified.

115,015. — VAPOR-BURNER. — William E. Bartlett, Newburg, N. Y.

Claim.—1. The cap A, tubes G, cap H, and the burner I, constructed and arranged substantially as specified.

2. The arrangement of the orifices N and O in the burner in the order specified.

3. The combination, with the burner-tubes and cap A, of the attachment B, adapted for connecting said burner to gas-pipes, substantially as specified.

115,016.—WAGON-TONGUE SUPPORT.—William Beers, Milan, Ohio.

Claim.—1. The segment or slotted standard E, as arranged in relation to and in combination with the tongue D, substantially in the manner as and for the purpose set forth.

2. The tongue D, when constructed with the lugs K, head I, and neck J, and arranged in combination with the segment E and journal-seats H, in the manner as and for purpose set forth.

115,017.—SEASONING WAGON-HUBS.—August Benninghofen, Hamilton, Ohio, assignor to Benninghofen, Northrup & Co., same place.

Claim.—The process of seasoning hubs by coating them with a viscous material which will harden and will completely close the pores of said hubs.

115,018.—COOLING APPARATUS FOR BEER, ALE, &c.—Theodore Bergner and Siegmund Zeisse, Philadelphia, Pa.

Claim.—In combination with a compartment or series of compartments, A, communicating with an ice-chamber, C, as described, the openings *g g*, provided in the top of compartment A, and located within the circular joints formed with the barrels, in the manner and for the purpose set forth.

115,019. — ADJUSTABLE RULER. — Edward Bostock, Philadelphia, Pa.

Claim.—The combination of the straight-edge, graduated scale-plate, protractor, and swinging-arm, with its adjusting-screw and nut, the whole forming an adjustable parallel and angular ruler, when the same is made and operated substantially as specified.

115,020.—FLAX-THRASHING AND SEPARATING-MACHINE. — James Boyce, Muncie, Ind.

Claim.—1. The combination of two or more sets of rolls, A B, constructed and operated as described, fluted roll M, concave L, and guide-boards N, all arranged as and for the purpose specified.

2. The combination and arrangement, in a flax-thrashing machine, of the breaking-rolls A B, elevator D, crushing-roll M, guide-boards N, concave L, riddle O, and fan P, substantially as and for the purpose specified.

115,021.—STOVE-GRATE.—Pardon Boyden, Amsterdam, N. Y., assignor of one-half his right to Oscar F. Nelson, same place.

Claim.—1. A centrally-bisected grate, hung below its journaled bearings, as described, so that both sections of the grate can be dumped without removing the bearings, upon which it is lifted, from their positions, substantially as herein set forth.

2. The combination of the semicircular bar-gates A A, knee-shaped bearings B B, levers B′ B′, and circular frame or rim C, all constructed and arranged to operate substantially as and for the purposes herein set forth.

115,022. — PULLEY-BLOCK. — George C. Brown, Brooklyn, N. Y., assignor to Eugene E. Cornell, same place.

Claim.—The arrangement, in a pulley-block, of the spring G, pawl D, and eye F, as and for the purpose specified.

115,023.—SPITTOON. — Samuel G. Cabell, Washington, D. C.

Claim.—1. A spittoon, having a hinged cover, with its body A extending down below its bottom B, and mounted on casters or rubber-tipped feet, substantially as described.

2. The cover provided with the lugs *e*, arranged to shut against the rubber pads *f*, as shown and described.

115,024. — EARTH-CLOSET. — Robert Alex. Cannell, New Orleans, La., assignor to himself and S. P. Parmly, same place.

Claim.—1. The case D and valve E, arranged and operating substantially as specified, and actuated by the falling-and-rising movement of the rear edge of the seat, the latter being actuated by the weight of the person in both directions, or in one direction, thereby, and by weights or springs in the other, substantially as specified.

2. The combination, with the seat pivoted at the front, of the foot-board O and connecting-levers or bars arranged for lifting the said seat by the weight applied to the foot-board, substantially as specified.

115,025.—COMBINED STOVE-PIPE DAMPER AND SHELF.—Edward H. Clinton and William H. Lavinia, Chicago, Ill.

Claim.—1. The ring or band A when provided with the opening *m*, in combination with the damper A when provided with the piece *i*, when the several parts are arranged to operate substantially as and for the purpose specified.

2. The band A having openings *m n*, in combination with the damper A having attached thereto a cut-off, *i*, and a register to close the opening *n*, all constructed and arranged to operate substantially as and for the purposes set forth.

3. The combination of the band A provided with the opening *m*, and the damper A provided with the piece *i*, with the shelf B and bars *c d e*, substantially as and for the purpose specified.

115,026.—COMBINED HARROW, ROLLER, AND SEED-PLANTER.—Robert J. Colvin, Lancaster, Pa.

Claim.—1. In a combined harrow, roller, and two-row seed-planter, the arrangement of the frame A A′ B B¹ B² B³ B⁴, with its device M N, lever L, hooks Z Z to adapt it for the attachment of a harrow, R′ T, with its spring S, connecting-rod K, and chains V, as also for the application of the sectional roller E E′ E, forming a combined harrow and roller, substantially in the manner shown, for the purpose specified.

2. In combination with the frame A A′ B B¹ B² B³ B⁴, with its devices S O *p′* P and *l m n* H, its adaptation for the hopper *h o*, shovels *t*, yoke *p*, and seeding devices *d e f*, in combination with the outer sections E of said roller, operating in the manner and for the purpose set forth.

115,027.—APPARATUS FOR HEATING AND LIGHTING LOCOMOTIVES AND RAILROAD CARS BY GAS. — Joseph H. Connelly, Wheeling, W. Va.

Claim.—1. In the gas-producer herein described, the water-chamber W, substantially as and for the purpose set forth.

2. The flexible pipe-coupling *e* D, made of gum or duck and lined within with asbestus cloth, substantially as and for the purpose set forth.

3. The producer Y Y, gas-pipe D, locomotive fire-chamber B, and locomotive-stack N, substantially as and for the purposes set forth.

4. The producer Y Y, heat-pipe F, and heat-pipe or pipes S, substantially as and for the purposes set forth.

5. Producing-chambers Y Y and gas-pipe E, substantially as and for the purpose set forth.

115,028.—APPARATUS FOR THE MANUFACTURE OF GAS FOR HEATING AND ILLUMINATING.—Joseph H. Connelly and John McLure, Wheeling, W. Va.

Claim.—1. In the producer A, herein described, the air-chamber and ash-pit *f f*, and grate-bars H and I, substantially as and for the purpose set forth.

2. In the gas-condenser P P, the open end 4 and extended seal 5, substantially as and for the purpose set forth.

3. The refractory gas and air-pipes R and S, in connection with the gas and air-tubes or apertures marked "gas" and "air," substantially as and for the purposes set forth.

4. The producer A, gas-pipe K, steam-exhaust pipe *g g*, water-pipe h h, condenser P P, and the gas and air-pipes R and S, substantially as and for the purposes set forth.

5. Condenser P P, gas-pipe L, water-pipe 5, condenser W, and purifier V V, substantially as and for the purpose set forth.

115,029. — CEMENT-PIPE MOLD. — David Copeland, Jr., Rochester, N. Y.

Claim.—1. The mold-case B when provided with the recess *a*, the main core A, and the branch core *b*, all constructed and combined together, substantially as and for the purposes set forth.

2. In combination with the detached branch core *b* and socket *a* in the mold-case, the guiding-stop *c*, operating substantially as set forth.

115,030.—MACHINE FOR MOLDING DRAIN AND SEWER-PIPES. — David Copeland, Jr., Rochester, N. Y.

Claim.—1. In combination with a mold-case, D, and a suitable central core E, an annular rammer, C, arranged to be operated by power, for the purpose set forth.

2. In combination with an automatically-retreating mold-case, D, a vertically-removable core, E, and a reciprocating rammer actuated by power, arranged to be operated substantially in the manner herein set forth.

3. In combination with a reciprocating rammer, C, the mold-case D, when arranged to retreat at and by the reciprocation of said rammer, for the purposes set forth.

4. In combination with the mold-case D and a reciprocating rammer, the vertically-adjustable supporting-frame B and counter-weights *k*, operating substantially as described.

5. The combination of a core provided with a conical extremity within the mold-case, and a regularly-reciprocating annular rammer, whereby the material is distributed and received under the latter, substantially in the manner set forth.

6. In combination with the vertically-adjustable mold-frame B, case D, and counter-weights *k*, the ratchets *m* and pawls *n*, for the purposes set forth.

115,031.—FURNACE FOR ROASTING METALLIC ORES.—Francis W. Crosby, Washington, D. C.

Claim.—1. The wooden or iron rods for the purpose of making flues or openings through a mass of pulverized ore.

2. The perforated floor, by which the flues in the ore are made to communicate with the fire-places.

3. The guides for retaining the rods in position while the charge is being put in.

4. The iron or clay disks for controlling the heat.

5. The combination of these devices, for the purposes herein set forth.

115,032.—MEDICINE FOR COUGHS, COLDS, &c.—Charles P. Crossman, West Warren, Mass.

Claim.—The medicine above specified.

115,033.—CULTIVATOR-PLOW.—David Culver, Kingston, Pa.

Claim.—The double mold-board A A, concaved to turn a flat furrow on each side, and horizontally edge-flanged at the bottom to run under outlying tubers of the potato-plant, as described.

115,034. — WAGON-SIDE BRACE.—Thomas Henry Daniels, Anderson, Ind.

Claim.—The brace D and the bar E, combined and arranged substantially as and for the purposes herein shown and described.

115,035. — LANTERN-GLOBE HOLDER.—Joseph S. Dennis and Willoughby F. Kistler, Chicago, Ill.

Claim.—1. The combination of the globe D, plate or flange *d*, and tubes B with a device for holding the globe in place when said device is attached to the tube B, and engages the globe at two or more points of the circle of its upper edge, substantially as specified and shown.

2. The device for a lantern-globe holder shown, consisting of the arms E E, with hooked ends *e e*, spring-lever F, hinge *b*, and catch *f*, all combined and arranged substantially as specified and shown.

3. The combination of the globe-holder and tube B, when said globe-holder is hinged to the tube, substantially as specified and shown.

115,036.—FEEDING MECHANISM FOR SEWING-MACHINES.—Philip Diehl and Ludwid Oehring, Chicago, Ill.

Claim.—The combination of the feed B with the toggle-levers D E, slide C, and rock-shaft G, all arranged to operate substantially as herein shown and described.

115,037. — COMBINATION-LOCK.—John W. H. Doubler, Darlington, Wis., assignor to himself and W. Logue, same place.

Claim.—1. The spring-bolt A B, tubes C and D, the tubular recessed and fixed blocks L, perforated toothed wheels *d*, and spring D′, combined and operating substantially in the manner described.

2. The combination, with the wheels *d*, of the racks *g*, sliding knobs, and the index-plate, substantially as specified.

115,038, antedated May 10, 1871.—DOOR-STOP. — Michael V. Doyle and Jacob Behel, Rockford, Ill.

Claim.—1. The combination of the pointed bolt D, spring *e*, and projection C, with its double inclines and staple E, all as described.

2. The combination of the socketed staple E, the adjustable plate F, and elastic cushion *m*, all as and for the purpose hereinbefore shown and described.

115,039. — MACHINE FOR MAKING AND BREAKING CONFECTIONERS' PASTE AND OTHER MATERIALS.—Robert Duff, New York, N. Y.

Claim.—1. The adjustable reversible rollers C C, working through the tables B B, in a machine for breaking paste or plastic materials, substantially as described.

2. In a machine for breaking or rolling paste, the double and single-edged adjustable scrapers F F, lined with felt *n*, substantially as described.

3. In a machine for breaking paste or plastic materials, the combination of the adjustable reversible rollers C C and approximated tables B B with the double and single-edged adjustable scrapers F F, lined with felt *n*, substantially as described.

115,040.—HANDLE-FASTENING FOR BROOMS, BRUSHES, &c.—Elijah F. Dunaway, Cincinnati, Ohio.

Claim.—The herein-described handle-connection for brooms, &c., composed of the disk B, constructed with a spike, *b'*, upon one side and a screw-threaded shank, *b*, upon the other, and the disk C, formed with one or more internally screw-threaded sockets, *c'*, substantially as and for the purpose set forth.

115,041. — INKSTAND. — Thomas Duncan, Brookville, Md.

Claim.—The combination of the cover vibrating vertically on a hinge on the inkstand, the counterbalance vibrating on a hinge on the cover of the inkstand, and the pen-socket C, mounted on the hinged top, all these being constructed to operate as hereinbefore set forth, automatically to open and close the inkstand by the mere act of removing or replacing the pen.

115,042. — REVERSIBLE CRIB.—Albert E. Eaton, Portland, Me.

Claim.—The reversible crib, as described—that is, combining the rails *a*, fastenings *b d*, and rockers *c*, all to operate as herein set forth.

115,043.—SPRING FOR BED-BOTTOMS.—Manasseh W. Farber, Mount Pleasant, Iowa.

Claim.—1. The combination, with the frame A, of the springs B, bars D, blocks E G, plates F, bolts H, cross-pieces I, and the spring bars K, substantially as specified.

2. The combination, with the above, of the frame N and adjustable braces Q, substantially as specified.

115,044.—FOLDING OR TUCK-LAYING DEVICE FOR SEWING-MACHINES.—Thomas Manchester Farrand, Skowhegan, Me.

Claim.—The slotted plate A having ledge D, extension A', and thin end E, the plate F having hook M, and the slotted plate P having shoulder Q, all combined, constructed, and arranged, as and for the purpose specified.

115,045. — LAMP-WICK. — John Farrell, Brooklyn, N. Y.

Claim.—The lamp-wick, made with a capillary cord extending from its lower end, as a new article of manufacture.

115,046. — CORN-HARVESTER. — Delos C. Flint, Bardolph, Ill.

Claim.—The combination of the husking-rollers E E', guide-apron S, carrying-belts *e*, *f*, and *g*, delivering-elevators T T', the whole arranged to operate in connection with the sickle, substantially as and for the purpose described.

115,047.—CREVICE-SEARCHER AND CLEANER FOR OIL-WELLS.—William Forker, Rockland, Pa.

Claim.—The shaft A provided with flexible scarbers *l*, spring *k*, collar *m* combined with the casing or sheath, consisting of the parts C D, cap A, and bottom piece B, all constructed, arranged, combined, and operating substantially as hereinbefore described, and for the purpose set forth.

115,048, antedated May 9, 1871.—CORDING ATTACHMENT FOR SEWING-MACHINES.—William Henry Fowler and William Pettingell, Painesville, Ohio, assignors of one-third interest to Louis Freitag.

Claim.—The cord-guide H, with its groove *f* and rounded end *i*, in combination with the gauge G, slotted slide *d*, clips A and *c*, and presser-foot F, substantially as and for the purpose hereinbefore set forth.

115,049.—MOLDER'S SLICKER.—William J. Fryer, Jr., New York, N. Y.

Claim.—The slicker herein described, having parallel ridges *a* on its face, adapted to produce smooth fine ridges on the surface of the mold, as herein set forth.

115,050.—SELF-COUPLING DRAW-HOOK AND BUFFER.—Perry G. Gardiner, New York, N. Y.

Claim.—1. The combination of the draw and buffer-rod with the peculiarly-constructed sliding and vibrating sleeve or buffer-head A, arranged upon the rod and shoulder of the hook, in connection with the buffer-spring, so as to maintain a constant elastic buffer pressure between the cars, constructed, arranged, and operating substantially as described.

2. The combination of the buffer-head or sleeve with the springs *g* and *f*, arranged upon the rod as draw and buffer-springs, constructed and operating substantially as described.

115,051.—MANUFACTURE OF GLUCOSE SIRUP AND SUGAR. — Jean Jacques Grosheinz, Logelbach, France.

Claim.—Manufacturing glucose sirup and sugar by the use of acids in combination with alkaline bases, which, by combining with the acids, will produce soluble salts, as herein set forth, and which soluble salts may, without inconvenience, remain in the substances that have been operated upon.

115,052.—HARVESTER-RAKE.—James Harris, Janesville, Wis.

Claim.—1. The combination of the following elements, i. e., an independent hub revolving about a vertical center, a cam-way, a rake-carrying arm, and a stop device for preventing the backward movement of the rake upon the cam-way, all the parts operating substantially as described.

2. The combination of the hub F, the rake-arm *f*, and the spring *g*, all constructed and operating substantially as described.

3. The combination of the guard-arm *d*' with the lever operating the clutch mechanism, and with the rake-carrying hub, the parts being constructed and operating substantially as described.

4. The combination of the bevel gear mechanism, consisting of the sleeve J, wheel I with its socket, and gear-wheel K, with the reel and vertically-revolving shaft, the shaft and gear mechanism being adapted to support the inner end of the reel, as described.

5. The combination and arrangement of the lever *d*' and its connections, the former having its point of connection with the treadle located in line with the pivots that unite the cutter-bar to the main frame, in order that the foot-treadle which operates the lever may not change its position relatively to the foot of the driver when the bar is adjusted for high and low grain, substantially as described.

115,053.—FRONT-FALL FOR PIANOS.—Azaria Horace Hastings, New York, N. Y.

Claim.—The lid or front-fall C of an upright piano, made box-shaped, with the ledges *b*, *c*, and *d*, of which one constitutes the music-holder, as set forth.

115,054. — INVALID BEDSTEAD. — William Heath, Bath, Me.

Claim.—1. The leg-frame levers or lifters F F, as arranged on and pivoted to the outer sides of the main frame A, and extended underneath and against shoulders *e* of the back-frame E, and connected with such back-frame, all substantially as described.

2. The toothed stop-board G and its spring *m*, combined and arranged with the main frame A and the back-frame E, and its depending toothed bars H, in manner and so as to operate as described.

115,055. — CORN-HARROW. — George Hill, Galva, Ill.

Claim.—The combination of hinges B B', when constructed and attached as described, drag-bars A A A A, rods C C', chains or rods D D', swaybar E, and handles F F', the whole constructed and arranged to operate substantially in the manner and for the purpose described.

115,056.—CONSTRUCTION OF HOLLOW VESSELS.—William F. Holske, New York, N. Y., assignor to himself and A. E. Beach, same place.

Claim.—1. In the construction of hollow vessels, the combination of the girdles B and the clamping-rods C with the bars or staves *a*, substantially as described.

2. The valve D, constructed and operating as described.

115,057.—RIDING-PLOW.—Benaiah C. Hoyt, Fort Atkinson, Wis.

Claim.—1. The single pivoted lever D, slotted disk A, and wheel G, all combined as described, for the purpose specified.

2. The bracket K, hub H, and shaft B, all combined as described, for the purpose specified.

115,058.—MOTOR-MACHINE.—Isaac G. Hubbard, Nokomis, Ill.

Claim.—In combination with the axle *b*, provided with toothed wheel *d*, spring, pawl, and ratchet *e f*, and *g*, cord *p*, weight *q*, and pulley *o*, or the spring described, and the shaft *c*, provided with the pinion-wheel *h*, band-wheel *i*, and fly *l*, arranged as described, and for the purpose set forth.

115,059.—LANTERN-GLOBE HOLDER.—John H. Irwin, Philadelphia, Pa.

Claim.—The lantern-globe holder, consisting of the encircling wire J, rigidly attached to the cap G at one side, and having at the other the part *p*, by which it may be operated, substantially as and for the purpose specified.

115,060.—CASTER FOR SEWING-MACHINES. Harry Jones, Richmond, Ind.

Claim.—The shoe A, provided with the slot for the toe and a set-screw, the latter being so arranged as to operate against the key *c*, or inside of the leg, as described, and for the purpose set forth.

115,061.—CHECK-HOOK AND TERRET FOR HARNESS.—William V. Kay, Chicago, Ill.

Claim.—The harness-terret A and hook A', each cast or made of one and the same piece of metal, and provided with the mortice D, having outer bars C C', substantially as and for the purpose described.

115,062. — HARNESS PAD-TREE.—William V. Kay, Chicago, Ill.

Claim.—1. The yoke A, provided with a stirrup, B, substantially as and for the purpose described.

2. In combination with the yoke A, when provided with stirrup B, the plate D and pad-plate C, arranged substantially as and for the purpose described.

115,063.—SHUTTER-FASTENER.—Peter Keffer, Reading, assignor to himself and John Droxel, Exeter township, Pa.

Claim.—The combined lever-catch and socket C D and bolt E, in combination with the shutter B, spring K, and plates F, G, and H, arranged substantially as described, and for the purpose set forth.

115,064.—MACHINE FOR MAKING HORSE-SHOE-NAILS.—Edward Watson Kelley, Hamilton, Scotland.

Claim.—1. The construction and arrangement of the stationary female dies *q q* and the revolving male dies *e e e d d d*, in the manner and for the purpose set forth.

2. The combination, with the revolving dies *e d*, of the device for operating the dies *e e e*, consisting of the eccentric *h*, with the fingers *k* and *l*, and the stationary operating-arms *m n*, as fully set forth.

115,065. — ARTIFICIAL LIMB. — Samuel B. Kepperling and Thomas B. Kreiter, Neffsville, Pa.

Claim.—1. The case C of an artificial leg, when made by the combination of leather, muslin, and glue, in the manner and for the purpose specified.

2. The arrangement of the slotted wedge W with its springs S², when inserted into the foot F at I, in the manner and for the purpose set forth.

115,066. — MACHINE FOR MAKING COMB-GUIDES FOR BEE-HIVES.—Homer A. King, New York, N. Y.

Claim.—1. The dies or wheels D, constructed as described for making comb-impressions, substantially as and for the purpose set forth.

2. The manufacture of comb-guides by means of dies D, the impression surface of which is kept wet with acid to prevent the adherence of wax, substantially in the manner described.

115,067.—MEAT-SAFE.—August Knoche, St. Louis, Mo.

Claim.—The case A, the meat-chambers *c d*, one above the other, and perforated on two sides, combined with the air-chambers *h i e* and flue B, constructed and arranged substantially as and for the purpose specified.

115,068.—MACHINE FOR SHARPENING CALKS. George W. Lane, Chichester, N. H.

Claim.—The swiveled yoke G carrying the emery-wheel *m*, and the vertically-adjustable post B, combined with the frames F, E, C, and A, and gearing *b* and *d*, as herein shown and described, for the purpose specified.

115,069.—ATTACHING HANDLES TO PLOWS.—John L. Laughlin, Peru, Ill.

Claim.—The means employed for attaching a handle, B, to a plow-standard, consisting of the splice-bar C and bolt *c*, constructed and arranged as shown and set forth.

115,070.—DENTAL FILE-HOLDER AND POLISHER.—Henry Laurence, New Orleans, La.

Claim.—The dental file-holder, as an article of manufacture, constructed as described, viz., with a fixed and a movable jaw, tubular shank, and thumb-screw *c*, the jaws being adapted to hold a file, as shown.

115,071. — HORSE HAY-RAKE.—J. George Lockwood, West Davenport, N. Y.

Claim.—The catch-hook M, catch-pin N, and foot-lever O, in combination with the rake-head

and rake-frame, and with the device I H h' J K, for raising the rake-head, substantially as herein shown and described, and for the purpose set forth.

115,072.—APPARATUS FOR PRESERVING AND COOLING BEER.—Jacob Lorenz, Hamilton, Ohio.

Claim.—The self-acting valve-spigot represented in fig. 4, in combination with the water-and-ice tank D, air-pump E, and pipes e e F, when the parts are constructed and arranged substantially as and for the purpose described.

115,073.—AUXILIARY SPRING FOR TREADLES.—Harvey Lull, Hoboken, N. J.

Claim.—The pivoted tube E and spring D therein, combined with arm F and pitman B, pivoted together at H, all arranged as and for the purpose specified.

115,074.—RAILWAY STOCK-CAR.—William M. Lyon, Salem, Ohio.

Claim.—1. The yoking-rack, secured in position by vertical and horizontal pins *b* and *c*, and capable of being swung up upon said pins *c*, and suspended in a horizontal position, in the manner and for the purpose described.

2. The pivoted top rail A of the rack, in combination with the pivoted hooks *f* and pins *i* of the foot-rail, for suspending the latter, in the manner and for the purpose described.

3. The arrangement in a stock-car of the pivoted suspending-hooks *f*, the holding and bracing-hooks *e*, and the confining bearing grooves *d* for the top rail, disposed in relation to each other so as to adapt the yoking-rack to be used at either side of the car, and to be swung up and suspended out of the way when so arranged at either side, as described.

115,075.—COMPOSITION BOOT AND SHOE-HEEL, SOLE, &c.—Frank Marquard, Newburyport, Mass.

Claim.—1. The compound for boot and shoe-heels and soles, substantially as described.

2. The combination of pulverized cork with pulverized leather in the manufacture of composition soles and heels, substantially as described.

115,076.—WASHING-MACHINE.—William C. Marr and Joseph S. Maughlin, Onawa City, Iowa.

Claim.—1. The hollow drum and the supporting-beam, constructed, arranged, and combined with a tub or boiler, substantially as specified.

2. The hollow drum having the hand rubbing-board or surface M arranged on the inside of one of the disks in such relation to the opening for introducing the clothes that the clothes may be rubbed thereon by hand when the cover of said opening is raised, all substantially as specified.

115,077.—PIANO ACTION.—Lorenzo Matt and Bernard Grueter, Boston, Mass.

Claim.—The combination and arrangement of the slide G and the tongue H with the oblique lever I, its stand-rod O, the two keys A B, and the separate levers C C, combined or arranged with jacks and hammers, as set forth, the oblique lever and the key over its front end being provided with the cams *p q*, or equivalent devices, to operate with the wedge-head of the tongue, all as specified.

115,078.—WHIFFLETREE.—Robert W. McClelland, Springfield, Ill.

Claim.—1. The combination of two ferrules, C C', one constructed with a flat horizontal plate attached to its under side, and the other with a flat horizontal plate attached to its upper side, said plates being adapted to fit together, and being connected by a pivot-bolt, E, in rear of the ferrule, substantially as described, and for the purposes specified.

2. The ferrule C with its plate M, in combination with the ferrule C' with its plate N, said parts being constructed with the flanges *m m'* *n* and hook *v*, and connected by the pivot-bolt E, substantially as and for the purpose set forth.

115,079.—HEATING-STOVE.—John McCoy, Philadelphia, Pa.

Claim.—1. The door E, when constructed either with or without the rectangular projections *a a*, and with rests or stops to hold it, when open, sloping in the direction of the ash-pit or ash-box; and this whether it works on a hinge, as described, or is removable as a lid or cover for the opening A, substantially as described.

2. The opening A and the door or lid E, in combination with the inclosed passage B and the opening in front of the fire-pot D, when constructed and used substantially in the manner and for the purposes above described.

115,080.—COFFEE-POT.—John T. McNamee, Baltimore, Md., assignor of one-half his right to Jacob L. Schoch, same place.

Claim.—1. The condenser G, with conical bottom *e* and pipes *f f* and h h, all substantially as and for the purposes herein set forth.

2. The combination of a coffee-pot, A, with spout B and cap C, the strainer D with sediment-cup E, and the condenser G with conical bottom *e* and tubes *f f* and h h, all substantially as and for the purposes herein set forth.

115,081, antedated May 16, 1871.—THRASHING-MACHINE.—Archibald McNaught, Alliance, Ohio.

Claim.—1. The inclined longitudinal and reciprocally-moving bottom or grain-board D', in combination with a stationary longitudinally-slotted platform, D, and vertically-reciprocating and longitudinally-moving beating-bars, E, in the manner and for the purpose described.

2. The pivoted vibrating arms *d'*, in combination with a fanning-mill shoe of a thrashing-machine and the inclined longitudinally and reciprocally-moving bottom or grain-board D', when said arms are connected to those parts so as to move them in different planes of motion, as described.

3. The combination of the grain-receiving space or slot *d*, arranged as described, with the stationary longitudinally-slotted platform and vertically-reciprocating and longitudinally-moving beating-bars, in the manner and for the purpose described.

4. The combination of a thrashing-cylinder, A', with an endless rotating web or apron, B, a stationary and longitudinally-slotted platform, D, a series of vertically-reciprocating and longitudinally-moving toothed beating-bars, E, an open grain-receiving space or slot, *d*, an inclined longitudinally and reciprocally-moving bottom or grain-board, D', and the vibrating arms *d'*, when all are arranged and operating as herein shown and described.

115,082.—WATER-WHEEL.—Alanson H. Merriman, West Meriden, Conn.

Claim.—1. The combination and arrangement of the wheel C, shaft D, boxes *d d*, and the case A with its compartments as shown, the whole combined and operating together, substantially as described.

2. The combination of the wheel C and annular water-chamber *g*, formed in the metal case A, by the outer and inner walls *f f* of the rings *a' a'*, the whole being combined and arranged in a portable water-wheel and case, substantially as described.

3. The arrangement of the wheel C and the boxes *d d*, the wheel discharging at both ends and mounted on a horizontal shaft, as described, whereby the spent water is continually discharged upon both of the boxes, as and for the purpose set forth.

4. The combination of the wheel C, case *f*, and the series of round chutes h, tangentially arranged therein, as described.

5. The buckets *k*, when constructed with the portion immediately in front of the chutes concave upon one side and convex upon the other, and brought to an edge, as shown and described, in combination with the chutes h, arranged to throw the water upon the convex side of the buckets, substantially as described.

115,083.—MANUFACTURE OF JAPANNED LEATHER.—Franklin S. Merritt, Boston, Mass.

Claim.—1. The boarding of japanned leather while in a wet state, or the employment of water with the leather during the process of boarding, as set forth.

2. The improved manufacture of japanned leather, produced by the processes of wetting and boarding the leather after being japanned, all being substantially as described.

115,084.—EXCAVATOR.—Solomon Miller and Edward Claringdon, Waterloo, N. Y.

Claim.—The arrangement and combination of the rear wheel B, chain-elevator M, spur-gears K and I, chain-band G, driving-wheel C, when connected and operating together as described.

115,085.—SPOON.—Henry C. Milligan, South Orange, N. J., assignor to Florian Grosjean, Woodhaven, N. Y.

Claim.—In combination with a bowl, A, and handle B, both made in one piece, the thick convex rib C, laid across the junction thereof, and riveted thereto by the spurs E, as described.

115,086.—LIFTING-JACK.—Hackley T. Morrison, Lawrenceville, Va.

Claim.—1. The screw *d*, provided with longitudinal grooves *m*, and combined with the spring-pin *l* having a beveled end, as specified.

2. The arrangement of the spring-pin *l* with the pointer *o*, as described.

3. The arrangement of the head and foot-pieces *a a'*, screws *d d'*, blocks *e e'*, ratchets *f f'*, pawls *h h'*, levers *g g'*, and spring-pins *l l'*, as explained.

115,087.—EXTENSION-TABLE SLIDE.—Stephen B. Nash, Buffalo, N. Y., assignor to Austin E. Messenger, same place.

Claim.—1. The double-flanged angle-iron H, provided with the shoulder *h*, as shown at fig. 1, when used in the manner and for the purposes described and shown.

2. The combination of the angle-iron H, provided with the pin O, as shown at fig. 2, with the angle-iron H having the pin O and recess N, as shown at fig. 4, for the uses and purposes set forth.

3. The combination of the angle-irons, as provided and shown at figs. 2 and 4, with the bumper B and pins *e* and *p*, for the uses and purposes substantially as shown and described.

4. The above in combination with the bars or slides A, when that part of the angle-iron H opposite the shoulder *h* works in a T-shaped groove.

115,088, antedated May 9, 1871.—TUB, PAIL, &c.—Peter H. Niles, Boston, Mass.

Claim.—A pail, tub, barrel, &c., provided with one or more elastic staves, B, or staves B and bottom strip C, substantially as described.

115,089.—VAPOR-BURNER.—Alanson F. Noble, Indianapolis, Ind.

Claim.—1. The stock A A' A'', constructed substantially as and for the purpose set forth.

2. The heating-chamber C, formed as shown, and having the collar D fitting onto the upper part A'' of the stock, substantially as and for the purpose set forth.

3. The vapor-burner composed of the stock A A' A'', mixing-chamber B, heating-chamber C, collar D, auxiliary burner E, regulating valve-rod G, burner H, and vaporizing-chamber I, all constructed and arranged substantially as set forth.

115,090.—WATCH-MAKER'S GAUGE.—Theodore Noel, Memphis, Tenn.

Claim.—1. An improved watch-maker's gauging-tool, comprising in one complete instrument the following sets of instrumentalities, or either of them, in connection with the plate A, lever M, and finger Q.

2. The adjustable plate C, scale G, finger L, pointer K, and scale I, for simultaneously gauging the diameter and depth of the glasses, substantially as specified.

3. The eccentric pin W, the scale T, and pointer S, for gauging the width of the mainsprings, substantially as specified.

4. The pin V and the scale T, for gauging the thickness of the springs, substantially as specified.

5. The arm Z, adjustable plate *a*, pointer B, and scale T, for gauging the pinions and other articles, substantially as specified.

6. The plate J, bracket J', and slot F, for gauging wheels and other articles, substantially as specified.

7. The hole B and sliding plate J, arranged for gauging wires, substantially as specified.

115,091.—COCK.—Samuel Norton, Stockport, Great Britain.

Claim.—The combination and arrangement of the filtering-vessel M and the valve-top, when internally divided and fitted with two or more valves, as and for the purposes described.

115,092.—SAWING-MACHINE.—Henry P. Ohm, Baltimore, Md.

Claim.—The combination of the reciprocating saw-frame, rock-shaft *s*, connecting-rod *q*, pawl *v*, and carriage h, carrying the standard *x*, lever *w*, and block *x'*, as specified.

115,093.—KEY-HOLE PROTECTOR.—John Hanson Parker, Waltham, Mass.

Claim.—The covering-plate B and the locking-plate C, as provided with the auxiliary notch *l* and the stud *m*, and with the slots *e g* and the tooth *h*, and combined and arranged substantially in manner and so as to operate as specified.

115,094.—CANE-STUBBLE SHAVER.—Felix F. Patout, Jeanerett, La.

Claim.—The knife 5 and mold-board 6, constructed as described, and secured to the slides 1 and 2 at an angle of forty-five degrees, more or less, when said slides 1 and 2 are provided with soles *m m*, and connected together by curved bars 3 and 4, the former supported by braces *k k*, and provided with devices for attaching the team, all in the manner and for the purpose hereinbefore specified.

115,095.—GUIDE-BOARD FOR SPINNING MACHINES.—Oliver Pearl, Lawrence, Mass.

Claim.—The thread-board B, arranged below the top of and inclined with respect to the roller-beam A, as described, in combination with the lip *b* and its movable thread-guide carrier C, hinged to the board B, as specified, all being substantially as and for the objects or purposes as set forth.

115,096.—KEY-BOARD.—John P. Perry, Yarmouth Port, Mass.

Claim.—1. The form and arrangement of the keys H and J constituting the manual L M N O, substantially as described, and for the purpose set forth.

2. The form and arrangement of the keys I and K constituting the double manual R L S N and M P O Q, substantially as described, and for the purpose set forth.

3. The combination and the arrangement of the manual L M N O and the double manual R L S N, M P O Q, substantially as described, and for the purpose set forth.

115,097.—BARREL-CAR.—William A. Plantz, Iowa Falls, Iowa.

Claim.—The construction of the barrel-car, as and for the purpose herein set forth.

115,098.—Truss.—William Pomeroy, New York, N. Y.

Claim.—The combination of a slotted plate or truss-pad and clasps with inwardly projecting buttons to form a fastening, substantially as described and for the purpose set forth.

115,099.—Clothes-Clamp. — Christian L. Poorman, Bellaire, Ohio.

Claim.—The clothes-fastener A, constructed as described.

115,100, antedated May 17, 1871.—Preparation of Materials for Tanning.—Francis Peyre Porcher, Charleston, S. C.

Claim.—1. The use of the articles above enumerated, when applied to the objects hereinbefore described.

2. The new commodity, manufacture, or article of trade which is produced by grinding, drying, and packing the above-mentioned articles, for the purposes stated.

3. The use of vegetable extracts from the substances above enumerated by processes hereinbefore described or contemplated, and for the purposes therein intended.

4. The use of the fruit excrescences and leaves of cypress or cedar-trees, or that of the leaves, stems, and flowers of the May-weed or wild camomile, in the manner and for the purposes hereinbefore set forth and described.

115,101. — Cigar-Mold. — John Prentice, New York, N. Y., assignor to Louis Prentice, same place.

Claim.—1. The flanges *e e* at the sides of the mold *b*, in combination with the mold *d* and the cutters 2 and 3 for shaping the tip, as and for the purposes specified.

2. The lifting-finger *i*, applied to and combined with the molds *b d*, substantially as and for the purposes set forth.

3. The molds *m n*, of a shape to receive the filling or cigar, and hinged together, in combination with an elastic band, for applying the necessary pressure to the cigar or filling, substantially as set forth.

4. The molds *m n*, made with beveled inner edges at *o*, for the purposes set forth.

5. The mold *m n*, made of metal perforated with numerous small holes to facilitate the drying of the cigar or filling, substantially as set forth.

115,102. — Machine for Bending Wire Fastenings for Bottle-Stoppers.—Henry W. Putnam, Bennington, Vt.

Claim.—The dies *e f g*, pusher *k*, clamping dies *m*, and presser *n*, arranged and acting substantially as set forth, for bending up wire fastenings for bottles, as set forth.

115,103.—Arbor for Saws and Grooving-Tools.—Jacob Rand, Boston, Mass.

Claim.—An arbor with the neck A, the fixed collar B, the movable collar G, the threaded sleeve F, and the screw I, all combined and adapted to be used together, as and for the purpose specified.

115,104. — Car-Coupler. — Thomas Ray, Pelham, Canada.

Claim.—1. The combination of the curved bars A, curved plates C, and keeper F, with the buffer-bar B and draft bars E, for connecting the coupling to the body and truck-frame of the car, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the roller G, stirrup H, and long rod or bolt I, with the slotted forward part of the buffer-bar B, substantially as herein shown and described, and for the purpose set forth.

3. The flange b^1 and groove b^2 formed upon the opposite sides of the forward end or face of the buffer B, substantially as herein shown and described, and for the purpose set forth.

115,105. — Washing-Machine. — Chauncy P. Remington, Smith's Mills, N. Y.

Claim.—The reciprocating plunger C, provided with the perforated bottom and top, and with the valves *j j*, and combined with the tub A, to operate partly by suction and partly by pressure, as set forth.

115,106.—Hay and Cotton Press.—Eugene Rock, Greenvale, N. Y.

Claim.—The arrangement of the T-shaped pawls M, the plates O, the double racks E E, follower D, and levers G G, in a cotton-press, substantially as shown, and for the purpose set forth.

115,107. — Composition for Stupefying Bees.—Alexander Y. Rozenbury, Waterloo, Ind.

Claim.—The above-described composition or opiate for stupefying bees, compounded in about the proportions specified.

115,108. — Invalid Bedstead.—Albert J. Russell, Baltimore, Md.

Claim.—The combination of the standards *a*, windlasses *c*, cross-bar *g*, and sliding frame *h*, as specified.

115,109. — Laundry-Box. — Mary A. H. Saurman, Philadelphia, Pa.

Claim.—A laundry-box, consisting of the box-stool A, having lids C, provided with openings or spaces, as described, in connection with the windlass E and crank F, all constructed and operating in the manner and for the purpose described.

115,110.—Machine for Cutting Splints.—Anton F. Scow, Chicago, Ill.

Claim.—1. The cutter-block G, provided with cutting-knife *d*, marking-tool *e* carrying the cutters *g*, as described, in combination with belt F, the whole arranged substantially as and for the purpose described.

2. The adjustable bed-plate H, in combination with gauges L L′, shafts K K′, and springs *o o*, the whole arranged substantially as and for the purpose described.

115,111.—Furnace.—Timothy P. Scripter, Des Moines, Iowa.

Claim.—The distributing-pipe A A with angling roof-partitions *a a*, combined with the sliding registers, the reservoir B, the conducting-pipe C, all made and operated to conduct an artificial current of air to a furnace-fire, in the manner described.

115,112.—Cider-Mill.—Garret Seger, Humberstone, Canada, assignor to himself and O. F. Kniseley, same place.

Claim.—In the cider-mill herein shown, the arrangement of the scraper K, hood L, and delivery-spout M, as shown and described.

115,113.—Clevis.—John H. Shaw, Inlet, Ill.

Claim.—The combination of the parts C, P, A, and S, all arranged as and for the purpose described.

115,114.—Machine for Stretching the Brims of Hats.—Julius Sheldon, Newark, N. J.

Claim.—The adjustable supporting-block G, in combination with arms D and C, which are roughened upon their holding surfaces, all acting together, as and for the purposes set forth.

115,115.—Sinking Shafts and Excavating Tunnels and Cuttings. — Jacob Shelley, Mahanoy, and Milan C. Bullock, Pottsville, Pa.

Claim.—The above-described method of excavation, by first boring all the drill-holes to the depth required, or as far as they can conveniently be bored, filling them with suitable material, making a space for charging and tamping between the filling and the face of the rock, and shattering the rock in successive lifts by repeated explosions.

115,116.—Burial-Case.—Isaac C. Shuler, Amsterdam, N. Y.

Claim.—1. The corrugated packing-frame, supported in exterior channel D by means of tongues G and socket H, as and for the purpose specified.

2. The combination of the adjusting set-screws with the packing-frame and corrugated coffin-lid, as and for the purpose specified.

115,117.—Sewing-Machine.—William Sidenberg, New York, N. Y.

Claim.—1. The combination, with the frame A and shaft C, of the removable shaft G′ and its cams, and the removable shuttle-race, connecting-rod, driver, and feeding mechanism, when all are constructed substantially as described, and operated from the shaft C, for the purpose set forth.

2. The slotted levers U R, constructed and operated as described, to govern the loose or slack thread, as set forth.

115,118.—Cutting-Press.—Nathan J. Simonds, Woburn Mass.

Claim.—In combination with cutting-die A, the perforated vertically-sliding plate *h* and vertically adjustable pins *e e*, all arranged to operate substantially in manner as and for the purposes specified.

115,119. — Registering Ticket-Punch.—James H. Small, Buffalo, N. Y.

Claim.—The arrangement, with the unit numbering-wheel of a combined register and alarm, of the auxiliary numbering-wheel I, provided with twice, or more times, the number of ratchets of the unit-wheel, and designed to move simultaneously therewith, substantially as and for the purpose hereinbefore set forth.

115,120.—Apparatus for Unloading and Moving Hay.—Alexander Smith, Hoosick Four Corners, N. Y.

Claim.—1. The improved hay-sling, composed of two parts, A or B, and hinged bars C, the latter being provided with holding and tripping apparatus, all substantially as specified.

2. The combination of a sling, such as herein described, with a hoisting-lever and derrick, substantially as specified.

3. The combination, with the hoisting-lever and rope S, of the holding and sliding bar V, and a guide or pulley, T, substantially as specified.

4. The combination, with sliding holding-bar V and pulley or guide T, of the clamp U Y, and the belaying-cleat Z, all substantially as specified.

115,121.—Medicine-Case.—Henry M. Smith, New York, N. Y.

Claim.—As a new article of manufacture, a pocket medicine-case, or other similar contrivance, constructed with one or more springs, in the manner and for the purpose hereinbefore described.

115,122.—Fifth-Wheel for Vehicles.—James P. Smith, Hillsborough, Ohio, assignor to himself and J. S. Black, same place.

Claim.—The two plates J, movable within the flange and on the circular face of plate E, combined with a brace, I, having its forward arm fast to the center of said circular face, for the purpose of preventing the axle from having a movement more extended than is absolutely necessary.

115,123. — Cotton-Seed Planter.—Peter E. Smith, Scotland Neck, N. C.

Claim. — A rotary seed-hopper, formed of two overlapping and closed tubes, I K, one movable around the other to adjust the size of the seed-apertures, and both turning together to drop the seed, in the manner described.

115,124. — Bobbin-Winder for Sewing-Machines.—Robert H. Smith, Baltimore, Md., assignor to himself and James B. Sanner, same place.

Claim.—The combination of the carriage *k*, ears *l l*, chaser *n r*, spring *o*, shaft *b*, rods *m m*, and guide *s t*, spindles *d e*, and gears *h i*, all constructed and arranged substantially as shown and described, for the purpose specified.

115,125.—Stump-Pulling Machine.—William Smith, Tomah, Wis., assignor to himself and H. Greve, same place.

Claim.—1. The two pairs of posts A, bed-pieces B, and beam C, combined, as described, with high inclined posts D, for the purpose of making the latter brace the frame and counterbrace each other.

2. The ratchet wheel G, slotted lever I K, and link-shaped pawl H, combined, as described, with the ratchet, for the purpose of insuring the operation of the latter no matter in what plane it may be thrown by the springing of the lifting-shaft.

3. The combination, with the lifting mechanism of a stump-extractor, of a hook, R, having the dart-shaped point S, for the purpose described.

4. In a stump-extractor, the pivoted tongue K′, combined with the main beam C M M, as and for the purpose described.

115,126.—Cotton and Hay-Press.—William M. Smith, Augusta, Ga.

Claim.—1. In combination with the upright timbers A of a cotton-press, the long brace A^2, when used to form a recess for the reception of the follower-block out of the way of the box of the press, the timbers being united only at the top and bottom, substantially as and for the purpose set forth.

2. The arrangement herein shown of the follower-block G, hinged link *c*, and notched head *d* of rack-bar F, as and for the purpose set forth.

3. The combination of the pawl-box I, provided with rectangular openings *s s′* and recess *k* with the lever K, when provided with beak *t*, and corrugated bearing *u*, as and for the purpose set forth.

4. The combination of the follower-block G with the long links *f*, the levers K, and the corrugated stirrup *g*, as and for the purpose set forth.

5. The arrangement of the racks F, provided with guide-ways and projecting teeth, with the pawl-boxes H and I having rectangular slots *s s′*, when constructed substantially as shown, for the purpose set forth.

115,127.—Oil-Tank.—Henry F. Snyder and George S. Snyder, Williamsport, and Autes Snyder, Freeport, Pa.

Claim.—1. The angular clearing surface Z on the threaded portion U^3 of the cover or cap U, adapted to clear the screw-threads of the top casting T, as specified.

2. The within-described cap U, carrying the soft metal *u*, as shown, and arranged to serve, as shown, relatively to the edge of the top casting T, for the purposes herein set forth.

3. The threaded portion U^3 and edge-guard or lip U^1 on the cap U, arranged to serve in connection with each other so as to provide for efficiently and tightly securing and easily releasing the parts, and guarding the soft metal against injury, as specified.

115,128. — Hammock-Supporter. —James M. K. Southwick, Newport, R. I.

Claim.—The combination of the two tripods and the brace-pole, when constructed and arranged substantially as specified, and for the purpose set forth.

115,129, antedated May 15, 1871.—Brake-Block for Vehicles.—Isaac W. Spore, New Scotland, N. Y.

Claim.—The block A, constructed as shown and described, provided with the slot C, when hung upon the pin *d*, so as to have an up-and-down and pendulum motion, substantially as set forth.

115,130. — Wagon-Brake. — William I. Spore, New Scotland, N. Y.

Claim.—1. The combination and arrangement of the rod *a*, backing-plate G, and lever H, when constructed and operating as described.

2. The levers H H, when provided with longitudinal slots and pins to permit a limited end motion, as described.

115,131.—Machine for Softening Hides, Leather, &c.—Linnæus H. Stanley and Gamaliel B. Draper, Attleborough, Mass., assignors to Peter F. Hughes, trustee, assignor to said Stanley and Draper and Nathaniel Faubrother and George S. Fales.

Claim.—1. The improved apparatus for softening leather, which consists in the combination, with a suitable pin-block, A, of a revolving clamp or series of clamps, E, substantially as described.

2. A revolving clamp or series of clamps, E, arranged to have a motion about their axes imparted to them, in combination with a suitable pin-block, substantially as described, for the purposes specified.

115,132.—Hoe.—John Stilwell, Griffin, Ga.

Claim.—The pendant A of the ferrule B, having the countersunk hole C and the dowel-pin; also, the plate G, bolt H, and nut I, combined with the blade and the ferrule B, the said blade having holes for the dowel-pin and bolt, all substantially as specified.

115,133.—Wagon-Tongue Support.—Lewis E. Stilwell, Franklinville, N. Y.

Claim.—The stiff wooden brace B, provided on its front end with the bearing *d* for the tongue to rest on, and attached at its rear end to the axle by the king-bolt, in combination with the set-screw D and strap or holder C, substantially as and for the purpose set forth.

115,134.—Coffee-Pot.—Orville M. Tinkham, Pomfret, Vt.

Claim.—1. The cup B, with flange F, projection G, and filter E, when combined and operating as described.

2. The reservoir A, with its perforated bottom H, combined with cup B and its filtering bottom, in manner set forth.

115,135.—Damper. — Albert Tracy, Paris Hill, Me.

Claim.—1. The combination of the eccentric C and the shaft A with the block B, substantially as and for the purpose hereinbefore set forth.

2. The combination of the wedge of right lines and the shaft A with the block B and handle, with cog or cogs, substantially as and for the purpose hereinbefore set forth.

3. The combination of either the eccentric C or wedge of right lines and the shaft A with the blocks B and I, or either of them, or with the band K or the band L, substantially as and for the purpose hereinbefore set forth.

4. The combination of the eccentrics C or C′ and the shaft A, with or without blocks or bands, and with handle of eccentric attached or unattached, substantially as and for the purpose hereinbefore set forth.

5. The combination of the eccentric C′ or wedge of right lines with the shaft A, with or without button or cone inverted at further end, and with or without notch, or cog, or groove, substantially as and for the purpose hereinbefore set forth.

115,136. — Printers' Furniture. — John Frederick Uhlhorn, Sacramento, Cal.

Claim.—The extension side-stick, composed of the pieces A and B, which have the tongue *a* and ledges *b b′*, respectively, as set forth.

115,137. — Apparatus for Electrical, Vacuum, and Vapor Treatment.—Maurice Howell Utley, Montreal, Canada.

Claim.—The receiver *a*, provided with the cap *c*, having the cocks *d e*, rest *h*, and electrical wire *c′*, as described.

115,138.—Cultivator.—Leander Walker, Victoria, Texas.

Claim.—The combination of the pivoted side beams E, to which the forward plows H I are attached, chains J, pulleys K, and pivoted handles L, with each other and with the beam D, substantially as herein shown and described, and for the purpose set forth.

115,139. — Washing-Machine. — Horace Warner, Ridgeway, Pa.

Claim.—1. The cup L, arranged as described on the inside of cover J to receive the drip from the cones, in the manner specified.

2. The arrangement of the open bottom G, springs H, and flange I, (on the bottom of the tub,) in combination with conical rolls B working within said flange, as and for the purpose specified.

115,140. — Carriage-Jack. — August H. Wellbrock, Boston, Mass.

Claim.—1. The lever *g*, lifter *e*, lever *f*, and connecting-chain or cord *h*, when combined and arranged to operate together, substantially as described.

2. In combination with the lifter *e* and lever *f*, the interposed swinging arm *e* carrying at its free end a friction-roll *d*, bearing both upon the lever and the lifter, substantially as described.

115,141.—Harvester-Rake. — George H. Weller, New Village, N. J.

Claim.—1. The frame H, provided with rear and front fingers P Q, either or both, for attachment to harvesters and mowers, substantially as herein shown and described, and for the purposes set forth.

2. The combination of the posts B C, horizontal bars D E, braces F G, frames H provided with fingers P Q, either or both, shafts I, connecting-bars J, cranks K L, crank M, connecting rod N, and crank fly-wheel pulley O, with each other, to adapt them for attachment to harvesters and mowers, substantially as herein shown and described, and for the purposes set forth.

115,142.—Railroad Rail.—Edward Williams, Batavia, N. Y.

Claim.—The head B, formed with the depending lips, tongue G, and grooves *a a*, as described, arranged, and operating in connection with the base A, formed with the grooves K and tongues *p p*, with the separate packings D E E interposed within the grooves, as shown, the head B, with its depending lips, being secured to the base A by the horizontal bolt *c* passing through the depending lips, base A, fish-plates H H, and playing within the horizontal slot *b*, the whole constructed substantially as set forth.

115,143.—Miner's Lamp.—William C. Winfield, Hubbard, Ohio.

Claim.—A new article of manufacture, viz., a miner's lamp, provided with a screw-cap, D, constructed, arranged, and operating with relation to the body of the lamp as herein described, and for the purpose set forth.

115,144.—Butter-Worker.—Philander G. Woodard, Waterford, Pa.

Claim.—The arrangement of the adjusting-slots D D, reciprocating-table A, and vibrating roller B moving on the fixed racks 2 2, the whole constructed and operating substantially in the manner and for the purpose set forth.

115,145.—Steam-Engine.—John C. Woodhead, Allegheny City, Pa.

Claim.—1. An auxiliary valve, arranged in the exhaust-chamber, in combination with the main valve, substantially as described.

2. The combination of a single induction-valve supplying steam directly to each end of the cylinder, with an eduction-valve controlling only the exhaust-ports, substantially as described.

3. The combination of the valves B and C, having the ports *a a b b* relatively arranged, as described.

115,146.—Name-Plate for Organ-Stops. Charles Edwin Bacon and William Jones Kent, Buffalo, N. Y; said Kent assigns his right to said Bacon.

Claim.—As a new article of manufacture, the ivory labels of organ-stops made from veneers or strips cut lengthwise or with the grain, and the name of the stop stamped therein by metal dies, as hereinbefore fully explained and set forth.

115,147.—Sash-Fastener.—Gilbert L. Bailey, Portland, Me.

Claim.—The bent lever A C′, furnished with an orifice or opening, C, for holding and securing one end of the sash-weight cord, the part C′ serving also as a positive stop for the sash, all arranged and operating as herein described and for the purpose set forth.

115,148.—Plant for Repairing Railway Rails.—Hugh Baines, Toronto, Canada.

Claim.—The plant, comprehending by this the arrangement of machinery, fixtures, and appurtenances generally, substantially as hereinbefore described, for the ready repair of damaged railway rails, without cutting them up and re-rolling them.

115,149.—Roll for Patching Railway Rails.—Hugh Baines, Toronto, Canada.

Claim.—1. The particular construction of the roll-sections K K′, seen in sheet 1, fig. 15, herein described, in virtue of which the rolls are prevented from end play and the metal welded to the head of the rail, and the whole reduced to proper finished shape in two passes, in the manner set forth.

2. The combination of the mechanism for starting, stopping, and reversing, and the rolls, substantially as described.

115,150. — Clothes-Wringer. — Elbridge G. W. Bartlett, Providence, R. I.

Claim.—1. The shoulders C and C′, on the rear ends of the bars A and A′, arranged at such a distance from and in such relation to the hinge-joint B that they will prevent, by their coming in contact, any undesirable separation of the bars, the rollers, or the gears of a wringing-machine, substantially as described.

2. In combination with wringing rollers mounted in suitable standards, the concavo-convex toothed gears D and E, substantially as described.

115,151. — Sewing-Machine.—Alexander B. Bates, Baltimore, Md.

Claim.—The combination of the shaft *a*, arm *b*, link *c*, levers *d* and *g*, connecting-rod *f*, and notched plate *j*, as specified.

115,152. — Adjustable Carriage-Seat.—Sylvester W. Beach, Ypsilanti, Mich.

Claim.—1. The handles and rests of the front seat of a carriage, when the same are connected, so that by throwing the handles in and out the rests are moved in the proper direction, substantially as herein set forth.

2. The combination of the rest B, handle D, and connecting-rod E, constructed and arranged substantially as and for the purposes herein set forth.

115,153, antedated May 19, 1871.—Smoke-Stack for Locomotives.—Landrow Bell, Washington, D. C.

Claim.—1. The supplementary flue G, provided with the supplementary bonnet I and pipes M M′ leading into the ash-pan, substantially as and for the purpose set forth.

2. The combination of the flue G, pipes M M′, branches T T′, and funnels O O′, substantially as and for the purpose set forth.

3. The fan-wheel *w*, channel Q, and funnel L, in combination with the flue G, arranged substantially as and for the purpose set forth.

4. The double adjustable bonnet, composed of the two parts I J, in combination with the supplementary flue G and pipes M M′, substantially as and for the purpose set forth.

115,154, antedated May 17, 1871.—Electric Lighting Apparatus. — Auguste Prosper Berlioz, Paris, France.

Claim.—1. An electric illuminating apparatus consisting of a case, C, having near one end a lens, L, and containing an adjustable stand, which supports adjustable carbon pencils, and an adjustable reflector, R, all substantially as described.

2. The said case and its contents, in combination with a stand, P, on which the said case is adjustable, as described, and through which extend the wires leading to the battery, as set forth.

3. The adjustable arm carrying the disk *r*, arranged adjacent to the carbon pencils, for the purpose described.

4. The tube K and its glass, in combination with the case C and the carbon points, as and for the purpose specified.

5. The lens, consisting in whole or in part of independent rings of glass secured to radial supports, as set forth.

6. The lamp A, adjustable in the case C by means of the screw V or its equivalent, substantially as set forth.

115,155.—Feeding Mechanism for Sewing-Machines.—Charles Beuttel, Cincinnati, Ohio.

Claim.—1. The combination of the feed-bar *g*, yoke G, adjustable rod D *d*, spring I, adjusting-nuts J J′, and cams H, connected and operating substantially in the manner and for the purpose specified.

2. The combination of the lifting-levers M N and cam L, when the levers are adjustable with relation to each other, the parts being connected and operated substantially in the manner and for the purpose described.

115,156. — Punching-Machine.—Ezra R. Brown, Mauch Chunk, and James Long, Packerton, Pa.

Claim.—The combination, with the discharger G and sliding bolster C, of the rock-shaft *k* with its levers *l m*, the rod *n* with its lever *s*, the arm *o*, guide-rod *q*, and spring *r*, substantially as specified.

115,157.—Cutter for Cutting Washers from Leather.—Ezra R. Brown, Mauch Chunk, and James Long, Packerton, Pa.

Claim.—A punch, consisting of a cutter, B, having a central spring, S, and surrounding cutter A, with annular spring R interposed between said cutters, all constructed, arranged, and combined, substantially as shown and described.

115,158.—Wagon-Seat.—Lewis Henry Bullock, Champaign City, Ill.

Claim.—In a wagon-seat, the flanged clasps H attached to the ends of the cross-heads, substantially as and for the purposes specified.

115,159. — CULTIVATOR. — Theophilus F. Capp, Bloomington, Ill.

Claim.—The arrangement of the cross-pieces D D′, the draft-pole E, the straps C C′, the axles B and the wheels A, when each of said parts is constructed substantially as described and shown, and as and for the purposes set forth.

115,160. — SPINNING-RING. — William T. Carroll, Medway, Mass.

Claim. — 1. The ring-rail A, provided with a flange, *b*, in combination with the reversible double-flanged ring having flattened surfaces *c c* or grooves *c′ c′* on the two opposite sides, and adjusted and held in position by but two set-screws, as specified.

2. The ring D′, having its neck provided with the flattened surfaces *c c* on two opposite sides, so as to render it adjustable in the ring-rail A′ by but two set-screws, Z Z, substantially as set forth.

115,161. — CLOTHES-WRINGER.—Cyrus E. Carter, Martinsville, Ohio.

Claim.—The arrangement of the treadle A, connecting-rods *g g*, levers *f*, and slotted bars *d d* in the same plane with the rollers *c c* and frame *a*, and connected to operate as and for the purpose specified.

115,162, antedated May 12, 1871.—PLANT-GROWER.—Benjamin B. Chadwick, Buffalo, N. Y.

Claim.—As an article of manufacture, the basket A B, when constructed of the materials and in the manner substantially as herein described, and for the purpose set forth.

115,163.—SEWING-MACHINE FOR WORKING BUTTON-HOLES.—William Chicken, Boston, Mass., assignor to Amos L. Wood, trustee, same place.

Claim.—1. In combination with the work-supporting plate *a* and its cam-operated pin *d*, the auxiliary cam-operated pin *i*, for enabling the plate to be fed laterally to form the bar, substantially as described.

2. The guide-plate *p*, in combination with and for guiding the work-plate laterally, substantially as described.

3. In combination with work-plate *a* and guide-plate *p*, devices, substantially as described, for locking plates *a* and *p* together while the sides and eye of the hole are being stitched, and for permitting relative movement thereof during the barring.

4. The combination, with the work-supporting plate *a*, of the sliding or movable cam-pin *d* and the movable cam-pin *i*, each provided with means to be thrown into and out of engagement with the cam-groove, substantially as described.

5. The eye and slit-locater *y*, in combination with the work-plate, substantially as described.

6. The bed-plate, provided with the pin-slot a^2 and the pin-operating cam-slot *t*, substantially as described.

115,164.—SAND AND SEED-EJECTOR.—Martin Christiansen, Winneconne, Wis.

Claim.—1. A sand-ejector, or seed, provided with devices for sifting the sand before it is ejected, and for regulating the quantity to be distributed, substantially as described.

2. The combination and arrangement of box A, handle K, driving-wheel L, connecting-rod H, cross-belt M, pulley G, oscillating valve or agitator C, hopper E, fan D, and slide F, substantially as and for the purpose set forth.

115,165. — FENCE. — Locklin N. Clark, Brighton, Mich.

Claim.—The construction of a fence wherein the posts B B′, having notches or gains *a*, the bricks D D′, and wire ties E are, arranged with relation to each other and the strips A, substantially as herein described, for the purpose specified.

115,166.—METHOD OF MAKING SPADES AND SHOVELS.—Levi Dewes Clift, Philadelphia, Pa.

Claim.—The method herein described of manufacturing a shovel or spade with the blade, socket, and solid shank of one piece of metal.

115,167.—GATE.—David M. Cochran and Lindley A. Hawkins, Richmond, Ind.

Claim.—In combination with the gate A, the upper hinge consisting of the parts D, D^1, and D^2, levers E, F, and connecting-rods E^1 and F^2, the latter being attached directly to the gate, all arranged to operate substantially as set forth.

115,168. — CHIMNEY-COLLAR.—Joseph H. Congdon, Coventry, assignor to himself and Benjamin C. Allen, Warwick, R. I.

Claim.—The flange C, in connection with the outlets B B, and in combination with the plate A and raised caps D D, substantially as described, for the purpose specified.

115,169.—SHOE.—Elisha S. Converse, Boston, Mass.

Claim.—1. A shoe the sides and rear of which are made of one continuous piece of elastic extensible fabric surrounding the whole or the greater portion of the opening in the shoe through which the foot is inserted, the vamp or front being made of an inelastic material, substantially as and for the purposes shown and set forth.

2. A water-proof overshoe, whose quarter, extending around the rear and along the sides of the shoe, and surrounding the whole or the greater portion of the opening through which the foot is inserted, is of an elastic and extensible material, while the vamp or upper is made of a distinctively non-elastic and inextensible material, substantially as shown and set forth.

115,170.—WASHING-MACHINE.—Ferdinand L. Copps, Atlanta, Ill.

Claim.—1. The combination, with the pressure-board E and frame F, of the sliding section G, provided with the adjusting spring rack *f*, substantially as specified.

2. The washing-machine herein described, provided with the tub A, cylinder C, adjustable sectional pressure-board E G, curved frame F, adjustable crank L, with rack and pinion and adjusting notches, lever M, and spring-bar N, substantially as specified.

115,171. — ROTARY ENGINE.—James Cox, Belle Plaine, Iowa.

Claim—1. The arrangement of a series of cylinders, E, radiating from a common hub, C, and provided with the piston-weights F and piston-rods G, as and for the purpose set forth.

2. The combination of the adjustable steam-chest H, for conveying steam to the cylinder, with the face-plate D, provided with its inlets *b*, constructed and arranged substantially as described, for the purposes set forth.

3. The combination of the shaft B, face-plate D, cylinders E, piston-weights F, piston-rods G, steam-chest H, and set-screw J, arranged and operating substantially as and for the purpose herein set forth and shown.

115,172.—STAMP-MILL.—John M. Crawford, Philadelphia, Pa.

Claim.—1. The cylinder H, provided with frictional lifting-cams F and guide-flange I, in combination with sleeve G and stamp-stem M, when constructed and operated substantially in the manner and for the purposes specified.

2. The sleeve G and collars *g*, in combination with stamp-stem M, when constructed and operated substantially in the manner and for the purposes set forth.

3. The combination of wheels E′, cam-shafts E, cylinders H with cams F, and flanges I, stamp-stem M, beveled wheels S and R, shaft *q*, and cog-wheels Q and P, when constructed and operated substantially in the manner and for the purposes described.

4. The wing or flange N on the boss on shoe *m*, in combination with the stamp-stem M, having a square or angular portion, for the purposes and in the manner specified.

115,173.—CENTER-BOARD.—Alonzo G. Crossman, Huntington, N. Y., assignor to Franklin M. Crossman, same place.

Claim.—The combination of the center-board B C, the frame A A, and the stay D, substantially as hereinbefore set forth.

115,174. — BOILER WASHING-MACHINE.—James Curtis, North Parma, N. Y.

Claim.—The combination, with the wash-boiler A, of the cylinder B, constructed with a closed periphery formed into a series of flutes or corrugations, and with closed ends perforated near the outer edge with a series of holes, as herein described, and for the purpose specified.

115,175.—METHOD OF BOXING BLIND-STAPLES. — Biram C. Davis, Binghamton, N. Y., assignor to himself and Robert B. Doubleday, same place.

Claim.—The combination and arrangement of the box A, having uniform grooves B B, with the strips or bars C C loaded with blind-staples, substantially as shown and described, for the purpose specified.

115,176.—FASTENER FOR DOORS AND WINDOWS.—Jacob Z. Davis, San Francisco, Cal.

Claim.—A fastener for doors, windows, and for other purposes, consisting of a metallic plate formed with a hook at one end, in the plane thereof, and provided with two or more holes for receiving the holding-screw or screws, substantially as shown and described.

115,177.—CHURN-DASHER.—Samuel F. Dolloff, Bloomington, Ill.

Claim.—A churn-dasher and cream-breaker, composed of the shaft A and arms B B, said arms being flat and diagonal on their rear sides, and the front sides beveled from *a* to *b*, and from *b* to the outer end flattened diagonally, either plane or concave, substantially as and for the purposes herein set forth.

115,178. — WINDOW-SHADE FIXTURE.—Alfred S. Dickinson, Brooklyn, N. Y.

Claim.—In self-winding shade-fixtures, the shade A, roller J, and its brackets L L, and bars G and B, when suspended and capable of being operated, substantially as and for the purpose herein shown.

115,179.—CHUCK FOR WOOD-LATHES.—Robert H. Dowling, Fenton, Mich., assignor to himself and Charles Winslow, same place.

Claim.—The construction and arrangement of the mandrel A and cruciform heads B and C, provided with set-screws *d* or their equivalents, substantially as and for the purpose set forth.

115,180. — TAILOR'S MEASURE. — Ithamar Du Bois, Brooklyn, N. Y.

Claim.—1. The vibrating block E and the sliding block F, provided respectively with the rods B^1 B^1 and B^2 B^2, in combination with the slotted rule or graduated bar A, the elastic piece N, and upright rule D.

2. The rule K, with its toothed graduated upright rule L, combined with the plumb-line and bob M, and with the blocks E and F, and rods B^1 and B^2, the upright rule D and elastic rule N, all made and operating substantially as set forth and described, or their mechanical equivalents.

115,181.—GUN-CARRIAGE.—James B. Eads, St. Louis, Mo.

Claim.—1. In combination with the gun A and levers B, the connecting-rod L, cross-head K, piston I, cylinder E, cylindrical piston-rod J, cylindrical plunger N, and valve O, or their substantial equivalents, for the purpose described.

2. The combination, with the cylinder E, of the movable head H, arranged and operating substantially as described, to adjust the air-cushion to correspond with the force of recoil.

115,182.—APPARATUS FOR CARBURETING.—George Edmonds, New Orleans, La.

Claim.—1. The basket D, provided with distributing-rings *y*, constructed substantially as and for the purpose specified.

2. In combination, the pump A, bellows B, reservoir C, basket D, and air-chamber M, constructed and connected substantially as and for the purpose specified.

3. The air-chamber M, arranged between the reservoir and the burner, and constructed substantially as and for the purpose specified.

115,183.—FOLDING BOX.—Nicolaus Erpelding and John Erpelding, Chicago, Ill.

Claim.—1. The folding box, consisting of the frame A, having the top, side, and end pieces hinged thereto, with the bottom G secured by a sliding joint to the end pieces, all substantially as described.

2. The inner plate D, arranged to fit within the bottom of the box and hold the side and end pieces in position, substantially as described.

115,184.—THILL-COUPLING.—John H. Fleming, Dundee, Mich.

Claim.—1. A device for securing the shafts or poles to wagons, wherein the jaws A and shaft or pole-iron D are constructed and arranged to operate substantially as set forth.

2. In combination therewith the clamp E, for the purposes set forth.

115,185.—STRIPPER-CARRYING FRAME FOR CARDING-MACHINES. — John F. Foss, Lowell, Mass., assignor to himself and John N. Pierce, same place.

Claim.—1. The stripper-carrying arms E, constructed as described, each with an offset, *g*, a shaft-receiving hub or plate, *f*, and a depending lower portion, I, arranged within the frame-work, whereby the lower cross-bar H can be applied in the manner and for the purpose described.

2. The stripper-carrying arms, constructed as described, in combination with and connected by cross-bars H and G, all constituting a frame-work capable of being traversed or oscillated from one side of the card to the other by a single traversing mechanism, substantially as described.

3. The lower cross-bar H, in combination with and carried by the depending arms I, arranged between the end frames D, for the purpose and in the manner substantially as described.

115,186. — LAND-MEASURING REGISTER.—William Frasius, Chatsworth, Ill.

Claim.—The measure A, provided with pivots B B′ and arch C, or its equivalent, in combination with shaft D, the whole arranged to operate substantially as and for the purpose described.

115,187.—ROCK-DRILLING MACHINE.—Gideon Frisbee, Titusville, assignor to himself and Samuel E. Griscom, Shenandoah, Pa.

Claim.—1. The cams or eccentrics E, operating as described.

115,159. — CULTIVATOR. — Theophilus F. Capp, Bloomington, Ill.

Claim.—The arrangement of the cross-pieces D D', the draft pole E, the straps C C', the axles B and the wheels A, when each of said parts is constructed substantially as described and shown, and as and for the purposes set forth.

115,160. — SPINNING-RING. — William T. Carroll, Medway, Mass.

Claim. — 1. The ring-rail A, provided with a flange, *b*, in combination with the reversible double-flanged ring having flattened surfaces *c c* or grooves *c' c'* on the two opposite sides, and adjusted and held in position by but two set-screws, as specified.

2. The ring D', having its neck provided with the flattened surfaces *c c* on two opposite sides, so as to render it adjustable in the ring-rail A' by but two set-screws, Z Z, substantially as set forth.

115,161. — CLOTHES-WRINGER.—Cyrus E. Carter, Martinsville, Ohio.

Claim.—The arrangement of the treadle A, connecting-rods *g g*, levers *f* and slotted bars *d d* in the same plane with the rollers *c c* and frame *a*, and connected to operate as and for the purpose specified.

115,162, antedated May 12, 1871.—PLANT-GROWER.—Benjamin B. Chadwick, Buffalo, N. Y.

Claim.—As an article of manufacture, the basket A B, when constructed of the materials and in the manner substantially as herein described, and for the purpose set forth.

115,163.—SEWING-MACHINE FOR WORKING BUTTON-HOLES.—William Chicken, Boston, Mass., assignor to Amos L. Wood, trustee, same place.

Claim.—1. In combination with the work-supporting plate *a* and its cam-operated pin *d*, the auxiliary cam-operated pin *i*, for enabling the plate to be fed laterally to form the bar, substantially as described.

2. The guide-plate *p*, in combination with and for guiding the work plate laterally, substantially as described.

3. In combination with work-plate *a* and guide-plate *p*, devices, substantially as described, for locking plates *a* and *p* together while the sides and eye of the hole are being stitched, and for permitting relative movement thereof during the barring.

4. The combination, with the work-supporting plate *a*, of the sliding or movable cam-pin *d* and the movable cam-pin *i*, each provided with means to be thrown into and out of engagement with the cam-groove, substantially as described.

5. The eye and slit-locater *y*, in combination with the work-plate, substantially as described.

6. The bed-plate, provided with the pin-slot s^6 and the pin-operating cam-slot *t*, substantially as described.

115,164.—SAND AND SEED-EJECTOR.—Martin Christiansen, Winneconne, Wis.

Claim.—1. A sand-ejector, or seed, provided with devices for sifting the sand before it is ejected, and for regulating the quantity to be distributed, substantially as described.

2. The combination and arrangement of box A, handle K, driving-wheel L, connecting-rod H, cross-belt M, pulley G, oscillating valve or agitator C, hopper E, fan D, and slide F, substantially as and for the purpose set forth.

115,165. — FENCE. — Locklin N. Clark, Brighton, Mich.

Claim.—The construction of a fence wherein the posts B B', having notches or gains *a*, the bricks D D', and wire ties E are, arranged with relation to each other and the strips A, substantially as herein described, for the purpose specified.

115,166.—METHOD OF MAKING SPADES AND SHOVELS.—Levi Dewes Clift, Philadelphia, Pa.

Claim.—The method herein described of manufacturing a shovel or spade with the blade, socket, and solid shank of one piece of metal.

115,167.—GATE.—David M. Cochran and Lindley A. Hawkins, Richmond, Ind.

Claim.—In combination with the gate A, the upper hinge consisting of the parts D, D^1, and D^2, levers E, F, and connecting-rods E^2 and F^2, the latter being attached directly to the gate, all arranged to operate substantially as set forth.

115,168. — CHIMNEY-COLLAR.—Joseph H. Congdon, Coventry, assignor to himself and Benjamin C. Allen, Warwick, R. I.

Claim.—The flange C, in connection with the outlets B B, and in combination with the plate A and raised caps D D, substantially as described, for the purpose specified.

115,169.—SHOE.—Elisha S. Converse, Boston, Mass.

Claim.—1. A shoe the sides and rear of which are made of one continuous piece of elastic extensible fabric surrounding the whole or the greater portion of the opening in the shoe through which the foot is inserted, the vamp or front being made of an inelastic material, substantially as and for the purposes shown and set forth.

2. A water-proof overshoe, whose quarter, extending around the rear and along the sides of the shoe, and surrounding the whole or the greater portion of the opening through which the foot is inserted, is of an elastic and extensible material, while the vamp or upper is made of a distinctively non-elastic and inextensible material, substantially as shown and set forth.

115,170.—WASHING-MACHINE.—Ferdinand L. Copps, Atlanta, Ill.

Claim.—1. The combination, with the pressure-board E and frame F, of the sliding section G, provided with the adjusting spring rack *f*, substantially as specified.

2. The washing-machine herein described, provided with the tub A, cylinder C, adjustable sectional pressure-board E G, curved frame F, adjustable crank L, with rack and pinion and adjusting notches, lever M, and spring-bar N, substantially as specified.

115,171. — ROTARY ENGINE.—James Cox, Belle Plaine, Iowa.

Claim—1. The arrangement of a series of cylinders, E, radiating from a common hub, C, and provided with the piston-weights F and piston-rods G, as and for the purpose set forth.

2. The combination of the adjustable steam-chest H, for conveying steam to the cylinder, with the face-plate D, provided with its inlets *b*, constructed and arranged substantially as described, for the purposes set forth.

3. The combination of the shaft B, face-plate D, cylinders E, piston-weights F, piston-rods G, steam-chest H, and set-screw J, arranged and operating substantially as and for the purpose herein set forth and shown.

115,172.—STAMP-MILL.—John M. Crawford, Philadelphia, Pa.

Claim.—1. The cylinder H, provided with frictional lifting-cams F and guide-flange I, in combination with sleeve G and stamp-stem M, when constructed and operated substantially in the manner and for the purposes specified.

2. The sleeve G and collars *g*, in combination with stamp-stem M, when constructed and operated substantially in the manner and for the purposes set forth.

3. The combination of wheels E', cam-shafts E, cylinders H with cams F, and flanges I, stamp-stem M, beveled wheels S and R, shaft *q*, and cog-wheels Q and P, when constructed and operated substantially in the manner and for the purposes described.

4. The wing or flange N on the boss on shoe *m*, in combination with the stamp-stem M, having a square or angular portion, for the purposes and in the manner specified.

115,173.—CENTER-BOARD.—Alonzo G. Crossman, Huntington, N. Y., assignor to Franklin M. Crossman, same place.

Claim.—The combination of the center-board B C, the frame A A, and the stay D, substantially as hereinbefore set forth.

115,174. — BOILER WASHING-MACHINE.—James Curtis, North Parma, N. Y.

Claim.—The combination, with the wash-boiler A, of the cylinder B, constructed with a closed periphery formed into a series of flutes or corrugations, and with closed ends perforated near the outer edge with a series of holes, as herein described, and for the purpose specified.

115,175.—METHOD OF BOXING BLIND-STAPLES. — Birum C. Davis, Binghamton, N. Y., assignor to himself and Robert B. Doubleday, same place.

Claim.—The combination and arrangement of the box A, having uniform grooves B B, with the strips or bars C C loaded with blind-staples, substantially as shown and described, for the purpose specified.

115,176.—FASTENER FOR DOORS AND WINDOWS.—Jacob Z. Davis, San Francisco, Cal.

Claim.—A fastener for doors, windows, and for other purposes, consisting of a metallic plate formed with a hook at one end, in the plane thereof, and provided with two or more holes for receiving the holding-screw or screws, substantially as shown and described.

115,177.—CHURN-DASHER.—Samuel F. Dolloff, Bloomington, Ill.

Claim.—A churn-dasher and cream-breaker, composed of the shaft A and arms B B, said arms being flat and diagonal on their rear sides, and the front sides beveled from *a* to *b*, and from *b* to the outer end flattened diagonally, either plane or concave, substantially as and for the purposes herein set forth.

115,178. — WINDOW-SHADE FIXTURE.—Alfred S. Dickinson, Brooklyn, N. Y.

Claim.—In self-winding shade-fixtures, the shade A, roller J, and its brackets L L, and bars G and B, when suspended and capable of being operated, substantially as and for the purpose herein shown.

115,179.—CHUCK FOR WOOD-LATHES.—Robert H. Dowling, Fenton, Mich., assignor to himself and Charles Winslow, same place.

Claim.—The construction and arrangement of the mandrel A and cruciform heads B and C, provided with set-screws *d* or their equivalents, substantially as and for the purpose set forth.

115,180. — TAILOR'S MEASURE. — Ithamar Du Bois, Brooklyn, N. Y.

Claim.—1. The vibrating block E and the sliding block F, provided respectively with the rods B^1 B^1 and B^2 B^2, in combination with the slotted rule or graduated bar A, the elastic piece N, and upright rule D.

2. The rule K, with its toothed graduated upright rule L, combined with the plumb-line and bob M, and with the blocks E and F, and rods B^1 and B^2, the upright rule D and elastic rule N, all made and operating substantially as set forth and described, or their mechanical equivalents.

115,181.—GUN-CARRIAGE.—James B. Eads, St. Louis, Mo.

Claim.—1. In combination with the gun A and levers B, the connecting-rod L, cross-head K, piston I, cylinder E, cylindrical piston-rod J, cylindrical plunger N, and valve O, or their substantial equivalents, for the purpose described.

2. The combination, with the cylinder E, of the movable head H, arranged and operating substantially as described, to adjust the air-cushion to correspond with the force of recoil.

115,182.—APPARATUS FOR CARBURETING.—George Edmonds, New Orleans, La.

Claim.—1. The basket D, provided with distributing-rings *y*, constructed substantially as and for the purpose specified.

2. In combination, the pump A, bellows B, reservoir C, basket D, and air-chamber M, constructed and connected substantially as and for the purpose specified.

3. The air-chamber M, arranged between the reservoir and the burner, and constructed substantially as and for the purpose specified.

115,183.—FOLDING BOX.—Nicolaus Erpelding and John Erpelding, Chicago, Ill.

Claim.—1. The folding box, consisting of the frame A, having the top, side, and end pieces hinged thereto, with the bottom G secured by a sliding joint to the end pieces, all substantially as described.

2. The inner plate D, arranged to fit within the bottom of the box and hold the side and end pieces in position, substantially as described.

115,184.—THILL-COUPLING.—John H. Fleming, Dundee, Mich.

Claim.—1. A device for securing the shafts or poles to wagons, wherein the jaws A and shaft or pole-iron D are constructed and arranged to operate substantially as set forth.

2. In combination therewith the clamp E, for the purposes set forth.

115,185.—STRIPPER-CARRYING FRAME FOR CARDING-MACHINES. — John F. Foss, Lowell, Mass., assignor to himself and John N. Pierce, same place.

Claim.—1. The stripper-carrying arms E, constructed as described, each with an offset, *g*, a shaft-receiving hub or plate, *f*, and a depending lower portion, I, arranged within the frame-work, whereby the lower cross-bar H can be applied in the manner and for the purpose described.

2. The stripper-carrying arms, constructed as described, in combination with and connected by cross-bars H and G, all constituting a frame-work capable of being traversed or oscillated from one side of the card to the other by a single traversing mechanism, substantially as described.

3. The lower cross-bar H, in combination with and carried by the depending arms I, arranged between the end frames D, for the purpose and in the manner substantially as described.

115,186. — LAND-MEASURING REGISTER.—William Frasius, Chatsworth, Ill.

Claim.—The measure A, provided with pivots B B' and arch C, or its equivalent, in combination with shaft D, the whole arranged to operate substantially as and for the purpose described.

115,187.—ROCK-DRILLING MACHINE.—Gideon Frisbee, Titusville, assignor to himself and Samuel E. Griscom, Shenandoah, Pa.

Claim.—1. The cams or eccentrics E, operating as described.

2. Facing the cams or wedges with diamonds or other hard substances, as and for the purpose described.

115,188.—SAMPLE-BOX FOR CIGARS.—John C. W. Frishmuth, Philadelphia, Pa.

Claim.—A sample-box for cigars, containing two compartments furnished with lids, or with a lid and drawer, all substantially as set forth.

115,189. — VAPOR-BURNER. — Thomas S. Gates and Alexander H. Fritchey, Columbus, Ohio.

Claim.—The application and attachment of the small tube or conductor K, of such different lengths and shapes as may be required to the mixing or gas-chamber B, communicating therewith at any suitable distance beyond the oxygen-holes D, for the purpose of conducting a portion of the oxygenized vapor back to the outer surface of the generating-chamber G for heating purposes.

115,190. — PLATFORM-SCALE.—William P. Goolman, Kansas City, Mo.

Claim.—1. In combination with the system of levers C C, C^1 C^1, C^2, and D, the bearing-connected standards D^4, substantially as set forth.

2. The combination of the diagonal beams B and bearing-blocks B^2 adjustable thereon, substantially as and for the purpose set forth.

3. A lever constructed with a square removable knife-edge, when the latter is secured to the former between two cars, c c^1, one of which is detachable, substantially as and for the purpose set forth.

4. The combination, with a lever, of a knife-edge, C^3, plate c^4, and block c^2, arranged substantially as and for the purpose set forth.

5. The combination of the car L, of the weight and case L^1 thereof, when the latter is pivoted upon the former at one end and constructed with a fixed tooth, l^2, at the other, substantially as and for the purpose set forth.

6. In combination with the car L, constructed with a projection, l^2, and the case L^1, the bell-crank lever L^4, substantially as and for the purpose set forth.

7. In combination with the beam I, the lopsided weight N, when arranged on a horizontal axis secured to the beam so as to operate substantially as set forth.

115,191.—SPINNING-MACHINE.—John Goulding, Worcester, Mass.

Claim.—In combination with the bobbin-frame and bobbins, the sleeve, shoe, or brake M, and the described mechanism for operating it to vary the friction upon the spindle, substantially as described.

115,192.—SCHOOL-DESK AND SEAT.—George H. Grant, Richmond, Ind.

Claim.—1. The combination and arrangement of joint-piece H and bracket F, having recess d and rubber block e, with bolt I and nut i, substantially as and for the purpose set forth.

2. The tongue or tenon E, in combination with the standards A and gained seat-back C, substantially as and for the purpose specified.

115,193.—GAS-BURNING FURNACE.—Jacob Green, Philadelphia, Pa.

Claim.—1. The combination of the air-chambers G G, perforated walls a a', and mixing-chamber, the whole being arranged and applied to a furnace, substantially as set forth.

2. The combination of the above with the steam-chamber E and perforated wall b.

3. The combination of the lower chambers H and I with the upper chambers G G, E, and B, and communicating passages.

115,194. — DEVICE FOR TURNING AND CANTING LOGS.—David S. Griffes, Flint, Mich.

Claim.—1. The construction and arrangement of the rock-shaft E, lifting-cams E', rocker-arm F, hooked rod F', disk I provided with wrist-pin or pins e, and the cranked shaft G, with relation to the shaft H and tilting-levers D, substantially as and for the purpose set forth.

2. The arrangement, with relation to the rocker-arm F, of the shaft J, cam f, and foot-lever g, as and for the purpose set forth.

115,195. — SHOW-CASE. — William Henry Grove, Philadelphia, Pa.

Claim.—A show-case, consisting of strips or moldings for retaining the glass, and of detachable strips, plates, or corner-pieces for connecting the moldings together, substantially as described.

115,196.—DIE FOR FORGING AXLES.—John Harrington, Bridgeport, Conn.

Claim.—The dies B S i n and D m u i e jointly with the breaking-down die A, connected therewith, substantially as described.

115,197.—HEMMER FOR SEWING-MACHINES. Milo Harris, Jamestown, N. Y.

Claim.—The double scroll, provided with the slot f, in combination with the plate c, as and for the purpose specified.

115,198. — PNEUMATIC ENGINE.—John F. Haskins, Fitchburg, Mass.

Claim.—1. In an apparatus for delivering liquids under and by the action thereon of compressed air or gases, the valve-operating mechanism combined and arranged substantially as shown and described.

2. In combination with said mechanism, the intermediate lifters v and w, arranged as specified.

3. The combination of the hollow piston-rod b with the cap d and guide e, as and for the purpose specified.

115,199. — HARVESTER-DROPPER. — Israel Hedges, Radnor, Ohio.

Claim.—1. The spring m, lever G, rods k k' r t, angular lever I, cut-off H, and dropper E, all combined and arranged for joint operation, substantially as and for the purpose set forth.

2. In combination with the above, tripping-lever n, substantially as and for the purpose described.

115,200. — CLOTH-STEAMING APPARATUS.—Luke M. Heery, Hinsdale, Mass.

Claim.—1. The cylinder a, provided with the head b, and combined with the pipes d^1, packings e f, block f, and lever g, as specified.

2. A spiral wrapper for enveloping a cloth-bale while steaming the same, as specified.

115,201. — COMBINED THRASHER, GRAIN-SEPARATOR, AND CLEANER.—George W. Heiges, Franklintown, Pa.

Claim.—The combined thrashing-machine, grain-separator, and fanning-mill herein decribed, when these several devices are constructed as set forth, and are made detachable, and arranged to be operated separately or together, as and for the purpose substantially as specified.

115,202.—BLEACHING RUBBER, GUTTA-PERCHA, &c.—John Helm, Jr., New Brunswick, N. J.

Claim.—The treatment of India rubber, gutta-percha, or other allied gums with chlorine in a liquid form or in solution, substantially as and for the purpose herein described.

115,203. — PRESS FOR FINISHING CLOTH, &c.—Conrad Heubach, Chicago, Ill.

Claim.—A press for finishing cloth, consisting of the frame A with a hollow bottom or bed, D, and hollow follower F, and screw G, the whole constructed and arranged to operate substantially as herein described.

115,204.—PROPULSION OF VESSELS.—Reuben W. Heywood, Baltimore, Md., assignor to himself and Warfield T. Browning, same place.

Claim.—1. The apparatus for throwing the clutch o out of gear, consisting essentially of the cord h, knobs d', staple y, cylindrical block z, sheaves x b', cord w, and sliding arm s, arranged as described.

2. The apparatus for throwing the clutch o into gear, consisting essentially of the block z h', rib g', spring-bar c', sheaves x b', cord w, and sliding arms s, arranged as set forth.

3. The apparatus for stopping the carriage, consisting essentially of the lever k', cord l', standard f, wedge m', arranged as explained.

115,205.—FIRE-KINDLER.—Joseph R. Hice, Salem, Ohio.

Claim.—The combination of the rod or handle B and metallic band C inclosing a fire-kindling compound, all substantially as set forth.

115,206.—METALLIC HEEL FOR BOOTS AND SHOES. — Augustus L. Holbrook, Fremont, Neb.

Claim.—The herein-described metallic heel for boots and shoes, consisting of the shell A having a beveled edge, D, web E provided with a slotted hole, H, and key or rivet I having a broad head, K, all constructed and arranged in relation to each other substantially as described, and for the purpose set forth.

115,207.—VULCANIZING APPARATUS.—Burritt M. Hotchkiss, Naugatuck, Conn., and George M. Allerton, New York, N. Y.

Claim.—A cylinder and piston outside the vulcanizing-chamber, and pipes connecting with a supply of fluid or liquid under pressure, substantially as specified, whereby the power exerted to hold the molds together with a yielding force is independent of the vulcanizing operation, as set forth.

115,208.—STEAM-ENGINE. — John Houpt, Springtown, Pa.

Claim.—In combination with the superheater G, the air-heating and supplying-pipe D, operating to aid in increasing the heat and quantity of the steam in the superheater G, substantially as and for the purpose hereinbefore set forth.

115,209. — PROCESS FOR UTILIZING IMMATURE COTTON-BOLLS. — John Hughes, New Berne, N. C.

Claim.—The process herein described of opening the immature cotton-bolls and preparing the cotton-lobes for ginning, substantially as and by the mechanism specified.

115,210.—SCROLL-SAW.—Hugh H. Humphrey and Henry Bickford, Cincinnati, Ohio, assignors to Henry Bickford.

Claim.—1. The combination of the ways B B', saw C, rolling arms D D', links E E', and suitable springs F to confine the arms to the prescribed path on the ways, substantially as and for the purpose set forth.

2. In combination with the frame A, saw C, arms D D', and links E, the springs F, adapted not only to press the arms against the frame but to give the upward stroke to the saw.

115,211.—BUNG-BORER.—William A. Ives, New Haven, Conn.

Claim.—The herein-described bung-borer, consisting of the pod C provided with a suitable handle, having the cutting-edge d formed by chamfering from the outside in, and constructed with a gimlet-point, a, as herein set forth.

115,212.—VELOCIPEDE.—Bernhard Janson, Effingham, Ill.

Claim.—In a velocipede, the arrangement of two driving-wheels turning on independent axles, worked by power applied through separate and independent levers and pendent treadles, as herein described, for the purpose specified.

115,213.—CULTIVATOR AND WEEDING-MACHINE.—Moses Johnson, Three Rivers, Mich., assignor of one-half his right to John G. Ott, same place.

Claim.—The implement herein described, consisting of the cross-head A, beam B, shanks C, nuts c^1 c^2, blades D, and handles E, when the same are constructed and arranged to operate as and for the purpose set forth.

115,214. — MOLDER'S FLASK.—Edward F. Jones, Foxborough, Mass.

Claim.—A metallic pin-and-socket connection for wooden flasks, composed of the pin a b c of the one part, and the socket-piece g e of the other part, applied to the contiguous faces of the top and bottom frames of the flask, substantially as shown and described.

115,215.—ROACH OR BUG-TRAP.—James M. Keep, New York, N. Y.

Claim.—The hereinbefore-described device, consisting of the box A, B, and D, partially inclosed by means of the gauze C, and provided with the entrance-tube E and food-receptacle G, substantially as and for the purpose specified.

115,216. — FIRE-KINDLER. — Abraham B. King, Camden, Ohio.

Claim.—The combination and arrangement of the oil-can A, provided with the guard-handle D and match-safe B, with the wire C passing through the cover C', and provided with the removable bulb c, substantially as and for the purposes herein shown and described.

115,217.—TURBINE WATER-WHEEL.—John J. Knowlton, Saccarappa, Me.

Claim.—In a water-wheel, substantially such as described, the combination of the curved wings or walls d and the gates i, pivoted at about their centers, and curved with relation to the wings d, as herein shown and set forth.

115,218.—BRICK-MACHINE.—John L. Kucker, Philadelphia, Pa.

Claim.—1. The rocking-beam E and plungers G, in combination with the cam-faced wheel H, arranged and operating substantially as and for the purpose described.

2. The rocking-beam E and fulcrum D, in combination with the perforated shaft B and cam-faced wheel H, the parts being constructed, arranged, and operating as described.

3. The flat springs N and pushers O, secured as shown, in combination with the fingers M, operating in the manner and for the purpose described.

4. The arrangement, with a single shaft, B, of the rocking-beam E, cam-faced wheel H, blades K, and fingers M, to operate as set forth, for the purpose described.

5. The brick-mold herein described, when provided with the sharp cutting-edges e e, beveled outwardly at the top, as shown, for the purpose described.

6. The mold provided with sliding spring bottoms, substantially as and for the purpose described.

115,219.—MACHINE FOR TRIMMING BOOT AND SHOE-HEELS AND SOLE-EDGES.—Richard C. Lambert, Quincy, assignor to himself and John R. Folsom, Stoneham, Mass.

Claim.—1. In combination, a boot or shoe-hold-

ing jack, having forward and backward and semi-rotative movements, a pattern-frame or guide-rail, (extending entirely around the boot or shoe near the sole,) and a non-rotative knife or cutter, having a gauge resting upon the guide-rail, while the entire length of the rail runs under it, and thereby controlling the position of the cutter and the curve or contour of the edge of the sole and the heel trimmed by the cutter, substantially as shown and described.

2. The rotary guide-bar *c* and the jack-carriage sliding upon said bar, arranged and combined substantially as shown and described.

3. The oblong gear or gear-plate fixed to the rear of the carriage, and slotted to permit the shaft to extend through the plate and the plate to ride longitudinally, substantially as shown and described.

4. The auxiliary jack or jack-carriage, adjustably fixed to and sliding upon the main carriage, substantially as shown and described.

5. The cutter-stock, hung by pivots to permit the edge to automatically tip and assume a cutting angle in accordance with the varying curve of the edge of the sole, and also hung by pivots to permit it to tip to cut the requisite inclination or bevel to the heel-edge.

6. The cutter-frame, (composed of the slide to which the cutter-stock is pivoted and the pivoted cross-rod,) the head to which said frame is hung, and the link and lever for raising or pressing down the cutter-frame, combined and arranged substantially as shown and described.

7. The cutter-frame head, hung upon a pivot by which it can be moved laterally, substantially as described.

8. The heel-pattern plate and the mechanism by which said plate is clamped to the boot or shoe-heel, substantially as shown and described.

9. The heel-clamp frame or mechanism hung upon a pivot, which permits it to be swung into or from position, substantially as shown and described.

115,220.—ALLOY OR BRONZE.—George Montefiore Levi, Brussels, and Charles Maurice Künzel, Liege, Belgium, assignors to Charles James Adolph Dick, Philadelphia, Pa.

Claim.—An alloy of copper and tin, with or without other metals, when treated with phosphorus, substantially in the manner described, and when the proportion of phosphorus in respect to the alloy is limited, as set forth.

115,221.—SAFE.—Samuel S. B. Lewis and William H. Sterling, Troy, N. Y.

Claim.—1. A centrally-bisected safe-door, provided on its inner and outer edges with tongues and grooves, and interlocking with corresponding grooves and tongues in the door-jambs, substantially as shown and described, so that neither edge can be moved square out from its seat, as herein set forth.

2. A safe-door, provided on its inner and outer edges with tongues and grooves interlocking with corresponding grooves and tongues in the door-jambs, and bisected vertically through the center, said central division having also interlocking tongues and grooves, substantially as and for the purposes herein set forth.

3. A centrally-bisected concavo-convex door, with corresponding door-frame, on a safe having square sides, where the door and frame are provided with interlocking tongues and grooves, substantially as and for the purposes herein set forth.

115,222.—ANIMAL-TRAP.—Christopher Long, Newark, Ohio.

Claim.—In combination with a spring trap, substantially such as described, a turning spindle, *c*, with a rounded notch or shoulder, *c*, and which spindle serves as a trigger and bait rod, as represented.

115,223.—THRASHING-MACHINE AND SEPARATOR.—Martin H. Mansfield, Ashland, Ohio.

Claim.—1. The vibrative shoe J, constructed with an imperforated step or steps, *o o'*, and screen *q* at its front end, and arranged as shown, in combination with the cylinder *a'*, straw-carrier C, grain-receiving table D, vibrating screen G, fan F, and spout S, substantially in the manner and for the purpose described.

2. The open rotary-screw beaters *t*, in combination with a straw-carrier of a separating-machine, substantially as and for the purpose described.

3. The arrangement of the pitmen *g g'* and double throw-cranks *r r* on the outside of the frame of the machine with suspenders *d d' c' c'*, straw-carrier C, and grain-table D, all in the manner and for the purpose described.

4. The arrangement of the adjustable and removable curtains *b* and adjusting device *b'* upon the end of the fan-case, and in relation to the wheels *B'* of the carriage, all in the manner shown and described.

5. The arrangement of shoe J, constructed as described, in relation to the hulling or thrashing cylinder, discharge-spout, and blast-fan, all substantially in the manner specified and shown.

115,224. — CHECK-REIN SWIVEL. — Arnold P. Mason, Frankliuville, N. Y., assignor to William H. Bard.

Claim.—The loop or check-swivel A and buckle B, constructed, arranged, and operating substantially as and for the purposes herein shown and described.

115,225.—COTTON-BALE TIE.—James R. McClintock, New Orleans, La., for himself and as the legal representative of John Cumberland, deceased, assignee of himself and said Cumberland.

Claim.—The buckle A, provided with a single central opening or slot, B, when the same is used for fastening the ends of metallic bands together around cotton-bales, in the manner substantially as herein described.

115,226. — COTTON-GIN.—Francis M. McMeekin, Morrison's Mills, Fla.

Claim.—The angular-toothed shaker E *b*, constructed as described, and operating in combination with the doffer and teeth or grate on the feed-board of a cotton-gin, substantially as and for the purposes herein set forth.

115,227.—MACHINE FOR SHELLING CORN.—James Miller and Napoleon Dubrul, Joliet, Ill.

Claim.—1. In combination with the hopper D and rag-piece N, the springs N' and O, constructed and arranged substantially as described and shown.

2. The combination and arrangement of the spring O, arm P, and rag-piece N, as and for the purpose herein specified.

3. The combination of the carrier-shell K, constructed with the upper beveled portion *l* and the picker wheel F, both constructed and arranged substantially as described and shown.

4. The combination of the door L, the carrier-shell K, and the picker-wheel F, when said parts are constructed and arranged to operate as described and shown.

5. In a corn-sheller, the cast-iron shaft-beds A''', provided with lower boxes B', constructed, arranged, and secured in place substantially as described and shown.

115,228. — COFFEE-ROASTER.—Richard L. Mills, Springfield, Ohio.

Claim.—1. The corrugated lining or inner cylinder *f*, in combination with the outer casing *f'* of cylinder B, substantially as and for the purpose hereinbefore set forth.

2. The three bearing points for the cylinder, consisting of upright *b*, collar *n*, and post D, substantially as described, for the purpose set forth.

3. Bearing-pin *c*, upright *b*, collar *n*, upright *b'*, and cylinder B, in combination, substantially as and for the purpose hereinbefore set forth.

4. The adjustable furnace mechanism, consisting of the hinged end plates A', outer furnace-plates E, grates C, locking-braces *i*, and rods *i''*, substantially as shown and described, for the purpose set forth.

5. Frame G, in combination with the adjustable furnace mechanism and roasting-cylinder described, substantially as and for the purpose hereinbefore set forth.

6. Gas-pipe *m*, in combination with cylinder B, cover A, end plates A', outer furnace-plates E, and frame G, substantially as described, for the purpose hereinbefore set forth.

115,229.—CORPSE-PRESERVER.—George W. Nash, Columbus, Ohio, assignor to himself and George Jamison, same place.

Claim.—In a corpse-preserver, the open removable ice-chamber F, arranged to surround the head and shoulders of the body and communicate with the chamber A, in combination with the upper open ice-box C, arranged to also communicate with the chamber A at the passages *a a*, as described.

115,230. — PERMUTATION-LOCK. — Jacob Obernesser, Cincinnati, Ohio.

Claim.—1. The lever A and cam A', arranged to operate substantially as described, whereby the dog may be raised and held free from the permutation-wheels while the combination is being changed, as set forth.

2. The operating-cam or arm A', located as described, so that the key that is used to loosen the dials on their hubs shall also serve to operate the cam, and through it the lever that raises the dog, substantially as described.

115,231. — PERMUTATION-LOCK. — Jacob Obernesser, Cincinnati, Ohio, assignor to Charles Diebold and Jacob Kienzle, same place.

Claim.—1. The combination of the yoke A, constructed with slot and tongue S and the lever E, provided with a fly or pin, Z, substantially as and for the purpose set forth.

2. The combination of the yoke A, constructed with slot and tongue S, the lever E, provided with pin Z, eccentric wheel B, and disk C having lug D thereon, substantially as and for the purpose set forth.

115,232.—SCHOOL-DESK.—John Peard, New York, N. Y.

Claim.—1. The flanged reading or book-board F G, attached to the under part of the pivoted desk-board B, substantially as herein shown and described, and for the purposes set forth.

2. A desk, B, pivoted brackets C C, having cheeks *c*, and the circular end *a'* of the frame having recess with shoulders *a² a²* thereon, all combined with reading-board F G, and constructed and arranged as and for the purpose specified.

115,233.—SPINDLE-STEP AND COVER FOR SPINNING-MACHINES.—Oliver Pearl, Lawrence, Mass.

Claim.—The spindle-step, provided with the pocketed projection B, the oil-reservoir *a*, annular space *d*, the perforated lateral bearing C, and the oil-receiving cup or space over the latter, and also having the cover or cap D applied as described to the body of the step, all being constructed and arranged substantially as set forth and represented.

115,234.—WASH-BOILER.—Henry W. Pell, Rome, N. Y.

Claim.—1. The combination of the bottom B, the sides C, apertures *e* in upper part of sides, and the deep channel F extending longitudinally of the bottom, and formed with perforations *f* for the passage of water, all as herein described, for the purpose set forth.

2. The combination of the inner boiler B C F and the double perforated lid D E, constructed and operating as described.

115,235.—EXTENSION BUSTLE.—George V. Pierce, Jersey City, N. J.

Claim.—The bustle, composed of the supporting-stays A A provided with extending ribs *c c*, to which stays the springs B are connected at their ends, and with the upper and lower edges of said stays, by straps, tapes, or flexible braces *e*, and adjustable by the lace *b*, hook and eye *a*, and strings *e*, all arranged substantially as herein shown and described.

115,236.—CAR-COUPLING.—Hiram Plumb, Philadelphia, Pa., assignor to William A. Drown, Jr., and Edward Evans, same place.

Claim.—A coupling consisting of two heads, A A', each of which has a recess with a flaring mouth, a horizontal pin, *h*, operated by a lever, E, hung to the head, and a vertical pin, to which is hung a link, D, having a beveled outer end and a hooked projection beneath the same, all as described.

115,237.—HEAD-BLOCK. — Hiram M. Popple, Warren, Pa.

Claim.—1. In combination with the hollow knee B, the slotted dog C, arranged within the walls of the knee, and operated by the lever C' and link *c¹*, as described.

2. The shaft G, provided with the spiral row of studs *g*, in combination with the knee B, as set forth.

3. The combination of shafts G H, gears *g h*, and hand-wheel H', substantially as described.

4. The crank-wheel E¹, provided with shoulders *e e¹*, in combination with pawls E, shaft E², and stop *e²*, when these parts are constructed and arranged for joint operation, as described.

115,238.—DEVICE FOR ATTACHING NAPKINS TO THE PERSON. — Philip H. Raiford, Houston, Texas.

Claim.—The flexible metallic or gutta-percha band B, slitted transversely, and having a napkin attached thereto in any suitable manner, capable of being distended so as to slide over and encompass the neck, whereby the napkin is retained in proper position over the bosom of the user, as herein shown and described.

115,239. — PRIVY. — Frank Riedel, San Francisco, Cal.

Claim.—1. The combination of the seat, rods, straps D, and projection C, as described.

2. In combination with the weight F having an opening, G, and cushioned end, the jointed arm H attached to the door, as described, and for the purpose set forth.

115,240. — GRAIN-DRIER. — Alfred Robert, Paris, France.

Claim.—1. A drying apparatus, consisting mainly of a perforated or gauze casing A, containing a number of heating-tubes, B, and a perforated or gauze ventilating-pipe, D, the whole being constructed, arranged, and operating so that the air shall traverse the body of grain transversely, substantially as described.

2. The combination, substantially as herein set forth, of chambers E and E' with the heating-tubes B.

3. The combination and arrangement, substantially as herein described, of the heating-tubes B, chamber E', pipe *g'*, flue F, and ventilating-tube D.

115,241.—DEVICE FOR ATTACHING BOOMS TO MASTS.—Ezekiel Rogers, Waterford, assignor to himself and H. A. Brown, New London, Conn.

Claim.—1. The semicircular shackle D, provided

with projecting studs *d* for connecting with the jaws of the boom, and the binding-strap E, the two being connected substantially as described, for the purposes specified.

2. The improved gaff jaw herein described, consisting of the jaws *c* and *c'*, and the semicircular shackle D, the two being permanently connected by means of the studs *d*, substantially as described

115,242. — CAR-COUPLING. — John Royal, Moses A. Lontz, and Jeremiah M. Deibert, La Fayette, Ind.

Claim.—The combination of the bumper A, partition B, pins C C', slide D, arm *b*, lever E, spring *d*, and rack G, all constructed and arranged to operate substantially as and for the purposes herein set forth.

115,243, antedated May 11, 1871.—PREPARING AND TREATING IRON ORES IN THE MANUFACTURE OF STEEL.—Edward L. Seymour, New York, N. Y.

Claim.—Preparing or producing the granulated or powder-like material, as described, for the making of iron and steel, by the process or series of operations set forth, namely, taking iron ore in a granulated or pulverized state, subjecting it to a high heat in the manner and to the extent described, and then suddenly and intimately admixing it with pulverized carbon, as set forth, and for the purposes and with the results set forth, and then separating the pure metallic iron powder from the waste remainder of the disintegrated ore, as explained.

115,244.—DUMPING-WAGON.—Jacob Skeen, Mound City, Ill.

Claim.—1. In combination with the side pieces A of a wagon, the yoke-bar C, constructed and arranged substantially as described and shown.

2. The means employed for supporting and giving elasticity of motion to a wagon-body, consisting of the spring-bar F and India-rubber springs H, the spring-bar and springs being constructed, arranged, and operated substantially as described and shown.

3. The fifth-wheel M and N, constructed and arranged substantially as described and shown.

4. The hollow spindles J, provided with flanges *l*, *m*, and *n*, in connection with a wagon-hub, when said spindles are constructed and arranged substantially as described and shown.

5. The boxes K and K', in connection with the spindles J, substantially as described and shown.

6. The dumping-wagon described and shown as a complete whole, constructed, arranged, and operating substantially as set forth.

115,245. — FIFTH-WHEEL. — Jacob Skeen, Mound City, Ill.

Claim.—1. The ring B, provided with arms C and shackle-bars D cast in one piece, constructed and arranged substantially as described and shown.

2. The ring I, provided with yokes K, constructed and arranged substantially as described and shown.

3. In combination with the ring B, the truss-rod H, constructed and arranged substantially as described and shown.

115,246.—FIFTH-WHEEL AND ATTACHMENT. Jacob Skeen, Mound City, Ill.

Claim.—1. In fifth-wheels, the combination of globular bearing surfaces, constructed and arranged substantially as described and shown.

2. In combination with a fifth-wheel, and forming a part of the same, the arms D' and E, constructed and arranged substantially as described and shown.

3. The combination of the fifth-wheel C, constructed as described, and the side springs F, constructed, attached, and arranged substantially as set forth.

4. The combination of the side springs F and the India-rubber spring K, constructed, arranged, and operated substantially as described and shown.

5. The bounds M, cast in one piece, constructed and arranged substantially as described and shown.

6. The combination of the bounds M and the fifth-wheel C, when both are constructed and arranged substantially as described and shown.

7. The combination of the hook O, the bounds M, and the fifth-wheel C, for the purpose of converting a flexible tongue to a stiff tongue, constructed and arranged substantially as described and shown.

115,247.—LUBRICATOR FOR MACHINERY.—George E. Smith, Fitchburg, Mass.

Claim.—1. The tube or passage A leading from or about the top of the oil-cup, and communicating with the space in the neck or shank of the same, arranged and operating substantially as described.

2. The oil-cup, provided with the longitudinal passage A, with its two openings, as described, in combination with the porous substance *f*, when the same are constructed and arranged to operate together, as and for the purpose set forth.

115,248. — PULLEY-BLOCK.—Henry Smith, Providence, R. I., assignor of one-half his right to Fred. R. Gibbs, same place.

Claim.—1. The lubricating-chamber E within the wheel, surrounding the sleeve, and provided with the supply-duct *g* and the discharge-duct *f*, the latter being so located with reference to the interior ends of the lubricating-chamber that oil can only be discharged by the attraction of the fibrous absorbent, substantially as shown and described.

2. The combination of the bearings C and C', the sheave, and the loose axle D, the whole being so arranged that the sheave is free to revolve on the axle and the axle free to turn in its bearings, substantially as shown and described.

3. The combination of the block with the bearings C and C', the sheave, the loose axle, and the removable end plate *e* so arranged that the axle and sheave may be freely removed from the block, substantially as described.

4. The improved pulley-block with its sheave, provided with a lubricating-chamber, and loosely mounted upon an axle or shaft, which in turn is free to revolve in bearings provided therefor in the walls of the block, all substantially as described.

115,249.—LOCK-NUT.—Loyst J. Smith, New York, N. Y., assignor to himself and Henry D. Blake, same place.

Claim.—1. The metallic washer, made as a segment of a cylinder, with the spring tongue upon one side thereof, to hold the nut in the manner specified.

2. The spring tongue *h*, with the outer end turned back to take a bearing so as to support the tongue at both ends, as and for the purposes specified.

115,250.—TOWEL-RACK.—Peter A. Snyder, Jersey City, N. J.

Claim.—The hereinbefore-described towel-rack, consisting of the disk C, secured to or upon a suitable standard, and provided with the openings E, and combined with the bars F G, constructed as and for the purpose shown.

115,251.—FLUTING-MACHINE.—Henry Sommer and Charles Bauer, Newark, N. J.

Claim.—The arrangement of the frame C, cam-lever *b*, upper roller *a* with the hinged supporting-frame D, constructed and operating as herein shown and described.

115,252.—TRAP-BALL.—Charles F. Spencer, Cleveland, Ohio.

Claim.—As a new article of manufacture, a skeleton metallic trap-ball, formed from a series of thin wires or bars, their ends being united together by means of the grooved eyelets or heads B, substantially as and for the purpose set forth.

115,253.—BUNG-CUTTER.—Adolf Wilhelm Cristian Sternberg, Davenport, Iowa.

Claim.—The combination of the sliding socket F with the pin *e'*, adapted to lift the shaft E within the stationary shaft B, as described.

2. The slotted face-plate a^3, pivoted at a^3, combined with and constructed to adjust the cutter D, substantially as described.

115,254.—ROTARY PUMP.—Hanson P. Tenant, East Germantown, Ind., assignor to himself, Jacob Spence, and Henry M. Sowers, same place.

Claim.—A rotary pump consisting of the grooved plates S fitting into the cam-groove K, shell A, cylinder B, abutments C D, radially-slotted disk H, and pistons I I provided with packing, compressible by means of plate R, and adjusting-screws *r r*, all constructed, arranged, and operated in the manner and for the purpose set forth.

115,255.—FAN ATTACHMENT FOR SEWING-MACHINES.—George Thompson, Springfield, Ill.

Claim.—1. In combination with the treadle G and supporting-rod I, the pivoted levers L and O, the fan M, and the connecting-rods N and Q, substantially as and for the purpose specified.

2. In combination with the driving-wheel E and supporting-rod I, the gear-wheel W, the pivoted levers R and O, the pivoted sleeve T provided with the arms *t* and *t'*, the connecting-rods U and V, and the pinion S provided with the crank *s*, substantially as shown, and for the purpose described.

115,256. — EARTH-CLOSET. — Charles A. Wakefield, Pittsfield, Mass.

Claim.—1. The combination, with the hopper A, of the pendent swinging hopper-bottom F, provided with a charging-chamber *e*, having a valve or flap-bottom for operation as shown and described.

2. The fingered sprinkling-chute G, constructed and arranged for operation in relation with the earth-hopper and soil-pit or chamber, delivering the earth between and beyond their ends, essentially as shown and described.

115,257.—HANDLE FOR SHOEMAKER'S TOOL. Charles G. Wegner, Philadelphia, Pa.

Claim.—As an article of manufacture, a handle for shoemakers' tools, constructed of the metal handle A and wooden bushing B, combined and operating together, substantially as and for the purpose described.

115,258. — REVOLVING FIRE-ARM. — Eli Whitney, New Haven, Conn.

Claim.—In combination with the spindle B, constructed with the notches *i* or *s*, one or both, and arranged in the frame as described, the notched slide *a* arranged and operating, as specified, to lock and secure the spindle.

115,259, antedated May 20, 1871.—BLOWING-MACHINE.—James M. Williams, Connersville, Ind.

Claim.—1. The cylinder-head herein described, composed of the perforated flat-plate B and the perforated concavo-convex plate B', arranged substantially as and for the purposes set forth.

2. In combination with the head B B', the valve E, playing upon the piston-rod C, substantially as and for the purposes herein set forth.

3. The combination of the cylinder A, double heads B B', rod C, piston-head D, valves E, chute G with openings *a a* and partition *d*, and the air-chest H with double-pivoted valve *b*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

115,260.—SASH-HOLDER. — Byron Wilmot, Montana, Iowa., assignor to himself and J. K. Gulihur, same place.

Claim.—The sleeve I, constructed as described, and combined with the slide R, rod F, and plate *k*, as and for the purpose set forth.

115,261.—CAR-TRUCK. — Reuben Winslow, Lock Haven, Pa., assignor to himself and Reuben Winslow Petrikan, same place.

Claim.—A car-axle, having the car or truck-frame suspended upon it in such a manner as to enable the axle-boxes to vibrate fore and aft, substantially as specified.

115,262, antedated May 11, 1871.—LAMP.—Frederick Yeiser and Stephen William Hedger, Lancaster, Ky.; said Hedger assignor to said Yeiser.

Claim.—The globe B and chamber D filled with cotton or other porous substance, in combination with the long tube A and wick-tube *c*, when the space between the two is filled with asbestus or other good non-conductor of heat, when each and all are constructed and arranged substantially as described, and for the purposes set forth.

115,263. — WASHING-MACHINE. — Theodore Tebow, Lexington, Ky.

Claim.—1. The box, composed of the body A, side pieces A', the copper bottom a^3, the pieces *c* c^1, and the screw-bolts *w* with their nuts, in combination with the furnace K having the grate M and ash-box L, when each is constructed and all are arranged substantially as and for the purpose described.

2. The rollers *b*, arranged and revolving in their frame B, in combination with the rubber C, fluted and perforated, as described, suspended and operated upon the uprights D D, the shaft E, the sliding rods T having the heads U U, and the adjustable-handle lever H, when each is constructed and all are arranged and operated substantially as and for the purpose described.

3. The treadle Q Q *q*, cord R, pulleys S and S', sliding rods T T, springs V V, when in combination with rubber C, shaft E, and adjustable-handle lever H, when each is constructed and all are arranged and operated substantially as and for the purpose described.

REISSUES.

4,388.—MACHINE FOR HUSKING CORN.—L. Augustus Aspinwall, Albany, N. Y.—Patent No. 101,809, dated April 12, 1870; reissue No. 4,099, dated August 16, 1870; reissue No. 4,174, dated November 8, 1870.

Claim.—1. A pair of husking-rollers with a depression or depressions in the surface of one or both, formed substantially as set forth, and which alternately pull the husk and then let go the same before the depressed portion of the roller impinges on the ear, substantially as set forth.

2. In combination with the rolls R R, constructed substantially as described, the double gears L L, as and for the purposes set forth.

3. The teeth P, introduced in the husking-roller R at the depressed portion of its surface, as and for the purposes set forth.

4. The knives or cutters M, applied to and combined with the husking-rollers R R, constructed as described, and for the purposes set forth.

5. The method of husking corn by means of rollers constructed and operating substantially as described, which pull upon and let go the husks alternately during their revolution, in the manner and for the purpose specified.

4,389.—BOLT FOR SAFES.—George L. Damon, Cambridge, Mass. — Patent No. 102,780, dated May 10, 1870.

Claim.—1. The shaft B, provided with the sleeve H and the wheel D, when arranged to operate the bolts G, as described, for the purpose specified.

2. The combination of the pinion-wheel D, sleeve H, and pivoted slotted lever K, substantially as and for the purpose described.

4,390.—TURNING-LATHE.—Luther R. Faught, Philadelphia, Pa.—Patent No. 60,163, dated December 4, 1866.

Claim.—The combination, with the spindle, of the stock, the split screwed clamping-sleeve embracing the spindle, and the nut embracing the sleeve, these parts being constructed and arranged to operate in combination, substantially as hereinbefore set forth, to keep the spindle in its true axial position, and to compensate for the wear of the spindle and sleeve, as described.

4,391. — Division A.—SCREW-PROPELLER FOR WATER-METERS. — National Meter Company, New York, N. Y., assignee of Henry F. Read.—Patent No. 92,884, dated July 20, 1869.

Claim.—1. A screw-propeller for liquid-meters, made in a metallic mold, essentially as described.

2. A screw-propeller for liquid-meters, having its body, spiral vanes or wings E, and interior screw-threads cast at one and the same operation, essentially as described.

3. A hard rubber screw-propeller for liquid-meters, as described, as a new article of manufacture.

4,392.—Division B.—MOLDING PROPELLERS FOR WATER-METERS. — National Meter Company, New York, N. Y., assignee of Henry F. Read.—Patent No. 92,884, dated July 20, 1869.

Claim.—1. The hollow cylindrical metallic mold for screw-propellers of liquid-meters having spiral openings E′ E′, when formed either by spiral segments G G, or in one piece, substantially as described.

2. The collars J and J′, in combination with the spiral segments G G and the screws *f f*, whereby said parts are securely fastened in position, constructed substantially as and for the purpose described.

3. The openings E′ E′, between the segments in which the wings of the propeller are molded, when constructed substantially as and for the purpose described.

4. The cap H, holding the body of the mold, and securely covering the several spiral segments and openings, constructed substantially as and for the purpose described.

5. The mold for casting spiral propellers, provided with spiral openings E′ E′, having a pitch from one end of the mold to the other, so that the casting may be drawn from the mold by being turned upon this spiral pitch, substantially as described.

6. The caps A and A′, in combination with the plungers K and K′, for holding the mandrel and shaft in position and forcing the material to be molded into every part of the mold, constructed and arranged substantially as described.

7. The steel mandrel I with its male screw-thread, upon which is formed the female screw *p′* in the body of the propeller, in combination with the plungers K K′, and collars J J′, as set forth.

4,393. — KITCHEN-BOILER. — William B. Scaife, Pittsburg, Pa.—Design No. 4,224, dated July 12, 1870.

Claim.—The design for a kitchen-boiler herein described, substantially as shown in the accompanying drawing.

4,394.—MANUFACTURE OF BAYONETS, AND APPARATUS THEREFOR. — Hervey Waters, Boston, Mass.—Patent No. 47,590, dated May 2, 1865.

Claim.—1. The improvement in the manufacture of bayonets, substantially as described.

2. A system of grooves for drawing and shaping, substantially as and for the purpose specified.

4,395.—HARVESTER-RAKE.—John C. Durborow, Ellicott City, Md.—Patent No. 78,654, dated June 9, 1868.

Claim.—The inclined shaft C, provided with the fixed gear-wheel B, in combination with the revolving gear-wheel E and inclined rake and reel-arms constructed and operating in the manner and for the purpose set forth.

4,396.—AUTOMATIC REGULATING-VALVE.—Birdsill Holly, Lockport, N. Y.—Patent No. 94,748, dated September 14, 1869.

Claim.—1. The shell or case A, constructed with a diaphragm, P, and provided with a spring-box B, in combination with the flexible diaphragm J, a valve, G, and a connecting-stem, *g*, substantially as described.

2. The diaphragm J and valve G, connected together by a stem, *g*, and joint *i*, substantially as described.

3. The adjusting-screw *c*, spring C, diaphragm J, partition P, and valve G, constructed and combined, substantially as described.

4,397.—PROCESS AND APPARATUS FOR PURIFYING PARAFFINE AND OTHER SUBSTANCES. — Frederick Lambe, London, England.—Patent No. 102,135, dated April 19, 1870; patented in England, December 4, 1868.

Claim.—1. The mode of treating and purifying paraffine, as above described.

2. The revolving blades or beaters, and perforated periphery A, in combination with the case D, arranged and operating substantially as and for the purpose set forth.

3. In combination with a centrifugal extractor A A, the employment of a close cistern or jacket D, as described, whereby such apparatus is adapted for use in washing and drying crystals of paraffine or other substances or materials which have been treated with hydrocarbon or volatile solvents, substantially as set forth.

4,398.—IRON BRIDGE.—David H. Morrison, Dayton, Ohio.—Patent No. 70,245, dated October 29, 1867.

Claim.—1. The construction of the arch or top chord of a bridge by the use of the iron T-beam, when arranged therein with its double flanges in vertical planes, substantially as described, for the purpose specified.

2. The universal washer B *f*, constructed and applied in the manner and for the purpose specified.

3. The combination and arrangement of the arch beams C, arch joint plates *g*, and universal washer B *f*, when constructed, connected, and operating conjointly in the manner substantially as and for the purpose specified.

DESIGNS.

4,916.—PLATES OF A STOVE.—Jacob Beesley and Josiah J. Ferris, Philadelphia, Pa., assignors to Charles Noble & Co., same place.

Claim.—1. The design for the base-relief figures *i* on the said cap of a stove, as shown.

2. The design for the profile or contour *k l* M N *o* of the illuminating-chamber of a stove, as shown.

3. The design for the base-relief figures *p p′ p″* on the illuminating-chamber, as shown.

4. The design for the contour and ornamentations *r s t* of the legs of a stove, as shown.

5. The design for the contour *u v*, and the ornamental figures and monogram *w*, on the covering hood X of a stove, as shown.

4,917.—CARPET-PATTERN.—Jonathan Crabtree, Philadelphia, Pa.

Claim.—The design for a carpet, as shown.

4,918.—CARPET-PATTERN.—Jonathan Crabtree, Philadelphia, Pa.

Claim.—The design for a carpet, as shown.

4,919.—MEDAL.—Samuel L. Denney, Christiana, Pa.

Claim.—The design for a medal, as shown.

4,920. — CARPET-PATTERN.—John Fisher, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,921.—ORNAMENTATION OF THE BOTTOMS OF DRINKING-GLASSES.—George B. Fowle, Cambridge, Mass.

Claim.—The design for the ornamentation of the bottom of a drinking-vessel, substantially as described and shown.

4,922.—CHAIN-PUMP.—Henry L. Fry, Cincinnati, Ohio, assignor to James L. Haven & Co., same place.

Claim.—The design for a chain-pump curb, as shown.

4,923.—GLOVE.—William B. Green, Mayfield, N. Y.

Claim.—The design for a glove-pattern, A, as shown.

4,924.—HOUSING-PLATE.—James L. Haven, Cincinnati, Ohio.

Claim.—The design for a housing-plate, as shown.

4,925.—CARPET-PATTERN.—Hugh S. Kerr, Philadelphia, Pa., assignor to Israel Foster, same place.

Claim.—1. The design for the tablets A, substantially as shown and described.

2. The design for the tablets A′, as described and represented.

3. The design for the tablets B, as shown and described.

4. The design for the whole pattern, including the tablets A A′, and B, figures *j*, and ornamented space *e*.

4,926.—CARPET-PATTERN.—Hugh S. Kerr, Philadelphia, Pa., assignor to Israel Foster, same place.

Claim.—1. The design for the border A of the carpet, substantially as shown and described.

2. The design for the body of the carpet, substantially as described and represented.

3. The design for the whole pattern, including the border A and body B.

4,927.—FLOOR OIL-CLOTH PATTERN.—Victor E. Meyer, Lansingburg, N. Y., assignor to Samuel W. Dunn, Salem, N. J.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, herein set forth.

4,928.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,929.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,930.—CUPBOARD-LATCH.—Joseph Ottner, New Britain, assignor to Hart Manufacturing Company, Kensington, Conn.

Claim. — The design for a cupboard-catch, as shown and described.

4,931. — FLOOR OIL-CLOTH PATTERN.—Charles L. Pierpont, Salem, N. J., assignor to Samuel W. Dunn, same place.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, herein set forth.

4,932. — FLOOR OIL-CLOTH PATTERN.—Charles L. Pierpont, Salem, N. J., assignor to Samuel W. Dunn, same place.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, herein set forth.

4,933.—CAP FOR TRUNK-HANDLES.—Thomas L. Rivers, Newark, N. J.

Claim.—The design for caps for trunk-handles, as shown and described.

4,934.—LAMP-SHADE.—James B. Russell, Wheeling, W. Va.

Claim.—The design for a lamp-shade, having an urn-shaped body, B C, and scalloped crown D, as shown and described.

4,935.—BUNDLE OF KINDLING-WOOD.—Joseph L. Seymour, Washington, D. C.

Claim.—The design for a bundle of kindling-wood, as shown.

4,936.—STREET-LAMP.—Thomas D. Stetson, New York, N. Y., assignor to the Heath & Smith Manufacturing Company, Portland, Conn.

Claim.—The improved design for street-lamps, as shown in the figure.

4,937.—PAPER BAG.—Samuel Winter Valentine, Bristol, Conn.

Claim.—The design for a paper bag, as shown, and folded on the line *a*, substantially as described.

4,938. — DRAWER. — Hiram P. Wetmore, Elizabeth, N. J.

Claim.—The design for drawers, as shown and described.

4,939.—CLOCK-FRONT.—John H. Bellamy, Charlestown, Mass., assignor to Elbridge Walcott and Jonas C. Young.

Claim.—The design for a clock-front, as shown, described, and set forth.

4,940. — REFRIGERATIVE BUCKET. — John Liming, Philadelphia, Pa., assignor to himself and Charles C. Savery, same place.

Claim.—The design for a refrigerative bucket, substantially as described and shown.

4,941.—BROILER.—James T. Page, Rochester, N. Y.

Claim.—The design for a broiler, as herein shown and described.

TRADE-MARKS.

266. — LUBRICATING-OIL. — Frederick M. Backus, Cleveland, Ohio.

267.—PREPARATION FOR THE HAIR.—George C. Barclay, New York, N. Y.

268.—Beer.—Benjamin Bates, Baltimore, Md.

269.—Machinery.—John Cooper, Mount Vernon, Ohio.

270.—Gentlemen's Furnishing Goods.—Fisk, Clark & Flagg, New York, N. Y.

271.—Gentlemen's Furnishing Goods.—Fisk, Clark & Flagg, New York, N. Y.

272.—Leaf-Tobacco.—Simon Hernsheim, New Orleans, La.

273.—Shirts.—Hutchinson & Thomas, Baltimore, Md.

274.—Tobacco.—W. S. Kimball & Co., Rochester, N. Y.

275.—Whisky and Bitters.—A. K. Lewis & Co., Covington, Ky.

276.—Fruit-Jar.—Mason Manufacturing Company, New York, N. Y.

277.—Horse-Nail.—Northwestern Horse-Nail Company, Chicago, Ill.

278.—Cooking-Stove.—Perry & Co., Albany, N. Y.

279.—Smoking and Chewing-Tobacco.—Edwin T. Pilkinton, Richmond, Va.

280.—Medicine.—Griffin Reno, Titusville, Pa.

281.—Paper.—Rock River Paper Company, Beloit, Wis.

282.—Burning-Fluid.—Buckley A. Rose, Urbana, Ohio.

283.—Vinegar and Cider.—Rowe, Graves & Co., Chicago, Ill.

284.—Frying-Pan.—Samuel Smith, New York, N. Y.

285.—Preserved Fish.—The American Club Fish Company, New York, N. Y.

286.—Tea.—The Fusiyama Tea-Importing Company, Pittsburg, Pa.

287.—Stove.—The Scranton Stove and Manufacturing Company, Scranton, Pa.

288.—Boots and Shoes.—Joseph H. Walker, Worcester, Mass.

289.—Leather.—Walker, Oakley & Co., Chicago, Ill.

EXTENSIONS.

William A. Royce, of Newburg, N. Y.—Letters Patent No. 17,394, dated May 26, 1857.

"Improved Machinery for Compressing Gaseous Bodies."

Claim.—The above-described apparatus for compressing or packing gaseous mediums, substantially as described and shown in the drawings.

Evelyn F. French, of New York, N. Y.—Letters Patent No. 17,269, dated May 12, 1857.

"Improvement in Corn-Huskers."

Claim.—The combination of the endless aprons D D E and rollers G G, two or more, covered with India rubber or other elastic material, the above parts being arranged and operating as shown and described, for the purpose specified.

John C. Gould, of Oxford, N. J.—Letters Patent No. 17,273, dated May 12, 1857; reissue No. 2,301, dated July 10, 1866.

"Improvement in Nail-Plate Feeding-Machines."

Claim.—1. The feed or nipper-rod Z, and the feeding device S S', in combination with the rod T and nose-piece U, as and for the purpose specified.

2. Fixing the bar F^2, on which the rack F^3 is formed, upon a shaft, Y, journaled within and supported by a vibrating box or bearing L, substantially as and for the purpose set forth.

3. Supporting the nose-piece and feeding devices upon a hinged or pivoted shaft M, to adapt them to be turned back to render the cutters accessible, as described.

4. Connecting the nose-piece with the driving-shaft, by means of the two rods V V', adapted to be disconnected, as described, to admit of the turning back of the nose-piece.

5. The combination of the rock-shaft G, vibrating box L^1, rock-shaft Y, bar F^3, cogged rim D, and nose-piece U, substantially as and for the purpose specified.

Asa Johnson, of Brooklyn, N. Y.—Letters Patent No. 17,331, dated May 19, 1857.

"Improved Mode of Fastening Sheet-Metal on Roofs, &c."

Claim.—The self-adjusting fastener, as described, for the purpose of attaching metallic coverings to buildings, and accommodating itself to the contraction and expansion of the metal, and for fastening metals in any and all other places where the contraction and expansion demand accommodation, substantially as set forth, or any mechanical device equivalent thereto.

Eugene L. Norton, of Charlestown, Mass. Letters Patent No. 17,445, dated June 2, 1857.

"Improved Process of Manufacturing Leather Shoe-Binding."

Claim.—The improved process herein described of manufacturing shoe-binding by dividing the skin or sheet of leather into strips of equal width, joining them at their ends so as to connect them into one long strip, and coloring the same when so formed, the whole being formed of or reduced to a uniform thickness, and the fleshy or surplus portions of the leather removed by splitting or otherwise.

John S. Hall, of Pittsburg, Pa.—Letters Patent No. 17,430, dated June 2, 1857.

"Improvement in Plows."

Claim.—Vibrating the beam in a circular bearing in the land-side, together with the oblique adjusting and securing slots i i, the whole combined and arranged substantially as described, whereby the draft end of the beam may be vertically adjusted, and the beam so secured to the land-side as that it is impossible for the former to slip.

ISSUE OF MAY 30.

PATENTS.

115,264, antedated May 19, 1871.—Machine for Winding Bobbins.—Judson Adams and Warren A. Tolman, Richmond, Ind.

Claim.—1. The combination, with the driving-shaft H, the arm X, and the faller-guide, of the arm G and frame I, pivoted on the said shaft, and the cams K and P mounted on the said frame, and geared together and with the shaft, in the manner substantially as specified.

2. The combination, with the faller-guide, moving arm G, and its operating mechanism, of the lever Z, cam Y, and its slide bar Z^1, all arranged for operation, substantially as specified.

115,265.—Fire-Place Fender.—Charles C. Algeo, Pittsburg, Pa.

Claim.—The attachment of the casters to the fender A by the screw-threaded shanks extending up through the ears, and the nuts screwed on the shanks above the ears, all substantially as specified.

115,266.—Railroad-Car Starter.—Arthur Amory, New York, N. Y.

Claim.—1. The arrangement, with the axle K and spring A, of the sliding wheel L, lever O, brake-lever S, the idler-wheel M, pinion N, gear-wheels G H, wheel F, drum E, and cord D, as shown and described.

2. The combination, with the shifting-lever U, of the bell-cranked lever V, pivoted foot-piece W, spring Z, and the notched guide X, all substantially as specified.

115,267.—Machine for Making Wrought Nails.—Daniel Armstrong, Chicago, Ill.

Claim.—1. The combination, with shaft D and hammer *m*, of the connected arch and bearings E *d d'* and mechanism to automatically and at regular intervals elevate and depress one of said bearings, and with it one end of said shaft, in the manner substantially and for the purpose specified.

2. The arch E provided with the bearings *d d'*, in combination with the shaft D provided with hammer *m*, connecting-rod F, lever G, and cam H of shaft B, substantially as and for the purpose described.

3. The gripers 1 and 2, arranged to operate alternately to and from the dies, in combination with rock-shafts N N', arms O O', levers R R', connecting-rods *r r'*, arms S S', rock-shafts T T', springs V V', connecting-rod W, arms *u u'* and *s s'*, and cams P P' of shaft B, substantially as and for the purpose described.

115,268.—Platform Weighing-Scale.—Sylvester C. Baker, Altoona, and Joseph Root and Emerson J. Case, York, Pa.

Claim.—1. The combination, with the graduated scale-beam J, locked case A B *s'*, and beam H, or their equivalents, of the shelved bail or support E, independently-adjustable weights G G^1, and independently-adjustable levers J^1 J^2, substantially as and for the purpose described.

2. The standard G^x, with the weight-carrying levers J^2 attached to it, combined with the weighing apparatus herein described.

115,269.—Hand-Stereoscope.—Alexander Beckers, New York, N. Y.

Claim.—1. The lenses made movable in relation to the surrounding hood, and connected with the picture so as to be adjusted simultaneously with the picture, substantially as and for the purposes set forth.

2. The lever *n*, applied between the hood and picture-holder, and connected with the separator and with the head carrying the lens, substantially as set forth, so as to give to the moving parts the proper position relative to the picture as the latter is adjusted, as set forth.

115,270.—Hot-Air Furnace.—James M. Blackman, Decorah, Iowa.

Claim.—The hot-air furnace composed of the fire-chamber A, smoke-chambers B and D, domes C and E, and provided with the air-tubes *g*, and perforated flange *j*, substantially as herein shown and described.

115,271.—Scroll for Operating the Carriages of Spinning-Mules.—William Bond, Windsorville, Conn.

Claim.—A variable scroll-wheel, constructed substantially as herein described, for operating the carriages of spinning machinery, substantially in the manner specified.

115,272.—Washing-Machine.—Nathan Booth, Cheshire, Conn.

Claim.—1. The combination of the fluted roller D and the sponge-roller C, substantially as specified.

2. The combination, with the sponge-roller, of the cords or straps H, substantially as specified.

3. The slots F, between the ribs and the surface of the roller D, in combination with the roller C, substantially as specified.

115,273.—Clamp for Thill-Couplings.—William Boyd, Hartford, N. Y.

Claim.—The combination of the lever A *a'*, crosshead B, stationary claw C, adjustable claw D, slotted bar E, and bolt F, with each other, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

115,274.—Machine for Converting Wood or other Fibrous Material into Pulp.—James Bridge, Augusta, Me.

Claim.—1. The combination of the stationary stone A and its rim B and sleeve C with the rotary wheel, provided with the inclined buckets K L, or such, and double-inclined plates M N, or the latter only, all being arranged and combined substantially in manner and to operate as described.

2. The wheel as made of the two rims, the single buckets or inclined plates, and the double inclined plates, all arranged and applied to a shaft, as set forth.

3. The arrangement and combination of the water-induct with the sleeve C, the stone A, and its rim B furnished with an educt, all being as described.

4. The stone as provided with the rim and the sleeve, as set forth.

5. The combination of one or more wooden slides, as described, with the inclined plate, bucket, and wheel combined, and to operate with the stationary stone, as described, for the purpose of reducing to paper-pulp yielding or soft as well as solid substances.

6. The combination of buckets or plates and slides, each assisting the other in disintegrating soft and yielding substances, including cotton rags, straw, and partly-disintegrated wood shavings, &c.

115,275.—Vise.—Harvey V. Brown, Warren, Ill.

Claim.—The anvil A, provided with the dovetailed groove, the stand J, and with the recess H, jointly with the vise C D, screw F, and nut G, substantially as shown and described.

115,276.—Washing-Machine.—John Brown, West Manchester, Ohio.

Claim.—1. The combination of the two pivoted beaters J J, connection-bars L, equal-armed levers M, connecting-rod P, and pivoted lever Q, with each other, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

2. The arrangement of the standards F, cross-bars H, cross-bar I, and disks O, with each other

and with the side bars E and tub A, for supporting the operating mechanism of the machine, substantially as herein shown and described.

3. The two beaters J J, pivoted at their upper ends, and arranged to move together toward and from each other, for washing clothes, substantially as herein shown and described, and for the purpose set forth.

115,277.—GLOVE.—Remus D. Burr, Kingsborough, N. Y.

Claim.—1. The palm or front piece A, having the tongue B and recess C, in combination with the thumb-piece E D F, the said parts being cut and united as and for the purpose specified.

2. The thumb-piece D, cut with the tongues E and F.

3. As an article of manufacture, a glove made up of the front piece A having the recess C and tongue B, back-piece H having the offset H', thumb-piece D having the tongues E and F, gore I, and wrist-piece K.

115,278.—MANUFACTURE OF ARTICLES OF ENAMELED METALS. — George A. Burrough, Providence, R. I.

Claim.—Articles of metal coated with an enameling compound, substantially as described, and developing such compound by heat, as herein set forth, and for the purposes specified.

115,279.—CONVERTER FOR THE MANUFACTURE OF BESSEMER STEEL.—Henry Chisholm, Cleveland, Ohio.

Claim. — The two sections, so arranged in relation to each other that the base and lining of section A and the surface F of section B shall be in line or nearly so at the joint *a*, when the sections, constructed substantially as described, are connected together, as and for the purpose set forth.

115,280.—TRACTION-ENGINE.—James Henry Clapham, New York, N. Y.

Claim.—1. The circular frame of the fore-body B B, resting upon the axles K K of the driving-wheels C C, substantially as and for the purpose set forth.

2. The forepart of the after-body A A, substantially as and for the purpose set forth.

3. The inner hub W W on the driving axles K K and its projecting arm X X, in combination with the projection Z Z on the driving-wheels C C, substantialy as and for the purpose set forth.

115,281.—MACHINE FOR BENDING SHEET METAL. — William Cooley and Henry Cooley, Toronto, Canada.

Claim.—The combination of the dies or molds A and B, the rods J, connected to the crank-shaft H, and turned by the crank-handle K, substantially as and for the purpose hereinbefore set forth.

115,282.—HEMMER FOR SEWING-MACHINES. Daniel H. Darby, Mendon, assignor to himself and David C. Cook, Chicago, Ill.

Claim.—The arms C and E, and spring F, bar J, spring K, and guide L, the whole arranged and combined to operate with the presser, substantially as and for the purposes set forth.

115,283.—LIQUID-FLASK.—Henry William Doe, London, England.

Claim.—The exterior tube *e*, perforated near its base with its annular interiorly-threaded screw-cap *g*, through which ascends the interior tube *b*, terminating in a mouth-piece or handle, all substantially as and for the purpose herein set forth.

115,284.—GRAIN-BINDER.—Charles G. Dickinson, Poughkeepsie, N. Y.

Claim.—1. The band-gatherer and twister, consisting of the reciprocating carriage G, pendent frame I, shaft *k*, and retaining-fingers *l l*, all constructed and operating substantially as set forth.

2. The pivoted cradle J and rotating jaws P P, when these parts are constructed and operated substantially as and for the purpose described.

3. The grain-binding attachment, composed of carriage and twister G I, cradle and rotating holder J P, and tucker R, all combined, constructed, and operating as and for the purpose specified.

115,285.—SURGICAL INSTRUMENT FOR THE RELIEF OF THE PILES.—Edward Dithridge, Pittsburg, Pa.

Claim.—The neck *c*, arranged between the base end of the corrugated portion *a* and the base *d*, substantially as described.

115,286. — AUTOMATIC ATTACHMENT FOR KEYED MUSICAL INSTRUMENTS.—Harrison Downes, New York, N. Y.

Claim.—1. The feelers or elbows *d d*, in connection with the wires or cords *g g* and the levers or buttons *b b*, and with the plate *h* having the projections *i i*, arranged and operating substantially as and for the purpose set forth.

2. The feeler *k*, in connection with the connecting-wire or cord I and the projection *m*, arranged and operating substantially as and for the purpose herein specified.

115,287.—MACHINE FOR PRODUCING STEREOTYPE-MATRICES.—Robert E. Draper, Sacramento, Cal.

Claim.—1. The oscillating indicating-segment C, shouldered type-chambers *c* within which shouldered type *e* are set, and springs *s*, in combination with the pressure-lever H, which carries follower *i*, and which changes its fulcrum for every new impression with a type, and with a bed, B, having stationary letters upon its top, substantially in the manner and for the purpose described.

2. The vertical shouldered type-chambers formed in the margin of the oscillating segment C and furnished with shouldered type *e* and springs *s*, which are arranged substantially in the manner shown and described.

3. The grooved stationary segment-guide G for receiving and guiding one end of lever H, in combination with the oscillating guide-post *d*, follower *i*, and a type-carrying segment C, substantially as described.

4. The combination and arrangement of the independent vertical type, oscillating and indicating segment C *p*, vertical plunger *i*, post *d*, hand-lever H, grooved guide G, lettered bed B, form-supporting carriages F P, feed-screws S T, and the devices for actuating said screws, all constructed substantially in the manner and for the purpose described.

115,288. — SEWING-MACHINE-WORK HOLDER.—Henry Eddy, North Bridgewater, Mass.

Claim. — An adjustable sewing-machine-work holder, consisting of the arms *a a*, the rod *b*, and the sockets *f f*, all constructed and arranged and operating substantially in the manner specified and for the purpose herein set forth.

115,289. — REVOLVING URN-STAND.—William John Evans, New York, N. Y.

Claim.—1. The combination of the stands D E F, or either of them, with the foot A, washer C *c*, and bolt G, substantially as herein shown and described.

2. The combination of the foot A, tubular column B, stands D E F, washer C *c*, and bolt G with each other, substantially as herein shown and described.

3. The combination of the stand H with the urn-stand F, foot A, washer C *c*, and bolt G, whether the stands D E and column B be used or not, substantially as herein shown and described.

115,290. — HOLD-FAST FOR LATHE-SPINDLES.—Luther R. Faught, Philadelphia, Pa.

Claim.—The combination, with the spindle, of the externally-screwed socket, the split conical clamping-sleeve, the adjusting-nut working in a groove in the sleeve and over the screwed socket, and the clamping-band or its equivalent, substantially as set forth.

115,291.—DIE-STOCK FOR CUTTING SCREWS. Luther R. Faught, Philadelphia, Pa.

Claim.—1. The combination of the stationary die, the movable dies adjustable radially relatively to the axis of the dies, and the adjusting-wedges moving endwise in the die-stock, all these parts being constructed to operate in combination, substantially as hereinbefore set forth.

2. The combination of the die-stock, the radially-adjustable dies, the adjusting-wedges, and the adjusting-screw, moving longitudinally in the die-stock, as described.

115,292.—HOISTING AND LOWERING APPARATUS.—Ross L. Fitch, Sing Sing, assignor to himself and William A. Van Houten, Haverstraw, N. Y.

Claim.—1. The combination of the platform-bars D, hoisting-cord C, drum F, weighted cord G, and brake L, all arranged in a suitable frame, substantially as specified.

2. The combination, with the platform, of the tilting-frame N, a suspending-bail, Q, and a hook, R, substantially as specified.

3. The said tilting-frame, arranged to be shifted as described, and provided with the arms T and V, said arms T being attached to bail Q, operating substantially as specified.

115,293.—POLISHING ORES TO AID IN AMALGAMATING THE PRECIOUS METALS.—Isaac William Forbes, La Porte, Ind.

Claim.—The improved process by the employment of diamond as a medium, substantially as and for the purpose described.

115,294.—CLEANING PULVERIZED ORES SO AS TO AID AMALGAMATION.—Isaac William Forbes, La Porte, Ind.

Claim.—The process of cleaning pulverized ores by the employment of emery as a medium, substantially as set forth.

115,295, antedated May 26, 1871.—STAMP-BATTERY.—Isaac William Forbes, La Porte, Ind.

Claim.—1. The mortar A, formed with one or more open thimbles, A', in combination with standards D and die B, substantially as and for the purpose described.

2. The bar E and bolts G, in combination with standard D and die B, substantially as and for the purpose described.

3. The combination of the mortar A, constructed as described, elastic substance C, standard D, bolts F G, bar E, packing L, and die B, constructed, arranged, and operating substantially as described.

4. The relative arrangement within the thimble A' of the elastic substance C, die B, and standard D, substantially as and for the purpose described.

115,296.—OSCILLATING VALVE FOR STEAM AND AIR-ENGINES.—Isaac William Forbes, La Porte, Ind.

Claim.—1. Valves A A, valves A^1 A^1, as and for the purpose set forth.

2. Valve-frame D D with its stem or stems D^1 D^1, as and for the purpose set forth.

3. Valves A A and valves A^1 A^1, in combination with the frame D D and valve-stem or stems D^1 D^1, as and for the purpose set forth.

4. Valves A A, in combination with the frame D D D D and valve-stem or stems D^1 D^1.

5. Valves A^1 A^1, in combination with frames D D and valve-stem or stems D^1 D^1.

6. Induction-ports B B, exhaust-ports B' B', in combination with valves A A and A^1 A^1, or with A A, or with A^1 A^1 singly, as and for the purposes set forth.

115,297.—OSCILLATING VALVE FOR STEAM OR AIR-ENGINES.—Isaac William Forbes, La Porte, Ind.

Claim.—1. The valve A, with steam-passage G, substantially as described

2. The valve-stem and frame D D, as and for the purpose described.

3. The valves A A, in combination with valve-frame and stem D D, as set forth.

4. Ports B^1 B^1, in combination with valves A A, steam-passages G G, and valve-frame D D, as described.

5. Stops K' K', stops *f' f'*, substantially as and for the purposes hereinbefore set forth.

115,298. — SLIDE-VALVE FOR STEAM-ENGINES.—Isaac William Forbes, La Porte, Ind.

Claim.—1. The valve or valves B B, valve-frame C C, and steam-passages B^1 B^1 C^1, substantially as and for the purpose described.

2. The valves B B, in combination with H H and H' H', substantially as and for the purpose described.

3. The valves B B, in combination with valve-stems C^2 and bosses, substantially as described.

115,299. — SLIDE-VALVE FOR STEAM-ENGINES.—Isaac William Forbes, La Porte, Ind.

Claim.—1. The valves G G and G' G', in combination, substantially as and for the purpose described.

2. The frame H H and frame H' H', substantially as and for the purpose described.

3. The valves G G G' G', in combination with frame, substantially as and for the purpose described.

115,300. — VALVE-GEAR FOR STEAM-ENGINES.—Isaac William Forbes, La Porte, Ind.

Claim.—1. The valve-stem A, lever B, blocks G G, in combination with inclines C C, as and for the purpose set forth.

2. Valve-stem A^1, spring lever D, balance-ball E, and lever B, in combination with inclines C C, as and for the purpose set forth.

3. Valve-stem A^2, spring shaft or rod F, balance-weight E', lever B, in combination with inclines C C, as and for the purpose set forth.

4. Valve-stem A, levers B^2 B^2, in combination with inclines C C, as and for the purpose set forth.

5. Valve-stem A, levers B^2 B^2, sleeve H, in combination with inclines C C, as and for the purposes set forth.

6. Valve-stem A^1, spring lever D, balance-ball E, levers B^2 B^2, in combination with inclines C, as and for the purpose set forth.

7. Valve-stem A^1 with its parts, levers B^2 B^2, sleeve H, as and for the purpose set forth.

8. Valve-stem A^2, spring shaft or bar F, balance-weight E', lever B^2 B^2, in combination with inclines C C, as and for the purpose set forth.

9. Valve-stem A^2, spring shaft or rod F, balance-weight E', levers B^2 B^2, sleeve H, in combination with inclines C, as and for the purpose set forth.

115,301.—STEAM-ENGINE.—Isaac William Forbes, La Porte, Ind.

Claim.—1. The ports D to D^2 for receiving and conveying steam to their respective cylinders at opposite ends, as described.

2. The pieces H H, in combination with the lower heads O' O', substantially as and for the purpose described.

3. The combination of the bearing M^1, having a chamber, M^2, and a gland, M^3, substantially as described.

4. The plate L' L' and water-passage P P, substantially as set forth.

115,302.—COFFEE-ROASTER.—James Galloway, Webster, Ill.

Claim.—Vessels A and B, constructed for the

purpose of browning and roasting coffee by the use of steam, in the manner substantially as set forth.

115,303.—STEAM-TRAP.—Isaac E. Giddings, Springfield, Mass.

Claim.—The case B, float-valve C, shield S, in combination with the screw *p*, nut *k* with rim *s*, and pin *m* with its spring, the parts being constructed and arranged substantially as shown and described.

115,304.—STANCHION.—Walter C. Gifford, Jamestown, N. Y.

Claim.—In combination with the transverse bar D of a swinging stanchion and the transverse bar P of supporting-frame, the button N, cut away at *n*, as and for the purpose specified.

115,305.—APPARATUS FOR FEEDING BLAST-FURNACES.—Leven S. Goodrich, Waverly, Tenn.

Claim.—The combination, with the top wall D of a blast-furnace, of the top A A′, the valve-tube B B^1 B^2, and the double conical plug C C′, all substantially as specified.

115,306.—PACKING-BOX.—Alexander Gregg, Watertown, Mass.

Claim.—The packing-box as having the metallic fastening-clasps arranged with and applied to the box-body and the cover thereof, in manner as hereinbefore described and as shown in accompanying drawing.

115,307.—WHIFFLETREE-HOOK.—Andrew J. Griggs, Pittsburg, Pa.

Claim.—The trace-hook B, provided with the spring-hook D, constructed as herein described.

115,308.—SOLDERING APPARATUS.—Jacob Gulden, Keyport, N. J., assignor to Uriah H. Dudley, New York city.

Claim.—1. The arrangement of a tool-holder, B, in the side of furnace A, resting upon the fire-grate *a*, and abutting laterally upon the fire, for the purpose of firmly holding the tool, easily transmitting heat thereto, and readily retaining said heat at the proper temperature.

2. The metallic block B, having a recess to receive the tool and hold it firmly on three sides, combined with a transverse strap and fastening-screw to form a holder for soldering-tools, which will admit of their ready attachment and detachment, as described.

3. The case I, pawl *r*, and spring-lever J, combined and constructed as and for the purpose specified.

115,309.—ENDLESS WIRE-ROPE WAY.—Andrew Smith Hallidie, San Francisco, Cal.

Claim.—1. Propelling or carrying the saddle or hanger over the bearing-pulley by means of teeth or projections on the bearing-pulley, substantially as described, and for the purposes set forth.

2. The curved side plates F of the saddle, in combination with the projecting cylinders D for raising the saddle off the rope and carrying it over the bearing-pulley, substantially as and for the purposes set forth.

3. The saddle or hanger A, substantially as described, and for the purposes set forth.

4. The employment of clips B, or their equivalent, in the saddle or hanger of an endless wire-rope way, substantially as herein described, and for the purposes herein set forth.

115,310.—ENDLESS WIRE-ROPE WAY.—Andrew Smith Hallidie, San Francisco, Cal.

Claim.—1. The hanger A, consisting, essentially, of an arm, B, secured to the upper part of the rope C, and proceeding from the rope upward so as to clear the sides of faces of the groove D of the bearing-pulley E, and projecting over the upper and outer edge F of the groove, substantially as herein described, and for the purposes herein set forth.

2. Constructing the hanger A with a horizontal plate, L, a vertical part, M, and a thin band, G substantially as and for the purposes set forth.

3. Securing the parts together by means of the hook O and nut P, substantially as and for the purposes set forth.

4. Hanger A, in combination with the pulley I substantially as described, and for the purposes set forth.

115,311, antedated May 19, 1871.—TEMPORARY SHOE FOR HORSES.—William Hudson Halsey, Philadelphia, Pa., assignor to himself and Theodore F. Taylor, same place.

Claim.—The combination of the plate A and the band B, consisting of a strip of leather fitted to the rear of the hoof, and cut to form tongues *e d* which are buckled together, crossed, and connected to the front and sides of the shoe, as specified.

115,312.—MACHINE FOR CREASING LEATHER.—Benjamin R. Hamilton, South Deerfield, and Samuel Swan, Conway, Mass.

Claim.—1. In combination with the swinging frame W having platform L, the removable arbor B with creasers, bar C, and handle D, the parts being constructed and arranged substantially in the manner and for the purpose shown.

2. In combination with the swinging frame with its creasers, the bed of the machine, consisting of the bed-block A resting upon the springs *x x*, &c. slats *g g*, &c., with their attachments, adjustable supports O O, and guides K K, the parts being combined, constructed, and arranged substantially in the manner and for the purpose shown.

115,313.—TURPENTINE BOX.—William Barkervill Hamilton, New Orleans, La., assignor to William P. Hamilton, East Pascagoula, Miss.

Claim.—1. The box A formed with an apron, D arranged as shown, in order that the apron shall serve as a conduit for the crude turpentine, and as the entire support of the box, substantially as described.

2. The box A, apron D, and bonnet D′, when the same are combined and arranged so as to operate substantially as described.

115,314.—AUTOMATIC TELEGRAPH-REPEATER.—Charles H. Haskins, Chicago, Ill.

Claim.—1. The combination of the electro-magnetic cores with two helices of separate circuits the helices being wound about opposite ends of the core, and directly around the core itself, substantially as and for the purpose set forth.

2. The combination of an extra coil or helix on the relay with a mechanism for repeating by the relay-armature lever, substantially as and for the purposes specified.

115,315.—LAMP-BURNER.—Hiram W. Hayden, Waterbury, Conn., assignor to Holmes, Booth & Haydens, same place.

Claim.—The removable portion of the burner, made of two pieces of metal united at their edges and forming the deflector, chimney-rest, air-distributer, and wick-tube guide, in combination with a chimney-holder applied at the base of the cone, substantially as set forth.

115,316, antedated May 23, 1871.—MODE OF ATTACHING CAPS TO HUBS.—Peter Hooter and Rudolph Victor, Grand Rapids, Mich.

Claim.—The improved hub-cap, composed of the metallic rabbeted ring or washer *e e*, provided with the hinged cover D, to be applied to the outer end of a carriage-hub, when constructed substantially as and for the purposes above set forth.

115,317.—WAGON-AXLE.—John Herrmann and Peter Herrmann, Tell City, Ind.

Claim.—1. The combination, with the wrought-iron extension A, of the axle B of the cast-metal wearing surface for the journal, substantially as specified.

2. The cast-metal part C, provided with the recess G in the extension E, and the wood part D of the axle fitted therein, substantially as specified.

115,318.—APPARATUS FOR ILLUSTRATING TRIGONOMETRY.—Edwin A. Hickman, Independence, Mo.

Claim.—As an article of manufacture, an apparatus for illustrating trigonometry, having the diametrical base combined with sliding sine and co-sine C D, sliding tangent and co-tangent E F, pivoted secant G, perpendicular I, and protractor H, all arranged, notated, and operated as specified.

115,319.—ANIMAL-POKE.—James Hopkins, Akron, Ohio.

Claim.—The adjustable guard-plate G, and spear-plate provided with slots E, attached to the end of the stale B, as arranged, and in combination with the spring H, stale B, yoke A, round C, and bolt I, operating conjointly, substantially as and for the purpose set forth.

115,320.—WASH-BOILER.—Marcus L. Horton, Windsor, Vt.

Claim.—The construction and arrangement of the chambers G and D, connected by one or more steam-pipes attached to the perforated bottom B of the receptacle, and passing through the perforated bottom E of the cover, the whole arranged substantially as and for the purposes herein specified.

115,321.—SELF-LOADING AND DUMPING CART.—Jerome B. Hulbert, Hermon, N. Y.

Claim.—1. The trunnions F F, in combination with the cam-levers H H, arranged to operate substantially as and for the purpose described.

2. The slotted upright frame E E, cam-levers H H, bar I, platform B, and spring catch J, in combination with the box or scraper A, and with a cart arranged to operate substantially as and for the purposes described.

115,322.—CASTER FOR STOVE-LEGS, &c.—Harriet A. Humphrey, Milwaukee, Wis.

Claim.—The combination of pin F, roller E, and arms D, with the stem G and nut H, arranged in the open recess in the leg, substantially as and for the purpose set forth.

115,323.—CHURN-DASHER.—William F. Jones, Easton, Kansas.

Claim.—The combination of the shaft A, round or cross-bar B, inner paddles or breakers C, short below shaft D, bars or arms E F G, and outer paddles or breakers H, said parts being constructed and operating in connection with each other, substantially as herein shown and described, and for the purposes set forth.

115,324, antedated May 16, 1871.—CHUCK FOR WATCHMAKERS' LATHES.—William Kerr, Jr., Boston, Mass.

Claim.—The sliding rectangular blocks or jaws C C, arranged in the chuck, each operated longitudinally by a screw at one end and by a spring at the other, substantially as and for the purpose set forth.

115,325.—WASHING-MACHINE.—Benjamin Kinne, Syracuse, N. Y.

Claim.—1. The arrangement and construction of the wheel C, when provided with chambers L, discharging water in either direction by the action of the lifters O, in combination with boiler A, as shown and described.

2. The construction and arrangement of sliding cover P, in combination with wheel C and boiler A, as shown and described.

115,326.—GLASS JAR.—William M. Kirchner, Pittsburg, Pa.

Claim.—A hand finished ring-jar, having external finless screw-threads and gasket-seat on the neck immediately below the mouth, substantially as described.

115,327.—BOILER OR DIGESTER FOR MAKING PAPER-PULP.—William F. Ladd, New York, N. Y.

Claim.—1. A long cylindrical boiler or digester having two sets of trunnions, one set on its longest and one on its shortest axis, and having corresponding boxes, as described.

2. A cylindrical boiler or digester having two sets of trunnions, the trunnions on the short axis being attached to a band in which the boiler can turn when supported on the trunnions of the longitudinal axis.

3. Placing trunnions on the short axis of a cylindrical boiler so that the boiler may be charged and discharged through the same man-hole.

4. A cylindrical boiler having trunnions on its shortest axis, and a discharge-valve at one extremity of its longest axis.

115,328.—HANDSAW.—Orrin H. Langdon, Homer, assignor to Charles W. Kinne, Cortland, N. Y.

Claim.—The combination of the blower above described, composed of the parts B G D C E I I H H, with a handsaw, substantially as and for the purpose set forth.

115,329.—LAMP.—Henry H. Laughlin, Philadelphia, Pa., assignor to Mary A. Laughlin, same place.

Claim.—The device for holding fibrous material in a lamp, when made of a single piece of metal cut and bent in the form and manner herein shown and described.

115,330.—CATCH FOR GATE AND DOOR-LATCHES.—George C. Lawton, Algona, Iowa.

Claim.—The combination of the plate C, latch B, and catch A, when the said catch is concaved inward from its ends toward the center, and beveled upward from the bottom to the top, and provided with the slot or recess *a* to receive the latch, the whole constructed and arranged to operate substantially as and for the purpose described.

115,331.—FLOUR-BOLTING REEL.—Fitch B. Lewis, Tiffin, Ohio.

Claim.—1. The hammer-handle, cranked at *x x x* so as to form the pivotal portions b^1 b^2, and the crank-arm b^1, in combination with the eye-bearing *f* and the attaching-block *e*, and the endwise movable rod G, substantially as described.

2. The combination, with the bolt-bar D, of the rod G, anvil J, provided with raised portion *j* and eye *i*, hammer *a*, having crank-handle b b^1 b^2, and actuated by spring S, when constructed, arranged, and operating as shown and described, for the purpose set forth.

3. The combination of the pivoted cam or beveled segment L, constructed, arranged, and operated as described, and the endwise movable rods with hammers attached to them, whereby the blow of the hammers can be regulated and controlled without stopping the reel by simply adjusting the segment directly, as herein set forth.

4. The bolting reel-hammer actuating-rod, consisting of the portion G, the socketed detachable portion *r*, roller *p*, and set-screw *v*, as herein described, and for the purpose set forth.

115,332.—Music-Stool and Book-Rack Combined.—John R. Lomas, New Haven, Conn., assignor to B. Shoninger, same place.

Claim.—The seat A and screw B, combined with a music-rack having partition C containing nut in which the stool screw is adjusted.

115,333.—Sheave and Rail for Sliding Doors.—Thomas M. Lyons, New York, N. Y.

Claim.—1. The flanged rail or trough A, provided with the rollers B B to constitute a guide and support for a sliding door, as set forth.

2. The sole or shoe D, having the rib *d* and projecting lug or lugs *e* and applied to a sliding door, substantially as and for the purpose herein shown and described.

3. The adjustable stop *g* applied to the flanged rail or trough A to arrest the outward motion of the door, substantially as herein shown and described.

115,334.—Exhaust Apparatus for Gas-Works.—Philip W. Mackenzie, Blauveltville, N. Y.

Claim.—1. The combination of the governing arrangement D, G, and H, constructed and operating substantially as shown and described, with the jet-pipe L and tube A, for the purposes specified.

2. The combination of the by-pass pipe M and by-pass valve C with the steam-jet L and tube A, as arranged, and for the purpose described.

115,335.—Elevator.—John Macomb, Chicago, Ill.

Claim.—1. The driving-disk K, fixed firmly upon a shaft, *e*, and having shoulders *i i*, in combination with the sliding ring *i'* on the fixed pulley *i*, for the purpose of carrying forward two chains, J J, connected with a cross-bar, H, in the manner described.

2. The anti-friction rollers or thimbles h h on the cross-bar H, in combination with the driving-disk I, for the purpose specified.

3. The platform G, hung centrally from the cross-bar H between the chains J J, as shown and described.

4. The platform G, provided with guide-pieces *g g* and socket-pieces *g' g'*, as shown.

5. The chains J J, or equivalent endless ropes, connected by the cross-bar H, in combination with the driving-disk I, for the purpose specified.

6. The chain-supporting cross-head L, with its collar-pieces *l' l'* and pulleys *l l*, for the object described and shown.

7. The device for elevating as a whole, consisting of driving-disk I and sliding ring *i'*, the chains J J, guide-boxes B B, platform G, and regulating cross-head L, all in the manner shown, and for the purposes described.

115,336.—Bag-Tie.—Cameron P. Markham and William H. Markham, Rogersville, N. Y.

Claim.—The looped cord or wire A and slotted bar or handle B in combination with each other, said parts A B being constructed and operating substantially as herein shown and described, and for the purpose set forth.

115,337.—Centering-Machine.—Eugene McNiel, Groton, N. Y.

Claim.—1. The board W, provided with a fixed point, *a*, in combination with the tongs B B, substantially as and for the purpose specified.

2. The board W, having a slot, S, in combination with the block L, spiral spring K, connecting-links C C, and tongs B B, all constructed as shown and described, and for the purpose set forth.

115,338.—Culinary Boiler.—Frederick Meyer, New York, N. Y.

Claim.—The boiler A, provided with a covered spout, C *c'*, stop-cock D, horizontal partitions H, vertical partitions E, pipes F, boxes G, short pipes H, slides I, rods J, and covers K, said parts being constructed and arranged in connection with each other, substantially as herein shown and described.

115,339.—Ventilator.—Benjamin F. Miller, New York, N. Y.

Claim.—The combination of the perforated casing with the inclosed disk, pyramid, or cone, and the flue-pipe *a*, substantially as and for the purposes set forth.

115,340.—Eaves-Trough and Conductor.—Rutger B. Miller, Utica, N. Y.

Claim.—1. The metal tubes or brick tiles, or their equivalents, marked *e e f*, on the roof, warmed by heated air from the attic, admitted through tubes *e e e e*, or their equivalents, for the uses and purposes mentioned.

2. The brick horseshoe-tiles or tin-pipes, or their equivalents, placed in the bottom of the eave-trough, for the uses and purposes mentioned.

3. The valve at the lower extremity of the conductor, marked *a*, or its equivalent, for the uses and purposes mentioned.

115,341.—Lock for Meeting Rails of Sashes.—William Miller, Boston, Mass.

Claim.—1. The pivoted lever A, provided with slot *e*, and held in position by spring F, substantially as described.

2. The plate G, provided with lugs I I, and slot J, and pivoted lever K, said lever having curved handle L, substantially as described.

3. The pivoted lever A, in combination with the pivoted lever K and lugs I I, as and for the purposes set forth.

115,342.—Lubricating Compound.—Adolph Millochau, New York, N. Y., assignor to Joseph W. Richards, same place.

Claim.—1. The combination of caustic soda, tallow, and petroleum, or their respective chemical equivalents, in about the proportions set forth, compounded and treated substantially in the manner described.

2. Combining with the semi-fluid compound thus produced, or its chemical equivalents, animal hair in about the proportions and as and for the purpose specified.

115,343.—Changeable-Gauge Car-Truck.—George F. Morse, Portland, Me.

Claim.—1. The combination of the screws *a a* and nut A with the wheels *a' a'* and the keys and slots in the axle *b'*, as and for the purpose herein set forth.

2. The combination of the wheels and axle with the sleeve *k*, the nut *l*, the ridge *m*, the teeth *n*, and the rack *p*, as and for the purpose herein set forth.

115,344.—Drainer for Tumblers and Dishes.—Peter W. Neefus, New York, N. Y.

Claim.—A drainer provided with a number of vertical ribs of elastic material, with inclined channels between the same to lead away the water, substantially in the manner and for the purpose specified.

115,345.—Door-Mat.—Peter W. Neefus, New York, N. Y.

Claim.—A new article of manufacture of a mat constructed of a single piece of vulcanized India rubber, or other similar elastic material, and provided with ribs of triangular or other similar-shaped section, arranged with separating-grooves leading to and running out at the edges of the mat in such manner as to permit the cleaning of the same without removing it from its position, substantially as shown and described.

115,346.—Breast-Collar for Horses.—James Nellis, Ypsilanti, Mich., assignor to himself and Sylvester W. Beach, same place.

Claim.—A breast-collar, composed of a metallic half-circle and adjustable pads attached thereto, substantially for the purposes herein set forth.

115,347.—Tassel.—James Norman, Brooklyn, N. Y.

Claim.—The block A, made of a solid piece of glass, as specified, combined with cords B and loop C, for the purpose set forth.

115,348.—Tin-Grooving Machine.—Horatio J. Noyes, Ashtabula, Ohio.

Claim.—1. The combination of the arm F, having on its side a ratchet, I, bar A, and pinion J, substantially in the manner as described, and for the purpose set forth.

2. The grooved roller C and roller D, friction-rollers L, pinion J, and head E, all arranged to operate in combination with the arm F and bar A, substantially in the manner as and for the purpose specified.

3. The wedge N, as arranged to operate in combination with the link or slide M for adjusting the rollers L, as and for the purpose set forth.

115,349.—Letter-Board for Object Teaching.—John H. Palm, Mansfield, Ohio.

Claim.—1. The combination of a box, A, mounted on detachable legs B, and having its interior divided into compartments, with the hinged cover C, consisting of the two parts E and D, both provided with a series of holes on one side, and the former with a black-board surface on its opposite side, when constructed substantially as and for the purpose set forth.

2. The hinged cover or letter-board C, provided with a series of holes, *a*, for the attachment of the letters or object devices F, in combination with the stay-braces G and *e*, when constructed and arranged substantially as and for the purpose set forth.

3. The combination of the hinged letter-board C provided with a series of holes, and the object devices F provided with pins on their rear sides, substantially as herein described.

115,350.—Vapor-Burner.—George T. Party, Philadelphia, Pa.

Claim.—The adjustable burner-stem A, the stationary solid valve-stem G, and the valve and valve-seats *n e*, combined to operate substantially as described.

115,351.—Stem-Winding Watch.—Edwin Hathaway Perry, Boston, Mass.

Claim.—1. The combination, with the plate A, of the spindle or stem-holding lever, operated from the rear of the plate, substantially as shown and described, in order to release or engage with said spindle or stem.

2. The combination of the lever *v*, sleeve *v'*, and thimble *h'*, united and operating substantially as herein described, and for the purposes stated.

115,352.—Handle for Garden Implements.—Archibald A. Porter, Griffin, Ga., assignor to John E. Moss and John M. Williams, same place.

Claim.—The combination of the handle A provided at its forward end with a female screw and outer circumferential groove *a*, the tube C provided with the stationary jaw D, having notch *e*, and held by the screws *d d*, with the jaw D', with screw E, hook *f*, and pin *i*, all substantially as and for the purposes set forth.

115,353.—Wash-Boiler.—Charles W. Powell, Yalesville, Conn.

Claim.—1. The frame A D E, constructed with the bottom or apron C forming a channel, F, which is curved around, as shown, and terminates at a point, G, over the cylinder and slightly beyond its axis, when said frame is provided with the holes B, arranged as represented, and has the channel C at one side, with discharge along the whole length of the apron, all as herein set forth.

2. The open cylinder, constructed as described, in combination with the frame A C D E, substantially as specified.

115,354.—Machine for Forming Wire Bottle-Stopper Fastenings.—Henry W. Putnam, Bennington, Vt.

Claim.—1. The fingers *i*, revolved around the pins or hinges 6 or 12, in combination with the form 5 and the apparatus for supplying the wire to be bent, substantially as set forth.

2. The spring jaws *t* and cam *u*, in combination with the fingers *i* and form 5, as and for the purposes set forth.

3. The fingers *i i*, applied substantially as shown, for bending the two eyes of the neck-band of a bottle-fastening simultaneously, as set forth.

4. The form 5, made adjustable to vary the length of the neck-band between the eyes 6, as and for the purposes set forth.

115,355.—Washing-Machine.—Leonard Putnam, Worcester, Mass.

Claim.—1. The combination, with the bottom C C', curved as shown, of the curved, grooved, and fluted hammers D D, spring pitmen I I, pivoted arms E E, and crank-shaft G, substantially as and for the purposes set forth.

2. A washing-machine, consisting of curved bottom and straight-sided tubs A, curved, grooved, and fluted hammers D D D D, pivoted arms E E E E, pitmen I I I I, springs K K K K, and crank-shaft G, the whole being constructed and combined for operation substantially as shown and described.

115,356.—Telegraph-Relay Instrument.—Clarence Rathbone, Albany, N. Y.

Claim.—1. The magnets A B, made separately adjustable in the direction of their respective axis, substantially as and for the purposes herein shown and described.

2. The connecting-bar E of a pair of magnets, made stationary, and perforated to admit the movable cores, as specified.

3. The relay-magnet, having one core with fine wire connected with the main circuit, and the other core with coarse wire connected with the local battery and vibrating armature, as specified.

115,357.—Bagatelle.—Montague Redgrave, Cincinnati, Ohio.

Claim.—1. The cups, courts, pins, and spring piston, combined with a board supported on an incline by a piece, E, at the further end, whereby the principle of gravity is applied to the ball to carry it in a direction opposite to that in which the spring piston tends to carry it.

2. The piston *d*, arranged in shooting-trough *b* and upon the end of slide rod *e*, combined with a spiral spring, *f*, placed on said rod between the piston and ledge *a*, for the purpose specified.

3. The arrangement centrally between the cups and pins of courts B D, through which the ball can only enter from the front and only reach the bells with difficulty; for the purpose of making high counts require care and skill, as described.

4. The arrangement of central courts B D, provided with swinging gates with respect to the cups and pins, as and for the purpose specified.

115,358.—Pinch-Bar.—Abram Reese, Pittsburg, Pa., assignor to himself, Robert W. Lyon, and George H. McNary.

Claim.—The combination of the bar or lever A, pivoted or hinged bar B, and pointed cutters C with each other, said parts A B C being constructed and operating substantially as herein shown and described, and for the purpose set forth.

115,359. — BASE-BURNING STOVE.—Henry R. Remsen, Newtonville, N. Y.

Claim.—1. The combination and arrangement of air-pipe I with reservoir F and heated chamber L of a stove, in the manner and for the purpose herein shown.

2. Plate K, with its semicircular openings l and 2, in combination with reservoir F, as herein shown, and for the purpose set forth.

115,360.—BOAT-DETACHING APPARATUS.—Ira Abiel Richards, Middletown, Conn.

Claim.—A double roller-trip, constructed and arranged substantially as shown and described, and for the purposes herein set forth.

115,361. — ICE-CREAM FREEZER. — Moritz Rosenstein, Boston, Mass.

Claim.—1. A revolving refrigerating apparatus combining an outer vessel, G, an air-space, J, a non-conducting vessel, K, containing the freezing mixture, and a central vessel, M, for holding the cream, substantially as described.

2. In combination with the three vessels, G K M, and the air-space J, the aperture through the double bottom H K, fitted with a screw-cap, U, for the purpose herein described.

3. The combination of the agitator V and the cream-vessel M, as described, and for the purpose specified.

115,362. — WATER-WHEEL. — Reuben R. Royer, Ephratah, Pa.

Claim.—A bucket, B, with a doubly-curved face, and provided with a bevel flange, F', projecting ear E, shoulder r', lug R', when said bucket is attached by a nut and bolt, f, through the ear E, and flange F of the top, and the flange F' of the buckets bolted through the conic sides C of the dished top, with its central hub H for the shaft s, all combined in relation to each other in the manner shown and for the purpose specified.

115,363.—TOBACCO-PIPE.—William G. Ruge, Holstein, Mo.

Claim.—A tobacco-pipe having a detachable and reversible bowl, all substantially as specified.

115,364.—SHUTTER-FASTENING.—Albert P. Seymour, Hecla Works, N. Y.

Claim.—The broad-faced parallel-sided arm a, combined, as described, with the journaled spring f g h and flanged case E, all arranged as described.

115,365.—HYDRAULIC DISK.—Thomas Shaw, Philadelphia, Pa.

Claim.—1. The revolving disk g, provided with an annular piston, e, and ring f, substantially as described.

2. In combination with the above, the grooved bed-plate d and pipe n, substantially as described.

115,366.—WAGON-GEARING.—Jacob Shoudler, Scottsville, N. Y.

Claim.—The extra cross-piece F, provided with mortise d, in combination with the detachable levers D G and pivotal reach A, arranged as described, for the purpose specified.

115,367.—DEVICE FOR REMOVING LIME, DIRT, AND SEDIMENT FROM BOILING LIQUIDS.—Alonzo J. Simmons, Indianapolis, Ind.

Claim.—A vessel, constructed and used upon the plan and principle herein described, for the purpose of extracting impurities from boiling fluids.

115,368. — CARPENTER'S GAUGE. — Daniel Webster Simmons, Lynn, Mass.

Claim.—An improvement in the joiner's gauge as made with the stock A, the adjustable slide C, and rotary conic frustum-cutter B, the said cutter, as arranged, with its lesser base against or at the end of the stock, and with its pivot applied so as not to project beyond the outer face or larger base of the cutter, all being as described and represented.

115,369. — APPARATUS FOR GENERATING, CARBURETING, AND BURNING HYDROGEN-GAS.—Byron Sloper, St. Louis, Mo.

Claim.—1. A carbureted hydrogen-gas lamp, consisting of a generating and carbureting-chamber combined, for the purpose described.

2. In combination with a carbureted hydrogen-gas lamp, the use of the auxiliary jet of pure hydrogen and the platinum-sponge, for the purpose of automatically lighting the carbureted hydrogen as it escapes at the burner.

115,370.—SHOT-GUN.—Dexter Smith, Springfield, Mass.

Claim.—A gun having a variable muzzle made adjustable in size by means of the ring A tapered inside, and secured to the tapered end b of the barrel having the openings a made therein, substantially as described.

115,371. — INVALID BEDSTEAD. — George Smith, Stratford, Canada,

Claim.—The combination of the legs A, made hollow to receive the supports or legs B, which have racks cut upon them, cog-wheels F which gear into the racks on the said legs B, the two shafts D and E upon which are the two pulleys H, around which passes the cord, chain, or belt I, connecting the aforesaid combination in such a manner that upon placing the handle J on any end of the shafts D or E, and turning the said handle in the proper direction, the frame c can be raised or lowered at will, and the head or pillow-rest K, connected to and forming part of the aforesaid combination, as described.

115,372. — CLOTHES-WRINGER. — Hamilton E. Smith, New York, N. Y., assignor to Mary Jane Smith, same place.

Claim.—1. The combination and arrangement, with the flexible roller B, of the driving-rollers C C^1 C^2 geared to operate in concert through the intervention of a loose spur-wheel, G, and fast wheels or pinions D, E, and F on the rollers C C^1 C^2, substantially as specified.

2. The arrangement of the washers f f on the ends of the flexible roller B, and between the same and the side frames A A, essentially as and for the purpose herein set forth.

115,373.—DEVICE FOR IGNITING GAS AND OTHER LIGHTS.—Willard H. Smith, New York, N. Y.

Claim.—1. The coating of friction-fuse or match with gutta-percha or rubber, substantially as and for the purpose herein described.

2. The employment of the sliding fuse-holder and nut H, in combination with the feed-screw E, substantially as and for the purpose herein described.

3. The combination of the tube A, feed-screw E, cross-plate L, the fuse-holder J, with the elastic ring or eye K, substantially as and for the purpose shown.

115,374.—FLY-NET.—William Sohier, Boston, Mass.

Claim.—The above-described house-fly net, of a long and conical shape, with a flattened side, and a wire hoop at the top attached to a handle socket, substantially as described.

115,375.—APPARATUS FOR DRYING PAPER. William H. Soley, Philadelphia, Pa., assignor to Lemuel Smith, New York city.

Claim.—1. The combined arrangement of the horizontal part c'' of the hot-draught flue c' within the case A B, substantially as and for the purpose hereinbefore set forth and described.

2. The arrangement of the heat-generating furnace C and the outlet of its flue c'' in relation to the case A B, so that the hottest end of the horizontal part c'' of said flue shall be near that end of the case A B at which the paper passes out of the same, and the cooler end of the said flue c'' near that end of the said case at which the paper enters, substantially as and for the purpose hereinbefore set forth and described.

3. The arrangement of the vapor-exhausting flue j' in relation to the case A B and the hot-draught flue c'', so that the current of vapor will be from the hottest end of the case toward the cooler end of the same, substantially as and for the purpose hereinbefore set forth and described.

115,376.—HARVESTER.—John Souder and Elias Miller, Litiz, Pa.

Claim.—The combination of the rod D and shoe A, when constructed and arranged substantially as set forth.

115,377.—GLASS-MOLD.—Carl Stadelmann, Pittsburg, Pa.

Claim.— 1. A glass-mold having a cavity or groove around its lower inner face, between it and the bottom core, whether made in the face of the mold, or in the side of the core, or in the bottom plate, or in any two, or all of them, for the purposes described.

2. In a glass-mold, the pins f f, in connection with the shoulder g, or their equivalents, substantially as and for the purposes described.

3. The bottom core e, extending up into the footcavity i, whereby the joint formed by the contact of the outer face of the former and the inner face of the latter shall be vertical instead of horizontal, substantially as and for the purposes set forth.

115,378. — APPARATUS FOR EXTRACTING TAR, &c., FROM PINE WOOD.—James D. Stanley, Baltimore, Md.

Claim.—1. The combination of two retorts, A A, set in masonry, with one furnace, E, common to both, substantially as and for the purposes hereinbefore set forth.

2. The combination of the said two retorts A A with skeleton cars B B upon tracks, substantially as and for the purposes hereinbefore set forth.

3. The combination of the free discharge-pipes e e and vapor-pipes n n, substantially as and for the purposes hereinbefore set forth.

115,379. — MOTIVE POWER FOR SEWING-MACHINES. — David E. Stearns, Berea, assignor to himself, Samuel M. Burt, Columbus, and William D. Fowler, Cleveland, Ohio.

Claim.—1. The combination of the shaft E, spring H, wheel I, ratchet-wheel J, and lever K, when so arranged that in winding up the spring the shaft is turned in the same direction as the wheel turns, as herein set forth.

2. In combination with the above, the pinion L, miter-wheels M M', and gear-wheels O O, for operating the needle-shaft of a sewing-machine, as herein set forth.

3. The brake a b, arranged with the needle-shaft of a sewing-machine, substantially for the purpose herein set forth.

115,380. — DRIVING PADDLE-WHEEL.—Joseph M. Story, Cincinnati, Ohio.

Claim.—The two intermediate friction-wheels E and D, and the sliding frames a and b, when combined to operate substantially in the manner and for the purpose specified.

115,381.—ENVELOPE-MACHINE.—Henry D. Swift and Daniel W. Swift, Worcester, Mass.

Claim.—1. The vibrating blade R, arranged on an envelope-gumming machine, as described, to constitute a divider for the envelopes, and a resistance-plate for the gummer, as set forth.

2. The arm s' carrying the shoulder a^2, arranged, in combination with the bed C and swinging gummer D, for holding the edges of the ungummed blanks, substantially as herein shown and described.

3. The tongs J, made vertically adjustable to lift the blanks off and replace them on the bed C, substantially as herein shown and described.

4. The rollers c^1 c^1 for spreading and the spring b^1 for closing the tongs J, combined, substantially as herein shown and described.

5. The reciprocating slide y, combined with the pivoted tongs J, rollers c^1, and springs b^1, substantially as herein specified.

6. The top d^3 on the wheel e^3, combined with the blade R for moving the same at intervals, substantially as herein shown and described.

7. The blade R, applied to the vertically-adjustable pin b^3, to be made yielding, substantially as herein shown and described.

8. The fingers r and springs s, combined with the revolving gumming-roller G, substantially as and for the purpose herein shown and described.

9. The vibrating gummer D, combined with the reciprocating bed C and gumming-roller G, all arranged to operate together, as specified.

10. The conveying-tweezers L, connected with the guide-arm i^1 and table j' to be held in proper direction, as specified.

11. The frame m', spring catch p', and spring q', combined with the jaws d^1 and l' of the tweezers L, to operate the same, substantially as herein shown and described.

12. The roller O on the vibrating frame P, arranged, in connection with the aprons M and tweezers L, to retain the blanks on the aprons, substantially as herein shown and described.

115,382.—ENVELOPE-MACHINE.—Henry D. Swift and Daniel Wheeler Swift, Worcester, Mass., assignors to themselves and G. Henry Whitcomb & Co., same place.

Claim.—1. The blank-support C, pivoted to the pin b, and combined with the spring catch f, hook g, and pin h, to operate substantially as herein shown and described.

2. The sleeve or weight i, arranged on pin e, as described, for the purpose of holding down the blanks and preventing more than one from being taken up by the gummer, as set forth.

3. The vibrating frame E, combined with the slide G, and connected with the same, as described, so that one blank is conveyed to the folder whenever a folded envelope is being removed therefrom, as specified.

4. The pivots k, o, and e^2 of the frames D E G and arm L, arranged around one axis, substantially as and for the purpose herein shown and described.

5. The vibrating frame G, having the fingers a^2, combined with the spring arms I, for conveying the envelopes to the same from the yoke F, as set forth.

6. The comb J, vibrating horizontally and vertically, and combined with the spring arms I to lift the envelopes from said arms to clear them for the further reception of envelopes, as specified.

7. The vibrating frame L, combined with the pivoted comb J to actuate the same horizontally, as herein shown and described.

8. The upright slide M, combined by the arm f^3 with the pivoted comb J to actuate the same vertically, substantially as herein shown and described.

115,383.—JOINT FOR DESKS OR SEATS.—Lavinia Sylla and William F. Sylla, Elgin, Ill., administrators of Philo Sylla, deceased.

Claim.—The additional stop f, in combination with the stop e and the joint, for settee and school-

desk seat above described, as and for the purpose specified.

115,384.—EMERY POLISHING-STICK.—George C. Taft, Worcester, Mass.

Claim.—A new article of manufacture and commerce, in polishing-sticks rendered adhesive, as herein set forth and described.

115,385.—LANTERN.—Augustus E. Taylor, New Britain, Conn.

Claim.—The combination of the base and neck B and C, hinged spring ring *b*, slot *f* or other suitable catches, and the groove *a* on the end of the globe A, all combined and operating together, substantially as and for the purpose described.

115,386.—LIFE-PRESERVER.—Benjamin W. Taylor, Henderson, Ky.

Claim.—A life-boat, consisting of the box or body A, with the air-chamber or float hinged thereto, the whole being constructed and arranged for use, substantially as herein described.

115,387. — MACHINE FOR BREAKING AND CLEANING HEMP, FLAX, &c.—Theodore Tebow, Lexington, Ky.

Claim.—1. The two breakers W W, in combination with the main shaft E′, the sections F′ F′, clutches P and K, the pulleys G and F, and shaft C^3, when constructed and arranged substantially as and for the purpose described.

2. In combination with the subject-matter of the above claim, the beaters Y Y, when constructed and arranged to operate substantially in the manner and for the purpose specified and set forth.

3. The machine for breaking hemp and flax herein described, consisting of the breakers W provided with cogged head-pieces D^2, beaters Y, shafts E′ and C^2, clutches P K and their operating mechanism, pulleys A^1 A^2 F G, gears B^1 B^2 and C^1 C^2, and pinions D and E, constructed and arranged substantially as described, and for the purpose set forth.

115,388.—MANUFACTURE OF BAGGING FOR COTTON, &c.—Theodore Tebow, Lexington, Ky.

Claim.—1. The combination of the kettle C with its two vertical slots, C′ C′, and perpendicular sides, the furnace and the frame E E with its rollers *b b b b*, constructed substantially as and for the purpose described.

2. The combination of the pressure-rollers I H, the inner frame composed of the uprights G G, the yokes K K, and openings *g g*, the rod *c′* with its pinion and pulleys, and the rods N N N N with their nuts *n n n n*, constructed and operated substantially as and for the purpose described.

3. The described process of preparing the tar for tarring hemp and flax bagging, substantially as above set forth and described.

4. The improved cotton bale covering herein described, namely, coarse-strand bagging impregnated with tar by the process described, substantially as set forth.

115,389. — WATER-WHEEL. — William J. Thompson, Springfield, Mo.

Claim.—1. The arrangement of the gates K with regard to the wheel and the case and the operating connections, substantially as described.

2. The disk-plate N, arranged to operate the gate, as shown and described, for the purpose specified.

115,390.—APPARATUS FOR STIRRING MALT IN THE KILN.—Wenzel Toepfer, Milwaukee, Wis., assignor to Wenzel Toepfer & Son, same place.

Claim.—1. The roller I, provided with the pivoted right-and-left ladles D D′, to be effective in opposite directions, as set forth.

2. The malt-kiln A, combined with the sliding boxes *d d*, which carry the rotating reciprocating roller, as set forth.

3. The T-link *h*, combined with the clutch *g* and with the projecting ears *j* of the chain F, substantially as herein shown and described.

4. The bolt *k*, applied to the sliding box *d* for locking the roller I, as set forth.

115,391.—PRINTING-PRESS.—William H. R. Toye, Philadelphia, Pa.

Claim.—The arrangement of the shafts D and F, spur-wheels C and C′, pinions G and G′, plate-drum J, gear-wheels L L L, bed-cylinders K, K′, and K^2, ink-rollers M M M, and guides N and N′, all combined and operating as and for the purpose herein specified.

115,392. — STEAM-HEATER. — Charles W. Trotter, Rochester, N. Y., assignor to himself and George Frauenberger, same place.

Claim.—1. The interior vertical water-chamber divided near the middle of its length so as to form a lower and an upper section, A and E, and leave an annular intervening space, *b*, for the passage of the heat and smoke from said interior chamber, as herein shown and described.

2. In a water-heating apparatus in which the interior water-chamber is composed of an upper and a lower section, supporting the former upon the latter by means of a series of vertical water tubes, I, arranged in a circular form in the division-space *b*, as herein shown and described.

3. The arrangement of the outer vertical water-tubes F for uniting the lower section A of the interior water-chamber with the upper outer water-chamber D, in connection with the inner series of vertical water-tubes I, arranged in a circular form for uniting the said lower section A with the upper inner section E, as herein shown and described.

4. In combination with a water-heating apparatus in which the interior chamber is composed of a lower and an upper section, A E, the interior vertical water-tubes I, the intervening space *b*, the outer vertical water-tubes F, the outer water-chamber D, the intervening flue *a*, the conducting-pipe G, and its connecting-tubes H and J, the several parts being constructed and arranged as herein shown and described.

115,393. — CUP OF BOBBIN-WINDING MACHINES.—John W. Vaughan, New York, N. Y.

Claim.—The tubular support F, and set-screw, combined with cup A having the segmentally-recessed arm, applied as and for the purpose specified.

115,394.—CAR-COUPLING.—Jerome B. Vedder, Gloversville, N. Y.

Claim.—The car-coupling herein described, consisting of the sliding plates A′ A′, connected at *a*, the fixed casting I, the spring jaws J J, the movable blocks *m* L, the springs H K, and the coupling-bar or link E, all constructed, arranged, and connected substantially as described and shown.

115,395.—APPARATUS FOR BOILING SUGAR, &c.—Isam Vest, New Iberia, La.

Claim.—The adjustable flues C, whereby a series of pans may be connected together and the gaseous products of combustion be returned through the pans and fluid, substantially as shown and described.

115,396. — WAGON-JACK. — John Wagner, Lancaster county, Pa.

Claim.—The resting-block D, through which the adjustable link *d* passes, in combination with legs B C and lever A, arranged and operating as shown and described.

115,397. — SMUT-MACHINE.—Thomas Wallace, Chicago, and George Warren Hyde, Joliet, Ill.

Claim.—1. The combination of sections of emery-stone B and perforated plates C in a smutter-case, substantially as specified.

2. The combination, in a smut-machine, of the sections B and beaters H made of solid emery-stone, held in place without retaining-lips or edges, so that the emery-stone may wear entirely out without disclosing any metal surface, as specified and shown.

3. The solid emery-stone beaters H, made and arranged as specified and shown.

4. The combination of the conical case A, conical beaters H, and shaft I having an adjustable step, J, substantially as and for the purposes specified.

115,398.—VAPOR-BURNER.—Thomas Ward, Columbus, Ohio, and Henry C. Hunt, Chicago, Ill.

Claim.—In combination with a slitted cap, A B, a burner, E, having the apertures G, recess F, and downwardly-concave deflector D, arranged as and for the purpose specified.

115,399.—CARPET-SWEEPER.—Otis H. Weed, Boston, Mass.

Claim.—The bearing-plates G G, with the openings *c i*, and gear *a* with its pin *b*, and cap *c* with its pin *h*, when constructed and combined with the brush-shaft C, substantially as and for the purpose set forth.

115,400.—STEAM-ENGINE.—Peter L. Weimer, Lebanon, Pa., assignor to himself, I. A. Weimer, and L. E. Weimer, same place.

Claim.—1. The cross-head D and guides E E, constructed, arranged, and applied together, as and for the purpose specified.

2. The arrangement of the bed B, cylinder A, cross-head D, guides E E, piston-rod C, (with the wrist J,) substantially as and for the purposes described.

115,401. — PLANING-MACHINE. — Samuel Whitesides, De Pere, Wis.

Claim.—The circular planer-head A, having the annular faces *c* and *d*, the outer face *d* being inclined at an angle of about five degrees, and both being provided with one or more openings for the reception of the cutters, substantially as described.

115,402.—CURTAIN-FIXTURE.—William C. Wilcox, Waltham, Mass.

Claim.—The hook E, as made and provided with the elastic tongue or spring brake *e′*, as described and shown.

115,403.—STOP-MOTION FOR WARPING-MACHINES.—Paul Wilson and James Hunter, Manchester, N. H.

Claim.—1. The combination, with the belt-shipper K, of the grooved roller R, the dropping-hooks or detectors, and the trough F, the latter having one or both sides pivoted, and carrying the crank-ed bar L, said cranked bar being arranged with the shipper, substantially as specified.

2. The friction ratchet-wheel for arresting the momentum of the driving-shaft, constructed and arranged substantially as specified.

115,404.—PRINTERS' FURNITURE.—William H. Windsor, Little Rock, Ark.

Claim.—The chase proper, having the notch C formed in the corner for arranging the heads of the two screws on the outside, substantially as and for the purpose specified.

115,405.—SWEDGE FOR HORSESHOE-CALKS. Edwin D. Withers, Parkton, Md.

Claim.—The above-described swedges, figs. 1 and 4, sheet 1, for the manufacture of horseshoes or horseshoe-calks, substantially in the manner and for the purposes set forth.

115,406, antedated May 17, 1871.—MECHANICAL MOVEMENT.—Jacob Woolf, Burr Oak, Mich.

Claim.—One or more weights, H, levers G, and inclines C, adapted to operate in connection, substantially in the manner set forth.

115,407, antedated May 22, 1871.—REMEDY FOR WORMS.—Ann E. Wright, Hamlin, N. Y.

Claim.—The worm-mixture, composed of the ingredients herein set forth.

115,408.—TABLE-SINK.—John Wylie, Bethel, Conn.

Claim.—The combination of the sink, *a*, with a hinged cover, *c*, drainer *d*, rack *e*, and bracket-shelves *b f*, substantially as set forth.

115,409.—MANUFACTURE OF ICE.—Albert Albertson, Jersey City, N. J.

Claim.—1. The herein-described method of forming blocks of ice by freezing the water in thin layers upon a moving surface, substantially in the manner set forth.

2. The combination of the water-tank C, revolving rollers C′ C′, and core D constructed with hollow walls, all arranged in a freezing-chamber, to operate substantially as set forth.

3. The combination of the revolving hollow core D and scrapers E upon the ends of the water-tank C, substantially as and for the purpose set forth.

4. The combination of the revolving hollow core D and deflector F, arranged to operate substantially as set forth.

5. The combination of the reservoir B and induction-valve B^1, which is automatically operated by a float, B^2, and a lever, B^3, to regulate the height of the water in the reservoir, substantially as set forth.

115,410. — SPRING-ADJUSTER.—Solomon A. Alexander, Sunbury, Pa.

Claim.—A spring-adjuster, consisting of a frame, *a d*, having fluid-chamber *e*, rams *b* and *c*, and screw *f*, the whole constructed substantially as and for the purposes set forth.

115,411.—ATTACHMENT TO THE CUTTING APPARATUS OF HARVESTERS.—Alexander Anderson and Leslie Johnston, London, Canada.

Claim.—In combination with supplementary fingers A, applied to the fingers as herein described, the supplementary shoe B applied to the divider by bolt E and shackle *v*, and constructed substantially as shown and described, for the purpose set forth.

115,412.—FLOUR-BOLT.—Ephraim D. Auchey, Manheim, assignor to himself and Francis J. Martin, Lancaster, Pa.

Claim.—1. The arrangement of a reel-head, H′, with its curved arms or spokes *h*, hollow gudgeons G′, in combination with the ribs I and head H, with its hollow gudgeon G, all substantially made in the manner and for the purpose specified.

2. In combination with the hollow gudgeons G′ G of the reel, the arrangement of the fan-shaft D, wings F, spider or arms *f*, and pulley E, or its equivalent, for imparting motion to a fan when said fan is within the reel of a flour-bolt, substantially in the manner shown, and for the purpose set forth.

115,413.—MACHINE FOR MAKING SPIRAL-WIRE SPRINGS.—Thomas Baggott, Baltimore, Md., assignor to himself and George J. Dufur, same place.

Claim.—1. As an improvement in machines for making spiral-wire springs, the combination of the overhung spirally-grooved former G with mechan-

ism to impart to said former a reciprocating rotation, substantially as described.

2. In combination with former G having a reciprocating rotation, the head D and springs D', arranged to operate substantially as set forth.

3. In combination with the shaft B communicating a continuous rotation to the head D and springs D', the segmental rack H and arms H^1 H^2, for communicating a reciprocating rotation to the former G, substantially as set forth.

115,414. — SAND-PAPERING MACHINE.—Joseph Barker, Chicago, Ill.

Claim.—1. The wheel K, formed with a recess or depression in the central part of its under side to obviate a dead point in said wheel when it is used for finishing flat surfaces, as described.

2. The wheel K, provided with a recess on its under side to obviate a dead point, and with a series of sectional blocks, N, to hold the sand-paper *f* in place when said wheel is used for finishing flat surfaces, substantially as described.

3. The wheel R, provided with openings P and furrows between the sectional blocks N, and under arms *g*, for allowing air to carry out the dust, as specified.

115,415. — PRUNING-SHEARS.—Albert Barling, West Chester, Pa.

Claim.—1. The hook or jaw *d*, provided with serrations *e* and a rebate or recess alongside thereof, its inner edge being square or right-angular, as set forth and shown.

2. The movable jaw *d*, provided with shank *e* bent at a right angle, the fixed jaw *d* provided with serrations and a rebate, the link *i*, shanks *g h*, and handles *f f*, all constructed and arranged as shown and described.

115,416.—WASH-BOARD.—Hartwell H. Bellows, Brooklyn, N. Y.

Claim.—The arrangement, in combination, of the single, lateral, convex surfaces E E, central depression F in the middle, and the plane faces G G at the ends of the wash-board face B, for the purpose specified.

115,417.—REFINING RAW SUGAR.—Richard William Bender, Boston, Mass.

Claim.—The improvement in refining raw sugar, substantially as described.

115,418.—SASH-BALANCE.—George W. Bishop, Saratoga Springs, N. Y.

Claim.—The clamp K, constructed with bars L and M and spring A, together with an operating device, when inserted in the meeting-rail of the sash for holding the cord, substantially as and for the purpose specified.

115,419. — WEIGHING-SCALE. — William Black, Baltimore, Md.

Claim.—The combination of a sliding counterbalance scale, constructed as described, with a holder and guard, E *e''*, made in one piece, and adapted to be hung loosely upon nails or pegs by means of loops *e' e'* on opposite sides of the link *a*, where the scale-beam is suspended, substantially as described, and for the purposes specified.

115,420. — PRESSURE-GAUGE.—Richard C. Blake, Cincinnati, Ohio.

Claim.—1. In the described connection with the diaphragm E, the gaskets F G, metallic ring H, and screw-threaded follower I, the latter being provided with projecting ring or collar *i*, the whole being combined and operating substantially in the manner and for the purpose set forth.

2. In combination with the segment *J j* and pivoted bar M, connected as shown, the lugs *c c'* and set-screws *d d'*, for the purpose specified.

115,421.—SPIKE-EXTRACTOR.—John A. Borgort, Jersey City, N. J.

Claim.—The combination of the lifting-lever C, intermediate link E, hinged die-plate H, and guide-strap K, arranged and operating substantially as hereinbefore set forth.

115,422.—BOOT AND SHOE.—Augustus O. Bourn, Providence, R. I.

Claim.—1. The combined vamp and quarter for boots and shoes, composed of rubber and a textile fabric practically elastic in but one direction, cut as described with reference to the elastic line, and requiring, above the soles or foxing, either one single non-elastic vertical heel-seam, or in lieu thereof a single longitudinally elastic instep-seam, substantially as shown and described.

2. The herein-described improved boot or shoe, composed in part of rubber and a textile fabric practically elastic in but one direction, the entire vamps and quarters of which are wholly elastic longitudinally, and in which all seams above the foxing or soles are vertically non-elastic or longitudinally elastic, as and for the purposes specified.

3. The improved overshoe, consisting of the longitudinally elastic vamp and quarter composed of a textile fabric and of rubber, practically elastic in but one direction, and of the rubber soles and foxing, substantially as described.

115,423. — STEAM-HEATER.—Noah Bowen, Columbus, Ohio.

Claim.—1. The hollow sections A of a heating apparatus united so as to communicate with each other by means of ball-joints C, for the purpose described.

2. The middle heating-section or sections A, supported endwise by the intermatching hollow ribs D of the outside sections, and vertically by and upon the communicating ball-joints, thus dispensing with fastenings for the middle sections, as described.

3. The pipe I, when arranged to enter the section A after having first passed directly from the boiler-pipe into the hot-air flue, for the purpose of increasing the draught by increasing the heat of said flue, and also heating the nest of sections quicker, as described.

4. The several sections A of the heating apparatus secured together by means of bolts E, arranged in a triangular form, so as to embrace within their bearings the hollow globe-joints C and their communicating tube-connections, to equalize the adjustment of the joints, as described.

5. To compensate for the expansion and contraction of the heating apparatus under varying temperatures of heat and cold, mounting the two outside sections upon rollers fitted to move upon a track, and thus prevent the breaking of the joints of the steam-pipes connecting the apparatus with the generator, as described.

6. The valve *d*, with its adjustable stop-plate *e* and tubular screw-cap *b*, as applied to one or more sections of a steam-heating apparatus, as described.

7. The combination of the heating-sections A, the intermatching hollow ribs D, the ball-communicating and sustaining-joints C, the connecting-rods E, the induction and exhaust-pipes G and H, and the regulating escape-valves, the several parts being constructed and arranged as and for the purpose described.

115,424.—LATHE FOR TURNING AXLES.—Adam J. Bower, Albion, Ill.

Claim.—1. In combination with a tail-block C, constructed with a center, K, which is adjustable both laterally and vertically, the rotary cutter-head R U, connected and operating as described, and for the purpose specified.

2. The combination of the tail-block C, adjustable blocks L and M, screws *d* and N, and nut P, as described, and for the purpose set forth.

3. The chuck, composed of the parts *f g h i*, as described, and for the purpose specified.

4. In combination with the cutters U, the adjustable slides W, screws X, gear-wheels Y, G, and H, and counter-spindle I, connected and operating substantially in the manner and for the purpose set forth.

115,425.—PROPULSION OF VESSELS.—Richard Boyman Boyman, London, England.

Claim.—The tubes for steam-jet propelling and backing, in combination with the curved reaction-tube, for propulsion, operating substantially as and for the purpose set forth.

115,426.—SINKER-WHEEL FOR KNITTING-MACHINES.—Horace C. Bradford, Providence, R. I.

Claim.—The improved sinker-wheel for rotary knitting-machines herein described, the teeth of which are bent or curved at their tips, as and for the purposes specified.

115,427.—CORN-CULTIVATOR.—Gustavus D. Brown, Lebanon, Ill.

Claim. — In a cultivator, the arrangement of standard-guides F F' having slots *f*, plows E, standards E' having holes *e*, hand-levers G, ratchet standard f^3, plow-frame A having holes *f'*, tongue B, hand-bar C, segmental bar C', seat-bar D', and seat D made adjustable, when all said parts are constructed to operate as described.

115,428.—MUSICAL TRANSPOSING-BOARD.—John M. Bruner, Roanoke, Ohio.

Claim.—1. The combined arrangement of the lettered scale, the several slides A B C, and the pointers, as and for the purposes herein specified.

2. The combination of the musical staves, lettered scale, slides A B C, pointers, and reversible slide D, marked on one side for flats and on the other for sharps, and provided with shutters for masking any desired number of the said signature marks.

115,429.—APPARATUS FOR DISTILLING TURPENTINE, &c. — Charles J. T. Burcey, Black Rock, Conn.

Claim.—1. The pipes N, provided with perforated heads, and arranged within the still, substantially in the manner described.

2. In combination with the pipes N, the outer encircling pipe *m*, provided with stop-cocks for pipes N, substantially as described.

3. In distilling apparatus, the reservoir H, worm-vessel J, coil J', and pipe *L'*, arranged and combined to operate substantially as described.

4. In combination with the next above, the bulb-valve *a'* in reservoir H, and stop-cock K in pipe *L'*, to equalize the influx of matter to be distilled with the efflux of matter distilled, substantially as described.

5. In combination with worm-vessel J and worm-tub G', the pipe I, when arranged to operate, substantially as described.

6. The serpentine pipe *r* around the discharge-pipe *s*, substantially as and for the purpose set forth.

7. In combination with a distilling apparatus, a filter, 5, constructed and arranged substantially as herein described.

115,430.—MATCH-BOX.—Denslow Burhans, Burlington, Iowa.

Claim.—The match-box and holder combined, constructed of the material and form described, as and for the purpose herein specified.

115,431, antedated May 26, 1871.—GRAIN-DRIER.—Jabez Burns, New York, N. Y.

Claim.—The jacket B, provided with an internal spiral flange, in combination with the perforated cylinder A, containing flanges *h h'*, and capable of being revolved together with the jacket, substantially as set forth.

115,432. — RIVET. — William Butterfield, Boston, Mass., assignor to himself and Charles E. Woodman, same place.

Claim.—The rivet described, having the slotted shank A, the slot dividing the shank into rounded and pointed sections, substantially as described.

115,433. — CAR-COUPLING. — William Callow, Jr., Baltimore, Md.

Claim.—1. The bumpers A C, constructed with enlarged solid convex faces, strengthened by means of ribs F F, and arranged to act in the double capacity of coupling and bumper, substantially as set forth.

2. In combination with the combined bumper and coupling constructed as herein described, the chain connections, all arranged to operate in the manner and for the purpose specified.

115,434, antedated May 19.—MINNOW-PROPELLER.—William D. Chapman, Theresa, N. Y.

Claim.—A minnow-propeller, composed of the body A, formed of the two convex plates, secured together at their edges so as to embrace the tail-piece B, and provided with the openings *a* and *a'*, and having attached to its end and sides, or either, as may be desired, the hooks C and E, substantially as and for the purpose specified.

115,435.—TWISTING AND SPINNING-HEAD.—John W. Chappell, Berlin, Mich., assignor to himself and Dennis Macomber, same place.

Claim.—1. In combination with a carding-cylinder, H, the above-described spinning-head and spool mechanism, operating substantially as and for the purposes specified

2. In spinning-heads, the rolls B B, slowly revolving in opposite directions on their own axes, and rotated, at the same time, in a plane at right angles to their axes, and having the reversely-obliqued teeth on the edges thereof, all substantially as and for the purpose specified.

3. The tube D having wiper F, and rolls B B having reversely-obliqued teeth on their edges, combined and operated together, as and for the purpose specified.

115,436.—SEWING-MACHINE MOTOR.—David A. Constable and John F. Riggs, St. Joseph, Mo.; said Riggs assigns his right to said Constable.

Claim.—1. The blades *a*, hinged and arranged in connection with the opening and closing apparatus, and combined with the motor mechanism for sewing, &c., as shown and described, whereby they are adapted to regulate the speed of the machine, as set forth.

2. The combination of the spring brake *o*, link *n*, and treadle *l*, with a motor mechanism, as described.

3. The apparatus herein described, constructed, arranged, and operating as explained.

115,437. — STEAM-COOKING APPARATUS.—John Graham Cooey, St. John, Canada.

Claim.—The combination of the sections designated on Figure 2 by the letters B C D, with the adjustable vegetable boiler and strainer designated on fig. 7, and the dome, designated by letter A on fig. 1, and also the cold-air condensing space, designated on fig. 3 by the letter H, with the spout, designated on fig. 1 by letter *c*, and the gutter, designated on fig. 3 by the letters *b b*, for reconducting the steam to the boiler, substantially as and for the purposes hereinbefore set forth.

115,438, antedated May 26, 1871. — SURFACE-GAUGE. — William F. Cornell, Adrian, Mich.

Claim.—The tapering shoulder *i* on the head H, the slot or opening *n*, and the recessed seat *l* in the end of clasp E, as and for the purpose set forth.

115,439. — ADJUSTABLE DRAW-HEAD FOR RAILROAD CARS.—David P. Cory and Josiah Crane, Jr., Crawford, N. J.

Claim.—The combination of the draw-head C, rear block B or its equivalent, block D, frame E, bolt *a*, and wrench-nut *b*, all constructed and ar-

ranged to operate substantially as and for the purposes herein set forth.

115,440. — Feather-Renovator. — Benjamin Franklin Cramer, Tyrone, Pa.

Claim.—The feather-renovator herein described, having revolving case A, drying-space C, feather-chamber, as represented, perforated steam-chamber G' arranged in the door G, as shown, together with the notched cleats F and pipes and cocks, as described, constructed, and arranged, substantially as specified.

115,441. — Cotton-Gin Saw. — Thomas C. Craven, Philadelphia, Pa., assignor to Barton H. Jenks, same place.

Claim.—As a new manufacture, a corrugated saw for cotton-gins, substantially as set forth.

115,442.—Standard for Drop-Lights.—James Cunningham, West Meriden, Conn., assignor to Bradley & Hubbard, same place.

Claim.—In combination with the tube A and cylinder B, the spring D arranged within the cylinder, the packing *a b*, and adjusting-plug E, substantially in the manner herein set forth.

115,443.—Machine for Rolling Leather.—John G. Curtis, Warren, Pa.

Claim.—The combination of the rollers G with the bearing-blocks K and weighted blocks I, forming a track for said rollers G, for the purpose herein described.

115,444. — Hot-air Furnace. — Mark A. Cushing, Aurora, Ill.

Claim. — The construction and arrangement, within the casing F, of the ash-pit A, fire-pot B, flue J, and crescent-shaped radiator H, having a sleeved or extensible exit-pipe, K, and with or without the air-pipes I, substantially as described, and for the purpose specified.

115,445.—Permutation-Lock.—George L. Damon, Cambridge, Mass.

Claim.—1. The lever O and arm Y, the lever O hung to a fixed point of the bolt Q and the arm Y to the case, and the two connected together through pin X and slot W for the lever O to move on the arm Y, and both constructed and arranged to interlock with the tumblers B and fixed disk V of spindle C, as described, for the purpose specified.

2. The bushing H^2, having a female-screw thread, a shoulder, K^2, and a flange, I^2, in combination with annular screw-nut M^2, and spindle C, as and for the purpose described.

3. An index or pointer, F, having an elongated slot, *n*, as and for the purpose described.

115,446.—Process of Seasoning Wood.—Ezra Davee, Marshall, Ill.

Claim.—1. The process for seasoning timber, substantially as herein described.

2. Seasoning timber by the agency of heat applied through an intervening wall or interval of earth, substantially as herein described.

115,447.—Sliding Gas-Joint for Extension Drop-Lights.—Charles Deave, New York, N. Y., assignor to the Archer and Pancoast Manufacturing Company, same place.

Claim.—The case B C, of conical form at its inner extremities, in combination with the flexible packing *e e* at each end, and the interposed spiral spring S, as shown and described.

115,448.—Locking-Latch for Gates. — Jonathan L. Devol, Parkersburg, West Va.

Claim.—In a gate-latch substantially such as described, the combination of the jaws A B and sliding plate G, serving to lock them, and operating in the manner set forth.

115,449, antedated May 18, 1871.—Axle-Box.—Davis Henry Dotterer, Philadelphia, Pa.

Claim.—1. In an axle-box, the combination of the journal of the axle with an annular or bell-shaped bearing, F, hung to and arranged to turn within the box, substantially as described.

2. The said journal and bearing, when geared together to insure a positive movement of the bearing, as set forth.

3. The combination, with the bearing, of a strengthening-band or collar, *h*, of wrought-iron or steel.

4. The combination of the openings *j*, arranged at the front of the bearing, and recessed at the edges, and passages *k* for conducting lubricating material from said recessed edges to the pin G, to which the bearing is hung.

5. The pin G, adapted to a recess at one side of the box, and to a block, H, fitted to and arranged to have a limited movement in an opening, *d'*, in the opposite side of the box, all substantially as described.

6. The trunnions I, resting in bearings supported by springs *v*, as specified.

115,450. — Tackle-Block. — Ellis Doty, Janesville, Wis.

Claim.—1. In a tackle-block, the independent wheels C C' C'', graduated to make their revolutions in equal times, substantially as specified.

2. In a tackle-block, a wheel provided with an extended hub to serve as a bearing for the other wheels of the block, substantially as specified.

115,451.—Machine for Tapping Nuts.—John N. Durrell, Dunkirk, N. Y.

Claim.—1. In machines for tapping nuts, the annular groove a^3 in the bed A, arranged with a series of taps and tap-spindles, the former pointing upward, and the latter arranged in the bed A, as hereinbefore set forth.

2. The arrangement, in relation to one another, to the table A, and central shaft C, of the series of tap-spindles, the series of fixed gear-wheels, and the several series of interchangeable gear-wheels, substantially as described.

3. The connection of the upper reservoir F with the table A by means of the slides E placed respectively between and equidistant from the tap-spindles, as described, for the twofold purpose of supporting said reservoir and guiding the nut-holders, substantially as hereinbefore set forth.

4. The construction of the tap-holders with a hole in each extending from end to end, and, jointly therewith, the arrangement of them in the table in a circular series, as described.

5. The stops I, constructed in halves *i i*, formed with offsets, and secured to the slides by a clamp-screw, *i*, in the manner and for the purpose hereinbefore set forth.

115,452. — Driven Well. — Jacob Edson, Boston, Mass.

Claim.—The combination of the suction-pipe *a*, holes *b b b*, the pointer *c* welded to the suction-pipe, and the corrugated perforated strainer *d*, when all are arranged and combined substantially as set forth and described.

115,453.—Wagon-Coupling.—Amos Fassett, Sterling, Ill.

Claim.—The combination of the plate A', tube *a*, with its exterior lugs *b b* and the interior lugs *a' a'*, the tube *d*, and support C with the recesses *c' c'*, and the plate D, tube *d*, and exterior flanges *d' d'*, all arranged to operate as herein set forth and shown.

115,454. — Spring Wagon-Seat. — Amos Fassett, Sterling, Ill.

Claim.—The combination of the hollow posts C, ferrule B, guides B' B', rod D, and springs *d*, when said posts C serve as the standards for the seat-rail, and the whole is arranged in connection with the seat so as to operate in the manner and for the purposes herein set forth.

115,455.—Watch-Case Spring.—Wesley Fenimore, Philadelphia, Pa.

Claim.—A watch-case spring, consisting of a block, adapted to, but detachable from, the case of a watch, and a strip of steel, having an uncut "skin" formed, in drawing or rolling the said strip, and secured to said block, as specified.

115,456.—Show-Stand.—William Fisher, New York, N. Y.

Claim. — The combination of the glass plates, shelves, or receptacles G G G, metal columns C C C, interposed washers *e e*, and central screw-bolts and nuts, substantially as and for the purpose herein set forth.

115,457.—Combined Concrete and Wood Pavement. — Mark Flanigan, Detroit, Mich., assignor to himself and Harvey D. Winser, same place.

Claim.—A pavement composed of small cylindrically-shaped blocks A, placed upon a composite, bed, B, and held in place by the composite filling C, substantially as set forth.

115,458. — Lamp-Chimney. — Samuel W. Fowler, Brooklyn, N. Y.

Claim.—The new article of manufacture of a lamp-chimney, constructed with a circular base, a contracted neck, an oval or elliptical flue, when said flue is provided with straight sides and when the opening through the neck is of less area than the opening at the top of the chimney or at any point along the flue, substantially as herein specified.

115,459. — Cultivator. — Conrad Furst, Chicago, Ill.

Claim.—1. The frame A, constructed as described, and extending back of the axles, when so combined with the short axles C that the ends of the plow-beams may be raised and lowered, substantially as and for the purposes specified.

2. The adjustable bars J, when combined with the frame and plow-beams so as to move with the beams E, substantially as described.

115,460.—Medical Compound.—George H. Goltry and Frederick W. Hogarth, Port Allegheny, Pa.

Claim.—The fluid extract of *uva ursi*, prepared of the ingredients and in the proportions substantially as herein set forth.

115,461. — Clothes-Drier. — Fred. W. Goodale and John J. Brennan, Danbury, Conn.

Claim.—The combination of the posts A and A' having slots or grooves *a a* therein, and cross-ties or rounds *d* and *d'*, and forming the end frames, with the folding slats B B B and cross-rods C', C'', and C''', when constructed and arranged to operate in the manner and for the purpose described.

115,462.—Canceled.

115,463.—Metallic Packing for Stuffing-Boxes.—Albert H. Hall and Theophilus Locher, Sacramento, Cal.

Claim.—The projections G G on ring F, substantially as herein described, and for the purpose set forth.

115,464.—Alarm-Baton.—John F. Haskins, Fitchburg, Mass.

Claim.—1. A pneumatic alarm or signal, consisting of a pump-cylinder, a piston, and a whistle or sonorific vibrator, constructed, combined, and relatively arranged, substantially as shown and described.

2. The air-pump, having an orifice through which the air is both admitted and ejected without any valve or valvular mechanism, and having a sonorific vibrator in combination with such pump.

115,465.—Combined Hand-Spinning and Reeling-Machine.—William P. Hatch, Lincoln Centre, Me.

Claim.—1. The combination and arrangement of the friction driving-wheel A, standard *t*, rocker-bar *r*, screw *s*, friction-wheel *a*, speed-wheel C, belt H, small pulley *l*, and spindle *v*, as herein described, for the purposes set forth.

2. The combination and arrangement of the friction driving-wheel A, standard *t*, rocker-bar *r*, screw *s*, friction-wheel *z*, pulley *c*, belt *w*, pulley *d*, and reel *g*, as herein set forth, for the purposes described.

115,466.—Lamp-Burner.—Hiram W. Hayden, Waterbury, Conn., assignor to Holmes, Booth & Haydens, same place.

Claim.—1. The interior air-tube *e*, made out of one piece of metal, notched, bent, and soldered in the manner and for the purposes set forth.

2. The guide *m* for the rack *l*, made of the metal of the burner-shell, and projecting inside the wick-tube *e*, as and for the purposes set forth.

3. The exterior Argand wick-tube *a* united to the shell of the burner by passing said tube through the metal of the shell and spreading said tube above and below said shell, as specified.

4. The reducing band 5, made with an internal screw for the burner-screw *b*, and an external screw, 6, of smaller diameter for the reservoir, as and for the purposes set forth.

115,467.—Coffee-Pot.—John Heberling, Mount Pleasant, Ohio.

Claim.—A coffee-generator and leacher having its sides and bottom perforated, and provided with a screen-bottomed funnel, C, and a lifting-handle, D, formed with a hook, E, all as herein shown and described.

115,468.—Cooling and Preserving Beer and other Liquids on Draught.—John M. Heiss, Baltimore, Md.

Claim.—The combination of the boilers B B', the pipes C, F F', and H H', with their respective cocks and gauge, acting upon any number of kegs, barrels, &c., that may be desired, together with the receiver M and its pipes, and the ice-box or chest N, the whole arranged for the purpose herein set forth, and substantially as described.

115,469.—Thread-Cutter.—John Joseph Henry, Baltimore, Md., assignor to himself and W. D. Williams, same place.

Claim. — The removable cutter C, fitting in grooves in the plate A, and hook B, substantially as shown and described.

115,470. — Railway Switch. — Benjamin Hinkley, Troy, N. Y.

Claim.—1. The sliding table D, with the rail sections C C' inclined to each other and fast thereon, when arranged in combination with the crossing-rails A A^1 and B B^1, substantially as described.

2. The combination of the sliding table, having inclined rail-sections C C' fast thereon, with the switch-rails J J' and track-rails A A^1 A^2 and B B^1 B^2, substantially as herein set forth.

115,471.—Fire-Proof Roof.—Isaac Hodgson and William H. Brown, Indianapolis, Ind.

Claim.—1. In a slate roof, the hooks D, for holding the slate E, in combination with the hollow

flanged laths C, with which said hooks interlock, essentially as described.

2. The slate E, held and secured in position at both ends, its outer one by means of the hook D, and its inner lapped end by the flange of the hollow lath, as described.

3. In a fire-proof slate roof, the combination, with the beams A, of the grooved flanged plates B, the hollow flanged laths C, and the hooks D, the several parts forming a frame for supporting the laths and slate, and locking the latter thereto, as described.

115,472.—Fire-Proof Beam, Floor, and Ceiling.—Isaac Hodgson and William H. Brown, Indianapolis, Ind.

Claim.—1. The plates B for securing the flooring to the beams, arranged as described, supported upon said beams by the flanges D, and having also flanges C for the support of the corrugated plates G of the flooring, as described.

2. The grooved plates B of the beams A, in combination with the dogs or nails E, constructed and applied to said plates and the flooring, as described, as a means for securing the flooring to said beams, as described.

3. The perforated lath-suspender I for securing and suspending the laths to the beams A, as described.

4. A metallic lath, hollow, and heart-shaped in its cross-section, and open at the bottom, as and for the purpose described.

5. In a fire-proof flooring, the combination with the beams A of the grooved flanged plates B, sliding knee-dogs E, the corrugated metal-plates G, hollow open laths J, and their perforated suspender I, the several parts being constructed and arranged essentially as described.

115,473.—Machine for Whitening and Shaving Skins and Leather.—Jabez Hodskinson, Salem, Mass.

Claim.—1. The longitudinally-reciprocating table G, in combination with the vertically-reciprocating cross-head O, with its attachments, substantially as described.

2. The sliding cross-head O, provided with the transverse cross-head P and its connections, as and for the purpose set forth.

3. The sliding plate *m*, with its pivoted rods *p p*, connected to cross-head P by cords *o o*, and to lever *d* by rod *r*, in combination with the track *l* and pulleys *n n'*, substantially as described.

4. The bell-crank levers *c d*, in combination with cams E F, operating the rocking-shaft L and cross-heads O P, all arranged and operating substantially as described.

5. The bent lever *f* for shipping or disconnecting levers *c d* from cams E F, substantially as described.

6. The shaft S, provided with cutters T and revolved by cogs U V and ratchet W, substantially as described.

7. The disk *s*, provided with depressions with which the dog *t* engages to hold the shaft S, substantially as described.

8. The circular table A' and roller B', in combination with cutters T, for treating skins when in a damp condition, substantially as described.

9. The adjustable guard C', in combination with the cutters T, substantially as described.

115,474.—Oyster-Shucker.—George Holtzmann, Baltimore, Md.

Claim.—1. The combination of the frame A, socket B, jaw C, and lever D, as specified.

2. The combination of the standards G, rest F, case H, blade L, spring plate I, and lever M, as described.

3. The combination of the standard P and universally-jointed blade O, as and for the purpose specified.

115,475.—Pavement.—William Wheeler Hubbell, Philadelphia, Pa.

Claim.—The manner hereinbefore described of building up the concrete and stone pavement by the application of a solution of lime with dry coal-ashes or gravel, and Rosendale or hydraulic cement, mixed and sifted into the crevices of the broken stone so that the broken stone shall interlock between the bed and each other with this concrete between them, and form the stone and concrete surface described.

115,476.—Open-Front Stove and Fire-Place.—James G. Hunt, Cincinnati, Ohio.

Claim.—1. In an open fire-place or open stove, the grate A and receptacle B, located relatively to each other, and operating in the manner described.

2. The air-chamber C, perforated back D, and receptacle B, when combined and operating as described.

115,477.—Steam-Heater.—Albert L. Ide, Springfield, Ill.

Claim.—The construction and relative arrangement of the cold-air duct F, the pipe-chamber E, the steam-pipes C, and the distributing-chambers G, substantially as and for the purpose specified.

115,478.—Valve-Motion.—Simon Ingersoll, Brooklyn, N. Y.

Claim.—The tappet-lever K, with its beveled tappets *k*, in combination with the piston P, and bent lever H to give motion to the valve-stem 9 and cause it to slide within the steam-chest F, substantially as and for the purpose set forth.

115,479.—Safe.—George H. Ireland, Somerville, Mass.

Claim.—1. A vault, safe, or chamber constructed, as set forth, of masonry, in combination with a metallic frame arranged to interlock with the said masonry, substantially as and for the purpose described.

2. In combination with the above, the entrance to the vault, constructed as described, together with a door arranged to fit therein of hydraulic cement, substantially as and for the purpose specified.

115,480.—Machine for Cutting off Horseshoe-Nails.—Charles Fred. Johnson, Jr., Owego, N. Y.

Claim.—1. As an improvement in machines for making nails for horseshoes, the combination of a stationary cutter, a rotating cutter, and mechanism for giving to the latter a variable velocity so as to cause it to approach and recede from the anvil at a comparatively slow speed, and to cross said anvil rapidly, substantially as and for the purpose specified.

2. The revolving disk I, the pivoted arm L, the pin *l*, the anvil A, the reciprocating carrier R, provided with the spring S, and the cutters M and N when combined with each other and with suitable actuating mechanism for operating the same, substantially as and for the purpose shown.

115,481.—Striking Mechanism of Clocks.—George A. Jones, New York, N. Y., and Horace H. Warner, Bristol, Conn., assignors to George A. Jones.

Claim.—The lever A and lever B hinged thereto, when the same are constructed and arranged for joint operation, as herein described, in combination with the click C, rack D, wheel E, and springs I, as shown and set forth.

115,482.—Rocking-Grate Bar.—James Jones, Rochester, N. Y.

Claim.—1. The combination, in a grate-bar, of the segmental spiral flanges *b b* with the axle A, substantially as and for the purpose described.

2. The arrangement of the truss C in relation to the ends *a a* of the flanges *b b*, so as to form the two draught and discharge-spaces I I, in the manner and for the purpose described.

3. The grate-bar, in which the axle A, flanges *b* *b*, truss C, and braces *d* are employed in combination, substantially as described, for the purpose specified.

115,483.—Revolving Fire-Arm.—Benjamin Franklin Joslyn, New York, N. Y., assignor to Tomes, Melvain & Co., same place.

Claim.—1. The combination, with the cylinder of a revolving fire-arm, of a sliding breech-piece, H, operating substantially as and for the purposes specified.

2. The said movable breech-piece, operated in one direction by a projection or projections, *i*, on the face of the hammer, on the descent of the latter, and in the opposite direction by a spring, *g*, or its equivalent, when the said hammer is raised, all substantially as described.

3. The combination, substantially as herein described, of the said movable breech-piece, the hammer, and a fixed pin, J, of the frame of the fire-arm.

4. The firing-pin *k*, adapted to an opening in the movable breech, and so combined with the latter and the hammer that it shall be thrust forward by an incline, *i*, on the latter, after the completion of the forward movement of the said breech-piece.

5. The ejecting-rod *k*, consisting of two sections, *p* and *p'*, hinged or swiveled together, and arranged to be operated substantially in the manner described.

115,484.—Compound for Staining Wood.—John Michael Keller, Evansville, Ind.

Claim.—The compound for staining wood herein described, compounded in the manner, of the ingredients, and in the proportions specified.

115,485.—Bedstead.—Michael Lally, East Palestine, Ohio.

Claim.—The center slat F', provided with the studs *g*, in combination with the side rails A and supporting-strips E, provided with the locking-plates H, substantially as and for the purpose specified.

115,486.—Machine for Washing Coal.—George Lander, New York, N. Y.

Claim.—1. The adjustable gate D, combined with and arranged to serve, as represented, relatively to the perforated flooring A, tank or bash N, and means B L for inducing an alternate up-and-down motion of the water through the openings in the flooring A, so that the coal and the foreign matter, while it may be tumbled promiscuously in any convenient quantities on the receiving sides of the partition D, will be introduced to the separating side thereof at the desired rate and at a uniform level, as herein specified.

2. The dead-flooring A', in combination with the gate D and with the perforated flooring A, bash N, and means for inducing an alternate up-and-down motion of the water through the perforated portion of the flooring, as specified.

115,487.—Skate.—Beecher M. Lank, Oswego, Kan.

Claim.—A runner for skates, composed of two parts or sections hinged together so that they may be swung apart, but still be held in true and proper position for grinding, and when ground be swung together and fastened into one, as it were, substantially as and for the purpose herein described and represented.

115,488, antedated May 27, 1871.—Comb and Brush.—Tolbert Lanston, Washington, D. C.

Claim.—A comb and brush attached to the same handle, and combined in such a manner that both operate on the hair at the same time.

115,489.—Granulated Photograph.—William Augustus Leggo, Montreal, Canada.

Claim.—1. The granulated positive, produced as described.

2. The granulated negative, produced as described.

115,490.—Process for Obtaining Molds for Electrotyping Purposes.—William Augustus Leggo, Montreal, Canada, assignor to himself and George Edward Desbarats, same place.

Claim.—1. The mole-skin, or its equivalent, in the manner and for the purpose substantially as herein shown and described.

2. The employment of the wax sheet, or its equivalent, to receive the impression, in connection with the mole-skin, substantially as described.

3. The taking of a second impression from the face of the types upon the wax sheet, or its equivalent, substantially as described.

4. The general method, herein described, of obtaining finished molds for electrotype and other purposes.

115,491.—Roller for Wringers.—John Makechney, Trenton, N. J.

Claim.—The shaft A provided with longitudinal slots or openings, in and around which the rubber cylinder B is formed, substantially as and for the purposes herein set forth.

115,492.—Head-Block.—Henry R. Martin, Hillsborough, N. H.

Claim.—The chains I I and sprocket-wheels H H, mounted and operating, as hereinbefore explained, to actuate the log-feeding or setting-carriage of saw-mills.

115,493.—Machine for Piercing Side Seams of Boots, &c.—William May, Binghamton, N. Y.

Claim.—1. The combination and arrangement of the series of awls and awl-plate C, and corresponding movable plate B, perforated plate F, gauge-bar G, and removable clamp I, substantially as and for the purpose herein set forth.

2. In combination with the plates B C F, gauge-bar G, and clamp I, the balance-wheel E, crank-shaft H provided with weighted arm *b*, and their connections, all being constructed and operating as hereinbefore described, for the purpose set forth.

115,494.—Electric Advertising-Cabinet.—Harry W. McAllister, Chicago, Ill.

Claim.—The cabinet A, when provided with advertising-spaces *a*, in combination with an electrical battery, D, so constructed and arranged as to be adapted to operate advertising mechanisms within said cabinet, substantially as specified.

115,495.—Fire-Plug.—John McClelland, Washington, D. C.

Claim.—1. The combination of the cam-cylinder G, provided with the cam-slots *e* and *f*, the operating-lever H, and the valve-rod E, substantially as shown and described.

2. The guides *d* and *b' m'*, located, respectively, below the main valve and above the delivery-port of the hydrant, in combination with the valve-stem and its operating device, substantially as shown and described.

3. The waste-water valve I, consisting of the weighted flap *n* and arm *p*, hinged to the interior wall of the hydrant, near its base, and adjacent to a suitable delivery-port, substantially as described.

4. In combination with a stack of hydrants, operated by axial valve-rods and supplied from a common chamber, the hanger F, and the radial guides *d*, substantially as shown and described.

115,496.—Churn-Dasher.—Jacob W. McClure, St. Louis, Mo.

Claim.—The metallic churn-dasher above described, consisting of the hub A, beveled above and concave beneath, the radial ribs C having the triangular cross-section shown in fig. 3, and the con-

centric rings D, spaced, as set forth, and having the cross-section shown in fig. 4, all as and for the purpose specified.

115,497. — CARRIAGE-WHEEL. — John McCreery, Springfield, Ill.

Claim.—A carriage-wheel, combining a raised centre, dodged spokes, metal bands, and bolts or rivets that connect the metal bands and pass through or between the spokes and through the solid wood of the hub, substantially as herein described.

115,498, antedated May 26, 1871. — CARTRIDGE.—Isaac M. Milbank, Greenfield Hill, Conn.

Claim.—1. The cylindrical case, of wood or similar material, receiving the ball, and made with a conical end and edge for cleaning the barrel, in combination with the rigid wad introduced in the cartridge-case between the powder and said ball and cylinder, as and for the purposes specified.

2. The projections *e e*, combined with the sectional charge *a b* and wad *c*, substantially as and for the purposes set forth.

115,499.—SAW-FRAME.—Henry S. Miller, Philadelphia, Pa., assignor of one-half his right to Samuel H. Davis, Jr., same place.

Claim.—The saw-frame herein shown and described, provided with the braces E of curved form pressing directly downward on the stretcher F, and yielding in the longitudinal direction of the frame, as and for the purpose specified.

115,500.—SAW-FRAME.—Henry S. Miller, Philadelphia, Pa., assignor of one-half his right to Samuel H. Davis, Jr., same place.

Claim.—The spring F, as arranged with the stretchers E E of the saw-frame, substantially as and for the purpose described.

115,501.—HIGH AND LOW-WATER INDICATOR FOR STEAM-BOILERS.—Frank Millward, Cincinnati, Ohio.

Claim.—A high or low-water indicator for steam-boilers having two chambers, C E, communicating with the water-line and steam-space of the boiler separately, and a diaphragm alarm-valve, B G, dividing the chambers, operated in one direction by a preponderance of pressure in one compartment created by the support of a hydrostatic column in the other, and in the opposite direction by any suitable retractile force, substantially in the manner and for the purpose set forth.

115,502.—MOUNTING AND WORKING ORDNANCE.—Alexander Moncrieff, Culfargie, Scotland.

Claim.—1. The combination herein described of the cylinder K, bar O, carriage N, and pipe K′, with elastic or non-elastic fluids for absorbing and storing up the force of the recoil of guns, and utilizing the same to raise the gun into firing position, as set forth.

2. The arrangement of the cylinders containing fluids or gases, as above described, with gun-carriages supported upon inclined slides, guides, or rails, substantially as described.

115,503.—ROCK-DRILL.—Duncan Morrison, Portland, assignor of one-half his right to Samuel Calderwood, same place, and F. F. Hall, Falmouth, Me.

Claim.—1. The combination of the pins *n n*, adjustable lever T with spring W, and adjustable post V, all constructed and arranged as described, for operating the immediate mechanism that rotates the drill, substantially as herein set forth.

2. In combination with the pins *n n*, upon the same shaft which carries the cams N N for raising the drill and the lever T, the slotted lever *m*, pawl *p*, and ratchet-wheel *k*, substantially as and for the purposes herein set forth.

115,504.—FELLY-PLATE.—Francis B. Morse, Plantsville, Conn., assignor to H. D. Smith & Co., same place.

Claim.—1. A felly-plate which, in the process of forming, is reduced or drawn from a point at or near the center to the edges, substantially as described.

2. A felly-plate having the flat seats *d d* formed around the bolt-holes *d*, as and for the purpose specified.

115,505.—FERTILIZER-DISTRIBUTER.—John A. Morton, New Orleans, La.

Claim.—1. The combination of the hopper A provided with followers G G G′, toothed cylinder C, and spout B, with the revolving axle and intermediate gear D and F, the parts being constructed and arranged in the manner and for the purpose herein set forth.

2. In combination with the hopper A, constructed as described, the cylinder L, arranged in the manner and for purpose set forth.

115,506.—GAS-BURNER.—Henry B. Myer, Philadelphia, Pa.

Claim.—The tube B, tip C, globe E, and mouth G, when arranged and combined as herein described, and for the purposes set forth.

115,507.—CAR-COUPLING.—William Nichols, Centralia, Ill.

Claim.—The wedge H, in combination of the link E and with the draw-bar A, constructed as described, and provided with the transverse slot G, substantially as and for the purpose specified.

115,508.—LOOM.—Archibald Nimmo, Philadelphia, Pa., assignor to himself, Thomas Moran, and Valentine Stausse, same place.

Claim.—1. The combination, with a drop-box, of graduated levers and slotted cams or their equivalents, the whole being arranged and operating substantially as described.

2. The combination of the slotted cams G G′ with double-hooked pawls I, controlled by a pattern-chain, the whole being arranged to operate in the manner described.

3. The levers L, controlled by the pattern-chain through the medium of a system of levers, *m*, hung to the said levers L, and controlled by pins on a cylinder, P, or by a supplementary pattern-chain on the said cylinder, all substantially as described.

4. The combination, with the supplementary levers *m m*′, of a series of pins, *n*, arranged on the cylinder P so as to operate the said levers successively when the roller is turned.

5. The combination of the projection *q*′ on the pattern-chain with the arm *q*, and with devices substantially as herein described, through the medium of which the roller P may be slightly turned at the termination of every complete movement of the pattern-chain.

6. A pattern-chain, the links of which are composed of two bars hinged or otherwise connected together so as to retain the pins of the pattern-chain in the manner described.

7. The hinged retaining-plate *s*, having journals which serve as pins for connecting the links of the chain together.

8. The said plate *s*, hinged to the bar *r*, as set forth, so as to be detached therefrom in the manner described.

115,509.—HINGE.—Edwin D. Norton, Cuba, N. Y.

Claim.—The combination of the pintle B, the perpendicular or nearly perpendicular offsets *c c*, the inclines of different angles upon bases of different widths, and the bearing-surfaces *d d*′, sustaining the entire weight of the gate when open, substantially as herein described.

115,510.—CHAIR FOR RAILROAD CARS.—William Palmer, New York, N. Y.

Claim.—1. The divided rack *r r* upon the base *a* and column *c*, in combination with the hinged foot-rest and pawl *u*, as set forth.

2. The cushion-board *d*′, pins 5 5, and holes 6 6 in the seat *d*, as and for the purposes set forth.

115,511.—PAPER FOR NAPKINS AND OTHER ARTICLES.—Edward Parrish, Philadelphia, Pa.

Claim.—1. A fabric, from which to make a substitute for woven towels, &c., consisting of the web or water-leaf dried after passing from the machine, without being pressed, and treated as set forth.

2. As a new manufacture, a sheet of said paper, having a wrinkled surface and forming a substitute for a woven towel or napkin.

115,512.—COMPOUND FOR EXTERMINATING VERMIN. — Ahira E. Pearl, Mansfield, Conn.

Claim.—A vermin-exterminator, the ingredients combined and compounded substantially as set forth.

115,513.—BUCKLE.—John Peckham, New Haven, Conn.

Claim.—The loop B, stuck out from a single piece of metal, with headed journals, substantially as and for the purpose set forth.

115,514. — DUMPING-CAR. —Alois Peteler, New Brighton, N. Y.

Claim.—1. The rockers *a*, provided with recesses *b*, resting in seats in the reach, in combination with inclined rails extending laterally from both sides of the reach and forming the supports for the rockers while the contents of the car are being dumped, substantially as set forth.

2. The rollers *d* in the ends of the box A, in combination with segmental rails *e* provided with hooks *g*, substantially as and for the purpose described.

115,515. — GRATE.—James Fisher Phelps, Huntsville, Ind.

Claim.—1. The outer grate A, shaped to suit the shape of the fire-box A′, made in one piece or in sections, and fitted together so slanted as to be in the shape of a hopper, and having the converging ribs B and conduits *g*, substantially as and for the purpose set forth.

2. The inner grate D, formed of straight or curved bars *f*, so arranged and shaped as to be adapted to the opening *e* in the outer grate, so that the ends of the bars *f* shall be opposite to the ends of the ribs B², substantially as and for the purposes set forth.

3. The combination of the outer grate A with the inner grate B, both constructed and arranged substantially as and for the purposes set forth.

4. The combination of the fire-box A′, outer grate A, and inner grate D, all constructed and arranged substantially as and for the purposes set forth.

115,516.—MOTIVE POWER FOR SEWING-MACHINES.—David T. Pittenger, Trenton, N. J.

Claim.—1. The beveled slotted cam-hook *c* and weight H for attachment to the belt, as an adjunct to the ordinary coiled-spring motion for sewing-machines, constructed, arranged, and adapted for use, substantially as specified.

2. The construction and arrangement of the spring-bar *e*, rollers *n*, lever *s*, guard *v*, and thumb-screw *y*, substantially as and for the purpose set forth.

115,517. — CAR-COUPLING.—Albert Porter, Irving, Ill.

Claim.—The turn piece, consisting of the hold-ing-pin C, provided with a projection, *c*, trunnions E E, and rear extension F, made in one piece, in combination with the shouldered gravitating-catch H *h*′ *h*′, cap I, and recessed draw-head A D G *a*, all constructed, arranged, and operated in the manner and for the purpose set forth.

115,518.—ELECTRO-MAGNETIC MACHINE.—James W. Powell, New York, N. Y.

Claim.—1. A scale, R, in combination with the movable and stationary coils B B′ of an electro-magnet, substantially as and for the purpose herein set forth.

2. An elastic lining or washer, K, in combination with the rim or edge of the battery-cup or cell D, of an electro-magnetic machine, and with a cap-plate, E, secured thereon, substantially in the manner and for the purpose herein set forth.

115,519.—GALVANIC BATTERY.—James W. Powell, New York, N. Y.

Claim.—The elastic plate K, in combination with the cells and battery-plates of a galvanic battery, fitted and arranged in reference thereto, substantially in the manner and for the purpose herein set forth.

115,520.—HORSESHOE-MACHINE.—David I. Pruner, Bellefonte, Pa.

Claim.—1. The reciprocating frame B, with curved flanges *b*, ram *f*, slotted bars *f*′′, in combination with the frames A and F, as arranged, and for the purpose specified.

2. In combination with the subject-matter of the first claim, the cams *d d*, projections *d*′ *d*′′, die G, lever H, and pins *g*, arranged to operate substantially as and for the purpose specified.

3. The table J, orifice I, and lever K having stub *k* and gauge *k*′, in combination with the frame B, constructed and arranged substantially as and for the purpose specified.

115,521. — INSULATOR FOR TELEGRAPH-WIRES.—Horatio Read, Jersey City, N. J., assignor to himself and B. B. Hagerty, Brooklyn, N. Y.

Claim.—A telegraph-insulator, A, provided with a smooth socket, in the inner part of which is secured a metallic screw-thimble, *a*, to screw on the supporting-pin, while the outer portion of said socket forms a guide for the body of the supporting-pin, substantially as described.

115,522, antedated May 25, 1871. — CAR-COUPLING. — William Rickards, Jr., Franklin, Pa.

Claim.—The plate E, made of iron or other metal, attached by a joint or hinge to the top of the draw-head A, with a hole to suit the formation of the coupling-pin, arranged and operating on the draw-head in combination with the bolt or coupling-pin, as described, for the purposes set forth.

115,523.—GRAIN-DRILL.—John L. Riter, Brownsville, Ind.

Claim.—In a seeding-machine, having radiating seeding-shafts *h h h* which carry the seeding-wheels, the pinions *i i* for the purpose of causing the right-hand seeding-shaft to rotate outward or in the opposite direction to the left-hand shaft, for the purpose set forth.

115,524.—LAMP-WICK.—Horace T. Robbins, Hyde Park, Mass.

Claim.—As a new article of sale, the coiled lamp-wick *c*, held in shape by the stitches *d*, and adapted to be used in a lamp, in manner shown.

115,525.—HARROW.—William E. Robbins and George Enderton, Sterling, Ill., assignors of one-third their right to Abram B. Enderton, same place.

Claim.—The triangular harrow-sections A A,

provided with lap-hinges *a a*, and coupled by means of a rod, B, in combination with the lever C, bar D, and chains *d d*, when said lever slides upon the rod B, and is connected by the chains *d d* with the opposite corners of the triangular harrow-sections, substantially as and for the purposes herein set forth.

115,526.—GARDEN-CULTIVATOR.—Caleb F. Ruggles, Henderson, Ky.

Claim.—The combination of the bent and curved bar A, having angular arms *a a*, with the mortised helves B B, which support the movable plows or shovels, and secured by the set-screws *b*, all substantially as shown and described.

115,527.—LAMP-SHADE SUPPORTER.—Edwin Russell, Waterbury, Conn., assignor to himself and Francis W. Platt, same place.

Claim.—The arrangement of the ring *d*, having a slotted arm, C, and tension-screw *f*, socket *b*, and set-screw *e*, for supporting a shade-holder by attachment to the lamp-collar D, substantially as shown and described.

115,528.—LAMP.—Marks Samuels, San Francisco, Cal.

Claim.—The burner-supporting tube *e*, surrounding the oil-tube B so as to leave an air-space between the two, substantially as and for the purpose above described.

115,529.—NEEDLE-WRAPPER.—Charles Schleicher, Schœnthal near Aix-la-Chapelle, Rhenish Prussia, assignor to A. Liebenroth and Von Auw, New York, city.

Claim.—The wrapper for needles, made in the manner specified, as a new article of manufacture.

115,530.—APPARATUS FOR PITCHING BARRELS, CASKS, &c.—Louis Schulze, Baltimore, Md.

Claim.—1. The combination of the frame A with standards D and cross-pieces G, constructed substantially as and for the purpose herein set forth.

2. The combination of standards D and cross-pieces G with transverse pieces H and the screws I, arranged as shown, for the purpose set forth.

3. The arrangement of the bed A, uprights B, standards D, rack *d*, and pinion *e*, wheel *e'*, and pinion *f*, on shafts E and F, when constructed substantially as and for the purpose set forth.

4. The combination of the scales *k k'* with block *l* and the barrel-heads, as and for the purpose herein set forth.

5. The method for centering and revolving barrels herein shown and described, as and for the purpose set forth.

115,531.—TREE-BOX.—Edward O. Schwageri, St. Louis, Mo.

Claim.—The rectangularly-arranged interior guards E and eyes or perforated lugs D, for the insertion and attachment of the same, substantially as specified.

115,532.—AX-HANDLE.—James M. Sears, Vandalia, Ill.

Claim.—1. The elastic, flexible joint in the ax-handle, substantially as and for the purpose herein specified.

2. The elastic flexible joint formed by the parts A B, straps C C, hook D, loop or eye *d*, and India-rubber block E, arranged substantially as and for the purpose herein specified.

3. The part A secured to the ax by the projection *h* and wedge *i*, and to the part B, or handle proper, by the straps C D, substantially as specified.

115,533.—RAILROAD-CAR HEATER.—Joseph Shackleton, Rahway, N. J.

Claim.—1. The arrangement, with relation to each other, of the steam-pipe A having the bents *a b* and cock *d*, the bent pipe F having the cock *e*, and the bent pipe G provided with the cock *f* and with the nozzle *e*, entering the pipe A at the bent *b*, all operating as herein set forth and shown, for the purpose specified.

2. The protecting-troughs I, in combination with the heating-pipe A and with registers *m'* in the bottoms of the cars, substantialy in the manner described.

115,534.—SHADE-ROLLER AND FIXTURE.—Charles D. Shrieves, Philadelphia, Pa., assignor to himself, Alfred B. Davis, and John H. Roeloss, same place.

Claim.—1. A shade-roller, consisting of two hinged sections, *a* and *a'*, adapted for the reception between them of the edge of the shade, in combination with tubular stationary or adjustable clamps F and F', or equivalent devices, by which the said sections may be bound tightly together so as to retain the shade, all substantially as specified.

2. The fixtures D and D', having pointed projections *h* and *i*, and arranged for attachment to a window-frame in the manner described.

115,535.—BUCKLE.—Earle A. Smith and Dwight L. Smith, Waterbury, Conn.

Claim.—The herein-described buckle, consisting of the frame A A, slots *a d*, and central bar *b*, and having the tongue D constructed, hinged to, and so as to bear against the said bar, and in relative position to the buckle-plate, substantially in the manner described.

115,536.—DEVICE FOR MAKING ENDS OF BURIAL-CASES.—Edward T. Smith and Joseph S. Winston, New York, N. Y.

Claim.—The rigid parts G and H', and flexible part H, with screws I, for forcibly operating when the parts are flared, as represented, and the strap H is drawn obliquely inward or together at the sides, so as to press all the surface of the bent and flared casket end, as herein set forth.

115,537.—SULKY ATTACHMENT TO PLOWS.—George M. Smith, Pittsburg, Ind.

Claim.—The reversible slides G, adjustable spindle F, and transverse bar B, cleft at each end, and provided with the adjusting-sectors H, constructed, combined, and arranged substantially as and for the purpose specified.

115,538.—ROLL FOR GANG SAW-MILLS.—Henry F. Snyder, Williamsport, Pa.

Claim.—The saw-mill roll herein described, composed of castings B B, matched, as represented, within the flared ends of the tubular surface piece C, and held together by bolts D, having their heads and nuts let in and protected, substantially as and for the purposes herein specified.

115,539.—ADJUSTABLE CAR-SEAT.—Charles Stevenbanks and Joseph Quinn, Wilmington, Del.

Claim.—1. The seat B, its slotted segmental plate C adapted to the plates *a*, in combination with tightening-rods, arranged substantially as described.

2. The combination of the seat B, its segments P, slotted arms L L, rods J, and back I.

3. A seat, B, having edges *i i* and a sliding cushion, so arranged as to afford a recess within the edges for the reception of the lower edge of the back.

115,540.—STOVE-LEG.—David Stuart and Lewis Bridge, Philadelphia, Pa., assignors to Stuart, Peterson & Co., same place.

Claim.—A stove-foot having a projection, B, in which is one or more recesses, in combination with the base-plate of a stove having a groove, *f*, and with a key or wedge, operating as described.

115,541.—AUGER.—James Swan, Seymour, Conn.

Claim.—The floor-lip constructed as herein described, commencing at a point at or nearly upon the opposite side of the center from its termination, and curved around the center up to the extreme edge of the cut, in the manner as herein set forth.

115,542.—DOCUMENT-CASE.—Constant S. Trevitt, Washington, D. C.

Claim.—1. The movable shelves or horizontal partitions S, formed with lips or flanges, (one or more,) substantially as herein described.

2. The combination of the aforesaid movable shelves S with vertical partitions X X X, grooved to receive them, substantially as and for the purpose set forth.

115,543, antedated May 22, 1871.—SUBSOIL-PLOW.—Robert Themar and Brand Brothers, Sheboygan, Wis.

Claim.—The subsoil attachment herein described for plow and wheel-cultivators, consisting of the ground-bar *a*, front and rear connecting-arms *b b* with forward sharpened edges, recess *y*, and convex point D, when constructed and combined as and for the purpose specified, substantially as shown and described.

115,544.—HOUSING FOR CLOTHES-LINES.—Andrew Turnbull, New Britain, Conn.

Claim.—The combination of bracket C, formed with the open bearings *i i* and holes K K to receive the pins *d d*, with the case B mounted loosely upon the gudgeons *a a'* of the reel A, as herein shown and described, for the purpose set forth.

115,545.—WEATHER-STRIP.—Amos M. Ulmer, Philadelphia, Pa.

Claim.—A hinged weather-strip, arranged to be raised by an inclined door-sill, and to be caught and held in its raised position by a spring, G, when the door is opened, and to be released by the said spring so as to again fall by its own weight onto the sill when the door is closed, all substantially as herein set forth.

115,546.—BREECH-LOADING FIRE-ARM.—Friedrich Von Martini, Frauenfeld, Switzerland.

Claim.—The combination, in a breech-loading fire-arm, with the breech-block, the cocking-lever or hammer, and the trigger, of a single flat bent spring, which shall perform the three separate functions of holding the breech-block in its proper place and position, of actuating the cock or hammer for discharging the arm, and of a trigger or sear-spring, substantially as herein shown and described.

115,547.—MEDICINE FOR THE CURE OF DIARRHEA.—Robert Ambrose Walton, Shawneetown, Ill.

115,548.—CARTRIDGE.—Charles S. Wells, Springfield, Mass., assignor to himself and William A. Brinie.

Claim.—1. The re-enforcing cup *b*, secured within the shell *a* by means of the flange *i* at the base of the cup, and the annular flange of pulp *n*, substantially as described.

2. In an improved cartridge-shell, the thin metallic covering *d*, having its edges secured by means of the fold or lock *e*, substantially as described.

3. The combination herein described of the re-enforce cup *b* and nipple *c* with the paper cartridge-body having a thick base, *a*, said base forming a curb for the nipple, all as set forth.

115,549.—AXLE-GAUGE.—David C. Wetsell, Carrolltown, Pa.

Claim.—A rule for wagon-makers, consisting of the rule A, lever B, slides C, E, D, G, and H, and set F, combined, arranged, and constructed substantially as and for the purpose specified.

115,550.—BRACKET.—James M. Whiting, Providence, R. I., assignor to himself and Heman M. White, same place.

Claim.—As an improved article of manufacture a bracket, when constructed of paper, cardboard, or other similar material, and covered with one or more coatings of enamel, as herein shown and described.

115,551.—WATER-WHEEL.—Titus Whitmore, Waterloo, Iowa.

Claim.—The plate E, with its cam-slots D D, in combination with the adjustable levers C C and gates *b b*, when constructed and arranged so as to open the gates of a turbine water-wheel in pairs and on the opposite sides of the wheel, substantially as and for the purpose set forth.

115,552.—CHURN.—James B. Williams, Glastenbury, Conn.

Claim.—The flaps *b b'*, arranged and operating as described, with a dasher, *a c*, substantially as set forth.

115,553.—SEED-DRILL.—George W. Millner, Charlottetown, Prince Edward Island.

Claim.—1. The adjustable tube D^1, in combination with the extension tube *d* and the bar D^2, arranged to operate substantially as described, and for the purpose set forth.

2. The combination of the frame H with the axle-tree M and adjusting-chain S, when the same is arranged in connection with the sliding bar D^2 so as to determine the inclination of the tube D^1, substantially as described, and for the purpose set forth.

115,554.—APPARATUS FOR FUMINATING PHOTOGRAPHIC PAPER, &c.—Joseph L. Winner, Elizabeth City, N. C.

Claim.—1. A single case, adapted to be used either for fuminating photographed paper, drying negatives or plates, or for evaporating baths.

2. The box A, provided with a top lid, B, and side door *c*, with lamp D, situated under the box, substantially as shown and described, for the purpose set forth.

3. The perforated inner top F of the box A for the escape of the vapor, and the lower lid of sheet-iron *e*, and pins *e e* to hang the paper while fuming, arranged substantially as described, for the purpose set forth.

REISSUES.

4,399.—APPARATUS FOR EVAPORATING SALT BRINES.—Samuel D. Gilson, Syracuse, N. Y.—Patent No. 108,701, dated October 25, 1870.

Claim.—1. The process or method of making salt by subjecting or exposing salt-water to the periphery or surface of one or more rotating cylinders heated by steam, hot air, or heated water, substantially as described, for the purpose set forth.

2. The hollow dripping-pipes formed with a slot or opening, and operating substantially as described.

3. The hollow rotary evaporating steam-chamber or cylinder, provided with an opening, H, for the passage of condensed steam, substantially as described, for the purpose set forth.

4. A hollow rotary steam or hot-air evaporating-cylinder, in combination with an evaporating-pan or reservoir, when the periphery of said cylinder touches the salt-water, substantially as described.

5. The combination of a knife or scraper with a dressed or undressed revolving steam-cylinder, substantially as set forth.

6. The dripping-pipes E E, steam-chamber or

cylinder C, in combination with the evaporating-pan or reservoir A and the knife G, substantially as described.

4,400.—PRINTING-PRESS.—Richard M. Hoe and Stephen D. Tucker, New York, N. Y. Patent No. 84,627, dated December 1, 1868.

Claim.—1. The combination of two or more feeding-tables, with the means described, or the equivalent thereof, for taking the sheets of paper from the feeding-tables and conducting them to the impression-cylinders, substantially in the manner and for the purpose described.

2. Separating or changing the direction of the printed sheets of paper so that they may be automatically piled in two or more piles, or in more than one pile, by mechanism constructed and operating substantially as described.

3. The means, substantially as herein described, for clamping stereotype or other printing-plates directly to the surface of the type-cylinder, as set forth.

4,401.—RADIATOR.—William Steffe, Philadelphia, Pa., assignor to himself and Jesse Reynolds, same place.—Patent No. 80,883, dated August 11, 1868.

Claim.—The compound radiator, consisting of the permanent wrought-iron radiators A A′, constructed with the cleaning-out passage B B′ at the bottom of each radiator, whereby the necessity of removing the radiators is obviated, and also with vertical partitions C C in each radiator, respectively, and with a transverse passage at F between the radiators, so arranged as to cause the products of combustion to circulate, substantially as described.

4,402.—STENCIL-PLATE.—Eugene L. Tarbox, New York, N. Y.—Patent No. 81,032, dated August 11, 1868.

Claim.—1. The plate B, shield C, and handle A, when the letters of the alphabet and the figures (or either the letters or the figures) are arranged in the plate facing the center of the plate, substantially as shown and described, and for the purposes set forth.

2. Using the margin of the plate and the distance between the openings and the figures as a spacing distance between the letters and figures, substantially as shown and described.

3. The shield C, constructed substantially as and for the purposes described.

4,403.—Division A.—TAP FOR OIL-PACKAGES.—Albin Warth, Stapleton, N. Y.—Patent No. 110,612, dated December 27, 1870.

Claim.—The protecting-plate d, formed with the vent e, spout f, and central depressed opening, in combination with the valve b provided with the loops g and k, the former operated upon by a bar, h, the latter connected with the end of the spring, the whole constructed and operating substantially as described.

4,404.—Division B.—TAP FOR OIL-PACKAGES.—Albin Warth, Stapleton, N. Y.—Patent No. 110,612, dated December 27, 1870.

Claim.—The combination of a flanged seat-plate, B, a valve-cap, c, and an inclosed valve, b, working between said cap and the flanged seat-plate, and acted on by a screw, i, which presses it down upon the seat of the flanged plate to close the opening therein, substantially as described.

4,405.—CRIB FOR HORSES.—Henry Eddy, North Bridgewater, Mass.—Patent No. 36,287, dated August 26, 1862.

Claim.—1. The metallic collar A, having substantially the configuration shown, to be applied as and for the purpose specified, substantially as described.

2. The adjustable feed-regulators M N forming, in conjunction with the inclined planes J J, the variable openings d p, substantially as described.

3. The plates B and e, connected and adjusted in the manner and for the purpose specified.

4,406.—LOCKING-WASHER FOR NUTS.—James H. Gridley, Washington, D. C, assignor to Hadwen L. Purdie.—Patent No. 62,483, dated February 26, 1867; reissue No. 4,354, dated April 25, 1871.

Claim.—1. In combination with a threaded nut working on a screw or bolt, a hinged or pivoted plate whose edge or edges fall close to and parallel with one or more of the sides of said nut, for the purpose specified.

2. In the same plate for locking nuts, a straight edge falling parallel to one side of the nut, and an angular recess shaped to correspond with the corners of the nut, for the purpose specified.

3. A hinged or pivoted nut-lock, combined with the washer of the nut, as and for the purpose specified.

4. The combination of the washer C and hinged or pivoted flap C′ with the talons b on the back of the washer, substantially as described.

4,407.—MACHINE FOR CHANNELING ROCK. Ebenezer G. Lamson, Shelburne Falls, Mass., assignor to The Windsor Manufacturing Company, Windsor, Vt.—Patent No. 58,435, dated October 2, 1866; reissue No. 3,366, dated April 13, 1869.

Claim.—1. The sliding stock with its chisel or chisels, the crank on a rotating shaft or its equivalent, the connecting-rod or equivalent device, a spring interposed between the chisel-stock and the connecting-rod, and the feeding mechanism or equivalent, all mounted in a frame adapted to move on ways, substantially as and for the purpose specified.

2. In machinery for channeling rock, the combination of the sliding stock with its chisel or chisels, the crank on a rotating shaft or its equivalent, the connecting-rod or equivalent device, a spring and strap or its equivalent interposed between the connecting-rod and chisel-stock, and the feeding mechanism or equivalent, all mounted in a frame adapted to move on ways, substantially as and for the purpose specified.

4,408—ADJUSTABLE METALLIC DASHER FOR VEHICLES.—George M. Peters, Columbus, Ohio.—Patent No. 102,315, dated April 26, 1870.

Claim.—1. The adjustable metallic dash for vehicles, with moldings raised or pressed into it in the form and for the purpose of stiffening it, as described.

2. The adjustable foot, when applied to a dash.

4,409.—CIRCULAR-SAW MILL.—Samuel R. Smith, Cincinnati, Ohio. — Patent No. 16,454, dated January 20, 1857; extended seven years.

Claim.—1. The knee V, arranged to slide independently on the head-block, and connected to the automatically-operating mechanism by the lever y and pawl z, substantially as described, whereby it can be operated automatically, and also by hand independently of the automatic apparatus, as herein described.

2. The combination in a saw-mill carriage of a head and tail-block having an automatic apparatus mounted thereon, and connected by the longitudinally-moving bar f with a hand apparatus, substantially such as described, whereby the log can be adjusted automatically equally at both ends, and also independently at either end, substantially as described.

4,410.—RAILROAD TURN-TABLE.—Andrew Jackson Wight and William Lewis Meeker, Newark, N. J.—Patent No. 104,388, dated June 14, 1870.

Claim.—1. Connecting the parts a a a a, composing the sides of the turn-table, by means of the oval straps or bands b of wrought-iron fitted over lugs or projections c cast on the outer surfaces of the parts a, in combination with the central casting B, constructed, as shown, with the two vertical plates d d and the horizontal plate e, all cast in one piece, together with the bolts C D for securing the castings a to the center-piece B, and securing the former at the proper distance apart, substantially as shown and described.

2. The keys i passing through lug h at the inner side of the parts a, in combination with the projections g, also at the inner sides of the parts a, and fitting in recesses in the vertical plates d d of the central casting B, for the purpose of retaining said parts a in proper position, as set forth.

3. The side pieces a a a a of a turn-table, constructed as described, and provided with projections g fitting in recesses in the vertical plates d d of the central casting B, in combination with the adjusting-screws G G, said projections retaining the side pieces in the proper position while the same are being adjusted up or down, substantially as described.

4. The elastic cushions i, in combination with the cross-bars H and side-pieces a a a a of a turn-table, substantially as set forth.

5. The combination of the disks n o with the stem m of the hemisphere l, which supports the bearing-plate E of the turn-table, substantially as described.

DESIGNS.

4,942.—CLOCK-FRONT.—John A. Batchelor, New York, N. Y.

Claim.—The design for a clock-front embodied and shown in the accompanying photographs.

4,943.—CARPET-PATTERN.—Richard Charlton, Liversedge, England, assignor to W. & I. Sloane, New York city.

Claim.—The design for a Brussels carpet, as shown.

4,944. — CARPET-PATTERN. — John Fisher, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,945.—CHAIN-PUMP.—Henry L. Fry, Cincinnati, Ohio, assignor to James L. Haven & Co., same place.

Claim.—The design for a chain-pump curb, as shown.

4,946. — SHOW-CASE. — William Henry Grove, Philadelphia, Pa.

Claim.—The design for a show-case having one side inclined, and the opposite side composed of two plates or sections inclined in respect to each other so as to form an angle at the point of junction, all substantially as described, and as represented in and by the accompanying drawings.

4,947.—STOVE.—Luther W. Harwood, Troy N. Y., assignor to Fuller, Warren & Co., same place.

Claim.—1. The design for the cover A, as hereinbefore described.

2. The design for the top plate E, as herein set forth.

3 The design for the door-frame H, as described and shown.

4. The design for the plate K, as herein described.

5. The pendent ornament P Q, shaped and arranged upon and cast with a panel of a door or plate of a stove, substantially as shown.

6. The design for the grate R, as described and shown.

7. The design for the damper-plate U, as shown and specified.

8. The design for the bottom plate X, as herein set forth.

4,948. — CLOCK-CASE SASH.—Elias Ingraham, Bristol, Conn.

Claim.—1. The design for the whole clock-case sash, as shown in fig. 1.

2. The design for the sash A, consisting of alternate radial sections of light and dark woods a b, substantially as shown and described.

3. The design for the rosette B, consisting of alternate radial sections of light and dark woods a b, substantially as shown and described.

4,949.—BELLOWS.—Alfred F. Jones, New York, N. Y.

Claim.—The design for the oval bellows, as shown.

4,950.—CARPET-PATTERN.—William Kerr, Philadelphia, Pa., assignor to William Hunter & Sons, same place.

Claim.—1. The design for the border B, substantially as described and represented.

2. The design for a pattern in which the border B and body A are combined, as shown and described.

4,951.—CARPET-PATTERN.—William Kerr, Philadelphia, Pa., assignor to William Hunter & Sons, same place.

Claim.—The design for a carpet-pattern, substantially as described, and as represented in and by the accompanying drawings.

4,952.—CARPET-PATTERN.—William Kerr, Philadelphia, Pa., assignor to William Hunter & Sons, same place.

Claim.—The design for a carpet-pattern, substantially as described and as represented in and by the accompanying drawings.

4,953. — OVEN-SHOVEL. — Thomas Lyons, Hartford, assignor to Russell & Erwin Manufacturing Company, New Britain, Conn.

Claim.—The design for an oven-shovel, herein described and shown in the photographic illustration.

4,954.—FRUIT-CAN.—John F. Merrill, Cincinnati, Ohio.

Claim.—The combined conformation of the can-body A a a′, the shoulders B C, and cover F, as herein shown and described.

4,955.—BED-QUILT.—John U. Nef, Housatonic, Mass.

Claim.—1. The design for the border of a quilt, as shown.

2. The design for the main part or body of a quilt, as shown.

4,956.—CARPET-PATTERN.—John H. Smith, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,957. — CELLULAR FABRIC.—Thomas Dolan, Philadelphia, Pa.

Claim.—The design for a cellular fabric, substantially as described, and as illustrated in and by the accompanying drawing.

4,958.—IRON MANTEL.—Caleb B. Evans, John Carlisle, and Grant H. Burrows, Cincinnati, Ohio.

Claim.—The design for iron mantels, as shown and described.

4,959.—IRON MANTEL.—Caleb B. Evans, John Carlisle, and Grant H. Burrows, Cincinnati, Ohio.

Claim.—The design for iron mantels, as shown and described.

4,960.—IRON MANTEL.—Caleb B. Evans, John Carlisle, and Grant H. Burrows, Cincinnati, Ohio.

Claim.—The design for iron mantels, as shown and described.

4,961.—IRON MANTEL.—Caleb B. Evans, John Carlisle, and Grant H. Burrows, Cincinnati, Ohio.

Claim.—The design for iron mantels, as shown and described.

4,962. — BRACKET. — Harlow Gilson and Charles F. Southwick, Nashua, N. H.

Claim.—The design for a bracket, as shown.

4,963.—CENTER-PIECE IN CEILINGS.—Edouard Goutink, Detroit, Mich.

Claim.—The design for a center-piece for ceilings, as shown.

4,964.—WEATHERBOARDING.—Jacob Jacoby, Johnstown, Pa.

Claim.—The design for a weatherboarding, as shown.

4,965.—CENTER-PIECE.—Samuel Kellett, San Francisco, Cal.

Claim. — The design for a center-piece, as described and shown.

4,966.—CENTER-PIECE.—Samuel Kellett, San Francisco, Cal.

Claim. — The design for a center-piece, as described.

4,967.—CLAW-BAR.—John McMahon, Wooster, Ohio, assignor to himself and Benjamin Scott, same place.

Claim.—The design for an improved claw-bar, as shown.

4,968.—FLOOR CLOTH PATTERN.—Victor E. Meyer, Lansingburg, N. Y., assignor to Deborah Powers, Albert E. Powers, and Nathaniel B. Powers, same place.

Claim.—The design for floor oil-cloths, as shown on said drawings and herein described.

4,969.—SPADE.—Harrison Parkman, Philadelphia, Pa.

Claim.—The design for a spade herein shown and described.

TRADE-MARKS.

290.—FLOUR.—S. H. Anderson & Co., Palmyra, Mo.

291.—TWIST-TOBACCO.—R. W. Cameron & Co., New York, N. Y.

292.—KEROSENE.—R. W. Cameron & Co., New York, N. Y.

293.—FERTILIZER.—Charleston (South Carolina) Mining and Manufacturing Company, Philadelphia, Pa.

294.—CARPET-LINING.—George W. Chipman, Boston, Mass.

295.—STOVE.—Comstock, Castle & Co., Quincy, Ill.

296.—GENTLEMEN'S FURNISHING GOODS.—Fisk, Clark & Flagg, New York, N. Y.

297.—GENTLEMEN'S FURNISHING GOODS.—Fisk, Clark & Flagg, New York, N. Y.

298.—GARTER.—Amasa H. Pike, Somerville, Mass.

299. — RAZOR. — Robert J. Roberts, New York, N. Y.

300. — RAZOR. — Robert J. Roberts, New York, N. Y.

301.—WHISKY.—Seltzer & Miller, Philadelphia, Pa.

302.—AX.—The Douglas Axe Manufacturing Company, Douglass, Mass.

303.—AX.—The Douglas Axe Manufacturing Company, Douglass, Mass.

304.—AX.—The Douglas Axe Manufacturing Company, Douglass, Mass.

305.—SOAP.—Charles E. Willetts, Chicago, Ill.

ISSUE OF JUNE 6.

PATENTS.

115,555.—BOLT-HEADING MACHINE.—John R. Abbe, Providence, R. I.

Claim.—1. The combination of the levers I I, having crooked slots *l l* in them, with the pins *k k*, the slide C, and the dies *a a'* and *g g'*, essentially as shown and described.

2. The treadles K K', in combination with the chain *q'*, the pulley L, the sliding frame J, the links *p p'*, and the jaws *h h'*, essentially as described.

3. The lever-spring R, in combination with the stud or stop *c*, the main shaft B, the loose pulley N, and clutch for establishing and breaking connection between the said pulley and shaft, essentially as described.

4. The friction-disk S, in combination with the loose pulley N, the driving-shaft B with its stud *c*, and spring-top or lever R, substantially as specified.

5. The combination and arrangement of the dies *a a' g g'*, the main slide C, the levers I I with their crooked slots *l l* and pins *k k*, the slide E carrying the upset *f*, and the bell-crank F, essentially as herein set forth.

115,556.—WHIP-SOCKET.—William R. Allen, Stockton, N. J.

Claim.—The whip-socket, supplied with the conically-shaped case having a lock and the semicircular flange or projection, substantially as herein shown and described, and for the purpose set forth.

115,557, antedated May 29, 1871. — DRY GAS-METER. — August W. Almqvist and Frans W. Ofeldt, New York, N. Y.

Claim.—1. The combination of the two chambers A and A' (each formed of two spheric or nearly spheric segments) with each other and with a rotary valve of the construction described and shown, substantially as herein set forth.

2. The arrangement of the chambers A A' herein shown and described, at such an angle to each other that the two slides of the casing L tangenting the outer curves of the said chambers, between their centers and rear edges, may meet at a right angle in the point M to obtain sufficient space for the play of a crank of such length as to secure an easy movement of the valve while maintaining the meter within a small and convenient compass, giving to it the desired prismatic form adapted to fit in an angle of a room, substantially as hereinbefore set forth.

115,558. — SMOOTHING-IRON. — William A. Andrews, Columbus, Ohio.

Claim.—The combination of the post and holder, marked with the figures 2, 3, 4, 5, 6, 7, and 8, substantially for the purpose hereinbefore set forth.

115,559.—FURNACE FOR ROASTING ORES.—John P. Arey, Georgetown, Col. Ter.

Claim.—1. The employment of adjustable plates in the shaft or stack of a roasting-furnace, whereby the flue-space can be contracted or enlarged and at the same time given a zigzag or serpentine form, substantially as described.

2. The combination of a chlorine-gas generator and injector, in combination with a roasting-furnace, through the stack of which the powdered ore falls, and in its fall is treated by fire and said chlorine gas, substantially as described.

115,560.—MECHANICAL FLY-BRUSH.—Henry E. Aughinbaugh, Harrisburg, Pa.

Claim.—The construction and combination of the flanged ferrule *a*, to secure it to the wall or other desirable location, with its pulley *e*, plate B, with its pulley S, crank-wheel, with its connection, cord *c*, pipe or tube *b*, with the ferrule *i*, flanged, with its ears and connecting-arms *c c c c*, crosshead *d*, with its stay-rods 1, 2, 3, 4, all as shown and described, and for the purpose specified.

115,561.—ELECTRO-MAGNETIC SEPARATOR. Alfred Holme Balch and Wolfred David Emelius Nelson, Montreal, Canada.

Claim.—1. The arrangement of magnets within the periphery of the cylinder *d*', as described.

2. The specific construction of the hopper *a* with its oscillating board *f*', the latter being operated by means of the wheel, shaft, gearing, and crank-shaft, as described.

3. The insulated wheel *h*', with its periphery of iron and wood, in combination with the springs of the cylinder-arms, as described.

4. The combination of the cylinder, having magnets arranged as described, with the hoppers, belts, and hub arranged as described, for the purpose set forth.

115,562. — APPARATUS FOR CARBURETING AIR.—John F. Barker, Springfield, Mass., assignor to the Gilbert & Barker Manufacturing Company, same place.

Claim.—In combination with a generator, A, the receiver B with its pipe F, having the orifice *b* at the upper end, and also the orifice *a* therein, said receiver B being inverted within the vessel D, or its equivalent, and communicating with the generator A through the pipe E, all substantially as described.

115,563.—SWAGE FOR FORMING CUTTERS FOR NAIL-MACHINES.—Elenzar Bless, Indianapolis, Ind.

Claim.—The swaging-dies A and M, formed as shown, to mold the moving and stationary cutters, substantially as set forth.

115,564.—APPARATUS FOR DRYING SALT.—George C. Briggs, Boston, Mass.

Claim.—1. The salt-drying apparatus, composed of instrumentalities as described, arranged to operate substantially as specified, such instrumentalities consisting of the drying-chamber A, the hot-air induct *b*, the vapor-strainer and fine-salt retainer E, and the rotary agitator and elevator C, as explained, the chamber being provided with an inlet for reception of the salt, and an outlet for its discharge, arranged essentially as represented.

2. The combination and arrangement of the hot-air receiving-space B, and its discharging-educt or educts *b*, with the chamber A, the elevating agitator C, and the fine-salt retainer and vapor-strainer or discharger E, all being substantially as described.

115,565.—APPARATUS FOR CLEANING PRIVIES.—Henry C. Bull, New Orleans, La., assignor of one-half his right to Joseph M. Lowenstein, same place.

Claim.—1. The combination and arrangement of the funnel O, neck *i*, and valve *d* with cask B, neck M, and float-valve *f*, substantially as shown and described.

2. The combination and arrangement of the vault A, cask B, and suction-pump C, substantially in the manner and for the purpose described.

115,566. — BOOT AND SHOE. —Duncan H. Campbell, Sunderland, Scotland, and Erastus Woodward, Charlestown, Mass.

Claim.—As a new article of manufacture, a boot or shoe, when the soles are attached together and to the boot or shoe-upper by means of pegs formed from one central wire, or a column of wires surrounded by one or more wires of any desirable pitch, and united together by means of an alloy or solder.

115,567.—BOOT AND SHOE-PEG ATTACHMENT.—Duncan H. Campbell, Sunderland, Scotland, and Erastus Woodward, Charlestown, Mass.

Claim.—As a new article of manufacture, the metallic cable-screw pegs *b b b*, soldered onto the metallic ribbon *a*, in the manner and for the purpose as herein fully set forth and described.

115,568.—COTTON-HOE.—John S. Carroll, Covington, Ga.

Claim.—The two blades E E of a cotton-hoe, arranged at an angle to each other of about one hundred degrees, and having the long cutting-edges *e*' and short cutting-edges *e*² located as specified.

115,569.—TOOL FOR MOLDING GLASS.—David Challinor, Birmingham, Pa.

Claim.—1. A tool for molding and finishing blown glass-ware, consisting of a pair of jaws, *d d*, which close on each other, with suitable cavities for giving the desired shape to the article to be blown, and the jaws being attached to handles *b*', or their equivalent, substantially as described.

2. A pair of jaws, *d d*, attached to a bow, *b*, in combination with a mold-plate, *c*, substantially as described.

115,570.—VARNISH FOR COATING AND WATER-PROOFING. — Cornelius V. Chapin, Collinsville, Conn.

Claim.—A varnish composed of the said ingredients, in substantially the proportion specified.

115,571.—PRUNING-SHEARS. — John Christy, Clyde, Ohio.

Claim.—The improved pruning-shears herein described, as a new article of manufacture, said shears combining the shouldered angular shank C,

the concave hook A with angular shank, and the convex slotted blade B with angular rear attaching end, all constructed and arranged as described.

115,572. — Apparatus for Evaporating Liquids by Means of Air-Blasts.— George Clark, Buffalo, N. Y.

Claim.—1. With a liquid-evaporating vessel, the arrangement of the nozzle of an air-blast pipe at an angle to the surface of the liquid, and in such close proximity thereto as to cause the air as it is discharged therefrom to impinge the surface of the liquid, substantially as and for the purpose herein-before set forth.

2. In combination with an air-blast pipe and evaporating-vessel, arranged as specified in the foregoing claim, the buoy E and sliding joint of the nozzle, or equivalent means, for maintaining a uniform and definite distance between the mouth of the air-discharge aperture and the surface of the liquid, substantially as and for the purpose hereinbefore set forth.

3. The arrangement, with an air-blast nozzle, E, and evaporating-vessel A, of a shield, G, as and for the purpose hereinbefore set forth.

115,573.—Process and Apparatus for Purifying Brine and other Liquids. George Clark, Buffalo, N. Y.

Claim.—1. The process of precipitating the heavier impurities held in suspension in liquids, by first heating the liquid in a suitable vessel to rarefy the same, and then applying a shower of cold liquid to the surface thereof, as hereinbefore set forth.

2. The combination, with the vessel A, provided with steam-pipe and coil C C′, or equivalent means for heating the liquid therein, of the cold-liquid reservoir D and perforated diaphragm G, or equivalent means, arranged so as to enable a cold liquid to be showered upon the surface of the heated liquid in A, substantially as and for the purpose hereinbefore set forth.

115,574. — Eye-Glass. — Isaac Clements, Fort Ann, N. Y.

Claim.—In combination with eye-glasses, the self-adjusting plates D D, substantially as and for the purposes described.

115,575. — Tinner's Swage. — Benjamin Coddington, La Fayette, Ind.

Claim.—The combination of the block or body A, the handle B, the adjustable grooved guide D, face-plate E, and gauge-screw F, substantially as and for the purposes hereinbefore set forth.

115,576, antedated May 27, 1871.—Parlor Game. — George A. Coffin, Cincinnati, Ohio.

Claim.—A ball, cue, and pocket game, having a central carroming-pin and surrounding advance and discount-pocket angles, substantially as described, and for the purpose specified.

115,577.—Governor-Valve for Steam-Engines.—William A. Cogswell, Rochester, N. Y., assignor to Junius Judson, same place.

Claim.—The conical collar B and ring C provided with the arm D, when combined with the valve-rod A, in the manner and for the purpose specified.

115,578.—Water-Wheel. — Ashly Dodge Cole, Toronto, Canada.

Claim.—The improved wheel formed by the straight inclined chute-plates E′ and buckets G a, curved as shown and described, and secured in a ring beveled or flared outward at its lower edge, all arranged and operating as set forth.

115,579.—Meat and Vegetable-Cutter. Enoch Covert, Farmer Village, N. Y.

Claim.—1. The lever-arm, when composed of two pieces connected together by the knife C and angular plate D, rendered laterally adjustable by the clamp-screws E, and operating as and for the purpose herein described.

2. The arrangement and combination of the bed-plate G, cutting-board K, transverse piece H, pieces A and B, knife C, and angular plate D, when operating together, as and for the purpose described.

115,580.—Earth-Closet. — Rensselaer A. Cowell, Cleveland, Ohio.

Claim.—1. In combination with the chamber D, the slide c, guides d, lugs f, ears k, rods l, spring m, rod i, and rods g, when arranged and operating as shown, and for the purpose set forth.

2. In combination with the chamber D, the door or chute A and rod j, as and for the purpose set forth.

3. In combination with the seat N, the elastic cushion o, arms p p, cords s s, and bar t, when constructed, arranged, and operating as shown, and for the purpose set forth.

115,581. — Heel of Boots and Shoes.— Albert O. Crane, Boston, Mass.

Claim.—A lift inserted between the sole of the boot or shoe and the heel, and matched to said heel by a tongue and groove, substantially as and for the purposes described.

115,582.—Screw-Driver.—Jonas P. Curtiss, New Britain, Conn.

Claim.—As an improved article of manufacture, a screw-driver, having the tang of its blade inserted in a solid handle and partially embedded in soft metal, in the particular manner herein described.

115,583.—Wagon-Seat.—John A. Dann and William F. Dann, New Haven, Conn., assignors to Dann Brothers & Co., same place.

Claim.—In carriage and other wood-work, the curved portion C, bent into shape, and united to the adjacent straight parts, in the manner substantially as described.

115,584.—Oar.—Nelson Davenport, Troy, N. Y.

Claim.—1. The adjustable row-lock T with the eyes O O, substantially as and for the purposes hereinbefore set forth.

2. The combination of the lower eye O with the pin P and oar-pin S, substantially as and for the purposes hereinbefore set forth.

3. The combination of the stiff arm L with the hook-and-eye joint at the oar-ring, substantially as and for the purposes herein set forth.

4. The combination of the adjustable handle H with the arm L and the hook-and-eye joint at the oar-ring, substantially as and for the purposes herein set forth.

5. The combination of the small crane N with the adjustable spring K and the oar, substantially as and for the purposes herein set forth.

115,585. — Cork-Screw Attachment.— Walter Dickson, Albany, N. Y.

Claim.—The blade D, constructed substantially as herein described, to serve as an ice-pick, screw-driver, and cord or wire-cutter, and arranged on one end of the cork-screw handle, substantially as herein described.

115,586. — Air-tight Joint for Gas-Retorts.—Charles F. Dieterich and August Schüssler, New York, N. Y.

Claim.—One or a number of recesses or grooves and corresponding projecting rims, in combination with an elastic packing, of suitable material, on joints of man or hand-hole plates or lids for gas-retorts which are subjected to a high temperature.

115,587. — Circular Cutter.—Rufus H. Dorn, Port Henry, N. Y.

Claim.—The protective guard g, applied to the rod D, in combination with the knife d, substantially as herein shown and described.

115,588. — Joint End for Sheet-Metal Pipes. — John T. Fanning, Norwich, Conn.

Claim.—As a new article of manufacture, a sheet-metal pipe provided with metal ends cast thereon, adapted to form the joints, as described.

115,589. — Apparatus for Converting Motion. — Lemuel Scudder Fithian, Brooklyn, N. Y.

Claim.—1. The arrangement of ratchet-wheel A upon shaft S, in combination with disks B B and partly-cogged and spring-dogs C C, substantially as and for the purposes set forth.

2. The longitudinal frame D, internally cogged and working within guides E E, in combination with and acting upon the gear of disks B B, substantially as and for the purposes set forth.

3. The ratchet-wheel A′, in combination with the single disk or wheel L, grooved on its outer side, substantially as and for the purposes set forth.

4. The arrangement of the single disk or wheel L, grooved on its outer side, in combination with the ratchet-wheel A, and in combination with the spring-dog C, substantially as and for the purposes described.

5. The cord or its equivalent H H, passing over the grooves of the pulley L, and having the treadle attached to one end and the weight to the other, substantially as and for the purposes set forth.

115,590.—Stove-Grate.—David A. Flood and Daniel W. Brown, Woodbridge, N. J.

Claim.—1. The divided grate, pivoted to opposite sides of the fire-place, and supported at its line of division by a movable support, substantially as herein described, which provides for either half or division of the grate falling from the center, and being let down separately from the other.

2. The combination of the divided grate of the semicircular supporting-bar D, arranged to provide for the dropping of either or both of the halves or divisions of the grate, substantially as described.

115,591.—Gas-Machine.—Thomas B. Fogarty, Brooklyn, N. Y.

Claim.—1. A secondary tank, placed either within or without the gas-holder tank, and communicating therewith below the water-line, and containing a float having a lever, or other equivalent devices for arresting the gas-holder and stopping the inlet of gas thereto from the retort, substantially as set forth.

2. The subject-matter of the above claim, in combination with an automatic gas-machine, consisting of gas-holder, tank, retort, and their connections and devices, substantially as shown.

115,592.—Gas-Machine.—Thomas B. Fogarty, Kings county, N. Y.

Claim.—1. A hydrocarbon-tank, E, containing compressed air for forcing carbureted air directly to the burner for heating the retort, or to the gas-holder, or to both at the same time, in combination with the pipes H, d′, J, and I, substantially as set forth.

2. The subject-matter of the first claim, in combination with a gas-machine, consisting of a retort, A, gas-holder D, and gas-holder tank C, substantially as set forth.

115,593.—Gas-Machine.—Thomas B. Fogarty, Brooklyn, N. Y.

Claim.—1. An air-injector or back-pressure valve for carbureters or gas-machines, moved mechanically, and actuated by the same mechanism which opens and closes the valve by which vapor is allowed to escape from the retort, operated substantially as described, and for the purposes set forth.

2. The air-valve, moved mechanically, as described, in combination with the lever K provided with the arm O or its equivalent, the lever H, and springs S, constructed and operated substantially as described, for the purposes set forth.

115,594.—Gas-Machine.—Thomas B. Fogarty, Brooklyn, N. Y.

Claim.—1. A valve, A, with its needle-guide a′ passing through the vapor-jet and working intermittently, having its stem passing directly through the blow-pipe C, and connected with the actuating devices either directly or through the partition D, opposite the mouth of C, substantially as set forth.

2. The subject-matter of the first claim, in combination with the lever K, clutch J, and air-valve I, substantially as and for the purposes set forth.

115,595. — Gas-Machine.—Thomas B. Fogarty, Brooklyn, N. Y.

Claim.—1. The combination of the holder S, float A, valve-gear V, levers B′ and C′, burner O, air-valve W′, injector J, and retort B, with their connecting-pipes and devices, constructed and operated as set forth.

2. A gas-machine, consisting of the subject-matter of the first claim, in combination with a pump, tank, and gauge, and their connecting-pipes and devices, constructed and operated substantially as set forth.

115,596.—Gas-Machine.—Thomas B. Fogarty, Brooklyn, N. Y.

Claim.—1. The combination of the chamber F and heater H with the retort-stove A, constructed and operated substantially as and for the purpose set forth.

2. The cock K and lever N, constructed and operated substantially as described, and for the purposes set forth.

3. The combination of the air-chamber T and its diaphragm d′, air-tube x, and rod y, with the lever N and cock K, constructed and operated as and for the purposes set forth.

115,597.—Gas-Machine.—Thomas B. Fogarty, Brooklyn, N. Y.

Claim.—1. The lever D, constructed and operated substantially as described, in the manner and for the purposes set forth.

2. The clutch F, constructed and operated substantially as described, in the manner and for the purposes set forth.

3. The lever K, constructed and operated substantially as described, in the manner and for the purposes set forth.

4. The sliding rod V, spring X, pin b, and roller d, constructed and operated substantially as described, in the manner and for the purposes set forth.

5. The combination, in a gas-machine, of the several parts herein claimed, constructed and operated substantially as described, in the manner and for the purposes set forth.

115,598.—Camp-Stool.—Henry Free, Lewiston, Me.

Claim.—1. A camp-stool, provided with jointed legs, sliding sleeves, and holding-springs, as described.

2. The camp-stool described, having its legs united by a triple screw, the legs being jointed and provided with sliding sleeves, substantially as described

115,599.—Gig-Saddle.—George D. Gillett, Meridian, N. Y.

Claim.—1. The box or depression b upon the top of the bow, arranged to lie below the upper ends or edges of its sides, and to project below the under side of the bow, substantially as specified.

2. The shoulders c c on the under side of the bow, in combination with the projections f f or upper ends of the under sides of the pockets, essentially as and for the purpose herein set forth.

3. The skirts or flaps G G, cut and fitted to embrace both the upper and under sides of the bow

and to enter between the shoulders *e e* and projections *f f* of the latter, essentially as specified.

115,600.—MACHINE FOR DRESSING MILL-STONES.—James T. Gilmore and John S. Crane, Lake Village, N. H.

Claim.—1. The elastically-extensible connecting-rod C, substantially as and for the purpose herein specified.

2. The cylindrical pulley D, having the conical portion *g* thereon, or connected and revolving as one therewith, substantially as and for the purpose herein specified.

3. The revolving diamond tool when provided with journals E E having the combined cylindrical and conical forms, as described, in connection with a corresponding double form of bearings, H H, to receive the journals, for the purpose herein specified.

4. The small capillary-threaded lubricating-passage *k* arranged just at the apex or extremity of the conical bearings H H of the diamond-tool journals, for the purpose specified.

5. The detachable jaws *t t* of the diamond-holder I, having a free self-adjusting movement to adapt themselves to the irregular shapes of the diamonds, in combination with the fixed jaws *s s*, substantially as herein specified.

6. The toggle-bars *z z*, arranged in combination with the carriage A, lever-arm B, and connecting-rod C, substantially as described, and for the purpose specified.

115,601.—BILLIARD-TABLE.—Louis A. Grill, New York, N. Y.

Claim.—A bed for billiard or other ball-game tables, consisting of pasteboard or other suitable material stretched upon a frame, substantially as specified, as a new article of manufacture substituted for slate or marble beds.

115,602. — ANTI-FRICTION BEARING FOR JOURNALS.—Alex. W. Hall, New York, N. Y.

Claim.—1. In combination with the journal or axle A and the box or hub B, the rollers C C and *d d*, journals *i i*, and circular bearings *n n*, all arranged to operate substantially as and for the purposes set forth.

2. Placing the center of the rollers *d d* within the center line *k k*, substantially as shown, and for the purposes specified.

3. The outer walls *r r* of the grooves *f f*, in close proximity to the journals *i i*, substantially as and for the purposes shown.

115,603.—TENONING-MACHINE.—Eminel P. Halsted, Worcester, Mass., assignor to R. Ball & Co., same place.

Claim.—1. The combination, with the auxiliary frame B, of the double adjustable shaft-supporting or bearing-frame C, adjusting-screws F and G, and adjustable bearings H H¹ H², substantially as and for the purposes set forth.

2. In the combination with the elements of the first claim, the vertically-adjustable frame I, adjustable shaft-bearings J J', and frame-adjusting devices, consisting of the screw L, gears L', shaft M', and hand-wheel M, substantially as and for the purposes set forth.

115,604.—PRESSING, IRONING, AND SMOOTHING-MACHINE.—Hugh Hamill, New York, N. Y.

Claim.—The combination of the rocking table with the ironing, pressing, smoothing, or fluting-wheel, so arranged that the cloth is caused to be drawn between the pressing and ironing or smoothing and fluting surfaces, and its withdrawal to be immediately followed, and in which latter operation the surface of the cloth is ironed, smoothed, or polished, the ironing or polishing-wheel being for that purpose held stationary during such withdrawal by the ratchet-wheel and pawl or other suitable device, arranged, constructed, and operating substantially as described.

115,605.—MILK-COOLER.—Jacob F. Harly, Cleveland, Ohio.

Claim.—The perforated tubing *b*, whose diameter, for the purpose of obtaining uniformity of pressure, is gradually reduced in size from the inlet *f* to the extremity, when constructed and applied substantially as described.

115,606.—MILK-CART.—John Harris, New York, N. Y.

Claim.—1. The milk-box or reservoir G, constructed to form the body of the vehicle, and pivoted, as at *a*, on opposite sides of the frame thereof, above the axle, substantially as and for the purpose herein set forth.

2. The combination, with the ice-box J, of the surrounding chamber, formed by the screen *e* and partition K, and the well L, in combination with said chamber within the reservoir G, substantially as described.

3. The partition *f*, with its lower passage *g*, in combination with the reservoir G, the screen-chamber K, the ice-box J, and the well L, essentially as specified.

4. The combination of the guides *g g* with the well L, the chamber M, the delivery-nozzle or spout O, and the sliding scoops or measures N, pivoted to their handles *h*, so as to be capable of tilting, and arranged for operation on and in relation to said guides, essentially as herein set forth.

115,607. — LAMP-WICK TUBE.—Edgar K. Haynes, Boston, Mass.

Claim.—The wick-tube A D, when the upper part A is made of thin metal, substantially as and for the purpose herein described.

115,608.—LAMP-BURNER.—Edgar K. Haynes, Boston, Mass.

Claim.—The dividing-bar B, with its arms or crosses C C, substantially as and for the purpose hereinbefore set forth.

115,609.—RAILROAD HAND-CAR.—John C. Hearne, Pleasant Hill, Mo., assignor to himself and George W. Deitzler, Lawrence, Kan.

Claim.—The independent shafts D D', in combination with levers I I', hubs H H', springs G G', ratchet-wheels F F', spring pawls *f f*, spur-wheels E E', and pinions *e e'*, substantially as and for the purpose set forth.

115,610. — RAILROAD DANGER-SIGNAL.—Stephen C. Hendrickson, Brooklyn, E. D., N. Y.

Claim.—The combination of an endless screw or worm, operated by a toothed wheel or wheels, with one or more electro-magnets, armatures, and armature-bars, substantially as and for the purpose specified.

115,611.—MODE OF EXPANDING WHEELS.—Daniel Hitchings, Litchfield, N. Y.

Claim.—As an article of manufacture, the socket C, having the end recesses F F, the transverse central recess G for containing the nut E, and the arched back for forming a continuation of the tire, as shown and described.

115,612.—ENAMELED FLEXIBLE METALLIC PLATE FOR PHOTOGRAPHERS AND OTHERS.—William Hoge and Joseph R. Peck, Washington, Pa.

Claim.—The preparation of a flexible metal plate with enameled surface, for photographing purposes, substantially as and for the purposes herein before set forth.

115,613, antedated June 1, 1871.—ROTARY PUMP.—Charles W. Isbell, New York, N. Y.

Claim.—1. The combination and arrangement of the revolving elliptical piston B, the cylinder or chamber C formed in part of a curvature corresponding to the travel of the major axis of the piston and in part of an enlarged sweep or outline, the inlet *a* and outlet *b*, and the flap or hinged abutment D, substantially as specified.

2. The combination of the spring E, arranged within the enlarged portion C² of the cylinder, the revolving elliptical piston B, and the cylinder C, constructed as described, and provided with an inlet *a* and outlet *b*, all arranged for operation together, essentially as herein set forth.

115,614.—LOOM-SHUTTLE.—Thomas Isherwood, Stonington, Conn.

Claim.—The combination of the float-preventive, as described, with a shuttle, such float-preventive consisting of the knife or clamp E, its operative spring *a*, shoulder *b*, the trigger *d*, and the bent wire *f* and its spring *h*, all arranged in and applied to the shuttle-body A and its eduction-tube D, substantially in manner and so as to operate as specified.

115,615. — ATOMIZER.—Charles P. Janes, Boston, Mass.

Claim.—1. The arrangement of the drip-cup *e* and its conduit *f* with the jet-tube *d* and the air-syringe nozzle, as described.

2. In the improved atomizer, the arrangement of the valve-case *b* and nozzle *a* of the elastic bulb A, the branch *k*, the jet-pipe *d*, the drip-cup *e* and its conduit *f*, all being substantially as specified and represented.

115,616. — SHUTTER-WORKER.—James W. Jedkins, Monmouth, Me.

Claim.—1. The bracket-plate D with the bars *e e*, the sector-plate F with the teeth H, stem G, crank J, and catch L, combined and arranged substantially as and for the purposes described.

2. The curved plate I and lip K, in combination with the sector F and bracket-plate D, substantially as and for the purposes described.

115,617. — SOLDERING APPARATUS.—Isaac Kaylar, Jersey City, N. J.

Claim.—1. The combination, with the furnace, of one or more angular hot-air flues B, constructed to form inclined soldering-beds *g*, and made to dip down into or through the fire-chamber, substantially as specified.

2. The angular hot-air flue or flues B, constructed with an annular groove, A, on their upper inclined surfaces *g*, and arranged in relation to the grate of the furnace and its top or lid, essentially as shown and described.

115,618. — MODE OF LUBRICATING AXLES AND JOURNALS. — William Kenworthy and John H. Pollitt, Birmingham, Pa.

Claim.—The arrangement of the oil-chamber *c*, gum washer *f*, and cavity with relation to the bore of the hub C of the wheel A, and collar A on and recess *x* in the axle B, the whole constructed, arranged, and operating as herein described, and for the purpose set forth.

115,619. — CASTER. — Joseph Kintz, West Meriden, Conn., assignor to himself and P. J. Clark, same place.

Claim.—In casters, the disk A and tube B, cast together, combined as described, with a wrought-metal band, F, spun on said disk, to provide a cup-connection which will not crack when driven on the furniture.

115,620. — SMUT-MACHINE.—Jesse Lantz, Wheeling, W. Va.

Claim.—The arrangement herein shown of the small fan M, rubber I J, beater H, and the large fan S, when all constructed and operating substantially as shown, for the purpose set forth.

115,621.—BOOK-BINDING MACHINE.—Robert G. Lowey, Brooklyn, N. Y., assignor to George H. Sanborn, same place.

Claim.—1. The combination of a platform, A, front gauge C, and top gauge D, when the same shall be constructed and operated substantially as and for the purposes set forth.

2. In combination with the platform A and gauges C and D, constructed and operated as described, the gauge B, for the purposes specified.

115,622.—PROCESS OF SEPARATING OIL AND NAPHTHA FROM PARAFFINE-WAX, &c.—Robert B. Lucas and William W. Lucas, Cleveland, Ohio.

Claim.—The process of chilling the wax by subjecting it to a water-bath before subjecting it to the press, for the purpose of readily separating the oil from the wax, substantially as described.

115,623.—CHILDREN'S CARRIAGE.—George Martiensson, Brooklyn, N. Y.

Claim.—The parts A A and C C, jointed together and forming the sides of the carriage, the wheels E and F, top G, bottom K, and cord I, constructed and arranged for use and to fold together, substantially as and for the purposes described.

115,624.—VEGETABLE AND FRUIT-PEELER.—Oscar F. Mayhew, Indianapolis, Ind., assignor to himself and William H. Weeks, same place.

Claim.—The combination of the roughened disk D, roughened removable lining B, tub A, and operating mechanism F T E, arranged and operating as specified.

115,625. — WEATHER-STRIP FOR DOORS.—Sylvester McFall, Blandinsville, Ill.

Claim.—The metal strip E, pivoted in the plates D D, and curved or shaped as shown, to adapt it to enter the groove in the bottom of the door, the guide-plates G, and the coiled springs F, all arranged and operating as set forth.

115,626.—OVEN.—Duncan McKenzie, Brooklyn, N. Y.

Claim.—1. The revolving carrier C, with its one or more shelves or bread-holders D held by positive means to occupy horizontal positions during the rotation of the carrier, in combination with an oven or baking-chamber within which said carrier is arranged, substantially as specified.

2. The combination of the shelves or bread-holders D with the revolving end frames *e e*, the cranks *h*, the ring *k*, and the eccentric track *m*, essentially as shown and described.

115,627.—RAILWAY-CAR COUPLING. — Edward D. Meier, St. Louis, Mo.

Claim.—In combination with the ordinary draw-head or bumper B, the draw-bars E, spring G, link *g*, chain *f*, and levers F, constructed and arranged substantially as and for the purpose set forth.

115,628. — TOY-WHISTLE. — Max Miller, Brooklyn, N. Y.

Claim.—The tubular stem A, open at both ends, but flattened at the lower end, combined with case B, having apertures *a a*, the whole adapted to be operated as and for the purpose specified.

115,629.—PLOW.—James G. Miner, Nashville, Tenn.

Claim.—1. The combination of the full-turning

mold-board with the rear of the colter of a subsoil-plow for the purposes above set forth, and constructed and operating as described, and this whether the same be attached to the colter in the manner herein described or is made stationary thereon.

2. The oscillating shaft J and wings P, constructed and arranged substantially as and for the purpose above set forth.

3. The mole N, elongated at the rear of the colter B, substantially as and for the purpose above set forth.

4. The combination of the mold-board A, colter B, lugs C, D, F, G, H, and K, pin E, parts I, shaft J, wings P, rod L, eyes M, and beam N, substantially as and for the purposes set forth.

115,630.—Railway-Rail Joint. — George E. Morris and Charles W. Gregory, Danville, Ill.

Claim.—The double-slotted plate B and the two slotted clips D, having upper ends E and slotted lower ends F, combined, as described, with a shouldered inclined gib, H, and key K, for the purpose specified.

115,631. — Sole of Boots and Shoes.—Alfred A. Moss, Philadelphia, Pa.

Claim.—The construction of boots and shoes with an unobstructed and durable air-space or chamber, formed by a convex exterior supplemental sole, strengthened, braced, or stiffened by a sufficient number of rivets, nails, or pegs, and secured to a raised welt or rand running around the edge of the sole, substantially in the manner described.

115,632.—Center-Seal for Gas-Works.—Peter Munzinger, Philadelphia, Pa.

Claim.—1. The distributing-chamber R, divided into two parts by the horizontal diaphragm S, for the purpose shown and described.

2. The vertical pipes or up-takes X, which connect the lower distributing-chamber T′ with the valve W.

3. Combination and arrangement of the inlet, outlet, and drip-pipes O P Q, the distributing-chamber R, the pipes X, and the valve W, as shown.

115,633. — Tidy-Pin. — Hial H. Newton, Cleveland, Ohio.

Claim.—The combination, with a pair of straight and parallel prongs, B B, of the opposite corrugations A A and laterally-branched head C, arranged to form an intermediate narrow recess, as and for the purpose specified.

115,634.—Seal for Hydraulic Mains of Gas-Works. — Alfred Odiorne, Springfield, Ill.

Claim.—1. The suspended and moveable sealing-box A, having separate compartments d d d, combined and operating with the series of dip-pipes C C C, as and for the purpose described.

2. The annular cups E and sealing-cups F, applied to form an air-tight packing for the connecting-rods a, substantially as herein shown and described.

115,635.—Reed-Organ Bellows.—Joseph R. Perry and Samuel R. Perry, Wilkesbarre, Pa.

Claim.—1. The inner fold *b′* of the exhaust-bellows, arranged as described, in connection with the valve-passage *c*, for the purpose of partly covering said passage when the fold is contracted.

2. The expanding-spring *d*, arranged in connection with the lever *h* and the bellows-boards, as described, and for the purpose of taking the spring off at any point, so as to reduce the pressure of the said bellows.

115,636.—Toy-Carriage.—Joseph W. Pilkington, Bridgeport, Conn., assignor to himself and Charles H. Cole, same place.

Claim.—1. The combination of a carriage, a pair of horses, the driving mechanism arranged between the horses, the leading wheels, and the mechanism for actuating the horses' legs, substantially as described.

2. The combination of a pair of horses, the driving mechanism arranged between and connecting the horses, the leading wheels, and the mechanism for actuating the legs of the horses, substantially as described.

3. The combination of the driving-wheels beneath the horses, the connecting-rod, the sliding cross-bar, and the pivoted legs of the horses, all these members being constructed and operating in combination, substantially as described.

115,637.—Hydrant.—Joseph L. Pillsbury, Columbus, Ohio.

Claim.—In combination with a hydrant having the two nozzles *a b*, the stem *c*, swiveled at an equal distance between said nozzles, and provided with an arm, *e*, and disk *f* at the inner end, as and for the purpose specified.

115,638.—Toy-Gun and Pistol. — Henry M. Quackenbush, Herkimer, N. Y.

Claim.—1. A toy-gun or pistol, provided with an annular movable piston around the barrel, so that the backward motion of the piston will cause a forward motion of the projectile, as set forth.

2. The sliding barrel D, arranged within the case B, and combined with the spring E, annular piston F, and trigger C, to operate substantially as herein shown and described.

3. The case B, provided with the movable breech-plate G and with the movable barrel D, substantially as herein shown and described.

115,639.—Gang-Plow.—William B. Quick, Belleville, Ill.

Claim.—The combination and arrangement of the seat-frame E, foot-board E′, movable frame G, connected to plow-beams D, lever-shaft H, carrying hook-rod I, with friction-roller I′, substantially as and for the purpose specified.

115,640.—Coal-Chute. — Joseph Rhodes, Dunkirk, N. Y.

Claim.—1. In combination with the coal-pockets or receivers A A, the sliding frame C, bearing and having a spout, D, said frame and spout being capable of being moved from one discharge-outlet to another of said pockets, as herein described.

2. In combination with the sliding frame C, the friction-wheels *e e* and *d d* at the top, and rollers *f f* at the bottom, acting upon the tracks *b* and *c*, in the manner and for the purposes specified.

3. In combination with the chute D and outlet-spouts *a a*, the extension E, having an end movement for closing the break between said parts, as hereinbefore described.

4. The sliding frame C, the adjustable chute D, hung upon the chains or links *g g*, and raised by cord *x* at the outer end, and the extension E moved by slides or rods *i i*, the whole arranged as described, and operating in the manner and for the purpose specified.

115,641.—Rock-Drilling Machine.—Norman W. Robinson, Burlington, Vt.

Claim.—1. The vertical slotted supports E F, mounted on the horizontal slotted bars, for lateral adjustment, the vertical driving-shafts and gears thereon, the vertically-adjustable brackets K, the brackets L, and the wheels Q, all combined and arranged for horizontal and vertical adjustment of the drills, substantially as specified.

2. The combination, with the vertically-adjustable brackets K and shafts G H, and the laterally-adjustable supports E F, of the vertically and horizontally-oscillating swivel-supports for the drill-rods, constructed and arranged substantially as specified.

3. The swivel-supports U V W X, constructed and arranged for supporting the drills on the brackets K, oscillating them vertically and horizontally, and clamping them thereto, all substantially as specified.

115,642. — Range.—Philip Rollhaus, Jr., New York, N. Y.

Claim.—The flue-partitions or walls D D and the smoke-dampers E E, in combination with the heat-inlets C C, the smoke-flues G G, and the ovens B B in the frame A, substantially as and for the purpose hereinbefore set forth and described.

115,643.—Car-Coupling.—John C. Rupp and Stephen Ott, Newark, Del.

Claim. — 1. The extension G, pieces L, and springs E, in combination with the pivoted jaws D and the slide C, substantially as described, for the purpose specified.

2. The slide C, carrying the coupling-jaws D, separately pivoted, or the head F, when connected to the slotted side pieces B by means of the double slots *a a′* and rods *b*.

3. The combination, with the adjustable tenoned slide C, of the separately-pivoted hooks D, head F, springs and guides *d e e*, and operating-cord or chain H, substantially as described, for the purpose specified.

115,644. — Fire-Place Range. — Watson Sanford, Brooklyn, N. Y.

Claim.—A warming-closet in a fire-place range, when said closet is arranged directly beneath the baking-ovens, flues, and ash pit, and at the base of the range, substantially as described.

115,645.—Door-Bolt.—Joseph B. Sargent, New Haven, Conn.

Claim.—A bolt in which the barrel is constructed with the flanges *a a* and the plate B with the slot C, so as to be set down over the barrel onto the said flanges *a a* for the purpose of securing the parts together, substantially as described.

115,646.—Corn-Sheller.—Silas C. Schofield, Chicago, Ill.

Claim.—1. The combination of the yielding and revolving roller E, and the revolving shelling-cylinder B, when constructed and arranged substantially as shown, and for the purposes set forth.

2. The combination of the yielding and revolving pressure-roller E, the revolving shelling-cylinder B, and the diagonally-ribbed bar F, all constructed and arranged substantially as shown, and for the purposes described.

115,647.—Locking Device for Dog-Collars.—Agustus R. Scott, Albany, N. Y.

Claim. — The detached screw-lock for metal strap, or other similar dog-collars, the same being constructed substantially as hereinbefore shown and described.

115,648.—Shoe.—Nathan J. Simonds, Woburn, Mass.

Claim.—As a new article of manufacture and sale, a leather stiffening, composed of a back, *a*, face *b*, and one or more diminished pieces, as shown at *a′* and *b′*, and having the edge rolled or otherwise flattened, as shown, and molded by machinery, substantially in form as described and shown in figs. 4 and 5.

115,649. — Manufacture of Metallic Rolls for Rolling Iron, Steel, &c.—Robert Sleeth, Pittsburg, Pa., assignor to Bagaley, Young & Co., same place.

Claim.—The manufacture of metal rolls, dies, and roll-pinions from a mixture of cast-iron and steel, substantially as set forth.

115,650.—Attaching Knobs to their Spindles.—Olney L. Smith, Providence, R. I.

Claim.—The combination of the knob D with a square socket and screw-nipple F, the sleeve or shank N with a right-and-left screw-thred, and the threaded square spindle S, substantially as described, for the purpose specified.

115,651.—Machine for Burnishing Boot and Shoe-Heels. — Vivian K. Spear, Lynn, Mass., assignor to Tapley Heel-Burnisher Machine Company, same place.

Claim. — A revolving disk for burnishing the heels of boots and shoes, provided on one of its faces with a recess to receive the heel, the sides of the recess being convex and its depth being such as to allow its bottom to come in contact with the tread of the heel, substantially as and for the purposes set forth.

115,652.—Malt-Reservoir.—Frederick Ch. Spiess, New York, and Anton Dobler, Brooklyn, N. Y.

Claim.—1. The combination of a grain-elevator with a so-called Archimedean or Dutch screw and two or more pairs of spouts communicating with four or more separated compartments, as hereinbefore fully described, and for the purpose set forth.

2. The combination of grain-elevator, Archimedean or Dutch screw, spouts, and sieve, arranged as herein fully described, and for the purpose set forth.

115,653.—Coping for Walls.—Daniel M. Sprogle, Annapolis, Md.

Claim.—The artificial-stone coping-blocks herein described, provided with the projections *a*, recesses *b*, and longitudinal hollow or groove *d*, constructed and arranged substantially as described and shown, formed either with or without the horizontal grooves *c*, and applied to and combined with the tops of walls by the use of cement or equivalent materials, as described and shown, and for the purposes set forth.

115,654. — Buckle.—George F. Stephens, Portland, Oreg., assignor to himself and John Nation, same place.

Claim.—A case, formed of slotted top plate A, upwardly-converging bottom plate B, side plates C C, and flange E, combined with a wedge, H, having stud I, all constructed as and for the purpose specified.

115,655.—Photographic Camera.—John Stock and Jacob Stock, New York, N. Y.

Claim.—1. The arrangement of the ways C on the inner sides of the frame B to guide the camera-box, in combination with the blocks D and D′ and the spring *n*, or their equivalents, attached to the bottom of the camera-box, substantially as and for the purpose hereinbefore set forth.

2. The corners *p*, constructed with projections or lugs *u*, in combination with pins *s*, substantially as and for the purpose described.

3. The plate E, in combination with its hinge *z*, bolt P, sliding plate R, and bolt T with tightening-nuts, substantially as and for the purpose hereinbefore set forth.

115,656. — Sewing-Machine.—Hannah G. Suplee and John H. Mooney, San Francisco, Cal.

Claim.—1. The combination of a rotating hook substantially such as described, with a recessed thread-holder, the two operating to hold one part of the bight of the thread and pass the loop over the bobbin-case, substantially as described.

2. The combination of a slotted hook with a recessed and stationary finger-plate, substantially as described.

115,657.—Ice-Cream Freezer.—John Tingley, Philadelphia, Pa.

Claim.—1. The horizontally-revolving motion of the vessel B, in combination with the can C, the spindle D, the iron belt E with its attached bear-

ings *e e*, the cross-bar *f*, the trunnion *d*, and the swinging brace *h*, by which the upright and horizontally-revolving positions are obtained.

2. The gasket J, in combination with the internal brass wire X, the lid K, and the loops *s s*.

115,658. — SCREW FOR WATER-GAUGES.— Charles Tivnan, Holyoke, Mass.

Claim.—1. In the combination consisting of the glass-tube B, elastic packing W, conical hollow screw and case A, with slits *f f* and nut H, the glass tube B entering loosely into the case A and not in contact with metal, substantially as and for the purpose set forth.

2. In the same combination, the shoulder *g*, substantially as and for the purpose set forth.

115,659. — REPEATING ORDNANCE.—Alfred H. Townsend, Georgetown, Col. Ter.

Claim.—1. A breech-piece, formed of two pieces, A B, with perforations *a' b'* and converging apertures F at their joint or junction, as and for the purpose specified.

2. A tongued breech-piece A B, grooved plates H E, and detachable pin and spring G, combined as and for the purpose specified.

3. The independent sectional barrels C, the perforated plates D K, and the bottom plate E, combined, constructed, and put together as described.

4. The arrangement of spring B B and hinge O beneath the barrel, as and for the purpose specified.

115,660.—CURRENT-WHEEL.—William Tuder, Moffettown, Tex.

Claim.—1. The gate F G, arranged to swing upon the shaft A of a current-wheel, as and for the purpose described.

2. The arrangement of circular racks K K, pinions L L, shaft M, worm O, pinion N, and shaft P, as and for the purpose described.

3. The arrangement of the buckets D to fold inwardly and flatly upon the radial arms B, as and for the purpose described.

115,661. — SEWING-SILK, THREAD, &c.— Archibald Turner, Leicester, England.

Claim.—A sewing-thread, having its several constituent strands interlaced by braiding, as described.

115,662, antedated May 30, 1871.—VINE-LOCK.—Edward F. Underhill, Brocton, N. Y.

Claim.—The within-described vine-lock, adapted to be permanently attached to the trellis-wire or its equivalent, and to allow the vine to be engaged and removed, as herein set forth.

115,663.—FENCE.—Matthew Van Wormer, Troy, Ohio.

Claim.—The wooden posts P P, metal hooking anchor-pieces *p p*, stone sills F F, short back-pieces J J, long wooden pickets A, base-board B, and metal hooking anchor-braces N, all constructed, arranged, and operating together in the manner and for the purpose described.

115,664. — FOLDING-STEP FOR CARRIAGES. George H. Vollhardt, New Haven, Conn.

Claim.—The two steps B C pivoted in the frame in the manner described, and combined with the jointed post D E, so as to operate as and for the purpose specified.

115,665.—FOLDING-STEP FOR CARRIAGES. Edward Wells, New Haven, Conn.

Claim.—In combination with the two steps B C, pivoted in the frame A, and provided with arms D, the transverse slide E and the two rods B' and C', independently connecting the two rods to the said slide, substantially as set forth.

115,666. — GAS-HEATER. — Henry F. W. Weeche, New York, N. Y.

Claim.—The cooking apparatus, composed of the stand I, lamp A, with cap and burner F E, combustion and illuminating-chamber O R R, pipe S, and pots T, U, W, and Y, constructed, arranged, and operating substantially as and for the purposes described and set forth.

115,667.—STEAM-POWER CAR-BRAKE APPARATUS. — George Westinghouse, Jr., Pittsburg, Pa.

Claim.—1. A steam or air-discharging nozzle, arranged in the air-outflow pipe of a car-brake cylinder, discharging in the direction of the outflow of air from the cylinder, and in combination with such cylinder, substantially as described.

2. In combination with the subject-matter of the previous claim, a check-valve, *m*, arranged substantially as set forth.

115,668. — STEAM-ENGINE VALVE AND PORT.—George Westinghouse, Jr., Pittsburg, Pa.

Claim.—1. A pair of valves arranged in a valve-chamber, intermediate in the line of steam communication between a main and a reversing or auxiliary steam-cylinder, substantially as set forth.

2. A pair of independently and alternately-acting valves, in combination with a steam-port which admits steam between them, and a pair of ports which conduct steam alternately from the seating-face of each valve to an auxiliary steam-cylinder, substantially as described.

3. The valves *c c* inclosing a steam-space between them for the admission of steam, which keeps both to their seats, in combination with ports which lead from such inclosed steam-space to the opposite faces of the valves, whereby when either valve is lifted from its seat the steam is free to pass by a port or ports so uncovered to the steam-cylinder B'.

4. The valve *c*, pressed to or toward its seat by steam or other suitable pressure, in combination with a stem, *f*, for lifting it from its seat and uncovering the port c^3, arranged substantially as described.

5. The valve *c* having a sleeve, c^4, projecting into the cylinder B, arranged to be lifted from its seat against the pressure by the action of the piston, and so as to uncover the port c^3, substantially as set forth.

6. The valve *c c*, seated as described, in combination with annular grooves c'' c'', port a'' c^3 c^3, and stem *f*, arranged substantially as set forth.

7. The valves *c c* operated by and in combination with a hollow piston-stem, substantially as described.

8. The construction and arrangement of the ports *a a'* with reference to the port a'', and in combination with the valves *c c*, substantially as described.

115,669.—WOOD-CARVING MACHINE.—John Westworth, Chicago, Ill.

Claim.—1. The combination of the frame B, pivoted to move both horizontally and vertically, with the pantograph device H I J carrying a tracing-point and a revolving bit or cutter, substantially as and for the purpose specified.

2. The frame B balanced upon a double pivot and carrying pulleys D D' E E' F F', in combination with the pantograph device H I J carrying the pulley G, substantially as and for the purpose specified.

115,670.—STEAM PUMPING-ENGINE.—Norman W. Wheeler, Morristown, N. J.

Claim.—1. The combination and arrangement, in relation to each other, of the stand-pipes *w*, distributing-cup *s*, and exhaust-pipe Y, substantially as and for the purposes described.

2. The combination of the valve M, exhaust-pipes Y Y, and stand-pipes *w w*, substantially as and for the purposes described.

3. The combination and connection of the valve M with the working vessel P and valve-thrower *h i k*, substantially as and for the purposes described.

4. The combination of the tubes *h*, barrel *i*, and diaphragm *k*, substantially as and for the purposes described.

5. The combination of the steam-pipe O, passages *e e*, and valve M, when they are so arranged as to supply the boiler with water, substantially as and for the purposes described.

6. The combination of the automatically-operated valve M with the two working vessels P^1 P^2 and the two condensing stand-pipes *w w*, substantially as and for the purposes described.

7. Actuating a valve, as M, by means of the pressure of secondary steam, generated in the manner and in the apparatus, substantially as described.

115,671.—CABINET-ORGAN.—George Woods, Cambridgeport, Mass.

Claim.—1. The music-rack I and cloth-screen L, constructed together in one device, and arranged substantially as specified.

2. The arrangement of slides M, plate N, and screws O in a cabinet-organ, as described, to allow of said slides being drawn out singly, in the manner described.

115,672.—STEAM-ENGINE.—Henry W. Adams, Philadelphia, Pa.

Claim.—1. A double-cylinder steam-engine, having passage arranged and valves operating, substantially as set forth, so that the within-described actions of the steam on the pistons will occur when the latter and the cranks are in the positions hereinbefore explained.

2. In a double-cylinder engine, a nozzle, *e*, for the escape of exhaust steam from the small cylinder into the pipe through which the larger cylinder is exhausted.

3. The combination, with a steam-engine's exhaust-pipe, of a nozzle, through which live steam can be discharged into the said pipe.

115,673.—FURNACE FOR ROASTING ORES OF THE PRECIOUS METALS.—Jonas Sely Akin, Rye Patch, Nev.

Claim.—The rotating or discharging-hearths H K, constructed with reference to a roasting and chloridizing-furnace, in combination with the pits L and cooling-floor M, substantially as and for the purpose set forth.

115,674.—HAND-CARRIAGE.—William Allen and John Wesley Bond, St. Paul, Minn.

Claim.—The within-described hand-carriage supported upon the wheels C C and D, having body A pivoted to the center of the axle B, pivoted upright bar I, head-rest J, cogged segments K L, rach M, and extending arms E E, cranks G G, shaft *e*, wheel *d*, chain *b*, and wheel *b*, the various parts being constructed, arranged, and operating substantially as set forth.

115,675. — ATTACHING KNOBS TO THEIR SPINDLES.—Matthew Andrew, Melbourne, Victoria.

Claim.—1. The bearing *i* of the socket D, in combination with the ratchet-spindle B, spring *f*, and recess *c*, substantially as and for the purpose specified.

2. In combination therewith, the arrangement of the aperture *l* through the side of the shank A, substantially as and for the purpose set forth.

115,676. — SPINNING-MACHINE. — Seth R. Ballard and George W. Ballard, Cold Water, Mich.

Claim.—The arrangement of the sliding frames K and L, rail M, the racks and pinions W and *v*, the ratchet mechanism R *t*, the coupling-bar S, and the cams T T, substantially as and for the purposes specified.

115,677. — FURNACE-POT. — John Ballou, Boston, Mass.

Claim.—The impermeable wrought-iron jacket furnace-pot, herein described.

115,678.—PIPE-WRENCH.—William Henry Barwick, Montreal, Canada.

Claim.—The wrench, formed of the fixed jaw A, movable jaw C, both serrated, and having the particular shape and angle shown, and provided, respectively, with the handles B and D, all as shown and described.

115,679.—THRASHING-MACHINE.—David C. Baughman, Tiffin, Ohio.

Claim.—In combination with the reciprocating rake-bars in a thrashing-machine, the bar A, constructed as shown, and provided with inclined cleats B B, grooved on their upper ends, and with the wire or metallic strip C, substantially as and for the purposes herein set forth.

115,680.—THRASHING-MACHINE.—David C. Baughman, Tiffin, Ohio.

Claim.—1. The rock-shaft *n n*, in combination with the toothed bars E E, substantially in the manner and for the purposes herein set forth.

2. The movable bottom H, shafts *n n*, and vibrating arm S, constructed and arranged substantially as and for the purposes herein set forth.

3. The vibrating arm S with its connections R, *z*, and *s'*, arranged to operate substantially as and for the purposes herein set forth.

4. The tailing-board M, provided with teeth on its upper side, and arranged in relation to the elevator N, substantially as herein set forth.

5. The arrangement of the belt *f'*, connecting the fan-shaft with the conveyer, the pinion *h'* on the conveyer-shaft, cog-wheel *k'*, shaft *m*, and pulleys *n' n'*, said pulleys to be connected with the stacker, all substantially as described.

6. The toothed bars E E, when operated by means of eccentrics *x' x'*, set at varying angles on a straight shaft, substantially as herein set forth.

115,681.—WATER-WHEEL. — William Bayley and Abner B. Crowell, Wilmington, Del.

Claim.—1. A gate for a turbine water-wheel, provided with webs or flanges A and B, the webs A being extended further from the line of contact with the case than the web B, substantially as described, and for the purpose set forth.

2. The combination of a turbine water-wheel, a shaft, and a case, so constructed as to afford greater space or clearance between the shaft and case at the upper than at the lower end, substantially as and for the purpose set forth.

3. The combination of the shaft S, the case U, and the coupling P, provided with a downward-projecting lip, *b*, substantially as and for the purpose set forth.

115,682.—FEED-WATER HEATER FOR STEAM-BOILERS.—Robert Berryman, Hartford, Conn.

Claim.—1. The combination of the extractor C and one or more pipes D proceeding from it, as described, with the vessel A and its pipes, for the induction and eduction of the exhaust steam, as set forth, all being arranged substantially in manner, and so as to operate as described.

2. The combination of the automatic feed-regulator herein first described (provided or not with the stand-pipe and the cock thereof, as explained) with the induction-pipe *b*, the vessel A, its exhaust-steam pipes, and the extractor C and its pipe or pipes D, all being arranged, combined, and constructed so as to operate substantially in manner as set forth.

115,683.—ELEVATOR.—Valentine C. Blair, Wheatland, Pa.

Claim.—1. The lever-clamps or catches C, placed

one upon each side of each of the slides B, and each provided with a spring, G, or equivalent spring, in combination with the frame-work A and slides B of an elevator or hoisting apparatus, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the lever-clamps or catches C, springs G, pivoted bars D, four-armed bow E, and stop *f* with each other, and with the frame-work A of the cage or platform, and slides B, substantially as herein shown and described, and for the purpose set forth.

115,684.—MANUFACTURE OF PNEUMATIC GAS.—Homer Bloomfield, San Francisco, Cal.

Claim.—1. In combination with the carbureter D, an automatic feeding device, substantially as described, whereby the gasoline or its equivalent may be maintained at different depths, as desired.

2. In combination with the carbureter D, the vaporizer R, or its equivalent, and an automatic feeding device, whereby the uniform depth of immersion of the vaporizer may be maintained.

3. In combination with carbureter D, an adjustable vaporizer, R, or its equivalent, constructed substantially as described, whereby the vaporizer may be maintained at any desired height within the carbureter, as set forth.

4. In combination with the carbureter D and a feeding device, made adjustable so as to vary the depth of the gasoline, an adjustable vaporizer, operated automatically to rise and fall to maintain a uniform immersion.

5. The combination of forked rod I, hand-wheel K, stand J, pipes F and L with carbureter D, substantially as set forth.

6. The combination of the forked rod I, hand-wheel K, stand J, pipe F, vaporizer R, with the carbureter D for adjusting the height of the vaporizer, substantially as described.

115,685.—BUILDING-BLOCK.—Nicholas Boch, New York, N. Y., assignor to himself and W. J. Maidhof, same place.

Claim.—As an improved article of manufacture, a rabbeted building-block, A B C, provided with the flue D, as and for the purpose specified.

115,686.—INKSTAND.—James A. Bowen, Boston, Mass.

Claim.—A cover or top, F, constructed on its under or inner side for interlocking with a key inserted in the hole G, substantially as and for the purpose described.

115,687.—COMPOUND FOR COVERING COFFINS.—James W. Bower, Greencastle, Ind.

Claim.—The compound for covering coffins, &c., to make them air-tight, formed of the ingredients, and applied in the manner specified.

115,688.—COMBINED SEEDER, PLANTER, AND CULTIVATOR.—John Bowman and William G. Selby, Princeville, Ill.

Claim.—The arrangement of the interchangeable rods K and *e*, seeders B, bearing or support-rods E E, lifting-lever *c*, and catch h h, whereby either of the cultivators I or the planters F may be readily combined with the seeder, the whole constructed so as to operate substantially in the manner as herein described.

115,689.—ORNAMENTING HAT-LININGS AND TIPS.—Thomas W. Bracher, New York, N. Y.

Claim.—1. Combining leaf-paper with linings or tips of hats and caps, to form a surface or ground for impressions between dies, substantially as described.

2. An embossed hat-lining, having a piece of paper or other material for support interposed between metallic foil or leaf, composing an embossing surface, and the silk or other material that composes the lining, substantially as set forth.

3. Combining metallic leaf or foil with leaf-paper in taking impressions between dies, by interposing such leaf or foil between the leaf-paper and the die, substantially as described.

115,690.—MACHINE FOR CROZING STAVES.—Hugh Bradshaw, Chicago, Ill.

Claim.—1. A crozing-machine, consisting of the vertical hangers A, frame C suspended from bolt *c*, and provided with cutter-head E, in combination with the table G provided with the sliding heads K, the whole constructed and arranged, to operate substantially as and for the purpose set forth.

2. The combination of the rod *c* with the vertical hangers A and frame C, both being provided with transverse holes, substantially as described, for the purpose of changing the line of movement of the cutter-head, as desired.

115,691.—ANIMAL HOPPLE.—George Lee Brent, Gordonsville, Va.

Claim.—A tether, composed of the ring A, straps B B, clasps C C, and rings D D, arranged and united in the manner and for the purpose specified.

115,692.—BALE-TIE.—Sydney Brett, New York, N. Y.

Claim.—The wire bale-tie, constructed as described, with the eye B upon one end and the hook C upon the opposite end, and applied to a bale in the manner herein set forth and shown.

115,693.—STAMP-CANCELER.—Franklin W. Brooks, New York, N. Y.

Claim.—1. A cap-plate, C, formed with spines to puncture and be turned down upon the under surface of the stamp, and held by a flanged or barbed spike or screw, or other fastening, said appliances being constructed and arranged in any manner, substantially as herein explained, to permit the sticking of the stamp directly to the surface of the barrel or other package without the interposition of a metallic plate beneath it, but effectually prevent the removal of said stamp in a whole condition.

2. In a cap-plate, C, constructed and applied as above specified, the embossed tables shown in fig. 1, for the purpose of permanently indicating the several particulars of date, number, and capacity, as explained.

115,694.—COMPOSITION FOR STEAM-PACKINGS.—William R. Bunnell, Jersey City, N. J.

Claim.—The herein-described composition for steam and other packing, consisting of asbestus, plumbago, and rock-salt, combined substantially in the proportions specified.

115,695.—COMBINATION TOOL.—Benjamin S. Burch, Petersburg, Va., assignor to himself and William H. Baxter, same place.

Claim.—The herein-described improved tool, comprising in one implement the hook, nippers, and shears, or the hook and nippers only, all substantially as specified.

115,696.—LADDER-STAND.—Daniel R. Burkholder, Plainfield, Pa.

Claim.—The combination of the ladder *g*, foot-piece A, hollowed braces *d*, cross-bar *a e f*, clamp *i*, and side frames *b c*, as specified.

115,697.—LOCKING-COVER FOR MILK-CANS.—Durrant Burnett, Bedford Station, N. Y.

Claim.—The tube D and bar E, the slotted neck B formed with a shoulder B′ and inclined plates *s s*, and the slotted cover, C, having hooks *y y* attached, when the same are so combined and arranged as to operate substantially as described.

115,698.—MEDICAL COMPOUND OR COUGH-SIRUP.—Benjamin F. Burroughs, West Perry township, Pa.

Claim.—The medical compound herein described, compounded in the manner, of the ingredients, in the proportions, and for the purpose specified.

115,699.—HOT-AIR FURNACH.—John H. Burtis, Brooklyn, N. Y.

Claim.—1. The combination, with the combustion-chamber C, of the drum H, provided with the vertical air-passages K K and horizontal flues I I, substantially as set forth.

2. In combination therewith, the downward flue-passages J J, supplementary chamber L, and smoke-pipe O, arranged and operating substantially as set forth.

115,700.—EXCAVATOR.—William J. Carroll, Natchez, Miss.

Claim.—1. The combination of the tongue, rigid double-tree draft-chains H H, single-trees I I, and supporting-bar and chain O O′, arranged with reference to one another and to the frame and carrying-belt, substantially as and for the purpose set forth.

2. The combination of the tongue F, supporting-bar and chain O O′, frame J, link E^2, and lever E, fulcrumed upon a post of the tongue, all arranged to operate substantially as set forth.

3. The combination of the frame, standards G, clips G^2 g^1, and chains g^2, substantially as set forth.

115,701.—PLOW.—Charles F. Chambers, Hutsonville, Ill.

Claim.—1. The combination of the forked and slotted sheth C *c c′* G, share F *f*, shaft H, provided with a collar, h, nuts J L, and convex wheel I *i i′*, as and for the purpose set forth.

2. In combination with the handle B, sheth C, and adjustable wheel I, the adjustable guards N *n n′* and O *o o′*, as and for the purpose set forth.

115,702.—BOLT-HEADING MACHINE.—George Chapman, Rockford, Ill.

Claim.—The header F and jaws G G, combined with slides B L, nuts C M, and screw D O P, the latter arranged to operate the former, as and for the purpose specified.

115,703.—CULINARY-VESSEL.—Samuel W. M. Chattaway, Middletown, Conn.

Claim.—1. The ball B^1 B^2, jointed a little above the edge of the vessel, and pivoted to the sides of said vessel a little above the horizontal plane of its center of gravity, substantially as herein shown and described, and for the purpose set forth.

2. The lock-catches C *c′*, constructed as described, in combination with the jointed ball B^1 B^2 and with the vessel A, substantially as herein shown and described, and for the purpose set forth.

115,704.—PEN-AND-PENCIL CASE.—James M. Clark, Jersey City, N. J.

Claim.—The two-part case *a b* screwed together, and containing a magazine, *d*, and pen-holder in the part *a*, and a pencil, projected by the tube *c* and screw-form slotted tubes in the other part *b* of the case, as and for the purposes set forth.

115,705.—APPLE-PULPING MACHINE.—Gregg Clayton, Marshallton, assignor to himself and Samuel Ringwalt, Downingtown, Penn.

Claim.—The combination of the cylinder B and its blades with the adjustable concave E and the blade D, rendered adjustable independently of the concave, all substantially as described.

115,706.—SLIDE-VALVE.—Joseph M. Coale, Baltimore, Md.

Claim.—The bridge *b*, having upwardly-projecting side flanges *e* and secured at each end to the ledges *a a* of the steam-chest A, the plate *e* provided with pendent end flanges *f*, and extended laterally to unite with the blocks h h of the valve *d*, the anti-friction rollers *g g* being arranged between said bridge and plate, as herein shown and described, for the purpose specified.

115,707.—GRAIN-CLEANER AND SEPARATOR.—William A. Cockrill, Zanesville, Ohio, assignor to himself and Charles H. Durban, same place.

Claim.—1. The guards or check-boards e^3 e^5, in combination with the inclined boards or steps e^4 e^6 of the screen E, arranged to operate substantially as and for the purpose described.

2. The screen E, side pieces e^2 e^3, cover e^5, inclined boards or steps e^4 e^6, and guards or check-boards e^5 e^6, all combined, constructed, and arranged to operate substantially as and for the purposes set forth.

115,708.—SEPARATING OIL FROM COTTON-WASTE.—Andrew Norton Cole, Brockville, Canada, assignor to himself and Herbert C. Jones, same place.

Claim.—Treating the oil-saturated waste or refuse cotton with the chemical solutions, prepared as described, in the manner and for the purposes set forth.

115,709.—CURRIER'S SLICKER.—George T. Collins, North Eastham, Mass.

Claim.—1. The arrangement of the blade and handle, substantially as shown, for adjusting the former, and the combination therewith of the adjusting-screws, substantially as specified.

2. The combination, with the blade and handle, of the metallic band D, substantially as specified.

115,710.—PLOW.—John Coston, Bowden, Ga.

Claim.—1. The combinaton of the foot E, arms *b b*, handles A A, cross-bar *d*, and latches *c c*, all constructed and arranged substantially as and for the purposes herein set forth.

2. The reversible plowshare G, pointed at both ends, and provided with two sets of holes, *h i*, in combination with the foot E, bolts *k m*, tap *n*, and brace *p*, all substantially as and for the purposes herein set forth.

115,711.—HORSE-POWER.—David D. Craig, Macon, Ga.

Claim.—The frame A, bed-plate B, stud C, branch-stand D, driving-wheel E, bevel-wheel K, pinions I and O, shaft L, and band-wheel P, constructed, combined, and arranged to operate substantially as and for the purposes herein shown and described.

115,712.—HANK FOR SAILS.—David Crowell, Jr., Yarmouth Port, Mass.

Claim.—The hank or mast-hoop herein described, consisting of the jaws D D, hinged at C, and bent in the form described, in combination with the spring catch A B and the mortise-and-shoulder J, substantially as and for the purpose specified.

115,713.—DEVICE FOR HANGING LOOKING-GLASSES AND PICTURES.—David Crowell, Jr., Yarmouth Port, Mass.

Claim.—The device shown, a dog's head, A, to be attached by screw H, in combination with cords C C, and mouth D, chain E, hooks J I I, as shown and described.

115,714.—DEVICE FOR OPERATING SAFE-DOORS.—George L. Damon, Cambridge, and Hiram B. Tripp, Boston, Mass.

Claim.—Hinge or hinges C, having an elongated opening or openings *f* and rod G, constructed with

a cam or eccentric *g*, when all combined with a door hung to said hinges C, substantially as and for the purpose described.

115,715.—HOSE-LEAK STOPPER.—William C. Davol, Jr., Fall River, Mass.

Claim.—The hose-leak stopper, constructed as described, viz., of the two semi-tubular jaws A B, hinged together, their rubber linings or water-proof cushions *h h*, and means, as explained, for clamping such jaws or the linings upon a hose, such means being the ears *e e*, the screw C, the tubular standard *b*, the nut *f*, and its handle *g*, all being as represented.

115,716.—BEDSTEAD.—Ira Deyo, Naples, N. Y., assignor to himself and O. Brown, Brookville, Pa.

Claim.—1. The device for connecting the rails and posts of a bedstead and supporting the bed-bottom, formed of the plate D, provided with the hook E, projecting both above and below the pin F, and with the socket G, as shown and described.

2. The combination of sectional bed-bottom I J, cross-slats H, devices D E G, rails A C, and posts B, as and for the purpose specified.

115,717. — STEP-COVER.—Daniel Popham Dieterich and Richard Morris Popham, Philadelphia, Pa., assignors to Daniel Popham Dieterich.

Claim.—As a new article of manufacture, a step-cover or protector, consisting of rubber or equivalent material inclosed in or secured to a frame or plate, and adapted to the top of a step, as specified.

115,718.—CURRENT WATER-WHEEL.—John F. M. Doan, Niles, Mich.

Claim.—The gates L and N, provided with the crank-rods M and O, and pivoted within the frame, consisting of the bed-plate B, top rail C, posts D and F', and the brace-rails K and K', substantially as and for the purpose specified.

115,719. — COMPOSITION OR SOAP FOR CLEANSING THE TEETH.—James O. Draper, Pawtucket, R. I.

Claim. — The above-described tooth-soap, substantially as specified.

115,720.—UMBRELLA.—William A. Drown, Jr., Philadelphia, Pa.

Claim.—An umbrella or parasol having a rod composed of lengths arranged to slide into each other, as set forth, and ribs or stretchers jointed to the said rod, as specified.

115,721.—WASHING-MACHINE.—Francis W. Dustin, St. Louis, Mo.

Claim.—1. The combination, with the tub B', yokes E, bearing-bow I, rollers F F^2 G G^2 K, and endless sheet H, of the hook-bearings *e g j*, constructed and arranged substantially as described, by which all of said rollers and said "sheet" are adapted to be readily removed.

2. The improved washing-machine herein shown and described, composed of box or tub B, with legs A and metallic bottom C, stove D, rollers F F^2 G G^2 K, endless sheet H, bearing-bow I, and crank-shaft J, the said legs, stove, rollers, and endless sheet being removable, and all combined and arranged as represented, for the purposes set forth.

115,722. — SUSPENDER. — Robert Henry Eddy, Boston, Mass., assignor to A. G. Eddy.

Claim.—1. In suspenders, the combination of the adjustable back or shoulder-straps and the adjustable front or button-straps, all being substantially and to operate as described.

2. Suspenders, substantially as explained, viz., as composed of the back connection, the adjustable back or shoulder-straps, and the adjustable fore or button-straps, all being to operate essentially as set forth.

115,723.—WASHING-MACHINE.—William N. Faucitt, Brooklyn, N. Y., assignor to himself and Thomas C. Morris, same place.

Claim.—1. The fixed or stationary apron *e* attached to the removable frame *b*, and provided with the spring slat *d*, in combination with the rubbing-roller C and reservoir A, the several parts constructed and operating as and for the purpose herein set forth.

2. The cylinder C of the reservoir A, fixed apron *e* attached to the removable frame *b*, counter-spring D, with its central bearing K and connecting-rods *a d*, combined, arranged, and operating substantially as set forth.

115,724.—COMBINED DOOR-FASTENING AND ALARM.—Oscar Fisher, Smyrna, Del.

Claim.—1. The cylindrical casing C, provided with opening *a*, slot *b*, and spring *d*, in combination with chain *e* and ball *f*, all arranged substantially as and for the purpose set forth.

2. The combination, with a door-frame and alarm, of the casing C with spring *d*, chains *e h*, ball *f*, and hook *i*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

115,725.—BEDSTEAD-FASTENING.—Seymour A. Frayer, Coxsackie, N. Y.

Claim.—As an improvement on bedstead-fastenings formed in two parts, the tongues *a*, having wedges *c* at the lower ends and outwardly-beveled sides *b* on the upper parts thereof, combined with the correspondingly-constructed plates C *d e*, as specified.

115,726.—VALVE OF STEAM PUMPING-ENGINES.—Lucien M. Gilbert, Cow Run, Ohio.

Claim.—1. In combination with the main slide-valve of a steam-engine, the oscillating valve H, arranged in a casing H^1 in the steam-chest, and operated by the steam in the latter, substantially as set forth.

2. The combination of the main slide-valve D, oscillating valve H H^1, steam-passages *a* and *b*, exhaust *c*, and secondary slide-valve I, substantially as set forth.

3. The combination of the recessed thimble L' on the rod of the secondary slide-valve I, and the collar H^2 A^2 on the journal of the oscillating valve H, substantially as and for the purpose set forth.

115,727. — MACHINE FOR PRESSING AND STUFFING HORSE-COLLARS. — William Guilfoyle, New York, N. Y.

Claim.—1. The perforated mold A and perforated plate B, combined to constitute an apparatus for preparing horse-collar stuffing, as set forth.

2. The spring catches *c c*, arranged within the mold to hold down the perforated plate B, substantially as herein set forth and described.

115,728.—BURGLAR-PROOF SAFE.—Edward K. Hall, Louisville, Ky.

Claim.—1. The plates *a*, constructed substantially as herein described, for use in safes, vaults, &c., as set forth.

2. The rubbeted back plates *c*, in combination with the series of plates *a*, when constructed and arranged substantially as described.

3. The T-shaped recesses *d*, in combination with the correspondingly-shaped projections *n*, when applied to the doors of safes, vaults, or cells, substantially as set forth.

115,729.—WHARF-BOAT.—Edwin W. Halliday, Columbus, Ky.

Claim.—The wharf-boat or floating dock, provided with a tower, B, having one or more floors, C, and platforms D, and a bridge, F, connecting with the tower or a platform thereon and the shore, or a platform or trestle thereon, the said bridge being detachably connected to the tower or platform thereon, and arranged for shifting from one to the other of the platforms or floors, all substantially as specified.

115,730.—MACHINE FOR MAKING SHEET-LEAD. — Henry Hannen, Philadelphia, Pa., assignor to himself, Thomas Woods, and Benjamin F. Pine, same place.

Claim.—1. The combination of the said flanged wheel, the melting-pot with its spout, and the stripping-blade K, substantially as and for the purpose specified.

2. The knife H, in combination with the wheel D, stripper K, reservoir A, and spout B, for the purpose specified.

115,731.—WINE-PRESS.—Christian Frederick Hartmann, Nazareth, Pa.

Claim.—1. The combination of the metallic casings E G, press-bottom H, grates I, and the wire-netting *f*, as herein shown and described, for the purposes specified.

2. The arrangement in the wine-press, substantially as herein shown, of the grates I, constructed of trapezoidal strips *d* united by dowels *e*, substantially as described.

3. In the wine-press herein shown, the combination of the wire-netting *f* with the trapezoidal strips *d*, forming the grates I, substantially as set forth.

115,732. — BED-LOUNGE.—George Hartzell and John P. Reifsneider, Philadelphia, Pa.

Claim.—The frame A, its inclined arm B, and back C, in combination with the frame D, also having an inclined end and sliding on the frame A, and with a cushion, consisting of two sections, F and F', hinged together, the section F being secured to the frame D and the section F' being thicker than the section F and flexible, so that when turned over it will adapt itself to the frame A and its inclined arm B and form a continuous couch, as specified.

115,733.—INKSTAND.—William O. Haskell, Boston, Mass.

Claim.—The continuous flanged edge *b* of plate D having hole E and closed portion G, in combination with a lid or slide, F, and desk-top A, as and for the purpose specified.

115,734.—BRICK-KILN.—Frederick E. Hoffmann, Berlin, Prussia.

Claim.—1. The arrangement, in a burning kiln, of a series of arched chambers, the arches of which are supported by zigzag partition-walls, substantially as and for the purposes herein shown and described.

2. The movable caps *l*, in combination with the hot-air flue *n* n^1 n^2, with apertures passing down and through the arch of the kiln, partly into the kiln-chambers and partly into the hot-air flue, substantially as herein set forth.

115,735. — PRUNING-SHEARS.—William E. Hughes, Aylmer, Canada.

Claim.—The combination and arrangement of the knives A and B, together with the arms C C and the steadying-arms D D, substantially as and for the purpose hereinbefore set forth.

115,736. — WATER-COOLER. — Thomas J. James, Petersburg, Va.

Claim.—The combination of the upper and lower water-reservoirs *b* A, the intermediate ice-chamber *d*, the connecting-pipe *i*, and the inverted conical bottom *e*, as specified.

115,737.—APPARATUS FOR SEPARATING AND CONCENTRATING ORES AND OTHER MATERIALS.—James Jenkins, South Bethlehem, Pa.

Claim.—1. The combination of the adjustable conduit *b* and water-pipe *c*, as and for the purposes set forth.

2. The adjustable conduit or conduits *b b*, supply *c*, and leads *d*, in combination with tanks *e* and frame E and F, when constructed and operating substantially in the manner and for the purposes set forth.

3. The hopper G, with feed-tubes *a*, in combination with the conduit or conduits *b*, leads *d*, and tanks *e*, when constructed and operating substantially in the manner and for the purposes set forth.

115,738.—APPARATUS FOR DUMPING COAL.—Robert Jenkins, and Theodore Woods, Allegheny county, Pa.

Claim.—1. The drums *f f'* attached together by the line *o*, in combination with the brake-band *d* and lever *e*, as described, and for the purposes set forth.

2. The roller *h* with pawl and ratchet *i*, in combination with the small rollers *m m'*, and lines *l l'*, and box *c* with pivoted arms *k k'*, substantially as shown and described, and for the purposes designated.

3. The combination of box *c* with gate *c'* and drums *f f'*, and lines *n n'* with roller *h* and lines *l l'* and pivoted arms *k k'*, arranged as described, and for the purposes set forth.

115,739.—OIL-CAKE TRIMMER.—Agur Judson, Newark, N. J.

Claim.—1. The plane-carrying levers M E, or their equivalents, provided with planes D F, and adapted to produce a reciprocal and alternate action of said planes on the adjacent edges of an oil-cake, substantially as specified.

2. The combination, with the table A and lever-stop J, of the plane-carrying levers M E, substantially as specified.

115,740.—PROCESS OF REDUCING WOOD AND OTHER FIBROUS SUBSTANCES TO PULP.—Vincent E. Keegan, New York, N. Y.

Claim.—The improved process, which consists in forcing the alkaline or acid solution into the pores of the wood or other fibrous vegetable substance by hydrostatic pressure, in combination with the after treatment of the saturated wood or other fibrous substance, with a high degree of heat, substantially as and for the purpose specified.

115,741. — WELT AND STRAP-CUTTER. — Charles Keniston, Somerville, assignor to himself, William Butterfield, and Charles E. Woodman, Boston, Mass.

Claim.—1. The standards C C, provided with concave outer sides and sharp edges, substantially as described, said edges being located in line with the outer cutters of a leather-cutting mechanism.

2. The standards C C, constructed as described, in combination with cutters B and grooved roller D, as and for the purpose set forth.

115,742.—FENCE.—Josiah J. Knight, Long Point, Ill.

Claim.—1. The means employed for locking together the panels and corner posts, consisting of the wedge-bar G and wire *g*, combined with said parts, substantially as shown and described.

2. In combination, the panels, composed of the rails A and strips B, the posts F provided with the studs or pins *f*, the wedge-bar G, and the wire *g*, substantially as and for the purpose specified.

115,743.—CURRY-COMB.—William E. Lanrence, New York, N. Y.

Claim.—1. The combination of the combs B, rods

a, and sleeves B, with the open cast-metal back A, all constructed as herein shown and described.

2. The open cast-metal back A, having the lugs *c* cast thereon to receive the front comb C, which is supported by and clamped to said lugs by the screws *d*, as herein shown and described.

115,744.—FLUID FOR WRITING ON CHECKS, DRAFTS, &c.—Charles L. Lawrence, New York, N. Y.

Claim.—The writing material, prepared as aforesaid, and bottled for use as an ink upon tinted paper, as set forth.

115,745. — PUMP. — Albert D. Laws and James C. Cooke, Bridgeport, Conn.

Claim.—The single cylinder, formed of two diameters, in combination with a single piston, the whole constructed and operating as described.

115,746.—GAUGE-COCK.—Bernhard E. Lehman and Robert Ross, Bethlehem, Pa.

Claim.—1. A gauge-cock, in which the orifice *a*, for the escape of steam, is closed by an elastic pad, D, fitted to a weighted lever, E, and adjustable by means of the screw-stem C of said lever, as described.

2. The lever, consisting of the weighted screw-stem C, block E, projection J, and pins *d d*, in combination with the stem A and its hooked lugs F F, as and for the purpose specified.

115,747. — MILLSTONE-EXHAUST. — Jacob Lingenfelter, Bloody Run, Pa.

Claim.—The case B, openings G, guards G′, chute H, exhaust-tube D, and fan E, all constructed and arranged substantially as and for the purpose specified.

115,748.—SHEET METAL.—John J. Locke, Whitestone, N. Y.

Claim.—The combination of sheet-zinc and tinned-iron plates soldered in contact, substantially as and for the purpose herein set forth.

115,749.—BROADCAST FERTILIZER-DISTRIBUTER. — James P. Machen, Centreville, Va.

Claim.—1. The arrangement of the stirrer *k l*, distributer *a b*, cleaner *h i*, receiver D, and sieve *p*, as described.

2. The arrangement of the slots *m* in the ends of the receiver, the springs *n*, and the journals of the distributer, as explained.

115,750.—BROADCAST FERTILIZER-DISTRIBUTER. — James P. Machen, Centreville, Va.

Claim.—In combination with the spirally-grooved rollers, the hinged scrapers *d d*, having inclined or oblique front edges to operate upon said roller, substantially as herein described, for the purpose specified.

115,751, antedated June 2, 1871.—STILL FOR SPIRITS, &c.—Wesley Makely, Alexandria, Va.

Claim.—A cooler, M, when employed in connection with a still, substantially in the manner and for the purpose specified.

115,752. — MITER-BOX. — Henry Markle, Spencer, Ind.

Claim.—The adjustable base C, hinged braces *d d*, adjustable guides A and D, reciprocating saw-frame E, and saw *a*, in combination with the adjustable table H, the whole being arranged, constructed, and operating in the manner and for the purpose specified.

115,753.—SLIDE-BAR FOR BRIDLE-BITS.—Arnold P. Mason, Franklinville, N. Y., assignor of one-half his right to William H. Bard, same place.

Claim.—The slide-bar, consisting essentially of the pieces *a*, pivoted together at *b*, and provided with the hooks *c* and slots *d*, the latter being in the same places as the hooks, as specified.

115,754. — SCREW-CAP AND RING FOR FRUIT-JARS.—John L. Mason, New York, N. Y.

Claim.—The metallic screw-cap or ring constructed with the struck-up peripheral thumb-piece C, substantially as described, for the purpose specified.

115,755.—CORN AND SEED-PLANTER.—Rodney H. Mathews, Nebraska City, Neb.

Claim.—1. The arrangement of the elongated frame H, hinged or pivoted to the front beam of the machine, the third or central wheel I provided on its axis with a disk having a projecting pin, *g*, oscillating rod H with dogs *h h*, central or dropper-bar S, levers L *n*, and holder *p*, all constructed and combined so as to operate substantially as described.

2. The arrangement of the runners O and P, shanks Q, braces R *p*, springs *t*, arched rods N, lever M, and holder *y*, all constructed and combined so as to operate substantially as described.

115,756.—TENSION-ROLLER FOR SEWING-MACHINES.—Joseph McCarthy, Woburn, Mass.

Claim. — As an improved tension device, the glass ring or wheel, formed with the peripheral groove *c*, having radial projections *d*, the whole being molded in a single piece and at one operation, substantially as shown and described.

115,757.—FIRE-KINDLER.—William H. McCrary, Kingston, Ga.

Claim.—The process of manufacturing balls for fire-kindlers, herein described.

115,758.—WAGON-SPRING.—Thomas A. McFarland, Erie, Pa.

Claim.—1. The springs B B and D D, when formed and secured as shown, rods C C and slats C′ C′, when the same are so combined, arranged, and connected as to operate substantially as described.

2. The springs B B and D D, when the same are combined and arranged so as to operate substantially as described.

3. The springs B B, D D, and E, when the same are so combined and arranged as to operate substantially as described.

115,759. — DUMPING APPARATUS.—Robert M. McGrath, La Fayette, Ind.

Claim.—A grain-dump, having the pivoted track with the weight guides *c*, lever A, and bar *g*, arranged and operated as herein set forth.

115,760. — SOLDERING-TOOL. — Louis McMurray and Robert J. Hollingsworth, Baltimore, Md.

Claim.—The combination of the tubular soldering-iron A, hollow stem B, handle C, and presser-rod D, which is guided in the handle to play through the stem and soldering-iron, substantially in the manner set forth.

115,761.—FOOT-MEASURE FOR SHOEMAKERS. John McNichol, Pontiac, Ill.

Claim.—The foot-measure herein described, consisting of the platform A, hinged graduated bar B, brackets C D, and graduated slide E, having cross-piece F, tape H, and removable uprights K K′, with adjustable transverse scale L, when constructed and arranged to operate substantially as shown and described.

115,762.—SHUTTER-FASTENER.—Joseph W. Megaw, Wilmington, Del.

Claim.—The catch or button *d*′, or its equivalent, attached to the arm D, and adapted for locking into the recess of a window-sash, substantially as and for the purpose specified.

115,763.—HAND-STAMP.—Joseph G. Moody, New York, N. Y.

Claim.—1. The combination, with the toothed wheel *p*, of the feeding-slide K having the under rack *m*, the clamping-spring *l*, and points *a′ a′*, substantially as specified.

2. The ratchet and pawl, operated by the arm B, and connected, by friction-spring, with the shaft of the pinion in gear with the rack of the feeding-slide.

115,764.—FOLDING-BOX.—Charles C. Moore, New York, N. Y.

Claim.—1. The hinged front C, swinging ends *b b*, and the lip A of the bottom, in combination with the back D composed of two longitudinal parts hinged together and to the top and bottom, the intermediate hinge being reverse-jointed, substantially as and for the purpose specified.

2. Forming inside stays by means of the knuckles of the continuous hinges, substantially as and for the purpose set forth.

115,765.—RAILWAY RAIL.—George C. Morgan, Chicago, Ill.

Claim.—The combination of wood A provided with the rib D, with the metal portion C provided with the shoulders *a*, substantially as and for the purposes specified.

115,766. — REVERSIBLE WINDOW-SASH.—William P. Nelson, St. Louis, Mo.

Claim.—The combination of the sash D, pivot E, and guide C with the rope *b* and weight B, substantially in the manner and for the purpose set forth.

115,767.—PARLOR-SKATE. — Oliver Benjamin Oakley, San Francisco, Cal.

Claim.—1. The combination of the ball D and plate *c* with springs G, inclosed in a suitable socket, substantially as and for the purposes set forth.

2. The ball D, plate *c*, springs G, in combination with the casing *c*, having flanges *d*, substantially as and for the purpose set forth.

3. The ball D and shaft E, when provided with springs G, in combination with the socket C, having a suitable opening through the cap *f* for the passage of the shaft E.

115,768.—DOOR-CHECK.—George W. Pagett, Oxford, Ind.

Claim.—The beveled latch E, hinged to the plate A, in combination with the stop C, pin G, and spring *g*, at right angles to E, constructed and arranged substantially as and for the purpose specified.

115,769.—FURNACE FOR OXIDIZING ORES. Ira M. Phelps, Chicago, Ill.

Claim.—1. The system of terraces *a′*, so arranged as to form a series of sub-terrace air-chambers, *f*, and inter-terrace air-slots, *g*, whereby the separate currents of air are introduced into the flue in a descending direction, and in a reverse direction to the draught-current, substantially as and for the purpose described.

2. The combination of the feed-hopper N and the fluted feed-roller O with the hollow arch wall L′, all arranged within the furnace and at the upper portion of the flue, whereby the ore is discharged into the flue beneath the draught-current, substantially as and for the purpose described.

3. In combination with the atmospheric reservoirs E E, the air-pipes *h* and cut-off valves *i*, the whole arranged to operate substantially as and for the purpose described.

4. The partitions *m m*, so arranged as to form a triangular-shaped air-chamber, *n*, substantially as and for the purpose specified.

115,770.—SCREW. — David Rufus Quick, New York, N. Y.

Claim.—A screw constructed in sections, having hollow hubs bearing on a common shaft, and united by clutch-coupling, substantially as specified.

115,771.—CULTIVATOR.—J. Eugene Reed, Mineville, N. Y.

Claim.—In combination with the curved and perforated beams A A and wheel E, the pivoted shafts D D with breast-plates H H, strap I, bar G, and strap *d*, all constructed substantially as and for the purposes set forth.

115,772. — RIDING-SADDLE. — Georg F. Schmidt, Kiel, Prussia, assignor to Rudulph Schmidt.

Claim.—In combination with the spring saddle-tree A A′ B C, the blanket E, and spring-bolsters D D′ attached to the latter, substantially as set forth.

115,773. — PRUNING-SHEARS. — David B. Seely, Sterling, Ill.

Claim.—The combination of the stationary hooked blade A connected to the handle B, and provided with the clip D, having set-screws *a a*, with the sliding blade C connected to the curved end of the handle B′, which is pivoted to the blade A, all substantially as set forth.

115,774. — WATER-WHEEL.—Lorenzo Dow Butters Shaw, Boston, Mass.

Claim.—The combination of the guide-cylinder E, dome-wheel D, and vertical shaft F, stepped as described, all constructed, arranged, and operating as and for the purpose specified.

115,775. — MACHINE FOR BENDING AND HARDENING HORSE-RAKE TEETH.—George F. Simonds, Fitchburg, Mass.

Claim.—1. The rotary griping and bending mechanism jointly with the hardening vat, relatively arranged, substantially as described.

2. In combination with the rotating bender, the mechanism for griping the wire, substantially as set forth.

3. In combination with the rotary bender, the mechanism for griping and bending the eye of the rake-tooth, substantially as described.

4. In combination with the bender and griping mechanism, the spring roll *r*, substantially as described.

115,776.—PUMP.—James A. Sinclair, Woodsfield, Ohio, assignor to himself and Warren Hollister, same place.

Claim.—1. The chamber *a*, constructed in pieces that are provided with lugs *b*, and connected by plates *c*, heads *d*, and stay-rods *f*, as specified.

2. The combination of the chamber *a*, pipe *j*, and reservoir *m*, as described.

3. The combination of the chamber *a*, pipe *j*, reservoir *m*, plunger *h*, collar *i*, and rods *g k*, as explained.

115,777.—TYPE-DISTRIBUTING MACHINE.—John T. Slingerland, New York, N. Y.

Claim.—1. The combination, with the column feeder, of a spring, *b*, pulley-block *c*, and cord *e*, substantially as described.

2. The arrangement, on the column side plate, of a projecting lip, *o*, and sustaining-spring *o²*, substantially in the manner shown and described.

3. The combination of the lip *o*, or the column side plate, with the spring *n*, with the first line of types in the galley, and with the type-channel *a*, substantially as set forth.

4. The arrangement of a recess in the line-feeder to receive a hook-shaped spring, *r*, substantially as and for the purpose described.

5. The lip *p*, on the line-feeder, to act on the projection *q* of the column side plate, so as to release said side plate whenever the line-feeder moves back to admit a fresh line in the type-channel, substantially as set forth.

6. The cam-edge h^1 on the feed-pawl *s*, in combination with the line-feeder E, feed-lever *t*, and weighted arm e^1, substantially as described.

7. The cam-disk d^1, in combination with the feed-pawl *s*, weighted arm e^1, and stop-pawl *x*, substantially as described.

8. The swivel-bar b^1 and lever a^1, in combination with the cam-disk d^1 and stop-pawl *x*, substantially as set forth.

9. The stop-pin f^1 and stop-lever k^1, in combination with the feed-pawl *s* and its weighted arm e^1, substantially as described.

10. The spring m^1, to prevent the feed-pawl and its weighted arm from rebounding, substantially as set forth.

11. The tappet n^1 on the line-feeder, in combination with the stop-lever k^1 and feed-pawl *s*, substantially as described.

12. The follower o^1 and spring p^1 in the weight G, which serves to retract the line-feeder, substantially as set forth.

13. The weighted arm f^2, in combination with the lifter f^3, constructed and operating substantially as described.

14. The set-screw u^2, in combination with the weighted arm f^2 and lifter f^3, substantially as set forth.

15. The arrangement of a governing-nick, s^2, in each type, substantially as set forth.

16. The governor t^2, in combination with the nick-levers m^2, substantially as set forth.

17. The governor-stop u^2, serving to recover all the nick-levers m^2, substantially as described.

18. The incline levers p^2, being made to oscillate on a pivot, q^2, substantially as set forth.

19. The long loose jaw x^{10} of the nippers x^1, to form a yielding abutment for the type, substantially as described.

20. The combination of the nippers x^1 with the lifter f^3, substantially as described.

21. The rotary conveyer, capable of grasping the types and of depositing them on the distributer-lifters, substantially as set forth.

22. The combination of the rotary conveyer with the oscillating nippers, substantially as described.

23. The hammer s^3 for knocking the types out of the rotary conveyer, substantially as set forth.

24. The spring-stop j^3 in the hammer s^3, substantially as described.

25. The lifter x^4, hinged to the distributer d^3, substantially as set forth.

26. The combination of the lifter x^4, hammer s^3, and rotary conveyer y^3, substantially as described.

27. The double incline z^4, in combination with the lifters x^4 and with the rotary conveyer y^3, substantially as described.

28. The distributers d^3, being hinged at their bottom ends to the wheel H, and provided with fingers b^3 at their middle, and with lifters x^4 at their top, substantially as set forth.

29. The lifting-ring L, in combination with the distributer-lifters x^4, substantially as described.

30. The perforated ring K and distributer-fingers b^3, in combination with the groove k^3 in the lifting-ring L, and with the lifters x^4, substantially as set forth.

31. The central bolt o^3 and radiating levers l^3, in combination with the lifting-ring, substantially as set forth.

32. The arrangement of spring catches r^3 on the opposite sides of the spouts of the type-cases, the tips of said catches being beveled off in opposite directions, substantially as shown and described.

33. The combination of the lifters x^4, having their upper edges chamfered off, with the spring catches r^3 on the type-cases, substantially as set forth.

34. The partitions z^4, situated between the lifters, and provided with notches to admit the ends of the spring catches r^3, substantially as described.

35. The combination of lifters x^4 and lifting-ring L with type-cases M, arranged on the circumference of a cone, substantially as described.

115,778.—Axle-Gauge.—Henry W. Spaulding, Chelsea, Vt.

Claim.—1. The standard A, arranged substantially as described, for the purpose intended.

2. The standard A, provided with the slide D, in combination with the standards B and C, provided, respectively, with the slides E and F, arranged and operating substantially as shown and described.

115,779. — Sewing Machine Casters.—Charles F. Stafford and Lemuel Stansberry, Evansville, Ind.

Claim.—The frame or support A, in combination with the shoes B *b*, slotted for adjustment upon the frame as shown, and casters D, substantially as shown, and for the purpose set forth.

115,780. — Washing-Machine. — Noah H. Stallins, Windsor, N. C.

Claim.—The tank or case A, provided with the lever C, fastened at one end, and having a cross-piece, D, resting on springs E E, in combination with the perforated board F attached to the upright arm *c*, with or without the box B, arranged and operating substantially as herein shown and described.

115,781.—Fastening for Window-Shutters.—Elbridge J. Steele, New Britain, assignor to Turner, Seymour & Judds, Wolcottville, Conn.

Claim.—The fastening made of the two-part case *a b*, knob *d*, swinging fastening *c*, projection *i*, and spring *e*, acting upon the cam-projection *i* to hold the fastening closed or open, as and for the purposes set forth.

115,782.—Piano-Action.—C. F. Theodore Steinway, New York, N. Y.

Claim.—1. The adjustable balance-spring *b*, arranged with relation to the hammer E and the fixed flanges D, as herein set forth and shown, for the purpose specified.

2. The arrangement of one or more springs in the cushion of the back-check F, substantially as set forth.

3. The metallic check-bar H, in combination with the jacks G of a piano forte action, substantially as and for the purpose described.

4. The arrangement of adjustable supports or brackets *f*, forming the connection between the metallic check-bar and the standards of the action-frame, substantially as described.

5. The arrangement of a filling of lamp-wick or other soft material in the metallic tubular check-bar H, substantially as set forth.

6. The soft pedal I, constructed of a metal tube filled with wood, and connected to the standards B by hooks *h*, substantially as shown and described.

115,783. — Hay-Gatherer. — Alexander Strean, Harrodsburg, Ind.

Claim.—The combination of the side beams A A, wheels B B, frame C, shaft D, teeth E E, pins I I, lever G, catch *b*, and toothed bar H, all constructed and arranged substantially as and for the purposes herein set forth.

115,784.—Preserving Wood.—Augustus Henry Tait, Jersey City, N. J.

Claim.—The process of preserving wood by means of sulphurous acid combined with a base in the manner described, and for the purposes set forth.

115,785.—Elbow for Hot-Air Pipes.—John M. Thatcher, Jersey City, N. J.

Claim.—An elbow, the branches of which are arranged at right angles, or nearly so, to each other, and are of different forms, one being adapted to an

flattened pipe and another to a cylindrical pipe, as set forth.

115,786.—Steam Road-Wagon.—Charles Franklin Thomas, Andrew James Craig, and James A. Craig, Jasper, and Jerome W. Hathaway, Woodhull, N. Y.

Claim.—1. A carriage or wagon-bed supported upon springs and carrying a boiler and engine, or boilers and engines, connected, by springs and upright shafts and other mechanism, with the axle, when said shafts are provided with universal joints, and allow one of the gear-wheels connected to the bed to slide up and down thereon, substantially as and for the purposes herein set forth.

2. In a steam road-wagon, a steering apparatus, in which one of the shafts connecting the wagon-bed with the axle is provided with a universal joint, and allows one of the gear-wheels connected to the bed to slide up and down thereon, substantially as and for the purposes herein set forth.

115,787.—Chair.—Joseph H. Travis, Charlestown, Mass.

Claim.—The foot-rest C^2, constructed of side rails D joined together, and provided with a handle or handles, G, hung to the chair-frame, and arranged to rest and move upon a guide, J, of chair-frame, substantially as and for the purpose specified.

115,788.—Apparatus for Exhausting Gas from Retorts.—Samuel Trumbore, Easton, Pa.

Claim.—1. The combination of the exhaust-pipe of a retort and a steam-pipe, *c*, arranged as specified.

2. The lip or plate *b*, arranged within the exhauster in respect to the steam-pipe or nozzle *c*, as described.

115,789.—Machine for Labeling Round Boxes.—Edward Tyrrell, Brooklyn, N. Y.

Claim.—1. The clamping-arm *r*, having pivoted finger *a'* on the end thereof, for the purpose specified.

2. The two rolls, *c' c'*, and spring *n'*, when attached to the vertically-reciprocating frame by hinged rods *d' d'*, and arranged immediately over the box-carrier, as and for the purpose specified.

3. The smoothing-rolls *e' e'*, held toward each other by yielding pressure, combined with a clamp, *r a'*, which holds the box centrally until the said rolls straddle it, in the manner specified.

4. The rod *v'* and T-headed crank-shaft *t'*, arranged as described, to open and close the divided nut, as set forth.

5. Pasting-plates O, having lateral play against a yielding support on their respective arms, for the purpose specified.

6. The box-carrier and label-pasting and carrying-plates O O, combined to operate together in the manner specified.

7. The label-pasting and carrying-plates and clamps *r*, combined to operate together in the manner specified.

8. The intermittently-moved box-carrier, label-pasting and carrying-plates, clamp, and smoothers, combined to operate together in the manner specified.

115,790. — Cough Mixture for Use in Candies.—Louis Violet, New Lebanon, N. Y.

Claim.—The cough mixture for candies, herein described.

115,791.—Grist-Mill.—Ausbert H. Wagner, Chicago, Ill.

Claim.—1. The means employed for securing in place and adjusting the fixed stone, consisting of the spider I provided with the angular arm or lug K, and the screws H provided with the nuts *h*, in combination with the plate G and standard C, substantially as shown and described.

2. The means employed for adjusting relatively the stones E and F, consisting of the step or bearing M provided with the inclined faces *m*, fitted within a corresponding box, N, and against the end of the spindle D, and capable of being partially rotated in either direction by any suitable mechanism, substantially as specified.

115,792.—Friction-Brake or Clutch.—Albert G. Waldo, Milwaukee, Wis.

Claim.—The application, simultaneously, to the opposite ends of a drum, spool, or similar gear, of friction-disks, by means of hinged levers operated by right-and-left screws on a shaft, substantially as herein described, for the purpose of making the friction on each end of the drum, as set forth.

115,793.—Brick-Kiln.—Benjamin Wallis, Baltimore, Md.

Claim.—1. In combination with the furnaces B, floor A^2, and pigeon-holed walls D' belonging to the permanent structure of the kiln, a chamber, C', extending to the cover of the kiln, as shown in fig. 4, formed in piling the green bricks, and openings through said green bricks for conducting the draught horizontally from the chamber C' through said openings into the flues, substantially as set forth.

2. The air-passages G, in combination with the hot-air chamber C C', substantially as and for the purpose set forth.

3. In a series of compartments or kilns, A, the flue F, in combination with the flues D of one kiln and the flue and hot-air chamber C C' of the next, said connecting-flue F being controlled by suitable dampers, and arranged substantially as set forth.

115,794. — Stop-Valve. — James Walsh, Philadelphia, Pa.

Claim.—1. The combination, with the screw-spindle F, carrying a valve, E, of the supplementary valves or disks *f* and *e'*, adapted to seats on the valve-casing and on a screw-plug, G, fitted within the said casing, all substantially as specified.

2. The screw-plug G fitted within the casing, slotted for the reception of the wings *d* of the valve E, and having a seat formed on it for the disk or valve *e'*, all as set forth.

115,795.—Slotting-Machine.—William H. Warren, Worcester, Mass.

Claim.—1. In a slotting-machine, the rocking block E', in combination with the rectifying slide H, the lever *k*, and the friction-clutch J M, or its equivalent, substantially as specified.

2. In a slotting-machine, the notched rocking block E', pivoted to the bar B', with its axis of rotation parallel with the cutting-edge of the chisel secured to its face, substantially as specified.

115,796.—Type-Composing and Casting-Machine Combined.—Charles S. Westcott, Elizabeth, N. J., assignor to Westcott's Type-Setting Company, New York city.

Claim.—1. The combination of type-composing and casting mechanism, substantially as set forth, so that the matrix will be presented and the type cast in the order in which they are composed or set up in line, substantially as specified.

2. Automatic self-adjusting mechanism for dressing types of various thicknesses, in combination with casting and composing mechanism, substantially as set forth.

3. Type-casting, dressing, and composing mechanism, arranged substantially as shown, in combination with a cylinder containing cam-ribs or grooves to communicate the respective movements at the proper time, as set forth.

4. A reciprocating carrier and a sliding gauge and matrix combined with the type-molds *a* and *b*, substantially as and for the purposes set forth.

5. The frames *k*, gauges *f*, and slides *g*, arranged at right angles to the slide-bars *h'*, in combination

with the carrier A, the parts being constructed and actuated substantially as set forth.

6. The locking-bar *p*, in combination with the keys *m*, levers *m'*, frames *k*, and slides *g*, as and for the purposes set forth.

7. The delivery-fingers *s* and stop 24, in combination with the mold *a b* and trough *u*, substantially as and for the purposes set forth.

8. The jaws *t t'* and cutters *x x' y y*, in combination with mechanism for pushing the type endwise between such cutters, substantially as set forth.

115,797.—WAGON.—Rand B. White, Sheboygan Falls, Wis.

Claim.—1. In combination with the axles A and A', the reaches D, pivoted and arranged substantially as and for the purpose specified.

2. The hereinbefore-described fifth-wheel, consisting of the plate F and G, and the disk I provided with the boss *i*, when constructed and combined substantially as shown, and for the purpose set forth.

115,798.—APPARATUS FOR CARBURETING GAS AND AIR.—Samuel Whitney, Flushing, N. Y.

Claim.—1. Gas-carbureters or carbonizers and gas-generating apparatus, provided with exterior protecting-cases or jackets, arranged to provide space between them and their shells, and the said spaces packed with gypsum or plaster of Paris, substantially as specified.

2. The jacket for the dome, arranged detachably with the other part, and provided with the slotted arm, for operation with the cap of the supply-pipe, substantially as specified.

115,799.—APPARATUS FOR COMBINING OR MIXING TWO OR MORE SUBSTANCES.—George W. Wilson, Chelsea, Mass.

Claim.—1. The duplex hopper, substantially as set forth.

2. The duplex hopper, in combination with one or more mixers, substantially as and for the purpose set forth.

3. In combination with the duplex hopper, the reciprocating agitator, substantially as and for the purpose set forth.

4. The adjustable gauge-plates C C', in combination with the hopper, as and for the purpose set forth.

5. The cylindrical mixer G, provided with beaters and rollers, as described, in combination with the cradle or concave mixer, substantially as hereinbefore specified.

6. The horizontal reciprocating mixers N N', constructed as described, in combination with the mixers S S', arranged in manner and for the purpose stated.

7. The mixers N N' and S S', constructed substantially as set forth.

8. The combination of the vibratory cylindrical mixer, provided with beaters and rollers, as described, and the concave mixer I with one or both series of horizontal mixers, arranged in manner and for the purpose set forth.

9. The hereinbefore-described apparatus for mixing pulverulent substances, the same consisting of the duplex hopper, the agitator, the cylindrical mixer, the concave mixer, and the two series of reciprocating horizontal mixers, the whole being arranged within a suitable case or structure, and made to operate together, substantially as and for the purpose set forth.

115,800.—COOKING-RANGE.—Charles J. Wood, Baltimore, Md.

Claim.—1. The improvement in that class of ranges which is provided with side ovens on a line with or below the fire-box, which consists in connecting the main flue with the oven-flues at a point below and in rear of the fire-box, and also with the fire-box direct, in order that, by opening or closing the dampers A, A', and I, the draught of hot air may be made to encircle one or both ovens, or be discharged direct from the fire-box to the flue, without coming in contact with the walls of either oven, substantially as described.

2. The peculiar location, combination, and arrangement of the dampers A A', *g g'*, and I, and the several flues with which they are respectively connected, by means of which a current or draught of cold air will, when desired, be made to encircle the ovens and flow in a reverse direction to that taken by the heated air, substantially as shown and described.

3. The water-heater E, provided with the end projections *e* and *f*, the interior partition *b*, and so arranged that both the induction and eduction-pipes may be attached thereto at one of its ends, as described.

4. The improvement in combined cooking and heating-ranges, which consists in the peculiar location, construction, and arrangement of the rear plate of the fire-box, the branching flues L L', main flue C, and air-chamber M, all substantially as described, for the purpose of utilizing the direct heat radiated from the rear of the fire-box and the flues.

REISSUES.

4,411.—MACHINE FOR CROZING STAVES.—Harrison Elliott, Elijah Smith, and Solomon S. Gray, Boston, Mass., assignees, by mesne assignments, of H. T. Elliott.—Patent No. 86,912, dated February 16, 1869.

Claim.—1. In combination with the cutters and carrier-wheels herein described, the table B for presenting the staves to the action of the teeth of the carrier-wheels, substantially as specified.

2. In combination with the carrier-wheels and table, the slide or follower D and mechanism for operating said follower, substantially as described.

3. In combination with the carrier-wheels and cutters, the springs G for holding the blanks to the wheels and to the action of the cutters, substantially as described.

4,412.—LOCK-NUT.—Pierre L. Gibbs, Dunleith, Ill.—Patent No. 96,218, dated October 26, 1869.

Claim.—1. The combination of a nut and washer fitted to turn together and take a bearing on or against a plate, so that, by tamping the edge of the washer into or over the edge of a groove or recessed portion of the plate, the nut will be prevented from working loose or becoming unscrewed, substantially as described.

2. The grooved plate B', having the one edge of its groove *a* beveled as described, in combination with the bolt or bolts C and nuts D screwing thereon, and fitted or provided with washers E so as to be capable of turning only with the nuts and of locking with the plate, essentially as herein set forth.

4,413.—LAMP.—Halvor Halvorson, Nashua, N. H., assignor to Rufus S. Merrill.—Patent No. 25,506, dated September 20, 1859.

Claim.—1. The combination, in a lamp-burner of the following elements, namely, two wick-tubes with a draught-passage between them, a deflector with a single slot, arranged so that the flames from the two wicks will pass through it in the form of a single flame, and appliances for holding the lamp-chimney in place, substantially as herein shown and described.

2. The combination, in a lamp-burner substantially such as described, of the two wick-tubes and the valve for regulating the supply of air which passes between said tubes to the flames, substantially as shown and set forth.

3. The combination, in a lamp-burner, substantially such as described, of the two wick-tubes, the valve regulating the supply of air passing up between said tubes to the flames, and the dome adjustable to a greater or lesser height above the wick-tubes, substantially as shown and set forth.

4. The arrangement of the wick-raising devices, substantially as shown and described, so that one or more of the wheels or pinions on the one shaft may gear into or engage directly with a corresponding pinion or pinions in the other shaft, for the purposes stated.

4,414.—BEDSTEAD AND TESTER.—François Layaux, Monroe, La.—Patent No. 106,842, dated August 30, 1870.

Claim.—The combination of the posts C C', tester B, inside posts A, and net D, when constructed and operating as and for the purpose herein described.

4,415.—CORSET.—Clementine D. Rutherford, Brooklyn, N. Y., assignor to David H. Fanning, Worcester, Mass.—Patent No. 60,428, dated December 11, 1866.

Claim.—1. A skeleton corset, the two parts or halves of which are constructed of cased vertically-arranged ribs, stiffeners, or braces, the cases of which are connected together at top, middle, and bottom by tapes or flexible cloth-band sections to sustain them in the corset form.

2. A skeleton corset, the vertically-arranged stiffeners of which are sustained in position by upper, central, and lower band-sections, the said stiffeners being connected at the breast portions of the corset by a material so constructed that it shall be sufficiently open to admit of ventilation and at the same time have sufficient body to support the breasts.

3. A skeleton corset, the vertically-arranged incased stiffeners of which are connected by an open net-work to support the person and permit ventilation.

4,416.—CHEESE-VAT.—Ezra H. Stuart and Walter A. Stuart, Cedarville, N. Y.—Patent No. 112,090, dated February 21, 1871.

Claim.—1. The arrangement, in a cheese-vat where steam is used to produce heat, of the steam-pipe at the sides of the vat, substantially for the purpose described.

2. The removable perforated steam-pipes C C, arranged or located on the side or sides of the air-tight space of the double vat A B, whereby the steam may be shifted from the sides to the bottom, and *vice versa*, substantially as set forth.

3. The case B, provided with faucet *a* at each end and a faucet, *b*, at the bottom, in combination with the milk-vat A, perforated pipes C C with their screw-plugs *d d*, cross-pipe D, connecting-pipe E, and levers G G, all constructed and arranged substantially as and for the purposes herein set forth.

4,417.—PROCESS OF TREATING PETROLEUM AND ITS PRODUCTS.—Joseph A. Tatro, Hartford, Conn.—Patent No. 99,728, dated February 8, 1870; reissue No. 3,867, dated March 1, 1870.

Claim.—The process described of applying the said substances—sulphuric acid, dry lime, (or phosphate of lime,) or their chemical equivalents, in about the proportions specified—to crude petroleum oil, to distilled oil, or to the whole product arising from the distillation of crude petroleum oil, for the purpose set forth.

4,418.—REDUCING WOOD TO PAPER-PULP. Henry Voelter, Heidenheim, Würtemberg, assignor to Alberto Pagenstecher, New York, N. Y.—Patent No. 21,161, dated August 10, 1858; antedated August 29, 1856; reissue No. 3,361, dated April 6, 1869; extended seven years.

Claim.—1. The improvement in the art herein described, which consists in tearing or grinding out fibers from blocks of wood, in the manner substantially as described, without cutting or severing the fibers either perpendicularly or diagonally to their length, as heretofore practiced in this art.

2. The improvement in the art herein described, which consists in regrinding the fibers already separated from a block, by grinding them over again between another block and a grinding surface.

3. In combination, a grinding surface and cells or boxes for blocks of wood, so constructed and arranged with reference to the surface that the fibers of blocks of wood placed therein lie in the plane, substantially, of the grinding surface, and across the line of motion of points in the grinding surface, as described.

4. In combination with a revolving grinding surface, blocks of wood, so held thereon that their fibers are in the relation to the surface and to the motion of points thereon, substantially as herein described, so that, by the operation of the grinding surface upon the blocks, fibers will be separated from the same without being cut across.

5. In combination, cells for holding blocks of wood and a revolving grinding surface, where the cells are so arranged in reference to each other and to the grinding surface, substantially as described, that fibers torn out or ground from one block shall, by the motion of the grinding surface, be carried under a succeeding block and there reground, substantially as described.

6. Feeding the blocks to be converted into pulp to the stone by mechanism, substantially such as herein described, whereby the blocks are forced forward by a motion dependent upon the velocity of the revolving grindstone.

7. The contrivance, substantially as herein described, whereby the feeding motion is intercepted or stopped automatically.

8. The separating apparatus as improved by me, and consisting, essentially, of a series of perforated revolving cylinders, in combination with take-up rollers, channels, and troughs, substantially as described.

DESIGNS.

4,970.—RANGE.—William H. Burrows, New York, assignor to Jordan L. Mott, Mott Haven, N. Y.

Claim.—The design for the front and fire-place end of a stove, herein shown and described.

4,971.—COOKING-STOVE.—William H. Burrows, New York, assignor to Jordan L. Mott, Mott Haven, N. Y.

Claim.—The design for a range, as herein shown and described.

4,972.—SHOT-POUCH, &c.—Joseph T. Capewell, Woodbury, Conn.

Claim.—The duplex design herein shown.

4,973.—BILLIARD-TABLE.—Hugh W. Collender, New York, N. Y.

Claim.—The design for billiard-tables, as herein shown and described.

4,974.—GAS FIRE-LOG.—Thomas N. Dixon and Charles Friese, Philadelphia, Pa., assignors to Thomas S. Dixon & Sons, same place.

Claim.—1. The design for gas-logs represented at A, substantially as shown and set forth.

2. The design for gas-logs as represented at B, substantially as shown and set forth.

3. The design for gas-logs as represented at C, substantially as shown and set forth.

4. The design for gas-logs as represented at D, substantially as shown and set forth.

5. The design for gas-logs as represented at E, substantially as shown and set forth.

6. The design for gas-logs as represented at F, substantially as set forth.
7. The design for gas-logs as represented at G, substantially as set forth.
8. The design for gas-logs as represented at H, substantially as set forth.
9. The design for gas-logs as represented at J, substantially as set forth.
10. The design for gas-logs as represented at K, substantially as set forth.
11. The design for gas-logs as represented at L, substantially as set forth.
12. The design for gas-logs comprising the specific features in combination as enumerated in the foregoing clauses of claims, substantially as represented in the accompanying photographs.

4,975.—STOCKING FABRIC.—Thomas Dolan, Philadelphia, Pa.

Claim.—1. The design for the stripe A, as shown and described.
2. The design for the entire stocking fabric, including the stripes A B B^1 B^2 and the ribs *c* and *d*.

4,976.—STOCKING FABRIC.—Thomas Dolan, Philadelphia, Pa.

Claim.—The design for a stocking fabric, substantially as described and as represented in and by the accompanying drawings.

4,977.—NAPKIN-RING.—Charles W. Goodhue, Lowell, Mass., assignor to Edward P. Woods, Daniel Sherwood, and Cyrus H. Latham, same place.

Claim.—The design for a napkin-ring, shown in the accompanying drawing—that is to say, a napkin-ring made of wire, the ends scalloped or pointed, and the center mounted by a band or ring, substantially as described and specified.

4,978.—SHOW-CASE.—William H. Grove, Philadelphia, Pa.

Claim.—The design for a show-case with inclined sides and vertical ends, substantially as shown and described.

4,979.—CLOCK-CASE.—Elias Ingraham, Bristol, Conn.

Claim.—The design for the molding A of a clock-case frame, consisting of alternate transverse stripes of light and dark woods 1 2, substantially as shown and described.

4,980.—CARPET-PATTERN.—Archibald McCallum, Halifax, England, assignor to W. & I. Sloane, New York city.

Claim.—The design for a carpet, as shown.

4,981.—TYPE.—John K. Rogers, Brookline, Mass.

Claim.—The design for printing-type, as shown.

4,982.—TYPE.—James A. St. John, Boston, Mass.

Claim.—The design for printing-types, as shown.

4,983.—LAMP-CHIMNEY.—Michael Sweeney, Martinsville, Ohio.

Claim.—The design for a lamp-chimney, as shown.

TRADE-MARKS.

306.—RANGE AND STOVE.—Abendroth Brothers, New York, N. Y.

307.—RANGE AND STOVE.—Abendroth Brothers, New York, N. Y.

308.—THRASHING-MACHINE.—James Brayley, Buffalo, N. Y.

309.—BAKING-POWDER.—William N. Hedges, Springfield, Ohio.

310.—MEDICINE.—Thomas E. Jenkins, Louisville, Ky.

311.—NETS AND LACE.—Abraham G. Jennings, New York, N. Y.

312.—NETS AND LACE.—Abraham G. Jennings, New York, N. Y.

313.—NETS AND LACE.—Abraham G. Jennings, New York, N. Y.

314.—COTTON-BALE TIE.—James Jennings McComb, Liverpool, England.

315.—UMBRELLA.—Horace T. Robbins, Hyde Park, Mass.

316.—CIGAR.—Schmidlapp Bros., Memphis, Tenn.

317.—COSMETIC.—Herman Schroeder, Quincy, Ill.

318.—PISTOL.—The American Standard Tool Company, Newark, N. J.

319.—FERTILIZER.—Walton, Whann & Co., Wilmington, Del.

320.—CANDY.—Francis M. Whitelaw, Cincinnati, Ohio.

EXTENSIONS.

ROSALIE CROOME, of Brooklyn, N. Y, executrix of WILLIAM CROOME, deceased.—Letters Patent No. 17,319, dated May 19, 1857.

"Method of Printing in Colors."

Claim.—1. The movable tablets for the separate colors, in combination with the guided roller or equivalent surface for taking up the inks, operating substantially as described.
2. In combination with the printing surface and with the inking surface, the corresponding guides for insuring the uniform action of the inking surface upon the printing surface, as set forth.

WILLIAM F. CHANNING, of Providence, R. I., and MOSES G. FARMER, of Boston, Mass.—Letters Patent No. 17,355, dated May 19, 1857.

"Electro-Magnetic Fire-Alarm Telegraph for Cities."

Claim.—1. The signal system herein described, consisting of a series of signal stations, scattered at short intervals, through a whole city or town, or any part thereof, and telegraphically connected with a common center or point, or with each other, by one or more signal circuits, by which means a constant communication may be established and maintained between all parts of a city or town, however extended, and with the center or centers at which the signal circuit or circuits converge or meet, so that the moment a fire occurs its existence and locality may at once be known at the center of the system, and efforts for subduing it be properly directed.
2. The alarm system herein described, consisting of a series of alarm stations, suitably distributed throughout a whole city or town, or any part thereof, and telegraphically connected with a central station, by one or more alarm circuits, by which means a public alarm of the existence and locality of a fire may be given at different points.
3. In combination with the alarm system for striking the number of the district upon the alarm-bells, the signal system for communicating the number of the station at which the fire occurs, to all the signal stations, as well as for communicating an alarm to the central station.

WILLIAM T. B. READ, of Chicago, Ill.—Letters Patent No. 17,451, dated June 2, 1857.

"Improvement in Harvesters."

Claim.—Making the shoe E in one piece, as described, so that by its peculiar formation it shall serve not only as a support for the finger-bar A, and as a support and guide for the inner end, both of the sickle-bar C and connecting-rod D, but also as a means of preserving the connection between the connecting-rod and the sickle-bar, as herein set forth.

ISSUE OF JUNE 13.

PATENTS.

115,801.—PASSENGER-RECORDER FOR VEHICLES.—James T. Aldrich, New York, N. Y.

Claim.—1. The independent spring treading-pieces, in combination with a reversible plate and rocking, swinging, or rotating punches, so that either treading-piece may interchangeably register the entrance and exit of passengers upon a paper fillet.
2. In combination with the treading-pieces, a wheel for indicating the number of the station along the line of travel, set by a device under control of any person other than the passenger, but operated only by the passenger.
3. In combination with the treading-pieces, a swinging, rocking, or rotating punch, either of which produce a double record, or a register of the ingress or egress of passengers.
4. In combination with the treading-pieces, spring clamping-rollers for feeding paper fillet.

115,802, antedated May 29, 1871.—STEAM-CARRIAGE FOR COMMON ROADS.—Francis Alger, Boston, Mass.

Claim.—1. The steering-handle K^3, when provided with a toggle-joint, K^3, in combination with the endless screw K^1, gear K, wheel H', and steering-ropes h h, substantially as described, and for the purpose set forth.
2. The combination of the double pawl L^3, the disk L^1, and axle L, operating substantially as described, and for the purpose set forth.

115,803.—MILKING-STOOL.—Levi O. Allen, Gardiner, Me.

Claim.—The curved wire pail-clamp C, formed with coils *a a*, and adapted to be secured by its ends to a milking-stool, substantially as and for the purpose herein shown and described.

115,804.—REFRIGERATOR.—Charles Lewis Anderson and Alfred Bogardus, Yonkers, N. Y.

Claim.—The water-refrigerating chamber E, placed between the ice and provision-chambers, and having the air-pipe G, supply-pipe F, and discharge-pipe H, all arranged as and for the purpose specified.

115,805.—MEDICINAL PREPARATION OF IRON.—Walter A. Aspinall, Brooklyn, N. Y.

Claim.—The compound of iron which I call jellate of, or gelatinized iron, composed of the ingredients in about the proportions herein described.

115,806.—LET-OFF MECHANISM.—George Bailey, Putnam, Conn.

Claim.—1. The strap A Q R, ring C, hook B, screw-bolt D, and nut E, combined with block F of the lever G, as and for the purpose specified.
2. The friction mechanism A Q R B C D E, the lever G, having hook H at one end and socket piece I at the other, and the spring mechanism K L M N O P, when said instrumentalities are constructed and arranged together, substantially as and for the purpose specified.

115,807.—BARREL, KEG, AND PAIL.—George W. Banker, New York, N. Y

Claim.—A barrel, tub, pail, or other round-hooped package having a taper on which to drive the hoops, the body of which is formed of a single piece of wood, with a single seam, when the taper is formed by annularly compressing the wood, all substantially as described.

115,808.—BOOT-AND-SHOE STRETCHER.—Emerson Reed Bardin, Newburg, N. Y.

Claim.—The sole A, the movable heel B, the reversible detachable anatomical projection attached to the heel, the loose detachable instep, when the parts are all constructed and arranged as described and specified, when used for the purposes set forth.

115,809.—STEAM-TRAP.—Albert G. Bearup, New York, N. Y., assignor to himself and Patrick Carraher, same place.

Claim.—1. The valvular sleeve B constructed with a closed end, *b*, but formed with an opening or openings at its side, and arranged to fit the end of the steam connection A, as described, in combination with the adjusting-nut D and water connection C, substantially as specified.
2. The combination of the outside nut or screw-box E, the interior adjusting-nut D, the valvular sleeve B, and the water connection C, the whole being constructed and arranged essentially as described.

115,810.—HOISTING APPARATUS.—Joseph R. Benedict, Williamson, N. Y.

Claim.—1. The combination of the standard A, track B, and adjusting-chain or rope C, the said track being provided with ways *f f* for the reception of car D, the whole arranged as described, and operating in the manner and for the purpose specified.
2. The standard A, track B, adjusting-chain C, and the crook or bend *e* of any hay-fork, the several parts being constructed and arranged to operate substantially as herein shown and described.

115,811.—STAVE-DRESSING MACHINE.—Lorenzo D. Benson and Leander C. Benson, North Jackson, Pa.

Claim.—1. The knives pivoted at one end and movable at the other, substantially as specified.
2. The combination, with the knives being movable at one end and pivoted at the other, of the tapered feed-rollers, one of which is adjustable, and the small ends being arranged relatively to the movable ends of the knives, all substantially as specified.
3. The combination of the conical rollers, springs, and knives, one roller being adjustable and mounted on the springs, and the knives also mounted on them, all substantially as specified.

115,812.—PHOTOGRAPHIC BACKGROUND.—Lyman G. Bigelow, Grand Rapids, Mich.

Claim.—A revolving background for photographic purposes, when its surface is graded radially from the center in regard to light and shade, substantially as and for the purposes described.

115,813.—ELEVATOR.—Josiah Bishop, Austin, Tex.

Claim.—The construction and arrangement, with the endless carrier D E F G *d'*, of the frame A a^1 a^2, and the carriage C, having rollers c^1 and loops c^2, for the purpose specified.

115,814.—PERMUTATION WHEEL FOR LOCKS.—Edward W. Brettell, Elizabeth, N. J.

Claim.—1. The flat cam *f*, in combination with

the ring *c* of the wheel, having the recess or box A, substantially as and for the purpose set forth.

2. The crab spring *e*, having bearing-points at each end, in combination with the inner ring *a* and cam *f*, or its equivalent, substantially as and for the purpose set forth.

115,815.—MOP-HEAD.—John Brizee, Alvarado, Cal.

Claim.—The handle A, mop-head B, clasps D D, wire E, jaws F F, and ferrule G, all constructed and arranged together, as and for the purpose specified.

115,816.—VARNISH FOR COATING THE SURFACES OF BOBBINS OR SPOOLS.—William Brooks, South Canton, Mass., assignor to himself and Isaac C. Fisher, same place.

Claim.—The improved composition, made of spirits of wine, gum shellac, gum sandarach, and oil of juniper alone, or such and a small amount of gum arabic, as stated.

115,817.—DISCHARGE-APPARATUS FOR OIL-TANKS, GRAIN-CARS, &c.—William J. Brundred, Oil City, Pa.

Claim.—A stem, B, for oil-tanks, made hollow, and threaded at *a' B'* to work in castings *a* D, when provided with a prolongation having the apertures E at the lower end, for the purpose of allowing the liquid to escape through the bottom of stem, but of retaining sticks and leaves.

115,818.—FRICTION-CLUTCH.—William C. Burch and George D. Oatley, Gloucester, N. J.

Claim.—The friction-dog D, provided with the hollow pillar *e*, spring *f*, piston *g*, and pin *j*, and combined with the slotted arm *i* of the pawl E, to operate substantially as herein shown and described.

115,819.—CAR-COUPLING.—Eugene Campbell, Medusa, N. Y.

Claim.—The bifurcated draw-head D, combined with the pivoted hook F, for the purpose specified.

115,820.—MACHINE FOR CUTTING IRREGULAR FORMS.—James W. Campbell, New York, N. Y.

Claim.—1. The expanding pattern, composed of a series of plates or sections, arranged to move toward and from each other, substantially as and for the purpose herein described.

2. The combination, substantially as described, with such series of plates or sections, of a system of "lazy-tongs" levers, L L, operating to produce and regulate the uniformity of the expansion and contraction of the pattern, substantially as herein set forth.

115,821.—RIVETING-TOOL.—Benjamin F. Cobb, West Troy, N. Y.

Claim.—As an improvement in double wheels, the two parts A B, constructed with internal spaces *d d*, and grooves leading thereto from the periphery, as and for the purpose specified.

115,822.—SASH-HOLDER.—David N. B. Coffin, Jr., Newton, Mass.

Claim.—1. The combination of the laterally-acting spring and friction-plate with the adjusting-screw and sash-guiding groove, substantially as described.

2. The arrangement of the accessible part or head of the adjusting-screw of a frictional sash or window-supporter within or beneath the lower rail.

115,823.—CUPOLA-FURNACE.—Anson G. Cook, Burlington, Vt.

Claim.—1. The bed D D, substantially as and for the purposes hereinbefore set forth.

2. The combination, with the bed D D, of one or more apertures, as E, substantially as and for the purposes hereinbefore set forth.

115,824.—WHEEL-BORER AND KEY-WAY CUTTER.—Benjamin F. Copp, West Cumberland, Me.

Claim.—1. The combination of the drum *b*, the pulley *d*, the screw-shaft *e*, band *c*, pulley *i*, head *m*, and threaded stock *j*, as herein described.

2. The combination of the sliding tool-post, fork *r*, sleeve *m*, cutter *n*, and mandrel *o*, arranged as described, for the purpose set forth.

115,825.—SWING.—Jesse A. Crandall, Brooklyn, N. Y.

Claim.—The elbow-levers *b c* D and swing-body A, combined with flexible cords B B and *d d*, arranged as and for the purpose specified.

115,826.—SPECTACLE-CLEW FOR SAILS OF VESSELS.—George H. Creed, New York, N. Y.

Claim.—The improved clew herein shown and described, the same consisting of the combination with a spectacle-clew of the additional ring or eye A, whereby the clew-garnet may be readily attached and held without jamming or chafing, as set forth.

115,827.—STOVE-GRATE.—Salmon P. Davis, Constantine, Mich.

Claim.—In combination with grate A, the vertical grate C, when the two are constructed and connected as and for the purposes set forth.

115,828.—MACHINE FOR CLEANING SISAL, HEMP, AND OTHER GRASSES.—Charles A. Dean, Boston, Mass., assignor to James A. Cole, same place.

Claim.—1. The scraper and roller or scrapers *g h*, arranged to operate automatically by the passage of the material between them, substantially as described.

2. In combination with the scrapers *g h*, the reciprocating feed or draw-bar *i*, substantially as described.

3. The method of holding the sisal or other grass or fibrous material for the action of the stripping or scraping mechanism by means of the reciprocating bar *i*, as and for the purpose described.

115,829.—CLOTHES-DRIER.—John K. Derby, Jamestown, N. Y.

Claim.—The combination of the central bar A, hinged blocks B, pivoted horizontal bars C, and pivoted vertical bars D with each other, substantially as herein shown and described, and for the purpose set forth.

115,830.—FENCE.—Henry Deyoe, Machias, N. Y.

Claim.—The post formed of the rods A, base-block B, and rings E, all arranged substantially as specified.

115,831.—COOKING-STOVE.—Nancy Duncan, Beaver Falls, Pa.

Claim.—In combination with a grate constructed substantially as set forth, the division plate or grate *c*, arranged and operated as described.

115,832.—PANTALOON.—George R. Enger, Boston, Mass.

Claim.—The pantaloons, with similar adjustable waistbanded front and rear flaps, substantially as and for the purposes described.

115,833.—GRAIN-DRIER.—Thomas W. Eaton, Kankakee, Ill.

Claim.—The grain-drier and cooler described, consisting of the walls A and B, shelves D D' and G, deflectors E, coiled pipes *e* and F, and conveyer K, all constructed, arranged, and operating substantially as and for the purpose herein set forth.

115,834.—PRUNING-SAW.—Peter Eberle, Freetown, Ind.

Claim.—The pruning-saw herein described, when constructed and used substantially as set forth.

115,835.—WASHING-MACHINE.—Francis M. Ellis, Galva, Ill.

Claim.—In combination with an ordinary perforated and stationary board, the corrugated and water-tight board J, arranged vertically to force the water through the perforated board H, in the manner described.

115,836.—BEDSTEAD.—Charles F. Nahmmacher, Pittsburg, Pa., administrator of Henry Evert, deceased.

Claim.—1. A bedstead-frame, consisting of side and end rails and posts of angle-iron, substantially as described.

2. The side rails *a a*, having split ends, each flange of the rail being folded against and riveted to a flange of the posts *c c*, substantially as described.

3. The end rails *b b*, having split ends, each flange of the rail being folded against and riveted to a flange of the posts *c c*, substantially as described.

115,837.—PROJECTOR.—William Farini, London, England.

Claim.—1. The springs *f*, movable stage *e*, stem *i*, and projecting platform *h*, arranged, combined, and operating substantially as herein set forth.

2. The trigger-detent *m* and its operating means *p*, arranged to serve relatively to the stem *i* carrying the projecting platform *h* and forced upward, substantially as herein set forth.

3. The self-acting detent *j*, for allowing the return of the projecting platform *h* immediately after its rise, as herein specified.

4. The elastic beds *c' c*, arranged as shown relatively to the projecting platform *h* and stem *i*, so as to induce a gentle extinguishment of the velocity, as herein specified.

5. The entire machine or apparatus, adapted for projecting objects or persons through the air by the means of springs acting on a platform, *h*, which may be flush with a stage or floor, as herein shown and described.

115,838.—BOAT-DETACHING APPARATUS.—Hickman E. Foster, Decatur, Ill.

Claim.—The slots G H and stops *g h*, in combination with the block A and weighted hook B, the whole arranged and operating substantially as described.

115,839.—SCHOOL-DESK.—John H. French, Burlington, Vt.

Claim.—1. The combination of the devices consisting of the braces G, H, and I, and the rod K, for the purposes of opening, closing, supporting, and operating the desk, substantially as herein described.

2. The devices for operating the desk, in combination with the devices consisting of the legs E and the braces F, combined with the seat B and the standard A, for folding and supporting the seat, as herein described.

115,840.—PIN-CLAMP FOR RIVETING.—Edward L. Gaylord, Terryville, Conn.

Claim.—The armed perforation B, one or more clamps, C, provided with recesses and springs D, and shaft E having inclined projections *e'* formed upon its upper part, in combination with each other and with the block A, in which they work, substantially as herein shown and described, and for the purpose set forth.

115,841.—HOT-AIR FURNACE.—William B. Geddes, Rochester, N. Y.

Claim.—1. The drum H, constructed of a series of rings formed with the walls *d d* and pipes *k k*, in combination with the air-passages *b b*, dome C, exit-pipes D, shell cone N, and fire-pot G, the several parts being constructed and arranged to operate as herein set forth.

2. The shell cone N, dome C, air-passages *b b*, stove-pipe L, with the arms L' L' and thimbles M M, arranged and operating in connection with the drum H, composed of the series of rings provided with the walls *d d*, pipes *k k*, and drum resting upon the fire-pot G, and forming a continuation of the fire-space, substantially as set forth.

3. The water-basin P, arranged within the front part of the chamber B surrounding the fire-pot G, operating in connection with the passage *m* in the top of the ash-pit E, said opening *m* being opened and closed by the slide *n* and stem *p*, as herein shown and described.

115,842.—CARRIAGE-SEAT.—Simon Peter Graham, London, Canada.

Claim.—1. The sheet-metal top rail *a*, combined with the rod *b*, made in one piece with the side handles *c*, as specified.

2. The improved carriage-seat, constructed of the several parts combined and arranged as herein shown and described.

115,843.—BEE-HIVE.—Daniel M. Griffith, Alum Bank, Pa.

Claim.—The arrangement of the part A, inclined bottom C, hinged body B provided with the openings E and doors *e*, the honey-cap F having the openings G G and L, the comb-frames D, and the removable cover J with opening M and plate *m*, all arranged and operating substantially as and for the purpose set forth.

115,844.—MILLSTONE-ELEVATOR.—Joseph B. Hall, Lebanon, N. H.

Claim.—The improved arrangement of the devices herein shown, consisting of the crane-post A, the gears I K, crank M, shaft H, the bevel-gears G F, and screw B, all constructed, arranged, and operated substantially as shown and described, for the purpose set forth.

115,845.—CAR-COUPLING.—James B. Harper, St. John, Mo.

Claim.—1. The stationary draw-head C, provided with lips *q* at the front, which are separated throughout their length so as to leave a clear cavity through the draw-head, in combination with the link *m m'*, weight *o*, bar and rotary draw-head A.

2. The rods *h h*, forming at their junction a pivot-bearing for the shaft *a* of the draw-head, and passing through the plates *b b* and elastic blocks *i i*, as shown and described.

115,846.—DEVICE FOR INDICATING AND REGISTERING THE MOTION OF MARINE ENGINES.—Andrew R. Harris, St. Louis, Mo.

Claim.—1. The shaft A having cam B, in combination with the T-lever D and slotted bar C, arranged adjustably to post B', substantially as and for the purpose set forth.

2. The T-lever D, bar C, post B', in combination with the tablet F', rods G G', springs *g g'*, and indicating-knobs H H', arranged to operate as and for the purpose set forth.

3. The parts described in second claim, in combination with the cam-levers I I' I², light signals J J', metallic plates *j j'*, and knobs *i i'*, when arranged to operate as indicating and registering devices, substantially as and for the purpose set forth.

115,847.—ELECTRO-MAGNETIC INDICATOR FOR STEAM-ENGINES.—Andrew R. Harris, St. Louis, Mo.

Claim.—1. The arrangement of wheel B on shaft A, spring C, metal brackets C' C² having keys *c c'*, post B', in combination with electro-magnets E E', armatures *e e'*, target-levers G G', hands

f f^1, to indicate the motions of engine-shaft A, substantially as set forth.

2. The plate H, light-signals h^1 h^2, pointer I, arranged in tablet F, in combination with target-levers G G^1, armatures e e', and electro-magnets E E', to register the motions indicated, substantially as described.

3. The arrangement of keys l l^1, springs L L', brackets k k', electro-magnets K K', vibrating armature M carrying pointer f^2, in combination with electro-magnets J J^1, armatures J^2 J^3 carrying hammers j j^1, for signaling and registering the bells, substantially as set forth.

115,848.—SAWING-MACHINE.—John Harris, Grand Ledge, Mich.

Claim.—The platform-frame B, provided with platform b, line or rope H, and bearing-bar G, in combination with frame A, lever C, pitman D, and guides F, constructed and arranged substantially as and for the purposes set forth.

115,849.—BEE-HIVE.—H. Harvey, Meriden, Ill.

Claim.—The metal strip b, combined as described with the double comb-frames B, for the purpose specified.

115,850.—BEER-COOLER.—George M. Hasinger, Vicksburg, Miss.

Claim.—1. The combination of the ice-box H and the reservoir D and waste-pipe B, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the ice-box H and reservoir D and waste-pipe B, of the spaces I and J, substantially as and for the purpose hereinbefore set forth.

115,851.—ANGULAR STRAP-HINGE.—Charles F. Hawley, Kansas City, Mo.

Claim.—An angular strap-hinge, having the inward corrugation B at the vertex thereof as a truss to the angle.

115,852.—MACHINE FOR BENDING SPOUTS. Daniel Hayes and John Marten, Cambridge, Mass.

Claim.—The mandrel A, having one or more joints, D E F, in combination with curved dies, as and for the purpose set forth.

115,853, antedated June 2, 1871.—MECHANISM FOR POLISHING THE HEELS OF BOOTS AND SHOES.—Charles H. Helms, Poughkeepsie, N. Y.

Claim.—1. The straight-edge R, in combination with either one or both of the right-and-left-hand vertically-reciprocating heel-polishers L, substantially as hereinbefore set forth.

2. The heel-rest P, in combination with one or both of the right-and-left-hand vertically-reciprocating heel-polishers L, substantially as hereinbefore set forth.

3. The combination of the right-and-left-hand polishers L with the vertically-reciprocating polisher-holder E and upright of the frame A having the slots B and C therein, for the purposes set forth, and substantially as described.

4. The combination of the intermediate crank G with the reciprocating polisher-holder E and crank-pin I on the shaft J, substantially as set forth.

115,854.—ROTARY ENGINE.—Benjamin I. Henderson, Salem, Mass.

Claim.—1. A circular case having inner concavities B and convexities C, packing F, and outlet-ports H, combined with a drum having pivoted blocks P T, recesses I M, and inlet-ports N, all constructed and arranged as and for the purpose specified.

2. The arrangement of the small steam-inlet channels G with respect to the cylindrical packings F to cause them to make a steam-tight joint with the drum, as specified.

115,855.—HAIR-PIN.—Edward Hewitt and John McAuliffe, New York, N. Y.

Claim.—As an improved article of manufacture, hair-pins provided with knobs or enlargements on the ends of the prongs, substantially as specified.

115,856.—EXERCISING-CLUB.—Charles E. Hiester, New York, N. Y.

Claim.—The exercising-club described, consisting of the shaft C provided with holes, V to V^6, for the insertion of keys, and surrounded with concentric weights, the outer ones of which are tongued and grooved, all the parts being arranged and combined substantially as set forth.

115,857.—BUTTON-HOLE-STITCHING MACHINE.—Daniel W. G. Humphrey, Chelsea, Mass., assignor to himself and Eugene Humphrey, same place.

Claim.—The two separate feed-cams for spacing the stitches on the sides of the button-hole, in combination with an intermediate ring for spacing the stitches around the eye of the button-hole, substantially as described.

115,858.—PISTON FOR STEAM-ENGINES AND PUMPS.—John Adam Huss, Bowling Green, Ky., assignor to Bowling Green Improved Cylinder and Pump-Packing Company, same place.

Claim.—1. The armed sleeve B, placed around the piston-rod, within the expansion ring D, which has the noses b b, to be operated substantially as herein shown and described.

2. The spring F and adjusting-screw d, combined with the arms a, sleeve B, and expansion ring D, substantially as and for the purpose herein shown and described.

3. The adjusting-pistons H H, fitted within the sliding piston, and combined with the ports A A and adjusting-arms a to move the latter by steam-pressure, as set forth.

115,859.—WOVEN FABRIC.—Thomas Isherwood, Ramsbottom, England.

Claim.—1. The new or improved fabric as made with the main and auxiliary warps and the main and auxiliary fillings carried by separate shuttles, all as described, each longitudinal tubular stripe of such fabric having a thickness double that of the part of the cloth next adjacent to it, all as specified.

2. The mode, substantially as hereinbefore explained, of weaving such new fabric or cloth, viz., by the main and auxiliary warps, and by fillings carried by separate shuttles operating with the said warps, in manner as hereinbefore described.

115,860.—BENT SLEIGH-KNEE, BENCH, AND BRACE.—George Ives and Hiram Ives, Detroit, Mich.

Claim.—A sleigh-bench, a, knee b, and supplementary knee or brace c, when bent from one piece of timber, substantially as set forth.

115,861.—MECHANISM FOR TRANSMITTING POWER.—Frederick P. Jaquith, Hoosick Falls, N. Y., assignor to himself, Lyman W. Wilder, William Chapman, and Alvin Willey, same place.

Claim.—The arrangement of the belt-rim H, intermediate rolls or gears E, and central shaft C, for transmitting power from said rim to said central shaft, the parts operating together as and for the purpose described and represented.

115,862.—EGG-BEATER.—Henry F. Jenks and Thomas Marsh, Pawtucket, R. I.

Claim.—The arrangement and combination of gears G H E E', piece X, beater I, and eccentric beaters D D', when operating in the manner and for the purpose substantially as described.

115,863.—BED-BOTTOM.—Robert V. Jenks and William Allan Miller, Paterson, N. J.

Claim.—The two-part and pawled side rails F f^1 J, webbing G, roller I, ratchets K, cross-pieces H f^2, and stapled cross-bar L M, all combined, constructed, and arranged as and for the purpose specified.

115,864.—POWER FOR SMALL MACHINERY. Charles L. Johnson, Omaha, Neb.

Claim.—The combination of a weight, a, when hung outside a building, by means of pulleys b c g and a cord, d, with the mechanism placed inside the building for driving small machinery, as specified.

115,865.—APPARATUS FOR HEATING AND DRYING SAND, GRAVEL, &c.—Hiram R. Johnson, Detroit, Mich.

Claim.—In a sand and gravel-drying apparatus, the combination of crank-shaft F, rods G, scrapers E, cross-tie I, V-shaped slides K, and pivoted slide L, with the pan B and arch A, when constructed and operating substantially as and for the purposes set forth.

115,866.—CLOTHES-DRIER.—John Johnson, Perry, Ill.

Claim.—1. The arms E E, arranged in pairs, and having toes G G on their inner ends, combined as described, with a notched post, A B, for the purpose specified.

2. The rack H, combined as described with the lower part of post A for the purpose of receiving and supporting the arms, as set forth.

115,867.—DRIVING ATTACHMENT TO WASHING-MACHINES.—William M. Johnston, Wilmot, Ohio.

Claim.—The separate driving attachment for washing-machines, constructed and arranged substantially as herein described, in combination with the sockets d d, so as to be instantaneously attached and detached, for the purposes herein specified.

115,868.—COMBINED MACHINE FOR CUTTING, PUNCHING, AND BENDING TIRES. James C. Jordan, Watertown, Wis., assignor of one-fourth his right to Thomas Baxter and one-half to J. W. Mathes.

Claim.—The combination described of the frame A, levers B C, pinion D, and blocks E F.

115,869.—HYDRAULIC MOTOR.—Volney Kromer, Grand Rapids, Wis.

Claim.—1. The improved water-motor, consisting of the case A, piston-valves or gates A A' and O O', and the driving-shaft X and valve-operating gear, combined and operating substantially as specified.

2. The combination of case A, vibrating blade D, and the valves or gates A A' and O O', arranged substantially as specified.

115,870.—BLAST-HEATING FURNACE OR OVEN.—Gabriel H. Lagorce, Newcastle, Pa.

Claim.—1. A blast-heating apparatus or stove mounted on trucks so as to be removable at will from the gas-chamber, and replaced in like manner, substantially as described.

2. In a blast-stove mounted on wheels, the trunk-pipes B, constructed so as to be extended through the walls of the gas-chamber, and with suitable external connections, whereby the stove can be disconnected from the blast and furnace-pipes outside the chamber, substantially as described.

3. Two or more series of air-heating pipes of different diameters, arranged with reference to each other, substantially as described.

115,871.—TREATING SOLID AND LIQUID HYDROCARBONS.—Frederick Lambe, London, England.

Claim.—The herein-described process of treating paraffine and fatty oil, consisting, essentially, in reheating the clarified portion of the same, agitating it mixed with sulphuric acid for removing the colored matter, adding fuller's-earth, and mixing it with naphtha, as shown and described.

115,872.—SEWING-MACHINE.—John H. Lester, Brooklyn, N. Y.

Claim.—1. The shaft D recessed at the neck D^1, and connected, by a remaining part, D^2, with an enlargement having horns D^3, D^4, and D^5, when operated within a race, A, and adapted to serve, relatively, to a shuttle, C C', and to a needle and its connections, as herein set forth.

2. The combination of the shuttle C C', and the means provided therein for carrying and delivering the shuttle-thread, with the peculiarly-formed driving means D D^1 D^2 D^3 D^4 D^5, operating together in a sewing-machine, as herein set forth.

115,873.—APPARATUS FOR CARBURETING HYDROGEN GAS.—Charles B. Loveless, Syracuse, N. Y.

Claim.—The combination of generators D d D d, connections f, rigid arms F, and a gasometer, A, the generators d d being connected with the carbureter by means of flexible tubes g g', all arranged and operating substantially as described, for the purpose specified.

115,874, antedated June 10, 1871.—FEEDING DEVICE FOR CATTLE-STALLS.—Ariel H. Maham, Hamden, N. Y.

Claim.—The combination and arrangement of the perpendicular sliding partition G, guide-boards C C, and retaining-pins d d, the whole being combined with the manger and stanchion-frame of cattle-stalls, in the manner and for the purposes hereinbefore set forth.

115,875.—CULTIVATOR.—Philip Maier, Mapleton, Wis.

Claim.—The arrangement of the frame A, axle C, standards B having the self-locking pins e, the standards h, lever D, hinged strap j, and hook k, as herein shown and described, for the purpose specified.

115,876.—STEAM AND OTHER MOTIVE-POWER ENGINE.—Robert Mudge Marchant, London, England.

Claim.—The provision, between the working-cylinder of a steam or other motive-power engine and the generator-reservoir or other source of supply of the steam or other gaseous body, of one or more measuring-chambers and valves, substantially such as are herein described, whereby charges of the steam or other gaseous body are measured and cut off from the generator-reservoir or other source of supply before their admission to the working-cylinder, as herein set forth.

115,877.—PROCESS OF OBTAINING MOTIVE POWER.—Robert Mudge Marchant, London, England.

Claim.—The process, herein described, of obtaining motive power by compressing air in progressive stages and passing it at each stage through water, and finally passing it through a heater, and from thence to the cylinder of an engine, substantially as specified.

115,878.—SLIDE-VALVE.—Isaac Martin and Daniel B. Perrow, Lone Jack, Mo.

Claim.—1. The arrangement, in the valve-seat, of recesses or chambers B B, communicating with each other by the ports or passage b, substantially as and for the purpose set forth.

2. The pipe C' with oil-cup C, when arranged in communication with oil-recesses B B, in combina-

tion with supply-steam pipe e, substantially as set forth.

115,879.—REFRIGERATOR.—Peter McBride, New York, N. Y.

Claim.—An improved refrigerator, formed by the combination of the rectangular wooden case A, cylindrical concentric sheet-metal cases D F, disks or washers C E, ring G, cover B, stop-cock or faucet H, and waste-pipe I, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

115,880. — FINISHING VULCANIZED INDIA-RUBBER BELTING.—Charles McBurney, Boston, Mass.

Claim.—The within-described process of successively heating, stretching, compressing, and cooling the belting after it has been vulcanized, substantially as and for the purpose set forth.

115,881.—COMBINED CRANK, RATCHET, AND BRAKE.—Robert B. McElrath, Newburg, N. Y.

Claim.—1. The lever L L^1, with slot G and with pawl M and brake H attached, substantially as described, and for the purpose as set forth.

2. The lever L, in combination with slot G, pawl M, hub H, ratchet-wheel D, with friction-face K, drum A, shaft B^1 B^2, and latch N, substantially for the purpose as specified.

115,882.—NON-FREEZING HYDRANT.—Hugh Merrie, Cincinnati, Ohio.

Claim.—1. In combination with a hydrant, the double case A, extending below the surface of the earth, and filled with hydraulic cement A', or similar non-conducting material, substantially as and for the purpose set forth.

2. The combination of the hydrant C, hermetically-sealed air-chamber F, and double case A, extending below the surface of the earth, and filled with hydraulic cement A', or similar non-conducting material, substantially as and for the purpose set forth.

115,883.—GATE.—Gershom Mott, Big Run, Ohio.

Claim.—The arrangement of the elongated staples c, c^1, and c^2, adjustable loop c^3, and pin c^4, when constructed and operating together, as and for the purposes described.

115,884.—ANIMAL-POKE.—Fordyce M. Moulton, Ferrisburg, Vt.

Claim.—The poke A, forked at one end and curved at the other, substantially as and for the purposes described.

115,885.—KNIFE-SCOURER.—David S. Neal, Lynn, Mass.

Claim.—The above-described combination of wooden cap A with the loose plate D and gauze E, or a perforated sifter, and the cork B, all constructed and arranged substantially as set forth.

115,886. — BOOK-SUPPORT. — Crandall J. North, Auburn, N. Y.

Claim.—1. The upright A, made in three sections of wire, e g d, with its clip B and thumb-screw C, as shown and described.

2. The curved arms F, attached to the curved uprights G on top of the frame, and connecting-link o, forming a spring to hold it in position on the book, as shown and described.

3. The combination of the upright frame A in sections e g d, clip B, thumb-screw C, legs D constructed with ends e e, braces E E, cross-bar or support I, holder F, curved uprights G, and connecting-link o, all constructed and arranged as shown and described, for the purpose set forth.

115,887. — CONCRETE ASPHALTIC PAVEMENT. — William B. Parisen, Newark, N. J.

Claim.—1. Fine gravel, Portland cement, plaster of Paris, distilled coal-tar, and asphaltum, combined with the stone by incorporating and mixing it therethrough before the base of the pavement is laid, as and for the purpose specified.

2. The amalgam or bond used with the angular stone forming the base, as set forth.

3. My system of coating with pure hot liquid (as herein specified) between the wedging and first mastic and second mastic courses, and the mode of coloring the surface to a slate color, as set forth.

4. The asphaltic pavement, composed of the several courses, substantially as herein shown and described.

115,888. — COAL-SCUTTLE. — John Pfeifer, Philadelphia, Pa.

Claim.—The shoulders a' a' and slotted flanches a'' a'' on the arched guard A, and the headed stud 4 and turn-button 5 on the corresponding inner sides of the bod B, constructed and arranged to operate together, substantially as and for the purposes hereinbefore set forth.

115,889.—NUT-LOCK.—William H. Phipps, Southborough, Mass.

Claim.—The nut-lock described, consisting of bolt A, having wedge-shaped groove B and curved spring plate C I, substantially as described.

115,890.—LAMP-BURNER.—Seabury B. Platt, Derby, Conn.

Claim.—1. The combination, with the wick-tube A, of the flame-regulator, the latter being arranged for confining the wick against A, and for adjustment vertically to regulate the flame, substantially as specified.

2. The flame-regulator, having the spiral slots j acting on the segmental flanges h and operated by the ring N, substantially as specified.

3. The stationary tubes A, roughened at I and ribbed at k, as and for the purpose specified.

4. The suspended ring N, studded at n, combined with cylinder f, notched at i, for the purpose of enabling the latter to be turned in the manner described.

5. The said tube, having the flare or bell-mouthed upper end, for action, in conjunction with the flame-regulator, for confining the wick and limiting the thickness of the flame, substantially as specified.

6. The combination, with the regulator, of the ring O, either having slots corresponding to slots p or not, all substantially as specified.

7. The revolving flame-regulator, having wick-adjusting slots p, substantially as specified.

115,891.—LANTERN.—William Porter, Jr., New York, N. Y.

Claim.—The guard-hoop A, provided with the loop b, which is fitted through the flange of the canopy, for the purpose of receiving the fastening-hook, as set forth.

115,892.—METALLIC CARTRIDGE.—Timothy J. Powers, New York, N. Y.

Claim.—A center-fire cartridge-case, having the butt perforated for the purpose of priming, when there is combined with it a gas-check that is formed and applied and fastened to the butt of the case as described, substantially as and for the purpose specified.

115,893. — RAISIN-SEEDER.—George Pratt, West Roxbury, Mass.

Claim.—1. The grate-jaw D and compressing-jaw C, in combination with lever or cam-flange F of wheel E, substantially as described.

2. The grate-jaw D and compressing-jaw C, provided with tail-pieces K and L, in combination with spring J, substantially as and for the purpose specified.

3. The retainer or rest H, operated by cam-groove G of wheel E, in combination with a grate-jaw, D, expelling-jaw A, and compressing-jaw C, substantially as described, for the purpose specified.

4. The expelling-jaw A or compressing-jaw C, or both, constructed with a bevel-sided opening, S, and perforated plate f, backed with soft solder, substantially as and for the purpose described.

5. The floor R, attached to and in combination with a moving jaw of the raisin-seeder, substantially as and for the purpose set forth.

115,894. — SUN-STROKE PROTECTOR FOR HEAD-COVERINGS.—Hellwig Prévôt, New York, N. Y.

Claim.—1. The sun-stroke protector, consisting of the box A, with the flexible water-tight bottom a, substantially as herein shown and described.

2. The double cover b d, combined with the box A and flexible bottom a, substantially as herein shown and described.

3. The combination, with the hood B, of the box A, as specified.

115,895. — HOSE-PIPE. — Adam R. Reese, Phillipsburg, N. J.

Claim.—As a new article of manufacture, the hose within described, consisting of the pipes B having the flared ends C, flexible connections A, and rings D, when all are combined, substantially as specified.

115,896. — BOOK-BINDING.—John L. Rile, New York, N. Y.

Claim.—The method herein described of making file and sample-books, with the aid of removable guards, as set forth.

115,897. — SNAP-HOOK. — Julius Robbins, Auburn, N. Y.

Claim.—1. The construction and arrangement of the hook A with its open socket a, loop cross-pin b^1, and pin-follower e, and the tongue B with its open socket b and cam f, the whole arranged and operating as described.

2. The tongue, provided with a cam, f, and an opening or socket, b, permitting it to be applied to the cross-pin b^2 of the loop C, in connection with the pin-follower e, as described.

115,898.—ADJUSTABLE MIRROR.—George S. Roberts, Meredith Village, N. H.

Claim.—1. The spring pulley C or its equivalent, cord E, bar B, friction-lever F, and glass A, arranged to operate substantially as and for the purposes described.

2. In combination with the glass A, arranged as above described, the glass J, jointed rod I, and swivel-rod L, substantially as and for the purposes herein shown and described.

3. In combination with an adjustable mirror or glass, A, the friction-lever F, either with or without the pulley C.

4. A pair of mirrors, A J, connected together, and rising and falling in unison, as and for the purpose specified.

115,899.—MOP.—Thomas F. Rooney, Chicago, Ill.

Claim.—1. The combination of the ring G, arms H, and rollers I with a mop-head provided with a rest or stop, N, substantially as and for the purposes specified.

2. The combination of a mop-head with a wringer arranged to slide thereon, substantially as and for the purpose set forth.

3. In combination with the wringing-rollers I, when mounted in the sliding arm-heads K, the springs J, as and for the purpose set forth.

4. The combination of the screw-piece C, provided with a groove, b, about its lower end, with the socket D and pin a, for the purpose of loosely connecting the socket to the screw-piece in such manner that the former will turn freely about the latter.

115,900.—ROLLER AND MARKER FOR PLANTING. — Frederick Roth and Bernhard Fürst, Lacon, Ill.

Claim.—The frame A, provided with a jointed tongue, and having side bars extended rearward, and beveled to form shoes or supports for the marking device when the same is elevated, as set forth.

115,901.—WATER-HEATER. — David Smith and John Lynch, Boston, Mass.

Claim.—1. The fire-box D, (with the cells G and water-back H_1,) cast in a single piece, substantially as and for the purposes described.

2. The combination of the shell F and base A with the fire-box D, arranged substantially as and for the purposes herein shown and described.

115,902.—DOOR FOR STOVES.—George W. Smith, New York, N. Y.

Claim.—The brace D, constructed of the tube d and rod e, in combination with the door or shelf B and plate A, as shown, and for the purpose set forth.

115,903.—SAW-MILL.—Edward H. Stearns, Erie, Pa.

Claim.—1. The wheel G provided with vertical flanges r and r, and the V-shaped grooves, and the counter-formed top g of the rail D, constructed, arranged, and operating for the purpose described.

2. The wheel G provided with the axle s, having end bearings, as described, in combination with the saw-carriage A provided with scrapers o n, head-block B, knee C, and gib-headed dog g, all constructed in the manner and for the purpose specified.

3. The combination of the windlasses mounted upon the sliding knees C C C and upon the shaft E, revolving in conjunction with the movement of the knees with the described saw-carriage, constructed and operated substantially as and for the purposes set forth.

4. The combination of the lever m with the hand-dog n, pivot V, and sliding knee C, as a device for locking said dog, constructed and operating as described.

115,904.—THROTTLE-VALVE GEAR.—Charles A. Stewart, Aspinwall, U. S. of Colombia.

Claim.—The combination of the throttle-valve with the levers B, strap C, eccentric D, shaft E, and lever F, all arranged substantially as herein shown and described.

115,905, antedated June 2, 1871.—TRUNK. Ninian Stewart, Detroit, Mich.

Claim.—The trunk A, provided with the slides C, table-top D, mirror E, and braces G G', all the parts being constructed and arranged substantially as described and shown, for the purposes set forth.

115,906. — STOVE-PIPE JOINT. — William Stine, Elmore, Ohio.

Claim.—Connecting stove and other pipe by means of an adjustable ring expanded by a cam constructed, arranged, and operated substantially as described.

115,907. — PLOW. — John Thomas Story, Magnolia, Ark.

Claim.—The screw-threaded standard A, cross-bar a, pivoted handles D, forked plow-beam C d e, adjustable brace i, and plowshares B j, all relatively constructed and arranged as herein shown and described, for the purpose specified.

115,908.—HAME-FASTENER.—Alvah Sweetland, Syracuse, N. Y.

Claim.—1. The link A, closing lever B, and hooked bar C, the said bar C having nibs or projections c c, and the lever B having rails e e, that embrace said projections c to lock the lever in the closed position, all constructed and arranged substantially as specified.

2. The detachable throat-blocks F f, in connection with the link A, lever B, and bar C, as and for the purpose described.

115,909.—HORSE HAY-RAKE. — Martin W. Trescott, North Canaan, Conn.

Claim.—The attachment of the rake to the truck-

frame by the flexible drawing-straps D and pivoted bars E, the lifting-rope G and the lever F, and the bar N O and lever L, all substantially as specified.

115,910.—FLAX-HARVESTER.—Samuel W. Tyler, Troy, N. Y.

Claim.—1. The combination of retracting gathering-arms *h*, with the pulling devices of a flax-harvester, substantially as described.

2. The frame A, constructed in one piece with the standard *a*, bearing a^1, and stirrup a^2, and applied for the purpose and in the manner substantially as described.

3. The endwise adjustable supporting-boards D, supported and arranged substantially as described.

4. The swath-guide or director *J*, arranged in rear of the flax-pulling devices, substantially as described.

115,911.—BREECH-LOADING FIRE-ARM.—Silvanus Frederick Van Choate, Boston, Mass.

Claim.—1. In a breech-loading fire-arm, substantially such as described, the combination with the rear end of the barrel of a rotating and sliding bolt, having a recessed front end to receive the rear of the cartridge-shell and a notch or equivalent formation in said recess into which a portion of the shell is forced, by the explosion of the cartridge, under the arrangement shown and set forth, so that the cartridge-shell shall be started by a rotary movement of said bolt, and then withdrawn from the barrel by the sliding movement of the same.

2. In combination with the elements named in the preceding clause, a cartridge-ejector, arranged and operating substantially as shown and described.

3. The breech-bolt, provided with hemispherical or equivalently-formed cavity in its front end, and a notch or score, *k*, formed in said cavity, in combination with the ejector, hinged to said bolt in such position that its front end shall form part of the wall of the said cavity or recess, as set forth.

4. The arrangement, herein shown and described, of the breech-bolt, the ejector hinged to the recessed front end of said bolt, and the block d' of the trigger in the slot m' formed in the bolt, said parts being constructed and operated as set forth.

5. The combination of the breech-bolt, the firing-pin, the grooved collar *q* and collar *r*, the block d^1, and trigger E, under the arrangement and for operation as shown and set forth.

6. In combination with the breech-bolt, trigger, firing-pin, and collars *q r*, the scar a^1, operating in connection with said parts, substantially as herein shown and set forth.

7. The scar a^1, united with the breech-bolt, in the manner and by the means herein shown and described.

115,912.—METALLIC TILE FOR ROOFS.—Cornelis G. Van Pappelendam, Charleston, Iowa.

Claim.—In tiles for roofs, plates formed with ridges a^1 a^2 a^3, two tiles thus making a covered channel, as shown in fig. 2 of drawing, to prevent the wind from driving the water over the second ridge.

115,913.—CARRIAGE-AXLE.—Ernest Friedrich Wagner, Houston, Texas.

Claim.—1. The linch-pin H J, washer D, pipe-box E with oil-recess *f*, sleeve B provided with recess *g* and collar C, arranged as shown and described, in connection with the axle-journal A, made square in cross-section, as shown and described.

2. The sleeve B provided with collar C, and the pipe-box E having oil-recess *f*, arranged in connection with the square axle A, as specified.

115,914.—LUBRICATING ARRANGEMENT FOR AXLES OF WAGONS.—Charles A. Wakefield, Pittsfield, Mass.

Claim.—An axle having a perforation, D, starting in the screw-thread *b* at its outer end and upper side, and extending downwardly to near its mid-length, in combination with the nut C having perforation *c*, arranged for operation, substantially as specified.

115,915.—WRITING-INK.—Edward F. Walsh and Sanford Duryea, Brooklyn, N. Y.

Claim.—The compound denominated writing-ink, of the ingredients, in the proportions, and for the purposes set forth.

115,916.—REVOLVING FIRE-ARM.—Franklin Wesson, Worcester, Mass.

Claim.—The combination of the filling-pieces *a* or a' with the frame of a revolving fire-arm, substantially as and for the purpose herein described.

115,917.—HOSE-COUPLING.—Levi Wharton, Salem, Ohio, assignor to Amos Rank, same place.

Claim.—1. The combination of the flaring socket, its internal lip, the tapering plug, and the spring-hooks on the plug, interlocking with the internal flange on the lip, all these members being constructed to operate in combination, substantially as hereinbefore set forth.

2. The combination of the socket, its internal flange, the gasket E resting on the flange, the plug inserted in the socket and bearing on the gasket, the packing-ring surrounding the plug, the spring-hooks on the plug, and the lip in the socket into which they interlock, all these members being constructed to operate in combination, substantially as hereinbefore set forth.

115,918.—STEAM-PUMP AND FIRE-ENGINE.—James W. Whitaker, Kenosha, Wis.

Claim.—1. The cold-water tank, arranged with the condensers for having the water forced through it, and provided with the weighted valve *p* in the escape-pipe and injecting-pipes *g*, with valves therein, all operating substantially as specified.

2. The arrangement, with the piston-valve and steam-chest L, of the valve O W, weighted lever X, floats, and the cranked rod thereof, all substantially as specified.

115,919.—Suspended.

115,920.—CHILD'S CARRIAGE.—John B. Wightman, Brooklyn, N. Y.

Claim.—Pivoting the body to a child's carriage or perambulator in such manner as will admit of its position being reversed, as and for the purposes specified.

115,921.—FURNACE FOR SMELTING LEAD ORES.—John V. Woodhouse, Mine La Motte, Mo.

Claim.—1. The arrangement of a reservoir or water-back, C, partially or wholly surrounding the top of a hearth, A, substantially as and for the purpose set forth.

2. The reservoir C, its bottom flange *c*, air-chamber E, tuyere pipes *c*, openings c^1, slides c^2, in combination with a hearth, A, projecting openings c^1, and flanges *c*, substantially as set forth.

3. The projecting ledges having openings c^1, substantially as set forth.

4. The reservoir C, air-chamber E, tuyeres *c*, openings c^1, tank or boiler D, supply-pipe *d*, return-pipe d', arranged in combination with a hearth, A, substantially as set forth.

115,922, antedated May 30, 1871.—PAPER-CUTTER.—Joseph Worell, Philadelphia, Pa.

Claim.—The combination and arrangement of the scorer C, adjustable collar B, and shaft A, substantially in the manner and for the purpose above described.

115,923.—STOVE-WAITER OR SHELF.—Charles D. Wright, Leesville, Conn.

Claim.—In combination with toasting-shelf, the yoke C D E F, band G, and screws H I I, constructed and arranged as and for the purpose specified.

115,924.—COMPOSITION PAVEMENT.—Anton Georg Anderson, Hoboken, N. J.

Claim.—The composition herein described, substantially as and for the purpose set forth.

115,925.—SEWING-MACHINE.—George W. Baker, Wilmington, Del.

Claim.—The arrangement on the shaft of the disk *e* having lateral eccentric e^1, and rod *g* having projection *h*, reacting spring h^7, and arms g^1 g^2, all constructed and arranged, with reference to the frame A B, substantially as and for the purpose specified.

115,926.—ELECTROPLATING WITH TIN.—John Edward Bingham, Victoria Park, Sheffield, Great Britain.

Claim.—The solution, composed of tin, potassic hydrate, cyanide of potassium, and calcic hydrate, substantially as and for the purpose herein specified.

115,927.—SCREW-CAP FOR CANS.—Louis R. Boyd, New York, N. Y.

Claim.—1. A metallic mouth-piece for cans and other vessels, having at its lower end a screw-thread, and at its upper end a nose or spout, substantially as described.

2. The combination, with a mouth-piece having the character described, of a screw-stopper, substantially as set forth.

115,928.—STEAM-ENGINE.—Gilbert Bradford, Watertown, N. Y., assignor to The Portable Steam-Engine and Manufacturing Company, same place.

Claim.—1. The arrangement of the engine-cylinder within a sectional steam-dome forming part of the man-hole of the boiler, substantially as shown and set forth.

2. The steam-dome, constructed in two sections, the upper of which contains the steam or engine-cylinder, substantially as herein shown and set forth.

3. The combination of the steam-cylinder with the base of the steam-dome and the boiler, substantially in the manner herein shown and described, whereby the base of the dome forms at once a part of the man-hole and a foundation for one end of the engine, and can be uncovered to open the man-hole into the boiler by removing the cylinder or the dome portion inclosing it.

4. The feed-water heater, arranged within a chamber in the steam-dome, substantially as shown and described.

5. The combination of the heater with an inclosing-chamber formed in the base of the dome, and communicating with the steam-cylinder exhaust under the arrangement shown and described.

115,929.—COTTON-SEED PLANTER.—Thomas E. C. Brinly, Louisville, Ky.

Claim.—1. The arrangement of the shovel C upon the frame of the machine and directly in front of the driving-wheel, for the purpose of opening a furrow for said wheel to run in, and for the reception of the seed as it passes from the seed-box.

2. The combination of the vertically-adjustable driving-wheel, the seed-box, and the seed-distributing wheel, and the mechanism for operating said distributing-wheel, the parts being constructed and arranged upon runners, substantially as and for the purpose specified.

3. The combination of the vertically-adjustable driving-wheel and the frame of the seed-planting machine, the whole being arranged upon runners, substantially as and for the purpose set forth.

4. The combination of the seed-coverer F F' and the frame of a seed-planting machine when such frame is carried upon runners, substantially as and for the purpose set forth.

115,930.—NOTATOR FOR MUSIC.—Samuel R. Brooks, St. Louis, Mo.

Claim.—1. The hollow markers R, adapted to contain a crayon, pencil, or any suitable marking material, and employed in combination with the levers L, wires or cords E, and carrying-rollers T T^2, V V^2, substantially as described.

2. The adjusting-plate F, when constructed and applied as described, in combination with the wires or cords E, for the purposes specified.

115,931.—PRESERVING WOOD.—Samuel P. Brown, Washington, D. C., assignor to himself and William E. Shaw, Portland, Me.

Claim.—The process of ironizing wood, substantially as described.

115,932.—SHINGLE-MACHINE.—George Challoner, Omro, Wis.

Claim.—1. In a shingle-machine having one horizontal saw and two carriages, the carriages D D' and their operating mechanism, when constructed and combined to operate substantially as and for the purposes herein set forth.

2. The adjustable yoke *d*, in combination with the carriage D or D' and the crank-shaft F *f*, substantially as and for the purposes set forth.

3. In connection with the eccentrics h^5 h^6 and shaft F *f*, constructed to operate as herein described, the pin *a* and collar a', substantially as herein set forth.

4. In connection with the eccentrics h^5 h^6, the shafts F *f* H^1 H^2, and the gear-wheels h^3 h^4, arranged and operating as described, the movable shaft H, the friction-wheels *h* h^1, and the hand-lever b', substantially as herein set forth.

5. The combination of the gauge ratchet and pawl *l* with the feed-ratchet l^1 and dog l^2, substantially as and for the purposes specified.

6. The combination of the pivoted lever M with the pins *m n*, the adjusting-screws, and the oscillating grate and cam-shaft, substantially as and for the purposes specified.

115,933.—WHEEL FOR ANIMAL-TRAPS.—William F. Collier, Worcester, Mass.

Claim.—1. A wheel for animal-traps, constructed substantially as herein described, with tread-bars F, corrugated holding-band and inner supporting-head, substantially as specified.

2. The combination, with the tread-bars F, of the corrugated holding-band H, substantially as and for the purposes set forth.

3. A wheel for an animal-trap, composed of a center disk, G, radial and horizontal wires F F^1 F^2, corrugated band H, and head-disk I, said parts being constructed and combined together, substantially as shown and described.

115,934.—MACHINE FOR ORNAMENTING PRINTERS' RULES.—James M. Conner, Brooklyn, N. Y.

Claim.—1. The combination of the screw-shaft G, clamping bed-plate B, and cam-shaft J actuating the tool-stock R, substantially as described, for producing wavy lines upon printers' rules, as set forth.

2. The combination, with the screw-shaft G and clamping bed-plate B, of the pattern feed-wheel *a* actuated by a pawl from the shaft J, substantially as described, for the purpose of producing crosswise or angular cuts or lines on the rules.

115,935.—PYROTECHNIC NIGHT-SIGNAL.—Martha J. Coston, Washington, D. C.

Claim.—1. The case C, consisting of the outer and inner parts *e* and e', having the friction composition and quick-match arranged between them as described, and for the purpose set forth.

2. The signal-holder Z, with its spring H and steel points I, constructed as described.

115,936. — Railway-Switch Signal.—Alonzo W. Cram, St. Louis, Mo.

Claim.—The spindle J, provided at its upper end with the signal N and colored lantern M, and having on its lower end the pinion I, said spindle J being attached to the switch-lever C, as shown, in combination with the lever C, rack H, and guide-bars G, all constructed, arranged, and operated as set forth.

115,937.—Water-Meter.—Joseph W. Cremin, New York, N. Y.

Claim.—1. A water-meter, in which is combined the case A, shaft *a*, ring *f*, and arms *e*, as specified.

2. In combination with the foregoing, the case A, tube *j*, and valve *m*, as set forth.

115,938.—Loom.—John Storey Davies and Walter Edward Yates, Manchester, Great Britain.

Claim.—1. The rod or shaft *a*, with its arms carrying the rods *e f* and its arms *g*, in combination with the warp-beam, the cords *k k*, spring *i*, and pulleys *l l*, the whole operating substantially as described.

2. The combination of the above and a device, substantially as described, for tightening and releasing the cords *k*, as set forth.

3. A reed, consisting of a central row of stationary dents, and at each end a series of dents separated by elastic washers, as and for the purpose described.

4. The adjustable swell *d*, in combination with the brackets *c* and stop-rod *f*, substantially as set forth.

115,939. — Corn-Sheller. — Lloyd Day, Baltimore, Md.

Claim.—1. The shelling-palms K L, constructed as herein shown and described, consisting of the slotted shanks *w*, with extended fingers *s'*, and provided with curved tines *s* on the upper side of said shanks, substantially as and for the purposes herein set forth.

2. The arrangement of the spiral springs *l l* upon the extended fingers *s'* of the palms K L, as and for the purposes described.

3. In combination with the stationary annular plate D and revolving annular plate *c*, the middle plate C, when provided with recesses *n n*, incline planes *a a*, and slots *d d*, substantially as and for the purposes herein set forth.

4. In combination with the shelling-palms K L and escaping-rollers F F, the yielding guides *b b*, when all such parts are constructed as described, and arranged to operate substantially in the manner and for the purposes specified.

5. The arrangement, in relation to the shelling-palms K L, constructed as described, of the relieving or escaping-rollers F F, as and for the purposes described.

6. In combination with a corn-sheller constructed substantially as described, the feeding attachment herein shown in figs. 11 and 12 of the drawing, when the several parts thereof are constructed and arranged to operate substantially in the manner specified and set forth.

115,940. — Water-Meter. — Augustus M. de Souchet, Evansville, Ind.

Claim.—1. The rotating or oscillating valve D, in combination with its operating rod, substantially as described.

2. The spring G, operated by the piston, in combination with the adjustable stud G', substantially as set forth.

3. The cylinder A, piston B, valve D, spring G, adjustable stud G', valve-rod I, and disk K, when all are combined to form a water-meter, substantially as described.

4. In combination with the valve D, the spring *o*, stem *d*' with its shoulder *e'*, and sleeve *e*, substantially as shown and described.

115,941. — Bee-Hive.—John Detrick and William B. Niven, Bellefontaine, Ohio, assignors to William B. Niven, same place.

Claim.—1. The combination of the protected induction-aperture H, the eduction-apertures *k*, the perforated bent tubes K, and protecting-cups *k'*, all constructed and arranged as herein described, for the purposes set forth.

2. The casing A, constructed with continuous sides extending from the bottom of the brood-chamber to the top of the store-chamber, in combination with one or more bottomless boxes, L, inclosed within said sides, the cap or cover I, and the projecting base D, all substantially as described.

3. The combination of the case A D, vertical frames *a'*, lighting-stand E, inclined support F, air-aperture H, side apertures *k*, and tubes K, and constructed and arranged substantially as and for the purposes set forth.

115,942. — Lifting Apparatus.—Charles H. Douglas, Hartford, Conn., assignor to William A. English, same place.

Claim.—1. The combination of the rod *c*, bevel-gear *z*, bevel-gears *x x x*, screw-rods *s s s*, and nuts *o o o*, the whole constructed, arranged, and operated substantially as and for the purpose set forth.

2. The combination of the rod *c*, springs *j j j*, rods *l l l*, pulleys *m m m*, forked nuts *o o o*, screw-rods *s s s*, gears *x x x*, and bevel-gear *z*, the whole constructed, arranged, and operated substantially as and for the purpose set forth.

3. The combination of the rod *c*, tube *d*, rod *f*, swiveled cross-bar and handles *h i i*, the springs *j*, and pulleys *m m*, the whole constructed, arranged, and operated substantially as and for the purpose set forth.

4. The combination of all the parts specified in the preceding clauses with the table *a*, legs *b b b*, and scales *t t t*, the whole constructed, arranged, and operated substantially as and for the purpose set forth.

115,943.—Sheet-Metal Can.—John G. Evenden, Chicago, Ill.

Claim.—1. The combination of a sheet-metal can, C, with a series of longitudinal wooden strips, W W, arranged around it with their edges parallel but not in contact, said strips being clasped firmly against the body of the can by means of hoops A A, and supported by the wooden base B, substantially as and for the purposes specified.

2. The supporting-hoop *i*, constructed with the large wire at its upper edge as described, and applied to the can in combination with the strips W W, which rest upon it and bear against the under side of the wire or rib formed by it, substantially as and for the purposes set forth.

115,944.—Device for Applying Remedies to the Ear.—Joseph Fanyon, Bridgeport, Conn.

Claim.—The pipe A, provided with the bulb B, flexible tube C, and mouth-piece D, constructed substantially as shown and described, and used for the purpose of applying remedies to the ear, as herein set forth.

115,945.—Weather-Board Gauge.—Henry Fellows, Bloomington, Ind.

Claim.—The combination of the cleat D having a rounded top, as described, nail E, staff A with scale, block B, and thumb-screw C, when arranged, constructed, and employed as and for the purpose set forth.

115,946. — Apparatus for Preserving Wood by the Robbins Process.—John W. Fielder, Princeton, N. J.

Claim.—1. The combination of the kiln *a*, boilers *d*, reservoir *e*, receptacle *j*, and pipes *f i*, as specified.

2. The combination of the kiln *a*, pipes *p*, and loaders *q*, as described.

3. The kiln *a*, provided with gutters *k* in the floor sloping from each end toward the center, as explained.

4. The kiln *a*, packing *w*, door *v*, and screws *s*, combined as set forth.

115,947.—Preparing Grain for Food.—R. Berkeley Fitts, Philadelphia, Pa., assignor to himself and George W. Waitt, same place.

Claim.—1. The within-described treatment of grain to the purifying and cooking by steam, followed by dry heat, for the purposes specified.

2. The product of the above-described treatment as a new commercial article.

115,948.—Invalid Bedstead.—Frederic G. Ford, Washington, D. C.

Claim.—1. In combination with the webbing or other suitable material forming the couch, constructed as described, a yielding bottom, H, arranged beneath the former, substantially as and for the purpose described.

2. In combination with the stationary frame or rails G, an inner frame, L, to which the webbing or canvas is rigidly attached, the two frames G and L being connected in a detachable manner, so that the head may be elevated or the foot lowered, substantially as set forth.

115,949.—Machine for Cutting Round Belts.—John C. Foster, New London, Conn.

Claim.—1. The combination of the feeding-slide C and pin E, the vertical and horizontal knives F and G, with the adjustable frame H, the spiral-spring presser I, and adjustable guide and gauge J and J', as shown and described.

2. The combination of the cutting-tube R and square unyielding die-tube S, as shown in fig. 2, the whole being constructed and arranged as described, for the special purpose hereinbefore set forth.

115,950.—Process and Apparatus for the Manufacture of Sparkling Wines.—William Gilham, Richmond, Va.

Claim.—1. The process of producing sparkling wine by its own fermentation in bulk, by inclosing it in tight vessels provided with suitable pipes and cocks, and causing the wine to become charged with the gas generated by its own fermentation under any required amount of pressure, substantially as herein set forth.

2. An apparatus comprising an exterior closed vessel, A, and open interior vessel B, in connection with a series of pipes or tubes, C D E, provided with cocks *c d e*, safety-valve I, and pressure-gauge J, all constructed, arranged, and operating substantially as and for the purpose herein described.

3. An apparatus comprising an exterior closed vessel, A, and interior closed vessel B, in connection with a series of tubes, C F' F G D E, provided with cocks *c d e*, safety-valve I, and pressure-gauge J, as and for the purposes herein specified.

4. The compound three-way cock H, having three sets of openings, $h\ h^3$, $h^1\ h^4$, $h^2\ h^5$, provided with conical valves or plugs $h^6\ h^7\ h^8$, substantially as and for the purposes specified.

5. The flanged wrought or plate-metal tank A, having a cast-metal head, A^2, with a single opening, a^2, in combination with the three-way cock H, pipes C D E, and interior vessel B, substantially as and for the purposes described.

115,951.—Atmospheric-Pressure Attachment for Dental-Plates.—James P. Gillespie, San Francisco, Cal.

Claim.—Corrugating the flexible disk on the side next to the plate, or corrugating the plate under the disk.

115,952. — Oscillating Engine. — John Goulding, Worcester, Mass.

Claim.—An oscillating engine having at each end of the cylinder the oppositely-arranged ports, communicating alternately with and being alternately cut off from the corresponding opposite inlet-ports and the opposite exhaust-ports, the pressure of the fluid being upon the opposite port-covers when the inlets are closed, all substantially as described.

115,953.—Lamp-Burner.—William H. Gray, St. Louis, Mo., and Samuel Ross, Washington, D. C.

Claim.—In a lamp-burner, the combination of the perforated shell B, wick-tube A, air-tube D D', and perforated flange *d* on the latter, all the parts being constructed and arranged with reference to one another, substantially as and for the purpose set forth.

115,954.—Corset.—Thomas F. Hamilton, New Haven, assignor to himself and Morris P. Bray, Birmingham, Conn.

Claim.—As an improved article of manufacture, a corset cut and formed substantially as herein described.

115,955.—Argand-Lamp Burner.—Hiram W. Hayden, Waterbury, Conn., assignor to Holmes, Booth & Haydens, same place.

Claim.—1. The tube *r*, introduced between the wick and the tube *a*, in combination with the said tube *a*, air-tube *c*, and lateral opening to hold a flat wick in a cylindrical form between said tube *r* and air-tube *c*, as set forth.

2. The tube *r*, made with a screw, in combination with the wick-holder *i*, air-tube *c*, lateral inlet, and tube *a*, substantially as set forth.

3. The sleeve *s*, in combination with the tube *r*, wick-tube *a*, air-tube *c*, and lateral inlet *f*, substantially as set forth.

4. The removable chimney-holder *d*, in combination with the sleeve *s*, tubes *r* and *a*, air-tube *c*, and lateral inlet, substantially as set forth.

115,956.—Hot-Air Furnace.—Shubael E. Hewes, Albany, N. Y.

Claim.—1. The pipe G, constructed and employed substantially as described, to conduct gases from the upper part of the magazine and deliver them in a heated state within the combustion-chamber.

2. The inner annular chamber E^2, supplied with cold air directly from the exterior, surrounding (excepting at the fuel-feed door) the sides and top of the magazine I, and surrounded on its own sides and top by the continuous smoke-flue L', as herein represented and described.

3. The two annular chambers E^1 and E^2, each supplied independently with air from the exterior, and communicating at top through pipes *e*, in combination with the annular smoke-flue L' interposed between the vertical sides and also between the upper parts of said air-chambers, as explained.

4. The connecting crown plate T *t t'*, constructed and employed substantially as and for the purposes set forth.

5. The drum K', constructed with partitions P P', arranged substantially as herein described, in combination with the damper Q, shaft or pivot R, and weighted arm S, arranged to operate substantially as described.

115,957. — Heating-Stove. — Shubael E. Hewes, Albany, N. Y.

Claim.—1. The coupling-bars B, employed to connect the sides A and crown C of the furnace, substantially as herein described.

2. The pivoted arms E, when constructed and arranged as herein represented and described, to form a close or continuous bottom in connection with the bars of the grate D, or to pass up between the said bars, for the purpose of stirring or shaking the burning fluid.

3. The combination of the furnace A, door or damper O, conductor P p, hot-air flue formed of the trays Q R S, and discharge-flues T K, substantially as and for the purposes set forth.

4. The air-discharge door or register N, one or more, in combination with the furnace A and casing M, substantially as described.

5. The continuous end plates A^1 A^2 extending from the base H to the top of the drum J, cast with flanges for the reception of the drum J, casing M, and the plates A B of the furnace, substantially as described.

6. The shield L, for protecting the sheet-iron drum and heating air admitted within the latter to effect the combustion of the gases.

7. The register f, in combination with the drum J and furnace A, substantially as described.

115,958. — HEATING-STOVE. — Shubael E. Hewes, Albany, N. Y.

Claim.—1. The extended grate D D^1, constructed and adapted for use in manner substantially as and for the purposes described.

2. The combination of the fire-chamber F and the crown I, when constructed and arranged as specified.

3. The combination of the oblong fire-chamber F and the surrounding casing E, substantially as described.

4. The combination of the casing E, open at top, and the conical hood G, constructed and arranged substantially as and for the purposes described.

5. The combination of the register k with the flue K, casing E, and hood G, substantially as and for the purposes set forth.

6. The double conical valve L, constructed and applied substantially as described within the enlargement K′ of the discharge-flue.

7. The combination of the two doors R and S with the crown I, air-casing E, and fire-place F F′, as described.

115,959.—BASE-BURNING STOVE.—Shubael E. Hewes, Albany, N. Y.

Claim.—1. In a stove, constructed substantially as herein described, the continuous casing E surrounding the stove, from the hollow base B to the top O, and employed in connection with the base ducts and the two sets of registers b^1 and O′, substantially as and for the purposes explained.

2. The combination of the upper combustion-chamber F^2, fire-pot F F^1, register i^2, and annular plate L, as and for the purposes specified.

3. The fire-pot F F^1, constructed of two converging portion, connected by a joint, f, and secured by means of short wires G to the plate B^2, substantially as herein described.

4. The annular air-heating plate H, constructed and applied in connection with the fire-pot F and grate D, and air-ducts h, substantially as and for the purposes specified.

5. The magazine I I′, constructed in separable parts, connected through the medium of the plate B^2, to admit of the removal and renewal of the lower part I′ when required.

6. The combined arrangement of the horizontal annular plates L L′ and vertical partitions M^1 M^2 M^3, adapted substantially as herein described, to impart a serpentine course to the heated gases on their way from the fire-chamber to the discharge-flue K.

115,960. — WOOD PAVEMENT. — Lysander Hill, Alexandria, Va.

Claim.—1. A wood pavement-block, having its under side formed of two oppositely-inclined surfaces extending entirely across the block, for the purposes specified.

2. A pavement consisting of the blocks B, interlocking with each other, as shown in fig. 3, and having the spaces filled with concrete, asphalt, or tar and gravel, substantially as described.

115,961.—CHIMNEY.—Seth Hopkins, Napoleon, Ohio.

Claim.—The sectional chimney, herein described, built of horizontal sections A superposed upon one another, and secured by the double dovetail keys B B, as specified.

115,962.—TOY-RING.—William Hutchings, Newark, N. J.

Claim.—The ring a, with flanges b b, in combination with the holder c, substantially as shown, and for the purpose specified.

115,963.—MOTIVE-POWER ENGINE.—John Stuart Johnstone, Ayr, North Britain.

Claim.—The arrangement and construction of motive-power engines, wherein the motive force employed is that due to the surplus units of velocity of a falling weight over and above the unit of distance through which it has fallen in any given time, and caused to act upon spring-balances, which in turn effect the reactions hereinbefore described.

115,964. — CAR-COUPLING. — Tolbert Lanston, Washington, D. C.

Claim.—1. The draw-head A, having the lateral walls of its bell-mouth notched at G G, and recessed above and below the notches, in combination with the coupling-link D having the slotted arms a a extending laterally beyond the walls of the bell-mouth.

2. In combination, the notched draw-head A, the automatic triangular catch E, and the coupling-link D, having the hook K, the laterally-expanded elbows c′ c′, and the slotted arms a a, substantially as specified.

115,965. — SHUTTER-FASTENER. — John S. Lash, Philadelphia, Pa., assignor to himself and Jonathan R. Seltzer.

Claim.—The lug L, provided with the rubber plug R P, said lug sliding in the slot S of the rod R, substantially in the manner and for the purpose specified.

115,966.—SWITCH FOR GALVANIC BATTERIES. George Little, Rutherford Park, N. J.

Claim.—The automatic circuit-closing wheel c, in combination with springs l l', and connections to two batteries, substantially as specified, whereby the circuit to each battery is automatically broken and closed through said wheel c, as set forth.

115,967.—RELAY-TELEGRAPH INSTRUMENT. George Little, Rutherford Park, N. J.

Claim.—A permanent magnet combined with the armature of an electro-magnet to withdraw said armature, substantially as set forth.

115,968. — CIRCUIT-CLOSING ROLLER FOR TELEGRAPHIC APPARATUS.—George Little, Rutherford Park, N. J.

Claim.—A circuit-closing roller made with projecting yielding points, substantially as and for the purposes set forth.

115,969. — APPARATUS FOR PERFORATING PAPER FOR TELEGRAPHIC PURPOSES.—George Little, Rutherford Park, N. J.

Claim.—1. The perforating-die c, made with a hollowed end and projecting corners so as to perforate the paper in the telegraphic composing instrument, in the manner set forth.

2. In a punch, die, and pressure-foot employed in perforating paper for telegraphic communications, a space made between the pressure-foot and the end of the die at the delivery side thereof, to allow the perforated paper to pass away without obstruction, substantially as set forth.

3. The pressure-foot f upon the paper and the die below such paper, in combination with a punch and an opening or space on the delivery side of the punch, to allow the paper to pass freely away, as set forth.

4. The circuit-closer, made of a pair of spring jaws receiving the swinging end of a lever, substantially as set forth.

5. The sliding sleeve d, adjusted by the screws 4 5, and connected to the lever f by the block and pin 3, in combination with the yoke d′, punch c, and die, arranged and acting in the manner and for the purposes set forth.

6. The arrangement of the feed-wheels n, elastic rollers o, levers o′, armature p, pawl 16, and ratchet-wheel n′, substantially as and for the purposes set forth.

7. The arrangement of the tablet t with the letter-plate in the middle of the tablet, for the purposes set forth, and the grooves allotted to rows of pins that are of greatest length at the sides of such letter-plate, substantially as set forth.

115,970.—ARRANGEMENT OF CIRCUITS FOR TELEGRAPHIC PURPOSES.—George Little, Rutherford Park, N. J.

Claim.—The arrangement of the batteries a and b with two opposite poles, connected to the main circuit, and with a switch, c, to connect either of the other two poles in the main circuit, as and for the purposes set forth.

115,971.—SASH-HOLDER.—Zephaniah Lockwood, Saratoga Springs, N. Y.

Claim.—The double-sash lock, consisting of the two spring jaws with their points arranged in opposite directions, in combination with the rotating hub E having the two inclines g, arranged to engage under the jaws B, and thereby withdraw one or the other, according to the direction in which it is turned, substantially as described.

115,972.—MODE OF REEFING SAILS.—John J. Mason, Girdletree, Md.

Claim.—The rope F, in combination with main boom, reef-nettles, and eyelets, when arranged and operated by power applied at one point, as described.

115,973.—MOLDER'S FLASK.—Alfred Merriman, Plantsville, Conn., assignor to himself and Freeman Carleton, same place.

Claim.—As a new article of manufacture, the improved flask-pin eye, provided with the adjusting-screws b b, substantially as described, and for the purpose set forth.

115,974.—CROZING-MACHINE.—William R. Middleton, Cleveland, Ohio.

Claim.—The wedge a, when constructed with a flange or rib, c, as arranged to operate in combination with the slides C C′, in the manner as and for the purpose set forth.

115,975.—MACHINE FOR FELLING TREES.—Enoch R. Morrison, New York, N. Y.

Claim.—1. The combination of the movable head D with the feeding mechanism and the swinging arm G, which is provided with a segment, h, operating against the projections k k on the lateral sliding frame F to feed the cutting uniformly, as described.

2. The combination of the hinged dogs a a, and the adjustable long-arm spike-dog b with frame A, for securing the whole apparatus to a tree or log for cutting off, substantially as and for the purposes specified.

115,976.—DIE FOR FORGING KING-BOLTS.—Francis B. Morse, Plantsville, Conn., assignor to H. D. Smith & Co., same place.

Claim.—Jointly with a die, in the two parts of which are arranged a dividing-rib, D D′, and recess to serve as a guide to govern the position of the metal, the die, in one part of which are arranged a dividing-rib, H, and a recess or seat to govern the position of the metal to be wrought, substantially as set forth.

115,977. — CUT-OFF FOR WATER-CONDUCTORS.—Henry Myers, Jr., McLean, Ill.

Claim.—The combination, with the expanded section A, provided with the tapering guide-tube B and the elliptical opening d, of the tubular elbow-spout D, hinged at the top of the opening d, and beveled at its inner end, substantially as herein shown and described.

115,978. — CORN-HARVESTER.—Richard L. Nelson, Orange Court House, Va.

Claim.—1. The combination of the brackets f, adjustable hinged sockets g, and round shank i, and slot 2 on the sickles, as and for the purpose described.

2. In combination with the adjustable socket g, hinged and capable of being raised and lowered by the foot-treadles 3 and their connections, and with the sickle-shank having a turning motion in said socket, the bearing-spring m for allowing the sickles to rise to pass any obstruction, and be returned again after passing it, as described and represented.

115,979.—CHAIR AND STOOL-IRON.—Henry Ocorr, Sheboygan, Wis.

Claim.—1. A chair or stool-iron for revolving seats, composed of the pivot-pin socket, rim, and connecting-frame or arms, substantially as herein shown and described.

2. A revolving chair or stool, provided with an "iron" composed of a socket for receiving the pivot-pin of the revolving seat, a rim formed with sockets to receive the ends of the chair or stool-legs, and a skeleton frame connecting said rim and pivot-pin socket, substantially in the manner herein shown and set forth.

115,980. — GANG-PLOW.—William Parrish, Dayton, Oreg.

Claim.—The sulky attachment herein described, connected as specified, in combination with the yoke C, caster-wheel D, arms E F, and lever F′, substantially as and for the purpose set forth.

115,981.—WHEEL FOR VEHICLES.—Joseph C. Pierce, Bridgeport, Ill.

Claim.—The combination of the hub or box A flattened at its top, and with a collar, a, corrugated or checkered plates B B′ flattened to correspond with the box, spokes C C, axle E with collar d, keys b b, and nuts D G, all constructed substantially as shown and described.

115,982.—COMBINED PRESSURE AND VACUUM-VALVE.—John Porteous, Cincinnati, Ohio.

Claim.—The described arrangement, in a suitable barrel A B C I, of the outlet and inlet-valves D d d′ and k k, springs E and L, and followers F and M, for the objects set forth.

115,983. — KNITTING-MACHINE. — Henry Pudder, Dayton, Ky., and Thomas W. Hulbert, Cincinnati, Ohio.

Claim.—The combination, in a knitting-machine, of the needles, needle-bed, and followers, constructed substantially as described, so as to enable the operator to lower any one or more needles in their place in the bed beyond the reach of the cam, so that they shall cease to operate without casting the stitch from the needles, or disturbing their longitudinal position.

115,984.—BROILER.—David E. Roe, Elmira, N. Y.

Claim.—1. The grate C, composed of a series of separate wires radiating from a common elevated central ring and united to a depressed outer ring, as shown and described.

2. The combination, with the frame A and channel or groove D, of the downwardly-projecting flange E, arranged substantially as and for the purposes herein set forth.

3. As a new article of manufacture, frame A, made or stamped from a single piece of metal, substantially as described.

115,985.—BUCKLE.—Frederick A. Ross and Silas De La Mater, Terre Haute, Ind.

Claim.—1. A harness-loop, which is constructed with a bed-plate, G, having tongue *b*, and with two longitudinal loops, *a a*, terminating in an end loop, *a'*, for receiving a continuous trace and tug, and also the belly-band and back-band billets, substantially as described.

2. The trace-strap B, inclosing between its strips a bed-plate, G, which is constructed with raised loops *a a* and tongue *b*, substantially as described.

115,986.—DRAW-HEAD AND BUMPER FOR RAILROAD CARS.—Daniel Shaaber, Reading, Pa.

Claim.—The housing, consisting of the box A, immovably attached to the front sill of a car, and adapted for the reception of springs *h* and *h'* and plates *f* and *f'*, or their equivalents, operating with the draw-head B, substantially as described.

115,987.—MEAT-CUTTER.—Frenzes G. Siemers, Winona, Minn.

Claim.—1. The shaft D, having the rotary knives F and pinions E mounted thereon, in combination with the bed A provided with the sides *a* and racks *c*, all arranged to operate substantially as described.

2. The bed A provided with the pins *e* for holding the material in place while being cut, substantially as set forth.

115,988.—APPARATUS FOR CARBURETING AIR.—Byron Sloper, St. Louis, Mo.

Claim.—An air-gas apparatus or lamp, so constructed that the air will be automatically admitted to and shut off from the carbureter, substantially as and for the purposes herein described.

115,989.—HAND-STAMP.—Joseph Sloper, Walbrook House, London, England.

Claim.—The general construction of apparatus for perforating, cutting, or stamping paper, metal, or other material in which a hanging frame is combined with a descending plunger, substantially in the manner described and set forth.

115,990.—ASH-SIFTER.—William T. Stoutenborough, Brooklyn, N. Y.

Claim.—The divided covers *a b* hinged together and carrying the supports *c* for the parallel bars *d d* of the sieve *e*, in combination with the handle *g* that passes out through the rim of the cover *a*, as set forth.

115,991.—SHIP'S RUDDER.—Levi P. Thurston, Rockport, Mass., assignor to himself, Alfred Parsons, and William Knutsford, Jr., same place.

Claim.—In combination with the rudder-post, the two sets of roll frames and their adjusting-screws, by means of which the frames which support the rolls can be simultaneously adjusted and kept up to the post as they wear, substantially as described.

115,992.—MANUFACTURE OF CAST-STEEL DIRECT FROM THE ORES.—Thomas Trafford, Dublin, Md., assignor to himself, John S. Brown, and Samuel A. Worth.

Claim.—The process herein described of manufacturing cast-steel or refined iron direct from ore.

115,993.—STEAM-BOILER.—Sewall Tucker and John R. Brownell, Dayton, Ohio.

Claim.—A tubular or flue-boiler, A, combined with a water-circulating boiler composed of tubes or flues D united at their ends by the hollow water-front and back E F, and connected with said tubular or flue-boiler A by the circulating-pipes G H, substantially as set forth.

115,994.—BOOT-AND-SHOE CHANNELING-MACHINE.—Henry S. Vrooman, Boston, Mass.

Claim.—1. In combination with feed-wheels and an edge-guide, e^2, a movable channeler-knife, *n*, hung to a swinging lever, so that it can be thrown out from the channel, substantially as described.

2. In combination with feed-wheels and an edge-guide, a channeler-knife, held in operative position, laterally, by the stress of a suitable spring.

3. A channeler-knife held in operative position by a suitable spring, and having provision for throwing it out of position against the stress of the spring, substantially as described.

4. In combination with feed-wheels and an edge-guide, a channeler-knife, arranged to cut a channel to uniform distance from the side of the sole opposite to which the knife enters.

5. In combination with the edge-guide e^1, a presser-foot, d^2, moving with said guide, or maintaining a fixed relation thereto, laterally, substantially as described.

6. In combination with the feed mechanism and edge-guide e^2, and with a channeler-knife arranged to cut to a depth uniformly distant from the surface of the sole opposite to that which the knife enters, a presser-foot, e^3, varying with the inequalities of the sole, coincidently with the upper feed-wheel *f*.

7. The combination of the laterally-movable channeler-knife, feed-wheel, and presser-foot with a lever, *r*, by operating which the movable knife, feed-wheel, and presser-foot may all be raised and the knife thrown outward, substantially as described.

8. The jointed presser-foot d^2, forced up by a spring and down by the arm *k*, substantially as described.

115,995.—PRUNING-SHEARS.—William A. Wallet and Isaac Harbaugh, West Salem, Ohio.

Claim.—The arrangement of the hook C, knife D, with toothed shank D', guides E and F, toothed lever G, rod H, lever H', and handle A, substantially as and for the purpose set forth.

115,996.—GUN-LOCK.—George B. Warren, Prospect, Pa.

Claim.—1. The tumbler of a gun-lock, when provided with projections on its circumference so that the tension of the mainspring may be regulated, substantially as herein set forth.

2. The dog H, provided with the projection *b*, substantially as and for the purposes herein set forth.

3. The combination herein shown and described, of the mainspring E, dog-spring G, dog H, and tumbler C, when they are attached to and arranged within the circumference of the lock-plate, substantially as herein set forth.

115,997.—BREECH-LOADING FIRE-ARM.—Eli Whitney, New Haven, Conn.

Claim.—1. In combination with the breech-piece C and cam D upon independent pivots, the latch L, arranged in the frame to catch and hold the cam when thrown back, and tripped by the breech-piece to release the cam, substantially as described.

2. The arrangement of the plate R, provided with one or more projections, S, upon the frame, in the manner described, so as to retain the pivots C D in place, substantially as set forth.

115,998.—EXCAVATING-MACHINE.—Elias H. Williams, Clermont, Iowa.

Claim.—1. The frame H carrying the roller M', and adjustable in two directions vertically with the plow-frame and horizontally, by means of the lever A, to tighten or loosen the belt, all substantially as explained.

2. The combination of the earth-elevating wheel E, endless apron F, the receiving-box C embracing the front and part of the side of said wheel, and the adjustable scraper S for removing the earth from the wheel and delivering it into the box, substantially as herein explained.

3. In combination with an excavating machine, constructed as described, the bell-crank axle's front bar *b'*, pivoted draft-frame D, tongue D', and whiffletree *b''*, all arranged and operated as described.

115,999.—FARE-BOX.—James F. Winchell, Springfield, Ohio, assignor to Elijah C. Middleton, same place.

Claim.—1. In combination with the case A, the movable part E, with gates B and C attached, and operated as described by means of cam I and link G.

2. In combination with the case A and the movable part E, having the gates B and C attached and operated as set forth, the stationary partition J, located and arranged in relation to the gate C, as set forth.

3. In combination with the case A and the movable part E, having the gates B and C attached and operated as described, the trip-bell O, adjusted to strike an alarm before the ticket-hole is uncovered.

116,000.—HORSE HAY-FORK.—Cyrus Yengst, Annville, Pa.

Claim.—The connecting-rod *r*, as attached to the beam B, and the brace-rod *b*, substantially as and for the purpose hereinbefore set forth.

116,001.—COMBINED LIGATURE, PROTECTOR, AND FERTILIZING-BAG FOR FRUIT-TREES.—Sheldon P. Gilbert, Racine, Wis.

Claim.—The combined ligature, protector, and fertilizing-bag for fruit-trees, consisting of the folded shield A, containing a fertilizer secured to a tree by the nail B and wire ligature C, as herein described, for the purposes specified.

REISSUES.

4,419.—TAPE-MEASURE.—Lewis P. Bradley, New Haven, Conn.—Patent No. 92,573, dated July 13, 1869.

Claim.—1. The arrangement of the spring cylinder B within a case, A, combined with a knob, D, arranged through the bearing of the cylinder so as to operate the bar *f*, the whole operating in the manner herein set forth.

2. The knob for actuating the holding and releasing-catch, arranged in the center of the case, substantially as specified.

4,420.—HARVESTER.—John Butter, Buffalo, N. Y.—Patent No. 27,034, dated February 7, 1860.

Claim.—1. A hollow-metal gear-frame, substantially as described, in which is placed the secondary gearing, through which motion is transmitted from the driving-wheel to the cutters.

2. The hollow-metal gear-frame, provided with bearings for the secondary or bevel-wheel shaft.

3. The hollow-metal gear-frame, provided with bearings for and adapted to inclose the crank-shaft, substantially as described.

4,421.—BASE-BURNING STOVE.—Albert C. Corse, Troy, N. Y.—Patent No. 107,597, dated September 20, 1870.

Claim.—1. In combination with the magazine O, provided with radial openings *o*, an annular or surrounding chamber, M, placed at the upper end of said magazine, and communicating, through suitable downward flues L and G, with the flues in the base of the stove, substantially as shown, and for the purpose described.

2. In combination with the magazine O, annular chamber M, and combustion-chamber S, the annular chamber H placed immediately above and communicating with said combustion-chamber, and connected with said annular chamber M and with the base-flues by means of the vertical flues L and G, respectively, substantially as and for the purpose specified.

3. An annular or horizontal flue or chamber placed above mica windows, when the same is arched upward immediately above each window, so as thereby to permit the vertical dimensions of the latter to be increased, substantially as shown and described.

4. An annular or horizontal flue or chamber placed above and projecting outward over mica windows, when the same is beveled or inclined inward and downward immediately above said windows, substantially as and for the purpose set forth.

4,422.—BOOT AND SHOE.—Charles Story Dunbrack, Swampscott, assignor of one-third interest to William N. Spinney, Lynn, Mass.—Patent No. 95,210, dated September 28, 1869.

Claim.—1. A shoe, as made with an upper receiving-channel, *c*, in that face of the sole which is next to the laps of the upper.

2. A shoe, as made with an upper receiving-channel, *c*, in the outer sole, and with a stitch-receiving channel, *d*, in the opposite face of the said sole.

3. A shoe, as made with an upper receiving-channel, *c*, in its outer sole, and with the stitching or sewing for connecting such sole to the upper carried around the periphery of, but not through, the insole.

4. A shoe, as made with the outer sole channeled in its two opposite faces, as set forth, and with the sewing for fastening the said sole to the upper carried through the two channels of the sole and around, but not through, the insole or the part *b*, for supporting the laps of the upper.

5. An outer sole, as made with the upper receiving-groove or channel *c*, arranged in that face, or part of it, which is to abut against the upper leather to be joined to the sole.

6. An outer sole, as made with the sewing or stitch-groove *d* on its outer face, and with the upper receiving-groove *c* in its inner or upper face, such grooves being arranged relatively or opposite to each other in manner as represented.

4,423.—MOUNTED HORSE-POWER.—Massena B. Erskine, Racine, Wis.—Patent No. 107,237, dated September 13, 1870.

Claim.—1. The axle A, formed with the standard B and hollow axle-arm C, substantially as and for the purpose set forth.

2. The standard B of the axle A, provided with the strengthening-bar A^1, substantially as and for the purpose set forth.

3. The enlargement or swell of the flange of the axle, said flange being perforated with three openings or holes out of direct line with each other, substantially as and for the purpose set forth.

4. The wrought-iron eyebolt H, when used in the connection and for the purpose substantially as herein shown and specified.

5. The truss-rod D, connecting the two axles, substantially as and for the purpose described.

6. The hollow axle-arm C of the axle A, in combination with the truss-rod D, for the purpose specified.

7. The two nuts *b b*, or equivalent fastenings, arranged upon the truss-rod at each end of the hollow axle-arm C of the axle, substantially as herein shown.

8. The master-wheel L, formed with a series of openings, *i*, and arranged to operate in connection with the adjustable brackets K and sockets N, substantially as herein shown and set forth.

4,424.—DIAPER.—John C. Hempel, Baltimore, Md.—Patent No. 91,334, dated June 15, 1869.

Claim.—The diaper A, substantially as described and shown.

4,425.—STOCK-CAR.—Amos Rank, Salem, Ohio, assignor to The National Cattle-Car Company, same place.—Patent No. 111,872, dated February 14, 1871.

Claim.—1. The combination, with a stock-car, of adjustable and flexible or elastic stall-partitions,

constructed substantially as hereinbefore set forth, to prevent injury to the stock from the jerking of the cars.

2. The combination, with a stock-car, of adjustable and flexible removable stall-partitions and suspending-rollers or swinging beams mounted in the ceiling of the car, and operating, substantially as hereinbefore set forth, to roll or fold the partitions out of the way.

3. The combination, with a stock-car, of adjustable flexible slatted rolling stall-partitions, constructed substantially as hereinbefore set forth.

4. The combination, with a stock-car, of adjustable rolling or swinging canvas stall-partitions, constructed substantially as hereinbefore set forth.

5. The combination, with a stock-car, of slatted partitions, constructed as described, swinging from the roof of the car, and made removable to serve as a foundation for a middle deck, as set forth.

6. The combination, with a stock-car, of the longitudinal feed-boxes, constructed as described, and divided into compartments, one set of which contains the feed while the other set communicates with the feed-troughs in the car.

4,426.—BASE-BURNING STOVE.—Alexander White, Rock Island, Ill., assignor to The Rock Island Stove Company, same place. Patent No. 101,688, dated April 5, 1870.

Claim.—1. The magazine of a base-burning stove constructed with telescopic sections, when the lower section is raised or lowered by means of depending rods, substantially as shown.

2. The movable base or lower section D', constructed with an expanded mouth, substantially as described.

3. In combination with the movable base D, rods I I and bail J, all arranged to operate substantially as described.

4. A ring or plate, H, encircling the lower end of the magazine in a base-burning stove, substantially as and for the purposes herein set forth.

5. In combination with a ring or plate encircling the lower end of the magazine in a base-burning stove, hooks attached to said ring, or lugs on the magazine for supporting the magazine, substantially as herein set forth.

6. In combination with a ring or plate encircling the lower end of the magazine in a base-burning stove, as herein described, openings in the outer shell of the stove, so as to admit air into the chamber above said ring or plate, for the purposes herein set forth.

DESIGNS.

4,984. — CHANDELIER. — Pietro Cinquini, West Meriden, Conn., assignor to Bradley & Hubbard, same place.

Claim.—The design for chandeliers, as hereinbefore described and shown in the accompanying illustration.

4,985.—PORTABLE STAND FOR A BILLIARD-MARKER.—Hugh W. Collender, New York, N. Y.

Claim.—The shape and design of my new marker-stand, substantially as shown and described.

4,986.—CLOCK-CASE. — Paschal Converse, New Haven, Conn.

Claim.—The design for clock-case, as herein described and shown in the accompanying drawing.

4,987. — CARPET-PATTERN. — John Fisher, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,988. — CARPET-PATTERN. — John Fisher, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,989. — CARPET-PATTERN. — John Fisher, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,990.—TYPE.—Julius Herriet, New York, N. Y., assignor to David Wolfe Bruce, same place.

Claim.—The design or pattern for printing-types, herein set forth and shown.

4,991.—TYPE.—Julius Herriet, New York, N. Y., assignor to David Wolfe Bruce, same place.

Claim.—The design or pattern for printing-types, herein set forth and shown.

4,992.—FORK OR SPOON-HANDLE.—William T. Kennedy, New York, N. Y.

Claim.—1. The design for the front of the handle, as shown.

2. The design for the back of the handle, as shown.

4,993.—LONG COMB. — Charles E. Moore, New York, N. Y.

Claim.—The design for a long comb, herein represented and described.

4,994.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,995.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,996.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,997.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,998.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

4,999.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,000.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,001.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,002.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,003.—CARPET-PATTERN.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,004. — TOY STEAM-ENGINE.—Edward P. Ryder, Brooklyn, N. Y.

Claim.—The design for a toy steam-engine, as shown.

5,005.—CHANDELIER.—Frederick R. Seidensticker, West Meriden, Conn., assignor to Bradley & Hubbard, same place.

Claim.—The design for chandelier, as hereinbefore described and shown in the accompanying illustration.

5,006. — HARNESS-TRIMMING.—Charles M. Theberath, Newark, N. J.

Claim. — The covering for harness-trimming, arched or raised in the middle and grooved near the side, as set forth.

TRADE-MARKS.

321.—WHISKY.—Allen H. Gillett, Syracuse, N. Y.

322.—WHISKY.—Jesse Moore & Co., Louisville, Ky.

323.—POLISHING COMPOUND.—Enoch Morgan's Sons, New York, N. Y.

324.—POLISHING COMPOUND.—Enoch Morgan's Sons, New York, N. Y.

325. — PERFUME. — Phalon & Son, New York, N. Y.

326. — CLOTHES-WRINGER. — Albert H. Spencer, Providence, R. I.

EXTENSIONS.

JAMES E. A. GIBBS, of Steele's Tavern, Va. Letters Patent No. 17,427, dated June 2, 1857; reissue No. 573, dated July 13, 1858.

"Improvement in Sewing-Machines."

Claim.—1. In single-thread sewing-machines, a hook or looper revolving in one direction only, being so constructed as to make a series of chain stitches, when operating in connection with a reciprocating needle.

2. The peculiar construction, substantially as herein described, of a revolving hook, whereby, while one loop is taken from the needle by the hook, spread, twisted, and held in the path of the needle until another or fresh loop is taken, the former loop shall be released and drawn up during the retreat of the needle.

JAMES G. HOLMES, of Charleston, S. C.—Letters Patent No. 17,567, dated June 16, 1857.

"Improvement in Chairs for Invalids."

Claim.—1. The arranging of the joint, by which the seat and back are attached and move, so that it shall correspond with the hip-joint of the human frame, that is, placing it above the seat and in advance of the back, substantially in the manner and for the purpose set forth.

2. Arranging the knee-joint in the chair or seat to correspond with that of the human knee joint of the person occupying it, substantially as described.

3. The frame-work of metal or other material, by which all the joints and pivots, excepting that of the separate apron which moves with and supports the leg from the knee down, are combined either with or without the arm-rest, as may be desired, as herein set forth.

GEORGE H. CORLISS, of Providence, R. I. Letters Patent No. 17,423, dated June 2, 1857.

"Improvement in Steam Pumping Apparatus."

Claim.—1. The arrangement of a series of steam-cylinders and pumps, combined radially around a central crank-shaft, with a central crank and crank-shaft with which the whole series of pumps and steam-cylinders is connected, substantially in the manner and for the purpose herein described.

2. The method herein described of forming the connection between the pistons of a series of cylinders and a single crank-pin, by means of a disk-ended connecting-rod, which is appropriated to one piston in the series, and which is fitted with a series of pins to which the remaining connecting-rods of the series of cylinders are applied, thus obviating the direct application of all the connecting-rods in the series to the same crank-pin.

CLARA A. EASTMAN, of Boston, Mass., executrix of JOSEPH L. EASTMAN, deceased. Letters Patent No. 17,560, dated June 16, 1857.

"Improvement in Steam-Pressure Gauges."

Claim.—The arrangement of the diaphragm I, disk M, bearing against the diaphragm's multiplying lever C, compensating spring R, and index, substantially as herein set forth.

GEORGE P. PERRINE, of Richmond, Va., and JAMES E. BOYLE, of New York, N. Y. Letters Patent No. 17,632, dated June 23, 1857.

"Improved Hydrant."

Claim.—The hollow piston-rod and nozzle when so constructed and arranged, in combination with cylinders of unequal diameters, and their corresponding pistons or plungers, that they will be elevated by the pressure of the water from the supply-pipe upon the under surface of the piston p, and the water withdrawn therefrom, for the purpose specified.

DISCLAIMERS.

JACOB LAGOWITZ, of Newark, N. J., assignee of JOHN MYERS and ROBERT G. EUNSON.—Letters Patent No. 10,965, dated May 23, 1854.

"Improvement in Machines for Sawing thin Boards, &c."

(Filed May 20, 1871.)

Disclaims:

"That part of first claim of said Letters Patent which covers the use of the deflecting plate E at the side of the saw;" also, that part of the description of nature of invention embraced in the following:

"1st. In the employment or use of deflecting plates 'one or two,' placed at the sides of the circular saw, &c."

EBEN PECK and GILBERT J. BOGERT, of New York city, assignees of John MYERS and GILBERT J. BOGERT.—Letters Patent No. 10,965, dated May 23, 1854.

"Improvement in Machines for Sawing thin Boards, &c."

(Filed May 20, 1871.)

Disclaim:

"That part of first claim of said Letters Patent which covers the use of the deflecting plate E at the side of the saw;" also, that part of the description of nature of invention embraced in the following:

"1st. In the employment or use of deflecting plates 'one or two,' placed at the sides of a circular saw, &c."

GEORGE H. CORLISS, of Providence, R. I.—Letters Patent No. 17,423, dated June 2, 1857.

"Improvement in Steam Pumping Apparatus."

(Filed May 27, 1871.)

Disclaims in the following words, viz.:

"Also, the method herein described of forming the connection between the pistons of a series of cylinders and a single crank pin, *a*, by means of a disk-ended connecting-rod, L, which is appropriated to one piston in the series, and which is fitted with a series of pins, S, to which the remaining connecting-rods M are applied, thus obviating the direct application of all the connecting-rods to the same crank-pin."

ISSUE OF JUNE 20.

PATENTS.

116,002.—SPRING HINGE FOR DOORS.—Robert Adams, Borough of Southwark, Great Britain.

Claim.—The circular spring, resting at both ends against the lug on the box, and operated in either direction by the direct action of the pintle, furnished with lugs for that purpose.

116,003. — COTTON-PLANTER. — Parker H. Altstatt, Clark County, Ind.

Claim.—1. The arrangement of the plows D D upon the sides of the opener E when they are provided with separate lifting-levers J, whereby the plows may be independently adjusted, all constructed, arranged, and operating as herein described.

2. The slot holes N, studs O, and iron rod Z, in combination with the truck-frame A, the bolster and axle X, the wheels B B, the hub-pulleys Y Y, and double-tree P, substantially as and for the purpose herein set forth.

116,004.—ATTACHMENT FOR VACUUM-CUPS. William Amer, Janesville, Wis.

Claim.—1. The conductor A B, constructed, substantially as herein shown and described, to adapt it for use with Dr. Hadfield's vacuum-cups, as and for the purpose set forth.

2. The adjustable cap electrode C D, in combination with the conductor A B, substantially as herein shown and described, and for the purpose set forth.

3. The conductor E, constructed, substantially as herein shown and described, to adapt it for use with Dr. Hadfield's receivers, as and for the purpose set forth.

4. The metallic electrodes F, constructed, substantially as herein shown and described, to adapt them, in connection with the conductor E, to be used with Dr. Hadfield's receivers, as and for the purpose set forth.

116,005.—WHIFFLETREE.—Joseph R. Ames, Chest Township, Pa.

Claim.—1. The revolving hook C', in combination with the whiffletree as constructed, substantially as and for the purposes set forth.

2. The hinged ends A A, in combination with the whiffletree, substantially as and for the purposes set forth.

3. A whiffletree provided with the revolving hook C', irons B B, hinges A A, and hooks C C, all constructed and arranged substantially as and for the purposes set forth.

116,006.—FASTENING FOR MEETING-RAILS OF SASHES.—Stephen D. Arnold, New Britain, Conn., assignor to P. & F. Corbin, same place.

Claim.—The latch *k* within the box *f*, and projecting therefrom as shown, in combination with the lever *d*, projection *i*, spring *e'*, and box *e*, as and for the purposes set forth.

116,007.—STEAM-BOILER.— John Bowman Atwater, Geneva, Ill.

Claim.—The auxiliary flue steam-generator B and the combustion-chamber C, arranged in front of a flue-boiler in the fire-chamber thereof, substantially as described.

116,008. — SOAP. — Israel D. Balch, Cambridge, Mass.

Claim.—A soap made with the peculiar silicious ingredient, substantially as described.

116,009.—SASH-HOLDER.—Robert R. Ball, West Meriden, Conn.

Claim.—1. In a sash-lock, the guard F or its equivalent, in combination with a pivoted tumbler, so as to operate substantially as and for the purposes shown and described.

2. In combination with the socket or key-hole of a sash-lock, the slot or recess E, substantially as and for the purposes described.

3. In a sash-lock, the combination of the guard F and the shoulders I I in the lock-case and lid, for limiting or stopping the guard, substantially as shown and described.

116,010.—DOOR.—Benjamin F. Barker, Belfast, Me.

Claim.—In combination with an ordinarily-apertured sill, F C, the door A, having vertical grooves D E D at the joints thereof to form channels for the reception of air, water, and dust, and its guidance into the discharge-channel F of the sill.

116,011.—AX-BIT-BLANK MACHINE. — Enos Bartholomew, Mill Hall, Pa.

Claim.—1. The combination of the cutters D E, carriers K, punch P, and die O, substantially as specified.

2. The compressers, arranged and operated in connection with the broad punch and female die, for the purpose of beveling the steel ends of the blank and swelling the sides in the center thereof, as specified.

3. The combination, with the die O and punch P, of the hinged plates L and adjusting-screws L', substantially as specified.

4. The cutters D E and carriers K, combined with female die, broad punch, and compressers, as and for the purpose specified.

5. The combination, with the cross-head and the movable plate, of the bent bar T, said bar working in the oblique hole S in said plate, substantially as specified.

6. The combination, with the compressers having the holes W and projections X, of the bars Z, attached to the cross-head, and having the curbed ribs Y, substantially as specified.

116,012. — DIE FOR FORMING CARRIAGE-SHACKLES.—Henry M. Beecher, Plantsville, Conn.

Claim.—1. Jointly, the swinging or hinged die-blocks A A, together with their dies, the bed B, and hammer C with its projection *c*, for use in the formation of carriage-shackles, substantially as described.

2. As an improvement in machines for forming carriage-shackle blanks into shackles, substantially as set forth, the points *k k* projecting from the bottom of dies *a a*, as and for the purpose set forth.

116,013.—BED-CLOTHES RETAINER.—John Birkenhead, Canton, Mass.

Claim.—As a new article of manufacture, the bed-clothes retainer, made in manner and for use as described.

116,014.—MILKMAN'S SIGNAL.—Elisha Belcher Blake, Tarrytown, N. Y.

Claim.—The signal C placed on a sliding yoke, D, and held up by the filled pitcher on platform G, the bell-clapping mechanism, and the cupolaed milk-house A, all combined for the purpose of, first, calling attention by the alarm that the milk has been deposited, and secondly, of exhibiting the corroborating signal thereof, whereby the housekeeper is notified to take charge of said milk.

116,015.—EARTH-CLOSET.—William Joseph Bradshaw, Cleveland, Ohio.

Claim.—1 The hinged hollow cylinder F, in combination with the elliptic plate H, substantially as and for the purpose hereinbefore set forth.

2. The combination of the roller G and weight O with arm N and cylinder F, substantially as described.

116,016.—BRICK-KILN.—Samuel C. Brewer, Water Valley, Miss.

Claim.—The arrangement, upon the top of the kiln, of the course A of bricks, forming a series of intersecting and horizontal flues, *c d*, and thereabove the edge-laid course B of fire-brick, with registers C therein, all as and for the purpose specified.

116,017, antedated June 16, 1871.—ANIMAL-TRAP.—William W. Brigg, Home, Tenn.

Claim.—1. The base A, rods *a a*, stub B, and trigger C, when permanently attached, as shown, latch D, cord E, and spring F, when the same are so combined and arranged as to furnish a trap, substantially as described.

2. Anchoring the trap by means of a rod, B, and staples *b b*, or their equivalents, substantially as described.

116,018.—OFFICE-INDICATOR.—Lewis Burger, Chicago, assignor of three-fourths his right to W. S. Gobble, Scottsville, Ill.

Claim.—The business-indicator, consisting of the box A, hinged face B, dial C, disks D, E, F, and G, plate H, and slats I, all combined substantially as herein shown and described.

116,019. — STEAM-ENGINE AND BOILER.—Gottlieb F. Burkhardt, Boston Highlands, Mass.

Claim.—1. In combination with the main boiler and engine, an auxiliary tubular boiler, *f*, arranged as shown and described, and having a series of steam-tubes leading through it, surrounded by a water-space, above which space is a steam-space connected by a pipe, *l*, with auxiliary steam-cylinder *o*, or with the steam-room of the main boiler.

2. In combination with the main boiler, the auxiliary tubular boiler *f*, the auxiliary fire-box *t*, and flue-pipes *s*, substantially as shown and described.

3. The arrangement of the auxiliary fire-box *t*, flue-pipe *v*, cylinder *f*, and flue-pipes *s w*, substantially as shown and described.

116,020.—PREPARING AND BLEACHING PAPER-PULP. — John Campbell, Chatham Village, N. Y.

Claim.—The combination of a receiver, G, and tube E provided with a stop-cock, F, with the pipe or pipes D, that introduce the air-blast and chemicals into the engine A, substantially as herein shown and described.

116,021. — TELEGRAPH-WIRE COUPLING.—Alanson Cary, New York, N. Y.

Claim.—1. A sleeve-coupling, A, for connecting the ends D D of telegraph-wires, substantially as shown and described.

2. The rivets E, passing through the sleeve-coupling A and between the wires D D, whereby said wires are forced into the spaces B of the coupling, substantially as shown and described.

116,022.—ROTARY ENGINE.—Warren Case, Troy, Ill.

Claim.—1. The sliding valves C C, operating in the radiating channels *e e* and circumferential groove *a* on the wheel B, substantially as and for the purposes herein set forth.

2. The wheel B, provided with circumferential grooves *a* and *b b*, channels *e e*, and slots *d d*, all substantially as and for the purposes herein set forth.

3. The grooves *b b* and tongues *h h*, constructed in the wheel B and casing A, substantially as and for the purposes herein set forth.

4. The combination of the casing A, wheel B, sliding valves C C, block D, steam-ports *m m*, and air-ports *n n*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

116,023, antedated June 17, 1871.—SEAT FOR STORES.—Daniel Christian, Chagrin Falls, Ohio.

Claim.—The detachable bracket A and detachable seat E, combined, as described, with the socket-plates and counter, for the purpose specified.

116,024. — FERRY-BOAT. — Henry Clenny, Gallatin, Tenn.

Claim.—1. A boat, having its hull or bottom formed with the four faces, *a*, *b*, *c*, and *d*, constructed and arranged as described.

2. The platforms T, hinged at opposite sides of the boat, and connected by a rope or chain to a windlass, U, substantially as described, whereby one is raised as the other is lowered.

116,025.—WATER-ELEVATOR.—Roderick F. Clow and William H. Down, New York, N. Y.

Claim.—1. The vented coil D, emptying itself so soon as the valve M is closed, and arranged to serve relatively to the valve M, pipe C, and elevated supply of water, and to the vessel A, heating apparatus E, piston B, and suitable automatic devices for communicating motion to the valve M, substantially as and for the purposes herein set forth.

2. The divided or two-part reservoir G^1 G^2 with the controlling-cock or valve *t*, for discharging the water from the compartment in which it is received into the cooling-compartment from which it is discharged, arranged as represented relatively to the condensing-vessel D, in an automatic steam elevating apparatus, for the purposes specified.

116,026.—CIGAR-MACHINE.—Seth L. Cole, Brooklyn, N. Y.

Claim.—The machine herein described, consisting of a mold or series of molds, each made in parts 1, 1', 2', 3, 4, 4', 5, 6, 6', &c., so arranged that each mold is independent of the other, the whole being operated by means of a rod or rods, R R, springs N N, screw-nuts S S, spring catches or hooks O O, and hinges A A, all constructed, arranged, and operating in the manner and for the purpose of forming the tip as well as the body of a cigar.

116,027.—BAND-KNIFE.—Frederick Coulon, Rockford, Ill., assignor to Elias Nashold and Jacob Martin, same place.

Claim.—The knife described, provided with the serrated edge *a* and the abruptly-curving shank *a'*, the latter being provided for the double purpose of raising the hand above the cutting-line, and of furnishing a guard to prevent the hand from being crowded forward onto the serrated edge, as set forth.

116,028. — HARNESS-BUCKLE. — Thomas Crakes, Mishawaka, Ind.

Claim.—The lever C, provided with the shoulder *c'*, pivoted to the piece A at its end c^2, and curved at its free or outer end to enter the hole a^2 in the part A, in connection with the plate B, provided with square holes b^3 and shoulders b^4, all as herein shown and described, whereby said parts are adapted to operate as set forth.

116,029.—KNIFE-SCOURER AND SHARPENER. David Crowell, Jr., Yarmouth Port, Mass.

Claim.—The combination and arrangement of the rollers C C, the extended roller B, scouring and sharpening devices A and F, journal-boxes with springs D, connecting device G with its gearing and crank to give motion, all as shown, for the purpose described.

116,030.—SCRUBBING-BRUSH.—William Devines, Williamsburg, N. Y.

Claim.—A scrubbing-brush, with its ordinary back A constructed with longitudinal strips of India rubber B on each end, and transverse strips of rubber B in the middle, sustained and held by strip C, as shown and described.

116,031.—STEAM-ENGINE.—Albert L. Dewey, Westfield, Mass.

Claim.—1. The construction and arrangement of the steam-chest B with its steam-passage P Q, in combination with the steam-cylinder A, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the steam-chest B and valve-face E, of the port-face D and steam-valve C, with its connections *e e*, substantially as and for the purpose hereinbefore set forth.

116,032. — WOOL-DRIER. — James Millen Dick, Buffalo, N. Y.

Claim.—1. In a wool-drying machine, a fan, C, and trunk B' B, so arranged that the current of air is impelled against the wool at its entrance, and is blown out, as herein described.

2. In a wool-drying machine, in combination with the fan-trunk B B' and fan C, the revolving picker E and picker-beds E^1 E^2, arranged and operating as herein set forth.

3. In a wool-drying machine, the expressing-rollers G G', and the endless apron H, having the water-space *f* between the same, in combination with the fan or blower C, constructed and arranged so that the wool receives the air-blast upon its entrance into the machine, substantially as and for the purpose set forth.

4. The flaring mouth D', for the exit of the wool, provided with the air-holes *g g*, when employed in a wool-drying machine, in the manner and for the purpose specified.

116,033.—STRAW-CUTTER.—John H. Dickinson, Chicopee Falls, Mass.

Claim.—The roller D, with its flat-faced spiral flanges, in combination with roller C furnished with square-faced spiral cutters *c c* so arranged that the faces of the cutters will press against those of the flanges, and, by the more rapid motion of the former over the latter, impart a surface draw-cut upon the straw passing between the rollers, substantially as described.

116,034.—CLOTHES-LINE HOLDER.—Emerson Dingman, Liverpool, N. Y.

Claim.—The cap or socket A, having standards *a a*, in which are mounted an anti-friction roller, B, and serrated cam-lever C, with counter-balance D, all constructed and arranged as and for the purpose specified.

116,035. — TEA-KETTLE COVER. — Zohrab Dixon, Bristol, Ill.

Claim.—1. In combination with the cover A, the case B and exhaust-pipe E, the whole arranged substantially as and for the purpose described.

2. In combination with the cover A, provided with the exhaust-pipe E and case B, the non-corrosive rim *a*, arranged substantially as and for the purpose described.

116,036.—COAL-SCUTTLE.—Edgar Eltinge, Kingston, N. Y.

Claim.—1. The slots *d'*, formed in the side flanges of the rear part of the shield D to receive the ears of the scuttle, substantially as herein shown and described, and for the purpose set forth, whether the openings into said slots be through the side or rear edges of said shield.

2. The bent projecting ends of the stiffening-wire, to form the outer sides of the slots *d'*, substantially as herein shown and described, and for the purpose set forth.

116,037. — HARVESTER.—Joel Farrington, Corry, Pa.

Claim.—1. The slide or sleeve H and rock-shaft G, in combination with the rake, operating substantially as and for the purpose described.

2. The crank-wrist *f'*, in combination with the rock-shaft G, slotted arm G', and chain or cord *f* for giving the vibratory and rising-and-falling movements to the rake, as described.

3. The slotted standard *c* and bolts *b*, in combination with the hinged platform for adjusting the angle of said platform, as described.

116,038. — GEARING FOR HARVESTERS.—Joel Farrington, Corry, Pa.

Claim.—1. The bevel-wheel B and smaller bevel wheel C, arranged concentrically to each other, and having their cogged faces in about the same vertical plane, in combination with the inclosed intermediate shifting-clutch E, substantially as and for the purpose described.

2. The pinion A, provided with the hub or shank A^1 A^2, in combination with the concentric bevel-wheels B and C, operating substantially as described.

3. The clutch E inclosed between the bevel-wheels, in combination with the loose collar F and rods *f*, for operating the same, as described.

4. The combination of pinion A, bevel-wheels B C, inclosed clutch E, and double pinion H H', arranged and operating substantially as described.

116,039. — PULP-ENGINE OR CRUSHER.—Moore R. Fletcher, Boston, Mass.

Claim.—1. The cylinder A, provided with cogs C and buckets E, the same alternating longitudinally, substantially as described.

2. The cylinder B, provided with cogs D and flattened spaces *b*, the same alternating longitudinally, substantially as described.

3. The combination and arrangement of cylinders A B, substantially as described.

4. As an equivalent of cylinders A B, the indented cylinder H and plain cylinder I, substantially as described.

116,040.—TREADLE FOR SEWING-MACHINES. Albert Fontayne, Cincinnati, Ohio.

Claim.—1. The combination of the leg of a sewing-machine, cam P, levers N N, and casters R R, substantially as and for the purposes set forth.

2. The combination of the leg of a sewing-machine, journal-box K, and axle B, substantially as and for the purposes set forth.

3. The adjustment of the balance-wheel C outside of the leg of a sewing-machine, and at or near the end of the shaft or axle M, substantially as and for the purposes specified.

4. The wooden platform W, within a metallic frame, substantially as and for the purposes set forth.

116,041.—FIRE-EXTINGUISHER.—David M. Ford and John A. Kley, Chicago, Ill.; said Kley assigns his right to said Ford.

Claim.—1. The top A of a fire-extinguisher, provided with the flange B, shoulder *d*, and female screw *e*, substantially as and for the purpose specified.

2. The cap or cover D, provided with a screw, *b*, shoulder *a*, and one or more handles, C, substantially as specified.

3. The top A of a fire-extinguisher, provided with the flange B, shoulder *d*, and female screw *e*, in combination with the cap D, provided with a screw, *b*, shoulder *a*, and one or more handles, C, substantially as specified.

116,042.—GATE-LATCH. — Charles W. Fox, St. Louis, Mo.

Claim.—The combination of the slotted plate A with its two projecting guiding-bands and openings *d*, *e*, and *s*, latch B, handle *k*, and keeper E, all constructed and arranged as and for the purpose shown and specified.

116,043, antedated June 10, 1871.—FERMENTING MASH. — Charles H. Fringe, Centreton, Mo., assignor to himself and Charles Braches, same place.

Claim.—The application to a grain mash, at the time and in the manner specified, of salts containing all the yeast-forming elements in a soluble form, as and for the purpose specified.

116,044, antedated June 10, 1871.—PREVENTING WASTE OF ALCOHOL IN FERMENTING-TANKS. — Charles H. Fringe, Centreton, Mo., assignor to himself and Charles Braches, same place.

Claim.—In combination with the grain-mash tubs of distilleries, a water-proof, flexible, and perforated cover of an animal bladder moistened, as and for the purpose described.

116,045.—BED-PLATE FOR PAPER-PULP ENGINES.—Phineas Frost, Medfield, Mass.

Claim.—A bed-plate for paper-engines, composed of the cast-metal box A having its upper surface concave transversely, the series of bars *a a*, &c., stripe *b b*, knives *c c*, and the re-enforced clamp-bars *d d*, the whole being united by the bolts *e e'*, and producing results herein stated.

116,046. — PROCESS OF MANUFACTURING NAIL-PLATES AND SHEET-STRIPS.—James Frowen, Edward Hemmings, and James Sheldon, Niles, Ohio.

Claim.—The herein-described process of preparing nail-plates and sheet-strips by hammering the mass or balls of metal directly from the furnace into blooms, ready, by reheating, for the finishing-rolls, substantially as set forth.

116,047. — SURVEYING INSTRUMENT.—Richard F. George, Palmyra, Va.

Claim.—The combination of the two movable or angle-measuring arms and perpendicular with the fixed or level distance-arm, as and for the purpose specified.

116,048.—PLOW.—Martin L. Gibbs, Canton, Ohio.

Claim.—1. The colter-head C and tension-bolt F, in combination with the colter E, plow-beam A, and standard B, the several parts being arranged as and for the purpose specified.

2. The arrangement of the colter E in a flaring seat in the colter-head C or beam A, and between the side set-screws *b b*, arranged as described, as and for the purpose specified.

3. The combination of the pitch-screw *a*, colter-head C, colter E, and tension-bolt F, the several parts being arranged in the manner and for the purpose specified.

116,049.—VENTILATOR.—Henry A. Gouge, Brooklyn, N. Y.

Claim.—The combination of the blower B and the ventilating-flue D, and the arrangement of the tube J, substantially as and for the purpose hereinbefore set forth.

116,050. — FELLY-CLIP FOR VEHICLE-WHEELS.—David Grim, Pittsburg, Pa.

Claim.—1. The hollow rib D, in combination with the screws *c c*, as a means of securing the ends of carriage-fellies, in the manner shown and set forth.

2. The hollow rib D and screws *c c*, in combination with the ferrule C, in the manner shown, for the purposes set forth.

3. Such construction of the hollow rib D as will cover the heads of the binding-screws *c c* and allow them to slide therein, in the manner shown, for the purposes herein set forth.

116,051.—DIRECT-ACTING ENGINE.—Thomas Hanson, New York, N. Y.

Claim.—In combination with the steam-piston and valve, the employment of the valve-rod *m*, working in the semi-hollow piston-rod for the purpose of operating the steam-valve mechanism, and which receives its motion at each stroke of the piston partially from the piston-rod and partially from a driving-spring and cam, substantially in the manner described.

116,052.—TRACE-LOCK.—George L. Hart, New Britain, Conn.

Claim.—1. The combination of the whiffletree *a*, the piece *b* having grooves *c c*, the spring *d*, the swinging piece *e*, and the pawl *f*, the whole constructed, arranged and operated substantially as and for the purpose set forth.

2. The combination of the whiffletree *a*, piece *b*, spring *d*, spring *i*, swinging piece *e*, and pawl *f*, the whole constructed, arranged, and operated substantially as and for the purposes set forth.

116,053. — APPARATUS FOR COOLING AND DISCHARGING BEER AND OTHER LIQUIDS ON DRAUGHT.—John M. Heiss, Baltimore, Md.

Claim.—1. The combination of the air-forcing vessels B B' with casks L L' and cooling-reservoir M, substantially as described.

2. The arrangement and combination of a series of casks, L L', and soda-fountain P with receiver M, provided with cooled pipes and spigots, so as to supply cool liquids of different kinds on draught, as described.

3. The combination of the vessels B B', the pipes C, F F', and H H', with their respective cocks and gauge acting upon any number of kegs, barrels, &c., that may be desired, together with the receiver M and its pipes and the trough N, the whole arranged for the purpose herein set forth, and substantially as described.

116,054.—ELECTRO-MAGNETIC GAS-LIGHTING APPARATUS. — Friedrich Heyl and Philipp Diehl, East New York, N. Y.

Claim.—The combination of the valve *a*, lever C,

and prong *f*, with the projecting plate *e* and electric conductors E F, all arranged to operate substantially as herein shown and described.

116,055. — MACHINE FOR TEARING UP LEATHER.—Edward S. Hidden, Millburn, N. J.

Claim. — 1. The combination, substantially as herein set forth, of a feeding-box, a follower or piston, and a set of revolving tearing-teeth, such teeth having intervals between them in the direction of their axes of revolution, and the combination being such that the teeth tear over the whole exposed surface of the material acted upon, substantially as described.

2. In combination with a feeding-box, a follower and a set of revolving tearing-teeth, all constructed and operated substantially as specified, a set of revolving clearers, acting as described, to clear out the tearing-teeth.

3. The combination of a feeding-box, a follower, a set of revolving tearing-teeth, and two sets of clearers, all operated and constructed substantially as set forth.

4. The combination of a feeding-box, a set of revolving tearing-teeth, a follower or piston, and a contrivance for jetting streams of water upon the teeth, all constructed and operating substantially as herein specified.

116,056.—BAND AND EDGING-GUIDE FOR SEWING-MACHINES. — Elijah Leavitt Howard, Malden, assignor to George Augustus Whiting, Charlestown, Mass.

Claim.—My improved band and edging-guide mechanism, made as described, viz., with the band and edging-guides A B G arranged and provided with adjustable gauges, as set forth, and with lateral openings *m m* and edge-receivers *e* and openings *f* to the band-guides, and with the edge-guide G adjustable relatively to the band-guides, and provided with a clamp-screw, all as set forth and represented.

116,057.—CLOTHES-PRESSING MACHINE.—Patrick Howe, Boston, Mass.

Claim.—1. The arrangement of the adjustable treadle *c*, bearings *d d*, levers *h h*, and bearings *i i*, and spiral springs *p p*, for the purpose set forth.

2. The construction of the bearings *r r* for the rail *y*, consisting of the forked blades with the slot-holes *u u* and projections *s s*, surrounded by the spiral spring *t*, in a manner and for the purpose described.

3. The press-board *v*, having one single support, *v'*, and provided on the inside with the ribs 3 3 3 3 and air-spaces 4 4 4 4, for the purpose set forth.

4. The construction and arrangement of the screw-threaded bolt 9, provided with the slot-hole 13, in combination with the handle 10 and the forked bearings 11 11, in a manner set forth, and for the purpose described.

5. The triangular frame 7 7 7, in combination with the rollers 6 6, hub 8, and bolt 9, for the purpose set forth.

116,058. — COOKING-STOVE.—William Jenkins Hoxworth and Silas Hoffman La Rue, Allentown, Pa.

Claim.—1. The fuel-magazine G, arranged on one side of the center of the fire-chamber C, and provided with a passage, J, leading into it at a point above its lower end, substantially as described.

2. The adjustable inclined plate S, arranged at the lower end of the fuel-magazine G, and adapted to operate substantially as described.

116,059.—RAILWAY.—Henry Temple Humphreys, West Limerick, Ireland.

Claim.—1. The combination of the metal cap *d*, the double-headed rails *b*, under-griping or guide-wheels *m*, and carrying-wheels *f f*, when constructed and operating together, as described.

2. The combination of the double-headed rails *b*, griping-wheels *m*, adjusting-rod k^x, suspension-rods l^x, and support-wheels *f*, when constructed and operating together, as and for the purpose described.

116,060. — PRINTING-PRESS. — Truman H. Ide, Claremont, N. H.

Claim.—1. The bed-plate E, supported and adjustable on the rails O, when combined, as described, with table D, for the purpose specified.

2. The vertically-adjustable beam H, held by the crossed levers I, and connected with the platen, and by said levers with the table D, substantially as herein shown and described.

116,061. — ROCKER FOR CRADLES, &c.—Richard A. Jackson, Alliance, Ohio, assignor to himself, Francis G. Walker, and Patrick Fetherstone, Allegheny, Pa.

Claim.—A new article of manufacture, viz., a rocker, provided with a plain groove and sockets, in which are secured the strip B and stops C, said strip and stops being in separate pieces from each other, as herein described.

116,062. — HAND-CAR. — David Johnston, Eddyville, Iowa.

Claim.—The railroad hand-car, constructed with the suspended adjustable beam G, foot-levers or treadles J J, crank-axle F, and pull-ropes *e e*, all arranged and combined substantially as described and shown.

116,063.—HARVESTER. — Samuel Johnston and Charles H. Jenner, Brockport, N. Y.; said Jenner assigns his right to said Johnston; said Johnston assignor to James S. Thayer, New York city.

Claim.—1. In a one-wheeled harvesting-machine, the main drive-wheel mounted in a yoke or frame which vibrates about the secondary pinion-shaft as a center, in combination with a grain-wheel mounted on a crank-arm of a rock-shaft operated from the drive-wheel shaft, substantially as set forth.

2. The yoke I I^1 I^2, in combination with the main frame, drive-wheel, secondary shaft, and a lifting device applied to the yoke and main frame, substantially as set forth.

3. The combination of lever N, standard O, link N', and standard M with the tongue and main frame, substantially as set forth.

4. The reel-bearer Q', pivoted at the main axle, in combination with the standard S' mounted on the main frame, made adjustable relatively to the main axle, substantially as set forth.

5. The reel-bearer Q, pivoted to the platform, in combination with the standard S mounted upon the crank-arm of the rock-shaft, substantially as set forth.

6. The movable socket P' and sliding block P, in combination with the lever N, standard O, and spring o^1, constructed and operating substantially as set forth.

7. In combination with the main frame and vibrating yoke, the tripod K *k k k*, screw L, and link *l*, substantially as set forth.

116,064. — WALL OR WAINSCOT-CHAIR.—John L. Kapple, Chicago, Ill.

Claim.—The combination of the hinged seat C, hinged swinging bracket D, and spring *g*, arranged and operating so as to compose a wall or wainscot chair, as specified.

116,065. — REFINING IRON AND STEEL.—William H. Kimball, Boston, Mass.

Claim.—The employment of the bromide of potassium in combination with the ordinary carbons and fluxes used in the process of producing iron or steel.

116,066.—MAGAZINE FIRE-ARM.—John L. Kirk, Mattoon, Ill.

Claim.—1. The slide *n* and spring catch O, arranged, as shown and described, to operate as and for the purpose specified.

2. The breech-plate P *p* and spring S, arranged, as shown and described, to operate as and for the purpose specified.

116,067.—TRACE-HOOK ATTACHMENT.—Jacob B. Kook and John S. Shrawder, Fairviewville, Pa.

Claim.—As an article of manufacture, the trace-hook herein described, formed of the body A G, leaves D D, stud E, and loop or ring F, constructed and arranged as shown and described.

116,068.—BREECH-LOADING FIRE-ARM.—James Lee, Milwaukee, Wis., assignor to Philo Remington, Ilion, N. Y.

Claim.—1. The combination of a hammer and hook attached, and a breech-block hinged at its rear end, with a firing-pin passing through it, so that on pulling back the hammer to half-cock the hook shall first draw back the firing-pin and then draw down the breech-block to a loading position, substantially as described.

2. In combination, the mainspring-lever, breech-block, and hook, whereby the double purpose of raising the breech-block and of disengaging the hook therefrom is effected, substantially as described.

3. In combination with a breech-block, hinged at its rear end, and drawn down by the hammer, an ejector that catches and holds said breech-block, and that closes or bridges the space between said breech-block and the frame of the arm, and that is acted upon by the mainspring to bind it against said block and frame, substantially as described.

4. The combination of a breech-block, hinged at its rear end, with the hammer, lever, and mainspring for the purpose of closing the breech and of operating the hammer, substantially as described.

5. The combination of the hammer, hooked lever, and mainspring, for the purpose of engaging and disengaging said hook with the breech-block, substantially as described.

6. The combination, herein shown and described, of a breech-block, hinged at its rear end, and an ejector near its front end, whereby said ejector hooks over and holds said breech-block when it is drawn down to a loading position, substantially as described.

7. The mechanism herein shown for drawing back the firing-pin by or through the medium of the hammer as it is raised, substantially as described.

8. The combination and relative arrangement of the hammer and mainspring, arranged for operation as described, whereby the mainspring is attached and moves with the hammer, substantially as described.

116,069.—CONSTRUCTION OF CARS.—John E. Looper, Godfrey, Ill.

Claim.—1. The combination of the beams A, cross-bars C, outer and inner sheet-metal shells D F, and the T-ribs E, all substantially as specified.

2. The combination, with the above, of the perforated floor H and the concave plate I, substantially as specified.

3. The bottom H and the inner shell F, being perforated, and having the air admitted to them from the space below the floor, all substantially as specified.

116,070. — SIDE-HILL PLOW.—George W. Leonard, Middle Valley, Pa.

Claim.—The combination of the pivoted adjustable plate B with the double mold-board of a swivel or side-hill plow, substantially as herein shown and described, and for the purpose set forth.

116,071. — WATER-WHEEL. — George W. Leonard, Middle Valley, Pa.

Claim.—The curved flutes, shoulders, or offsets *c'*, formed in the inner surface of the outer sides of the buckets C, substantially as herein shown and described, and for the purpose set forth.

116,072.—ROOF-GUTTER.—James F. Lockwood, Taylorville, Ill.

Claim.—A roof-gutter of sheet metal to be placed on the roof, the channel being formed by the curved side A and inclined plane B, the latter extending up under the shingles, and the gutter being supported and having the adjustable fastening, as herein described and shown.

116,073.—BABY-WALKER.—Conrad Maschmann, Watertown, N. Y.

Claim.—The baby-walker, consisting of the ring A, legs B B, straps C, belt D, flexible removable seat E, and hinged table F, all combined substantially as herein shown and described.

116,074, antedated June 8, 1871. — SAW-SET. — George W. May, Baldwinsville, Mass., assignor to himself and Daniel L. Thompson, same place.

Claim.—1. The lever B, carrying the set C, and operating the feed-lever G by means of the lever E and cam F, substantially as described.

2. The removable feed-lever G, having the spring tooth I, in combination with a hand-lever and a cam, F, substantially as and for the purpose described.

3. In combination with the removable feed-lever G, having spring tooth I, the pin M, substantially as described.

4. The adjusting-screw K, in relation to the projecting arm E of the hand-lever, substantially as and for the purpose set forth.

5. The adjusting devices, consisting of set-screw K, cam F, and pin M, in connection with the feed-lever G and hand-lever B, substantially as and for the purpose set forth.

116,075.—TENONING-MACHINE. — Andrew C. McQuaid, Wenona, Ill., assignor to Edward L. Mouser, same place.

Claim.—The adjustable guide M, in combination with the guide H and knife C, arranged to operate substantially as and for the purposes described.

116,076.—FASTENING FOR MEETING-RAILS OF SASHES.—Charles Morrill, New York, N. Y.

Claim.—The combination of the sliding slotted toothed jaw B, the stationary toothed jaw A, holding-plates C C', and locking-lever D, all constructed, arranged, and operating substantially as and for the purposes herein specified.

116,077. — WRENCH AND PIPE-TONGS.—James A. Morrison, Brady's Bend, Pa.

Claim.—The jaws B B, serrated on their concave inner surfaces, and pivoted to the tenoned and curved ends of the handles A A, as shown and described, whereby said parts are adapted to operate, as specified, to clamp tubes and other articles.

116,078.—REVOLVING FIRE-ARM.—John L. Moss and Edward W. Johnson, Columbus, Miss.

Claim.—1. The breech-plate D, provided with the grooved recesses to constitute a holder of cartridges and shell-extractor, as set forth.

2. The sliding cylinder B, combined with the rotary breech-plate D, substantially as herein shown and described.

3. The barrel C, connected and combined with the rotating reciprocating cylinder B, substantially in the manner herein shown, so that it can slide together with the same, as specified.

4. The guide-pins *e e*, combined with the sliding barrel C and the frame, substantially as herein shown and described, for the purpose specified.

5. The lever E and link *f*, combined with the sliding barrel and cylinder to operate the same, as set forth.

6. The base-pin A, grooved lengthwise, combined with the headed keys *d*, whereby the sliding and also the rotating motion of the cylinder is obtained, as specified.

116,079.—CENTER-BOARD FOR VESSELS.—John J. Moule, Huntington, N. Y.

Claim.—1. The combination of the center-board A with the end strap C, substantially as and for the purpose herein shown and described.

2. The second chain *e*, combined with the strap C and center-board, substantially as herein shown and described.

116,080.—GRATE-BAR.—William Muir, Archibald, and Pierce Butler, Carbondale, Pa.

Claim.—A furnace-grate having broad base, narrow oval top, concave sides, and grooved and apertured bottom, all made of cast metal and in one piece, as specified.

116,081.—CLOTHES-DRIER.—John F. Mullowny, Pittsburg, Pa.

Claim.—The telescopic extension staff having long socket B and threaded socket below it, combined with the movable rack-staff F G, carrying-arms M, and the base C, having screw D, all constructed, arranged, and applied together as and for the purpose specified.

116,082.—DOOR-BELL.—Wallace T. Munger, New Britain, Conn., assignor to P. & F. Corbin, same place.

Claim.—The tumbler *s* and arm *t*, in combination with the spur-cam wheel *r*, stops 2 2, and bell-hammer *d i*, the parts being arranged and operating substantially as and for the purposes set forth.

116,083.—APPARATUS FOR STEAMING, FILTERING, &c.—John Murdock, South Carver, Mass.

Claim.—1. The stand A, composed of the funnel B, flange B′, and legs E, and either with or without the cone F and pipe H, substantially as and for the purposes herein shown and described.

2. The combination of the stand A and cask D, substantially as and for the purposes described.

116,084, antedated June 17, 1871.—SAFETY-VALVE. — Adolphus F. W. Neynaber, Philadelphia, Pa.

Claim.—The construction of valve A, substantially as and for the purpose hereinbefore set forth.

116,085.—SLEIGH-BELL.—William H. Nichols, East Hampton, Conn., assignor of one-half his right to Robert H. Hall, same place.

Claim.—1. As a new article of manufacture, a sleigh-bell composed of two sections, A C, of sheet metal, hardened, the one being formed with a flanch, *a*, and the other with a concave rim, whereby the parts are joined, substantially as set forth.

2. In combination with a sectional sleigh-bell, A C, having a flat base provided with two slots, the plate-clamp E, inserted and bent, as herein set forth, to rigidly secure the bell to the strap.

116,086.—WATER-SUPPLY ATTACHMENT TO WASH-BASINS.—Frederick Norboe, Chicago, Ill.

Claim.—In combination with the reservoir or supply-pipe C, the double-acting faucet-stopper G, pipes B and E, sleeve M, valve P, and discharge-pipe N, the whole arranged to operate together substantially in the manner and for the purpose described.

116,087.—BUTTON-NEEDLE AND FASTENER. John August Ostburg, Boston, Mass.

Claim.—1. As a new article of manufacture, the eye-pointed needle *a*, constructed so as to carry the fastener or anchor *f*, as fully set forth and described.

2. The fastener *f*, provided with an eye, and having one end, *g*, pointed and the other end, *h*, curved, in a manner and for the purpose as fully set forth and described.

116,088.—MANUFACTURE OF CUTTER-BAR HEADS FOR HARVESTERS.—Amos Padgham, Syracuse, N. Y.

Claim.—A cutter-head or heel, constructed as herein described, of a cutter-bar, by welding a steel bush or plug into a wrought-iron forging, forming a permanent hardened-steel lining to the eye thereof, as and for the purposes herein set forth.

116,089.—TENONING-MACHINE.—George W. Passel, Cincinnati, Ohio, assignor to J. A. Fay & Co., same place.

Claim.—The combination, in a tenoning-machine, of the cutter-heads and shafts when belted at the side of the machine, and when both or either of them are made laterally and vertically adjustable, substantially as described.

116,090. — EXTENSION SHANK FOR BORING-BITS. — William S. Pattin, Portsmouth, Ohio.

Claim.—In combination with a stock, D, slotted and having a clamp-dog at the end, and a sleeve, B, to close it, the flat-sided bit-shanks converging diminishingly upward, and the threaded nut C placed above the sleeve for the purpose of locking the bit more securely and preventing lateral play thereof.

116,091.—CUT-NAIL MACHINE.—Archie W. Paull and John Morgan, Jr., Wheeling, W. Va.

Claim.—As our improvement of nail-cutting machines of the character generally herein described, the particular construction of the rotary cutter-stock—that is to say, with lateral eccentric flanges for operating the pivoted nail-cutter D, preventing lateral displacement of the nail-plate, and alternating reversely-inclined recesses in and extending across its periphery between the cutters, all as described, and for the purpose specified.

116,092.—HEMP-HATCHELING MACHINE.—George W. Pittman, Brooklyn, N. Y., assignor to Samuel L. Thursby, same place, and Todd & Rafferty, Paterson, N. J.

Claim.—The cylinder *b* armed with radial-pointed teeth, and the cylinder *c* armed with inclined-pointed teeth, the latter traveling faster than the former so as to draw and comb the fiber, in combination with the feeding-rollers *a a* and drawing-rollers *e*, as and for the purposes set forth.

116,093. — COMBINED SUSPENDER AND SHOULDER-BRACE. — Thomas O. Potter and Joseph William Smith, Boston, Mass.

Claim.—1. A suspender and shoulder-brace combined, consisting of the shoulder-straps A A′ and the dorsal-strap B, and the connecting-straps D D′ when the front ends of the shoulder-straps are free and when the dorsal-strap is connected to each of the shoulder-straps at C, and also by means of connecting-straps D D′, the whole being substantially as described.

2. The combination of the shoulder-straps A A′ and dorsal-strap B (when united together at C) with the connecting-straps D D′ and their attachments E F F, whether these connecting-straps be adjustable or not, the whole arranged and operating substantially as described.

116,094.—METALLIC CARTRIDGE.—Timothy J. Powers, New York, N. Y.

Claim.—The combination and relative arrangement, herein shown and described, of the internal flange *a* and cap-pocket or battery-cup *b*, whereby the said battery-cup is secured in position and a gas-tight connection effected, as set forth.

116,095. — PROPELLING BOATS BY OARS.—Thomas G. Pringle, New York, N. Y.

Claim.—1. The oar-lock, formed in two parts, F G, constructed and arranged as and for the purpose specified.

2. The combination of the row-lock F G, constructed as described, journals D, studs C, plates B, and segmental gear-wheels E with each other and with the adjacent ends of the parts a^1 and a^2 of the oar A, substantially as herein shown and described, and for the purpose set forth.

116,096. — HOISTING-MACHINE.—Henry J. Reedy, Cincinnati, Ohio.

Claim.—1. The combination of the ratchet-wheel or its equivalent and a stationary pawl, substantially as and for the purposes specified.

2. The combination of hoisting-axle, slotted journal, ratchet-wheel or its equivalent, and stationary pawl, substantially as and for the purposes set forth.

3. The clutch N N′, of which one-half, as N, is attached to the hoisting-axle X, and the other half, as N′, is attached to the axle of operating gear, substantially as and for the purposes set forth.

4. The combination of clutch N N′, hoisting-axle X, slotted journal S, ratchet-wheel N, and stationary pawl P, substantially as and for the purposes specified.

116,097.—POLICE-BATON.—Henry C. Reichard, Pottsville, Pa., assignor to Sol. Foster, Jr., same place.

Claim.—1. The combination of the rattle devices D S R with the baton A, when arranged in relation to each other so that the baton can be secured in a straight rigid position to the handle by means of the plates *b* and *b′*, stays C C, and catches *c c*, substantially as described.

2. The combination of the chamber E with the police-baton A, for containing the manacles F F, substantially as described.

116,098.—TUBE-FASTENING OF CONDENSERS. George H. Reynolds, New York, N. Y., assignor to himself, C. H. Delamater, and A. K. Rider, same place.

Claim.—1. The tapering thimbles C, arranged, as represented, in correspondingly-tapered holes made through the tube-sheet A, so as to make a tight fit around the tube B and provide for variations in the sizes of the parts, as herein specified.

2. The arrangement of the cut and bent portion *b* of the metal of the tube, so that its cut end shall abut against the thimble C to serve directly to prevent the end movement of the tube or thimble, as specified.

3. The entire tube-fastening, having a tapering thimble fitted in a tapering hole extending through the tube-sheet, and retained by an abutting portion, *b*, of the metal of the tube, all constructed and arranged for joint operation, as and for the purposes herein specified.

116,099.—SLIDE-VALVE.—Alexander K. Rider, New York, N. Y., assignor to himself, C. H. Delamater, and G. H. Reynolds.

Claim.—1. The side bearings of the main valve G and of the pieces I and J, arranged, as represented, relatively to each other and to the exhaust-ports H, so that when the steam begins to be received upward through the small port *g* to act on the valve *g* to complete its throw, the exhaust-passages or ports H shall be covered until the valve has leaped forward, and shall then be opened widely, as herein specified.

2. The top bearing-ring G′, mounted on the main valve G, and operating as represented against the parallel surface or bearing on the upper side of the interior of the steam-chest, opposite the cylinder-face, in combination with the means I and J, or their equivalents, for commencing the throw of the valve G by a positive movement of the mechanism, and also with the ports *g*, arranged as specified, and adapted to allow the completion of the throw of the valve G by direct steam-pressure, as herein specified.

116,100.—CULTIVATOR.—Thomas B. Roberts, Franklin, Ill.

Claim.—A straddle-row cultivator having three turn-plows on each of two beams, the foremost two arranged to turn from the row of plants, and the hindmost one throwing the pulverized dirt back and up to the roots of the crop, as described.

116,101.—FEATHER-RENOVATOR. — James C. Rose and John F. Silversmith, Albany, N. Y.

Claim.—1. The arrangement of the feather-chambers B′ and B″ within the renovating-box B with a connecting passage between, whereby the feathers may be alternately received and discharged from one of the said chambers to the other in the process of the manipulations of the feathers, substantially as set forth.

2. The arrangement of the D-shaped steam-chambers C C centrally between the feather-chambers B′ B″ and opposite each other, with a space between, whereby the said steam-chambers are made to act as heaters, hoppers, and divisions for the said feather-chambers B′ B″, substantially as set forth.

3. The arrangement of the feed steam-pipe D, hollow journal *b*, and exhaust-pipes F F, with the steam-chambers C C, whereby the said steam-chambers can be supplied with steam independently from the chambers B′ B″, substantially as and for the purpose set forth.

4. The arrangement of the perforated steam-pipe E in the passage-way between the feather-chambers B′ B, and the steam-chambers C C, to operate on the feathers when passing from one chamber B′ to the other chamber B″, substantially as set forth and shown, for the purpose specified.

5. The arrangement of the trunnions *b b* and their bearings *a a* with the renovating-box B, provided with the two feather-chambers B′ B″ placed opposite each other, whereby the said chambers may have their relative positions alternately reversed, substantially as and for the purpose set forth.

6. The arrangement of the pickers G G in the passage-way between the steam-chambers C C and feather-chambers B′ B″, whereby the said pickers are rendered capable of operating on the feathers in small quantities to draw the same from the chamber B′ above to the chamber B″ below, in the while the said feathers are being disintegrated or otherwise manipulated, substantially as set forth.

7. The arrangement of the fan-blower H with a doubled-chambered renovating-box, provided with pickers G G placed between the chambers B′ B″, and operating simultaneously with the same, whereby the feathers will be acted upon in small quantities to be discharged, dried, and sorted, substantially in the manner set forth.

116,102.—TREATMENT OF SACCHARINE LIQUIDS. — George L. Rundle, Greenville, N. Y.

Claim.—1. The fumigation of vessels, to contain saccharine fluids, with the combined vapor of brimstone, kino, and benzoin, in the manner and for the uses and purposes substantially as herein shown and described.

2. The process for treating sweet cider, as set forth and described.

3. The process for treating "dry" cider, as set forth and described.
4. The fumigator, Fig. 3, as herein described.
5. The composition pastil, as herein described.

116,103.—SAFETY APPARATUS FOR HOISTING-MACHINES.—William T. Sands, New York, N. Y.

Claim.—1. The spring F, combined by the bolt *e* and with the lever L, for automatically regulating the brake or safety attachment, as set forth.
2. The lever L combined with the slide J, sleeve H, and rod G to operate and lock the platform, substantially as herein shown and described.
3. The rod G fitted through sleeve H, which has the loose section *e*, and works in the eccentric jacket I, substantially as herein shown and described.

116,104.—BOILER.—William P. Skiffington, New York, N. Y.

Claim.—The combination of expansion joints B and square flanches C, arranged on the ends of boiler-tubes A, substantially as and for the purpose hereinbefore set forth.

116,105.—METALLIC CARTRIDGE.—William S. Smoot, Ilion, N. Y.

Claim.—The combination, herein shown and described, of the closed tube A and disk *c*, whereby said disk is secured to the body of the cartridge, the fulminate-pocket formed, and the anvil secured in place, when said head is riveted to the cylinder by the metal of which said cylinder is composed, and forms a head and flange, both as described.

116,106.—BREECH-LOADING FIRE-ARM.—William S. Smoot, Ilion, N. Y.

Claim.—The solid block E, interposed between the open rear end of the chamber and the bearings on the frame, in combination with the link F and tumbler I, as and for the purpose described and represented.

116,107.—BOTTLE-CAPPING MACHINE.—William H. Sperling, Washington, N. J.

Claim.—The arrangement and combination of the jaws A and C with a spring and treadle, when the former are made to operate substantially as and for the purpose described.

116,108.—BOBBIN.—John N. Stearns, New York, N. Y.

Claim.—The tubular axle, soldered to the sheet-metal heads A A of a swift, and covering the heads of the rivets *a*, which constitute the gudgeons, substantially as herein shown and described.

116,109.—GRAND PIANO.—George Steck, New York, N. Y.

Claim.—The improved grand piano-forte iron frame, as herein described, having the entire space back of the bridge G and between it and the border parts F J of the frame open and free for the transmission of sound, and arranged in connection with the wooden case, substantially as herein specified.

116,110.—ELECTRO-MAGNETIC MEDICAL APPARATUS.—Albert J. Steele, Brooklyn, N. Y.

Claim.—1. The bath-cup A, combined with the cover B, which constitutes one element, and with the other element, C, suspended therefrom, as set forth.
2. The combination, within and on the block D, of the coil E, rods *b c*, binding terminals *p q*, helix F, spring armature G, and screw *m*, all arranged substantially as herein shown and described.
3. The adjustable magnets or plugs H I J of different strength, arranged in the electro-medical generator for producing currents of suitable strength, as set forth.
4. The case N, combined with the electric battery A and apparatus D for inclosing, and provided with springs *t* for supporting, the same, as set forth.
5. The sponge or cup-holder L, provided with the pin *r*, and arranged substantially as shown and described.
6. The combination of the cup A, block D, cups M and O, and inclosing-case N with each other, all arranged to operate substantially as herein shown and described.

116,111.—WASHING-MACHINE.—T. H. Stewart, Winona, Miss.

Claim.—A washing-machine, with its rubbing-board C and revolving rubber D constructed with openings, in combination with box A, standing so inclined that the suds or water is conducted through openings E', in the manner shown and described.

116,112.—FISH-HATCHING APPARATUS.—Livingston Stone, Charlestown, N. H.

Claim.—A fish-hatching box or trough, carbonized or charcoal-lined, as described.

116,113.—TENSION MECHANISM FOR SEWING-MACHINE SHUTTLES.—Joseph W. Strange, Bangor, Me.

Claim.—1. In combination with shuttle *c*, the spring *d* and block *e*, when all are constructed and arranged to operate substantially in manner as and for the purposes specified.
2. The sliding bar C, with its spurs *f* and *f'*, when constructed and arranged to operate substantially as and for the purposes specified.

116,114.—CAN-FILLING AND SOLDERING APPARATUS.—Leopold Charly Straub, Pittsburg, Pa.

Claim.—1. The rotary frame B, carrying the several swivel-disks C C^1 C^2, whereon a number of cans can be supported to be filled, closed, and soldered, as set forth.
2. The shaft E and pinion *e*, combined with the gear-wheels *c*, arbors *b*, and spring catches *k*, all arranged to operate substantially as herein shown and described.
3. The hopper F hinged to the post A, which carries the rotating swivel-disks C, C^1, and C^2, to be used for filling cans, as set forth.
4. The spring-bar G, carrying the lamp H, vessel I, and tube *f*, to constitute a soldering apparatus, as specified.

116,115.—SAD AND FLUTING-IRON.—Joshua E. Swift, New York, N. Y.

Claim.—1. The swinging fluted segment *d*, in combination with the sliding bed *b*, handle *g*, and iron *a c*, substantially as set forth.
2. The stop *e* upon the swinging fluted segment *d*, in combination with the fluted sliding bed *b* and iron *a c*, substantially as and for the purposes set forth.
3. The pin *i* in a segmental slot in the portion *f* of the handle, in combination with the pin or rivet *h*, smoothing-iron *a*, standard *c*, and fluted segment *d*, substantially as and for the purposes set forth.

116,116.—MACHINE FOR SOWING PULVERULENT MANURES.—N. G. Swift, Hart's Village, N. Y.

Claim.—The arrangement of box A, roller C, spring pressure-bar D *a*, gauge E, and spring clearer G H, as and for the purpose specified.

116,117.—GAME-SIGNAL.—William M. Tileston, New York, N. Y.

Claim.—The toy herein described, consisting of handle A, spring B, plug C, and toothed wheel D, all the parts arranged as and for the purpose described.

116,118.—BOILER-FLUE SCRAPER.—Hermann Voelker, Newark, N. J.

Claim.—1. The sliding heads C C, applied loosely to the stem A to receive the springs B, and combined with the sliding sleeves D D, substantially as herein shown and described.
2. The nuts E and F, applied to the ends of the stem to retain the springs, in combination with the heads C and sleeves D, and so shaped as to constitute, respectively, the point and coupling of the stem, as set forth.
3. The scrapers *d*, arranged in zigzag rows around and upon the springs B, substantially as herein shown and described.

116,119.—WAGON-SEAT.—Henry Wahlstedt, Princeton, Ill.

Claim.—The combination of the supplementary seat B, seat-support C, and sliding rod D, substantially as described and for the purpose set forth.

116,120.—HARVESTER-DROPPER.—John N. Wallis and Theodore Wallis, Fleming, N. Y., assignors of one-third of their right to Henry G. Wise, same place.

Claim.—1. The dropper B and beater E, combined with a carrier, D, as described, arranged in close proximity thereto, to enable the former to throw the grain on the latter, as specified.
2. In combination with the above, the described mechanism for operating the same, as set forth.

116,121.—LAMP-CHIMNEY CLEANER.—Lewis Ward, Poughkeepsie, N. Y.

Claim.—The combination of the staple C with the sponge B and the handle A, as and for the purpose specified.

116,122.—GRAIN-CLEANER.—John H. Weaver, Gap, Pa.

Claim.—1. The screen Q and shoe K, combined with grooved and pivoted arms S and slotted arms T, as and for the purpose specified.
2. The screen Q, movable plate U, bar V, shoe K, and screen O, combined, constructed, and arranged as and for the purpose specified.
3. The box B, having end projections R, vertical gates W W, and pivoted bottom X, constructed and arranged as and for the purpose specified.

116,123.—ROUNDER FOR REINS.—David Webber, Houlton, Me.

Claim.—1. The combination of the wheels B C, having grooves varying in size formed in their faces, bars A, wedge-key E, screw D, plate, bolt, and nut F G H, brake-block K, and crank-screw L M with each other, substantially as herein shown and described.
2. The combination of the gear-wheels J and crank I with the wheels B C, for the purpose of adjusting said wheels, substantially as herein shown and described.
3. The combination of the wheels B C, having grooves varying in size formed in their faces, bars A, wedge-key E, screw D, plate, bolt, and nut F G H, crank I, gear-wheels J, brake-block K, and crank-screw L M with each other, substantially as herein shown and described.

116,124.—BUCKLE.—David Webber, Houlton, Me.

Claim.—The buckle-frame A C C having the cross bars B B flush with the sides, in connection with the rectangular clamp having curved sides G G working in grooves F F, and the piece H, elongated at each end to rest upon the frame, the whole being arranged and operating substantially as shown and described, and for the purpose set forth.

116,125.—APPARATUS FOR COLORING WARPS.—Nelson D. White, Winchendon, Mass.

Claim.—1. The combination, with the coloring-tank A, provided with a series of yarn-rolls, C, and draft-rolls F F' of the yarn-guides *e d*, supporting-rolls G, separating-rod or pin K, and holding-pin *e*, substantially as and for the purposes set forth.
2. The swinging frame I, provided with comb-guides *d*, and separating-rod K, substantially as and for the purposes set forth.
3. The combination, with the delivering-beam E, receiving-beam H, and supporting-rod G, of guides *e d* and separating-rod K, substantially as and for the purposes set forth.

116,126.—BROOM.—William E. S. Whitman, Augusta, Me.

Claim.—The method of manufacturing a broom, as herein shown, combining the handle A, screw B, the socket C having the threaded aperture D and shoulder E, and the broom F, substantially as described, for the purposes set forth.

116,127.—DUMPING-CAR.—Jacob C. Wiswell, Lennoxville, Canada, and Frederick A. Wiswell, Beebe Plain, Vt.

Claim.—1. In combination with the railroad car, a platform, D, made in two longitudinal sections, *a b*, hinged together at *c c*, and applied, as and for the purpose specified.
2. The levers E E F F, combined with the hinged leaves *a b*, and with the nuts *m* and screws *h*, to operate substantially as herein shown and described.

116,128, antedated June 6, 1871.—FLOOR-COVERING, ROOF, &c.—David Ludwig Wolff, Chicago, Ill., assignor to himself, Matthias Poncelet, and Henry Nass.

Claim.—As a new article of manufacture, the roofing or flooring-felt, prepared substantially as herein described.

116,129.—FURNACE FOR MELTING ORES AND METALS.—William S. Wood, Newtown, N. Y.

Claim.—Admitting a current or currents of atmospheric air into a melting-cupola or pot, substantially as and for the purposes described.

116,130, antedated June 7, 1871.—PROPELLING APPARATUS FOR LAND CONVEYANCES.—Jacob Woolf, Burr Oak, Mich.

Claim.—1. In combination with the eccentric annular weight M and elevating-cranks L, one or more planet-wheels, which turn the said elevating-cranks by their axial rotation, and have an orbital revolution around the central wheel and shaft, as explained.
2. The concentric shafts I and O, in combination with the eccentric annular weight M, elevating-cranks L, and connecting or planet-wheels, as represented and described.

116,131.—STEAM-PUMPING ENGINE.—Henry R. Worthington, New York, N. Y.

Claim.—A duplex engine, consisting of two independently-acting steam-cylinders of different sizes, the movement of the piston in the high-pressure or smaller cylinder operating the valve of the larger or low-pressure cylinder, the piston of which, in turn, operates the valve of the high-pressure or smaller cylinder, between which said cylinders is interposed an equalizer or reservoir admitting the steam from the high-pressure and delivering it into the low-pressure or larger cylinder, all constructed, arranged, and operating substantially as herein shown and described, and for the purposes set forth.

116,132.—HAND-STAMP.—Parker O. Wright, Oswego, N. Y.

Claim.—A pivoted lever, A, having vertical play, in combination with a canceling-stamp, G, a circular cam-flange, P, and one or more springs, S S, when the lever and the cam-flange are arranged substantially as described, so that a revolution of the one or the other shall produce a successive lifting and dropping of the lever and stamp, in the manner and for the purpose herein set forth.

116,133.—Folding Easel.—Rufus Wright, Brooklyn, N. Y.

Claim.—1. The central bar A, the uprights G G, the bottom pieces H H, the two pairs of joint-bars I I and L L, and brace-hooks M M, arranged substantially as and for the purposes described.

2. An easel so constructed that the uprights may fold toward the center, substantially as described.

3. In combination with an easel, the cam-fastening F, substantially as shown and described.

116,134.—Split Casting.—James Yocom, Jr., Philadelphia, Pa.

Claim.—A metal casting which is separated or split by means of one or more pieces of metal, which form, when the wheel is cast, interlocking joints for the sections, substantially as described.

116,135.—Compound for the Cure of Spavin.—William J. Andrews, East Machias, Me.

Claim.—The combination of the within-named ingredients, compounded, substantially as and for the purpose described.

116,136.—Tobacco-Cutter.—José M. Aguayo, Boston, Mass.

Claim.—A knife or cutter, combining a fixed blade, B, and a free wheel-blade, E, substantially as and for the purpose described.

116,137.—Manufacture of Glass.—William Henry Balmain, St. Helen's, Great Britain.

Claim.—1. The use of caustic alkali of the purity described, in the manufacture of glass.

2. Glass produced by the use of a caustic alkali of the purity described.

116,138.—Bucket for Chain-Pumps.—William C. Barker, Ypsilanti, Mich.

Claim.—1. The semi-spherical elastic bucket A, provided with apertures *a b*, arranged, when drawing water, with the spherical part uppermost, as described and shown.

2. The combination of the bucket A, provided with leak-holes *a*, the washer or button B, and loop-link C, when each is constructed and arranged to operate as set forth.

116,139.—Slate-Frame.—William N. Bartholomew, Newton Centre, Mass.

Claim.—1. An elastic corner for slate-frames, composed of a metallic supporting and holding-plate, made substantially as described, and a vulcanized-rubber head placed upon the said plate while in the green or plastic state, and then united therewith by vulcanization, as set forth.

2. The combination of an elastic corner, made as described, with the corner of a slate-frame, the shank of the holding-plate being let into the frame, and the two being united by the same rivet which fastens together the adjoining ends of the frames, substantially as shown and set forth.

116,140.—Broom-Holder.—Charles T. Beardsley, Hamden, Conn.

Claim.—The herein-described broom-holder, consisting of the socket A and India rubber ring B, substantially in the manner described.

116,141.—Machine for Molding Pipes.—Benjamin S. Benson, Baltimore, Md.

Claim.—1. In combination with the revolving flask D, the sliding packer D', packer-shaft *e*, and the steady-shaft F, as and for the purpose described and represented.

2. In combination with a revolving flask and sliding packer, the hopper, measuring-wheel, and conveyer, when timed and regulated to run together and deliver to the flask measured quantities of sand, as and for the purpose described.

3. The air-tubes *h i*, arranged in connection with the friction-rolls 2 and the shafts *F e*, as and for the purpose described and represented.

116,142.—Purifying Pyroligneous Acid.—Carl Frederich Binder, Philadelphia, Pa.

Claim.—The treatment of the vapor of pyroligneous acid by subjecting the same to sulphuric acid and manganese, substantially in the manner described.

116,143.—Water-Back for Stoves.—Abner J. Blanchard, Boston, Mass.

Claim.—The combination, with a cooking or heating-stove or range, of a water-back, when said parts are constructed and arranged substantially as herein shown and described, to permit the water-back to be readily withdrawn from and inserted in said stove or range.

116,144.—Cotton-Press.—James P. Bolin, Orangeburg county, S. C.

Claim.—The arrangement, in the cotton-press herein described, of the frame L, follower H, levers F F, braces G G, wheel D, chain or rope E E, rope C, and windlass B, when all these parts are constructed and operated as shown and described, for the purpose set forth.

116,145.—Fur-Box.—Henry Braunhold, New York, N. Y.

Claim.—A fur-box cut in an oblique direction, and containing in one part a reversible semi-cylindrical muff-receiver and in the other a covered collar-receptacle, substantially in the manner herein shown and described.

116,146.—Fire-Place.—Phillip Brecher, Louisville, Ky.

Claim.—1. The basket-grate C C' formed in two parts, hinged together so that the front part can be thrown on top of the back part, substantially as and for the purposes herein set forth.

2. The rear part C of the grate, provided with hooks *d f* and eyes or loops *e e*, substantially as and for the purposes herein set forth.

3. The combination of the rear part C, having hooks *d f* and eyes or loops *e e*, with the front part C', provided with pins to fit in the loops *e e*, substantially as and for the purposes herein set forth.

116,147.—Cultivator.—Thomas E. C. Brinly, Louisville, Ky.

Claim.—The herein-described shaft-cultivator, composed of a rectangular frame, the elongated side beams of which form the shafts A A, and carry at the rear the handles B B, fixed central beam D tied to the side beams by triangular stay D', laterally-adjustable beams E and F, slotted iron standards H, which are provided with adjustable shovels G and adjustably connected to their respective beams D E F by braces I, and the gauge-wheel K, hung in a frame, L, which is suspended from the side beams of the main frame, and raised or lowered by means of a brace, M, passing through the beam D, all the parts being constructed and arranged substantially as set forth.

116,148.—Wheel for Vehicles.—Marshall R. Brown, Mingo, Ohio.

Claim.—1. The sleeve C, provided with the shoulder *b* and a circular flange around its outer end, having its face surface beveled and provided with double V-shaped lugs *d d*, substantially as and for the purposes herein set forth.

2. The combination of the box A with shoulder *a*, sleeve C with shoulder *b*, and double V-shaped lugs *d d*, spokes D D, and screw-sleeve B with circular V-shaped bead *e*, all constructed and arranged substantially as and for the purposes herein set forth.

3. The combination of the sleeves C B with inclined flanges, flared spokes D D, flanged spoke-seat G, and felly E, all substantially as set forth.

116,149, antedated June 15, 1871.—Water-Wheel.—Robert Buchanan, Winslow, Ill.

Claim.—1. The combination of the curved buckets D D with the rims C C, curved so as to form water-passages which increase in width from the center each way toward the outer and inner ends, substantially as and for the purposes herein set forth.

2. The combination of the curved buckets D D, the inner curved rims C C, and the plate G with the chutes F F, all constructed and arranged substantially as and for the purposes herein set forth.

116,150.—Sash-Holder.—Charles M. Burns, Jr., Philadelphia, Pa.

Claim.—The combination of the plate with its recesses and the tumbler with its shoulders, when united and held in working position by a spring and without any pivot, and when automatically operated, as herein set forth and described.

116,151.—Steam Fire-Engine.—Lysander Button and Theodore E. Button, Waterford, N. Y.

Claim.—The improved steam fire-engine herein described, formed by the arrangement of an engine, A, directly over the forward axle F, so that the wheels E E may turn about it, and the boiler B, in connection with the rear axle G, together with the curved reaches C C, all constructed and arranged substantially as shown and described, for the purpose specified.

116,152.—Nautical Alarm.—Samuel G. Cabell, Quincy, Ill.

Claim.—1. The divided tube, with slotted partition and vibrating tongue, substantially as herein described, and shown in Fig. 2 of the drawing.

2. The combination of a clarionet-trumpet and a whistle, substantially as described.

3. The combination of my improved trumpet, or trumpet and whistle combined, as herein described, with a rotary blower, substantially as herein set forth.

4. In combination with a trumpet or whistle, or whistle and trumpet combined, the improved blowing apparatus herein described, substantially as represented in Fig. 4 of the drawing.

5. The combination of a trumpet or whistle, or both combined, with a buoy, the same being constructed and arranged to operate substantially as herein described.

116,153.—Hinged Hay-Rack.—Milo Carpenter, Wayland, Mich., assignor to himself and J. H. D. Snell, same place.

Claim.—The wings or side frames C, when constructed and operating substantially as herein set forth, in combination with the bed-frame or wagon-box, the whole forming an adjustable hay-rack, wagon-box, or platform, as herein described.

116,154.—Railroad-Car Seat.—Dexter H. Chamberlain, West Roxbury, Mass.

Claim.—A rest-block, E, for car-seats, &c., provided with an elastic cushion, *b*, and a stirrup shield-plate, *c*, applied about the block E, and partially or wholly encircling the same, as described, for the purpose specified.

116,155.—Tap or Faucet for Bottles.—Dexter H. Chamberlain, West Roxbury, Mass.

Claim.—A tap constructed with a tapering spigot or pipe, D, in combination with a pointed stem, F, arranged within it, substantially as and for the purpose described.

116,156.—Elevator.—Dexter H. Chamberlain, West Roxbury, Mass.

Claim.—The screw-shaft A, endless connected sector nuts H, pulleys K, vertical guide-posts I, and platform N, combined and arranged together for operation, substantially as described, for the purpose specified.

116,157.—Apparatus for Holding and Adjusting Umbrellas on Vehicles.—George F. Child, Dayton, Ohio.

Claim.—1. The umbrella-holder A, constructed substantially as described.

2. The combination and arrangement of the holder A, shaft B, and eyes E and F, in their relation to a vehicle, substantially as and for the purpose specified.

116,158, antedated June 15, 1871.—Apparatus for Heating Bolt-Blanks.—James B. Clark, Plantsville, Conn.

Claim.—The apparatus herein described, consisting of the fire-box A, side boards B B, back C, and slats D D.

116,159.—Pool-Board.—Hugh W. Collender, New York, N. Y.

Claim.—A ball-rack, composed of a plane or board of any suitable material, provided with a series of projecting ball-holders, substantially in the manner and for the purposes set forth.

116,160.—Running-Gear for Vehicles.—James L. Corbus, Quincy, Mich., assignor to himself and William H. Cole, same place.

Claim.—1. The box-clip D, spring plate D', and nuts *d*, arranged and operating with relation to the reach B and circle-iron C, as and for the purpose herein shown and specified.

2. The elastic perches G, when interposed between the body of a vehicle and its springs F, substantially as and for the purpose set forth.

116,161.—Roller-Skate.—Allen Thompson Covell, San Leandro, Cal.

Claim.—The T-shaped lever D, pivoted in the stock A, with its vertical part working in the recess or slot of the front reach, as shown and described.

116,162.—Sash-Holder.—James M. Cowles, Burlington, Iowa.

Claim.—The combination of the slotted face-plate F with spring roller-arm B, secured upon a lug, *f'*, on the back side of it, the loop C surrounding it, the arm C', and the screw E, arranged and operating substantially as and for the purpose described.

116,163.—Plotting Instrument.—James E. Crupper, Berlin, Ky.

Claim.—1. The method of draughting herein described, consisting essentially in the simultaneous delineation of all the courses and distances to be draughted, by means of a series of slotted rules, R R, clamped together, substantially as herein set forth.

2. The set of instruments, adapted to operate, in combination with each other, in carrying out the method herein described, such set consisting essentially of the slotted rules R R, graduated in rods and decimals of rods, the circular or annular protractor A, graduated in degrees, &c., and marked with the points of the compass, and the set-screws *s s*, for clamping the rules together, all adapted to and designed to be used in connection with each other, substantially as described.

116,164.—Folding-Table Support.—Joseph Daly, Troy, N. Y.

Claim.—1. The combination of the bars A A^1 A^2 A^3 and connecting-bars B and B', when constructed and arranged to operate substantially as and for the purpose described and set forth.

2. The braces G and H, when constructed substantially as and for the purpose described and set forth.

3. The jointed bars E and F, in combination with their respective bars A A^1 A^2 A^3, when arranged and operating substantially in the manner and for the purpose as described and set forth.

4. The combination of the bars A A^1 A^2 A^3, connecting-bars B and B', jointed bars E and F, and braces G and H, when arranged and operating substantially in manner and for the purpose as described and set forth.

116,165.—APPARATUS FOR FEEDING FURNACES WITH FUEL.—George Frederick Deacon, Liverpool, England, assignor to Dillwyn Smith, Burlington county, N. J.

Claim.—1. The combination, with the hopper and fuel-distributing fan, of a screw or worm, revolving within a cylinder or trough and conveying the fuel, substantially as herein described.

2. The combination, substantially as herein described, of the hopper or other receptacle for the fuel, fans, or vanes, by which the said fuel is projected into the furnace, and a screw, tapered, as and for the purpose specified.

3. The opening *b*, close to one end of the screw-cylinder and above the level of the bottom of the same, in combination with pins or projections *c* on the screw-shaft, for the purpose of lifting the fuel and pushing it into the said opening.

4. The adjustable deflector J J', arranged and operating in combination with the fans and with the discharge-opening *a*, substantially in the manner described.

5. The spiral vanes *e*, cast on or secured to the bottom of the propelling-fans, for the purpose specified.

6. The combination of the feed-screw, the feeding-fan or fans, the conical pulleys *i i* on the driving-shafts of the fan and feed-screw, and their adjustable strap, the whole being arranged as described, so that the speed of the feed-screw may be increased or diminished without altering that of the fan, as set forth.

116,166.—MEAT-CRUSHER.—Oliver P. Dennison, Mulberry, Ohio.

Claim.—The roller C', movable bearing-plates *c c*, and plate D, in combination with the frame A B B, stationary roller C, spring *d'*, bar *d*, and lever E, substantially in the manner shown and for the purpose described.

116,167.—STEAM-GENERATOR.—Erasmus P. Doyen, Portland, Me.

Claim.—1. The vertical transverse section herein described, comprising in an entire casting the steam-chamber B, water-tubes A C, fire-box F, mud-drums D, and water-grate E, substantially as specified.

2. The combination, with a sectional casting comprising the steam-chamber B, water-tubes A C, fire-box shoulder F, and mud-drums D, of the hollow grate-bars E, substantially as specified.

116,168.—DEVICE FOR HOLDING SPINNING-BOBBINS ON SPINDLES.—George Draper, Hopedale, Mass.

Claim.—1. In combination with the dead-spindle A and its whirl B, the friction-bobbin supporter C, extended from and above the whirl and on the spindle, and constructed substantially in manner and for operation with the bobbin and spindle, as described.

2. In combination with the subject of the above claim, the bobbin and spindle-pivot *i* and step h, or the equivalent thereof, arranged at the head or upper part of the bobbin, as set forth.

116,169.—RAILWAY-CAR BRAKE.—Charles B. Eaton, Grafton, Ill.

Claim.—1. The lever H, rod I', cranks J, shafts K and Q, cam L, friction-pulley S, and rope or chain T, arranged substantially as and for the purpose described.

2. The sliding frame O, frame R, and sliding box N^2, in combination with the springs P and *r* and tilting shaft Q, substantially as and for the purpose described.

116,170.—FLOOD-GATE.—Joseph W. Edgerton, Thorntown, Ind, assignor to himself and David J. Moffitt, same place.

Claim.—The combination of the section-fence, composed of the pickets *a* and the sills B, the latter being journaled in the posts A, with the springs D secured upon the apron C, when the several parts are constructed and arranged substantially as described and shown, and operated so that the gates are locked in either a vertical or horizontal position.

116,171.—DREDGING-SCOOP.—Albert C. Ellithorpe, Chicago, Ill.

Claim.—The combination of adjustable weights with a pair of scoops operated by means of the lowering and opening-chain Y and the closing and lifting-chain Z, substantially as specified.

116,172.—MORTAR-MIXING MACHINE.—Albert C. Ellithorpe, Chicago, Ill.

Claim.—1. In a mortar-machine, the mixing-reel D, provided with the curved springing arms *f* and the spatula ends *g*, substantially as specified.

2. The combination, in a mortar-machine, of the rotating reel D having vertical motion, and the mortar-bed *e* having horizontal motion, substantially as specified.

116,173.—MACHINE FOR PASTING PAPER UPON STRAW BOARD, &c.—Maurice Fitzgibbons, New York, N. Y.

Claim.—1. The combination of the rollers Q and Q' with the coiled spring *a* and the reservoir P', substantially as set forth.

2. The combination of the reservoir P', the valve V, rod W, lever Y, connecting-rod U, and the crank-pin on eccentric Z, substantially as set forth.

3. The roller O, in combination with the rollers Q and Q' and the screw-roller R, substantially as set forth.

4. The drying-roller G with the rollers E and H, the shield F, apron C, and knife I, substantially as described.

116,174.—MOP-HEAD.—Bridget French, Rochester, N. Y.

Claim.—The angular groove or water-receptacle *m* of the pivoted clamp C, in combination with the T-shaped cross-head B, provided with the saw-teeth *b*, the several parts constructed and operating substantially as set forth, for the purpose specified.

116,175.—TYPE-WHEEL FOR PRINTING-TELEGRAPHS.—Robert H. Gallaher, New York, N. Y.

Claim.—1. A monogrammic wheel, drum, cylinder, roller, disk, or plane, provided with or having formed and arranged on and around the periphery, rim, or circumference, or face thereof, in any suitable manner, abbreviated and condensed combinations of letters, emblems, signs, symbols, characters, figures, or numerals to represent names, show quantity, denote kind, and express rate of value of any railroad stock, bonds, or other securities or commodity of commerce, the said devices combined in operation, and used in connection with any kind or system of electro-magnetic or telegraphic or other printing machinery for the purpose of communications, substantially as set forth and represented in the accompanying diagrams.

2. The combination of my monogrammic wheels, provided with their several peculiar signs and symbols, with a system of single or double arrangement of wheels, drums, rollers, or cylinders having plain separate alphabetic letters, numerals, figures, or fractions, and producing similar impressions and communications to what are shown on the pilot representation in Fig. 9.

116,176.—GAS-REGULATOR.—Henry Gerner, New York, N. Y.

Claim.—1. In combination with the tube A having cap D, and connected with the inlet and outlet-pipes B C, the inner sliding tube *a*, open at both ends, and the float *b*, connected together by the screw-rod *c*, provided with the regulating set-screw *e*, all substantially as and for the purposes herein set forth.

2. In combination with the tube A with inner tube *a*, screw-rod *c*, set-screw *e*, and float *b*, the elbow E and glass tube F, provided with cap H and air-regulating screw K, all substantially as and for the purposes herein set forth.

116,177.—LANTERN.—Orrin L. Gridley and Carl Engelskerchen, Buffalo, N. Y.; said Engelskerchen assigns his right to said Gridley.

Claim.—In combination with A and B, the transparent protecting-disk D, for the use and purpose specified.

116,178.—DOVETAILING-MACHINE.—Crawford Staples Griffin and Josiah Wells Wilkins, Chelsea, Me.

Claim.—1. In a dovetailing-machine, the back plate A, upon which is supported the turning plate B, in combination with the standard F, when constructed substantially as and for the purpose specified.

2. The arms F', in combination with the standard F and back plate A, constructed substantially as and for the purpose set forth.

3. The combination of the screw-shafts H and I, arms F', standard F, and plates A and B, constructed substantially as and for the purposes specified.

116,179.—BLOW-OFF PIPE FOR STEAM-BOILERS.—James S. Griffith, St. Louis, Mo.

Claim.—The combination and arrangement of the vertical perforated pipes *a y*, horizontal pipe B, vertical pipes C C^1, horizontal pipe C^2, and the valve *b g*, said pipes increasing in diameter from the bottom of the boiler up to the discharge-valve *g*, as shown and described, and the several pipes with the valve forming an attachment which can be applied to a boiler in the manner represented, all for the purpose set forth.

116,180.—ENVELOPE.—J. William Groomes, Portsmouth, Ohio.

Claim.—The flap M, provided with two slits, *o o*, and fold G, in combination with the top fold C having tongues A A', and flaps E E having slits B B, substantially as shown and described.

116,181.—SAW-MILL.—Samuel W. Harris, Jamestown, N. Y., assignor to himself and Josephus H. Clark, same place.

Claim.—The stirrups M, in combination with the oscillating cross-head H, gibs F F, strap E of the pitman B, and the keys D and *x x*, all constructed and operating substantially as and for the purposes herein shown and described.

116,182.—UPRIGHT PIANO-FORTE ACTION.—A. Horace Hastings, Jersey City, N. J.

Claim.—1. The cast-iron frame A B C, constructed, as described, to form the key-rest rail and the hammer and damper-rail, and to support the hammer-rest rail, substantially as described.

2. The wooden plugs *a a*, in combination with the iron key-rest rail, for the purpose of receiving the tacks by which the cushion is secured to the rail, substantially as herein specified.

3. The detached wooden strip *w*, in combination with the grooves in the hammer-flanges, the screws S S, the hammer-rail C, and the interposed cloth *c*, substantially as described.

4. The combination of the projections *i* on the front jaws of the hammer-flanges, the notch *e* in the said jaw, and the recesses *i* in the back jaws, substantially as and for the purpose herein set forth.

5. The arrangement of the damper-lever in oblique positions, in which that for each note is supported by the flange which supports the hammer of the next or a neighboring note, substantially as and for the purpose described.

6. The head *b* of the hammer-check, constructed of continuous bands of cloth, leather, or other material, through which the shank passes, and which are each lapped twice over or around the head of the shank, substantially as and for the purpose herein described.

116,183.—HOG-STOCK.—William Clark Hays and John Doddridge Scott, Sharonville, Ohio.

Claim.—The combination of the tapering box A, hinged gates B B, sliding door C, slide D catching in notches *a a*, hinged door I, forked gate E with lever G, and the sliding gate H with scallops *d d*, all constructed, arranged, and operating substantially as set forth.

116,184.—FOLDING BRUSH.—Peter Henrichs, Erie, Pa.

Claim.—The bars B B, having tufts of bristles B' B', connecting-rod C, and spring D, when the same are so combined and arranged as to furnish a folding brush that is automatically opened for use, substantially as described.

116,185.—BRUSH, &c., FOR THE POCKET.—Peter Henrichs, Erie, Pa.

Claim.—1. A memorandum or similar book, having one or more folding brushes, B, arranged as stated, and a hat-brush, C, when the whole are so constructed, combined, and arranged as to operate substantially as described.

2. One or more folding brushes, B, hat-brush C, either with or without the mirror C', flexible leaf D, tablets E E, pouch F, when the same are so combined and arranged as to form a memorandum-book, substantially as described.

116,186.—TORSION-SPRING FOR VEHICLES.—Benjamin Hershey, Erie, Pa., assignor to himself, E. Geer, Richard Dudley, and Richard F. Gaggin.

Claim.—1. The looped spring, when the same is so formed that its narrowest section shall be at the point from which the lateral lever-arms turn off, substantially as described.

2. The looped torsion-spring, when the lateral lever-arms are so turned out as to project in opposite directions, substantially as described.

3. The lateral lever-arms, when the same are formed with a concave face as to act in connection with the rocker-plates, substantially as described.

116,187.—TORSION-SPRING FOR VEHICLES.—Benjamin Hershey and Richard F. Gaggin, Erie, Pa., assignors to themselves, E. Geer, and Richard Dudley.

Claim.—The V, or angular, and the U, or curved, spring, formed of two rods or sections, so as to avoid the opposite wrenching of the rod during the torsional action of the spring, substantially as described.

116,188.—LAWN-MOWER.—Amariah M. Hills, Hockanum, Conn.

Claim.—The combination of the flexible adjustable connection E with the pivoted handle D and frame A of a lawn-mowing machine, substantially as described.

116,189.—MACHINE FOR SHARPENING SAWS.—Rudolph Hines and Louis Beyer, Washington, D. C.

Claim.—1. The combination of the spring T with

the sliding pin *a*, adjustable lever N, and bed B, substantially as and for the purpose described.

2. The link P', oscillating slotted lever arm P, and clamp-screw *d*, applied between the rocking saw supporting bed and the saw-sharpener A, substantially as and for the purpose described.

3. The clamp G', yoke G, carriage *e e*, and bed B, arranged on the frame A, in combination with a self-feeding rotary saw-sharpener substantially in the manner and for the purpose described.

4. The head *e*, carrying a saw-tooth sharpener A, in combination with an adjustable block, *n*, carrying the saw-feeder *k*, substantially as described.

5. A saw-supporting table, which is adjustable in different planes, in combination with a combined rotary saw-feeder and saw-tooth sharpener, substantially as and for the purpose described.

6. The combination of a rotary self-feeder for feeding the saw longitudinally, a rotary sharpener, and a mechanism for feeding the saw laterally and holding it up to the sharpener, substantially in the manner herein described.

116,190.—MACHINE FOR SHARPENING SAWS. Rudolph Hines and Louis Beyer, Washington, D. C.

Claim.—1. The flexible feeder D, made adjustable at both ends, substantially as and for the purpose described.

2. The fixed head B on arbor A, with adjusting-screws *c d*, in combination with the slide C and flexible feeder D, substantially as described.

3. The screw *c*, shouldered and connected to the free end of the feeder D so as to prevent deflection or twisting of said feeder, as described and shown.

116,191, antedated June 7, 1871.—SELF-PROPELLING SLEIGH.—Charles H. Hudson, New York, N. Y.

Claim.—1. The combination, with a sleigh, of the vibrating seat C and pawl *d*, substantially as and for the purpose hereinabove set forth.

2. The combination, with a sleigh, having the vibrating seat C and the pawl *d* applied thereto, of the guiding-runner *g*, substantially as specified.

3. The combination, with a sleigh, having the vibrating seat C and pawl *d* attached thereto, of the pins *l* secured to said pawls, and the slotted guides F secured to the sleigh, substantially as set forth.

116,192.—CORN-SHELLER.—Lester T. Hulbert, Painesville, and Albert P. Teachout, Madison, Ohio.

Claim.—1. The hollow cast-iron cylinder D, when the heads L and bars *c* thereof are of one entire piece and having attached thereto the reversible toothed bars *d*, substantially in the manner and for the purpose set forth.

2. The arrangement of the tube H, having the spiral revolving fan G therein, in relation to the mouth J and cylinder D, as and for the purpose substantially as described.

3. The corn-sheller herein described, consisting of the case in two sections, A and B, jacket or shell K, mouth J, cylinder D, tube H, and revolving spiral fan G, constructed and arranged to operate in the manner as herein described.

116,193.—WHEEL FOR VEHICLES.—Willis M. Hunt, New York, N. Y.

Claim.—A wheel composed of a loose tire, A, an elastic band, C, a wooden filling-piece, B, and side flanges D E, clamped to the wooden filling-piece by screw-bolts, which do not come into contact with the tire, all constructed substantially in the manner herein shown and described.

116,194.—CHURN.—John Jackson, Coopersville, Mich.

Claim.—In churns, the shaft B, rods H, and paddles or dashers I, when constructed and arranged relatively to each other, substantially as and for the purposes herein set forth.

116,195.—BINDER FOR SEWING-MACHINES. Frank Stephen Judd and John G. Powell, Philadelphia, Pa.

Claim.—1. The presser-foot, notched at its forward end for the passage of the needle, the binding-guides with their edges lying close to the edge of the presser, and the adjustable guide for the back of the binding, all arranged in relation to each other, as described, and forming a presser-foot binder.

2. The combination of the flexible lips *e* and *f* having bent ends, and a guiding-tongue or tongues, *h*, extending from the edge of one or both of the lips, as specified.

116,196.—DOOR AND GATE-SPRING.—Philip Kern, Dayton, Ohio.

Claim.—The spring S, when attached at one end to the door or frame, while the other end passes under a bridge, V, which resists torsion, but permits longitudinal movement, substantially as described.

116,197.—SPONGE-HOLDER FOR ELECTRO-MEDICAL APPARATUS.—Jerome Kidder, New York, N. Y.

Claim.—The sponge-holder, composed of an insulating handle, A, central conducting-rod B, and clamping-plates D and E, the whole combined substantially as and for the purpose herein set forth.

116,198. — VIOLIN TAIL-PIECE. — Robert Kirk, Clarksville, Ohio.

Claim.—The violin tail-piece herein described, provided with the notches G', F', and H, arranged as shown, for winding and attaching the E-string, substantially as specified.

116,199. — MEDICAL COMPOUND OR EYE-BALSAM. — William Klingbeil, Champaign City, Ill.

Claim.—The composition for an eye-balsam, herein described.

116,200. — VALVE-OPERATING MECHANISM FOR WATER-METER.—Orrin H. Langdon, Homer, assignor to himself and Charles W. Kinne, Cortland, N. Y.

Claim.—A valve-operating mechanism for water-meters, consisting of a water-case or division, one end or side of which is formed of a flexible or moving diaphragm to receive the direct impact of the water, within which case is placed a suitable device for tripping the valve, the said device being actuated by the pressure of the head of water and the throw of the diaphragm or the piston within the meter, substantially as described.

116,201. — APPARATUS FOR HEATING THE CONVERTERS AND OTHER VESSELS USED IN THE BESSEMER PROCESS OF TREATING IRON.—Carl G. Larson, Stockholm, Sweden.

Claim.—The apparatus called "gas-heater," and described in specification and drawing, which, by means of air as well as gas led from a furnace or from a separate gas-generator, coursing through the same, heats the converters, ladles, and other tools and utensils requisite in the Bessemer process and other metallurgic operations, or in repeated operations retains said apparatus at a high temperature.

116,202.—GATE. — Nathan Long, Muncie, Ind.

Claim.—1. The incline P with slot O and catch C, substantially as and for the purposes herein set forth.

2. The combination of the gate R, inverted cup S, arm Y, and rod E, said rod placed in the slot O on the incline P, and in an eye on the spider J, substantially as and for the purposes herein set forth.

3. In combination with the incline P and catch C, the rod N, pitmen Z Z, and double crank M, all arranged to operate substantially as described.

116,203. — SILK-WINDING APPARATUS. — James Macfarlane, Mansfield, Conn.

Claim.—The arrangement, with the spools A and the yarn-guide-operating bar H, of the guide C, bar E, and lever G, all substantially as specified.

116,204.—APPARATUS FOR SUGAR-COATING PILLS.—Frederick Marriott, Detroit, Mich.

Claim.—1. The peculiar arrangement of the pan A with the pivot C and socket D, curved arm G, and adjustable counter-balance H, as and for the purposes above set forth.

2. The combination of the above-named parts with the slotted arm E supporting the socket D, as and for the purposes substantially as set forth.

3. The combination of the pan A, pivot C, socket D, curved arm G, counter-balance H, slotted arm E, with the adjustable crane I and fire-pot K, substantially as and for the purposes set forth.

116,205.—VELOCIPEDE. — Michael Martin, New York, N. Y.

Claim.—1. The arrangement in a velocipede, with relation to the box E, the crank-axle C, and the pedal-rod *a*, of the loose arm *c*, coiled spring *d*, and straight spring *e*, as herein set forth and shown, for the purpose specified.

2. The tiller D, spring *f*, and king-bolt *k*, in combination with box E, the front axle C', and reach A, as described.

3. The boxes *h* and *i*, in combination with the box E, springs *g*, and crank-shaft C, substantially as set forth.

116,206. — DIE FOR FORGING CARRIAGE-SPRING HEADS.—Joseph H. Mason, New Haven, Conn.

Claim.—The dies for forging carriage-spring heads, constructed as herein described.

116,207.—COAL-SIFTER.—Alonzo D. McMaster, Rochester, N. Y., assignor of one-half his right to John W. Stebbins, same place.

Claim.—The coal-sifting apparatus herein described, constructed with cover A having the cleats B with grooves *c*, together with the sieve D having bumpers *m*, all arranged substantially as specified.

116,208.—SCROLL-SAWING MACHINE.—Andrew W. Mitchell, Detroit, Mich., assignor to himself and Henry W. Yates, same place.

Claim.—1. The arrangement of the frame, composed of the bars M O and posts N, and braces A, with the working-beams P, and the eyes or hooks *o* of the frame A, substantially as and for the purposes set forth.

2. In combination with the working-beams P, jig or scroll-saw Q, and elastic strap R, the elastic strap S, guide W, lever T, and rack U, substantially as and for the purposes set forth.

3. The arrangement of the parts named in the two preceding paragraphs with the frame A, shafts E H, belt G, circular saw I, boring-tool J, and supplementary table D, when the parts are combined to operate substantially as set forth.

116,209. — WASHING-MACHINE. — Matthias K. Morris, Louisville, Ky.

Claim.—1. In a clothes-boiler, in which water is forced or conveyed to or upon the upper side of the clothing being operated upon, a filter for cleansing said water as it leaves said clothing and before it is again returned to the upper side of the same, substantially as and for the purpose specified.

2. The boiler A, provided with the tube B, the fixed and removable diaphragms C and E, respectively, the filtering material D, and the removable cover F, substantially as shown, and for the purpose described.

3. The reservoir G, provided with the perforated false bottom G', and connected with the boiler by means of the pipe H, and the pipe K extending upward from said boiler and provided with the flaring or rose-nozzle L, in combination with each other and with said boiler, substantially as and for the purpose shown.

116,210, antedated June 9, 1871.—PIPE-CUTTER.—Eri Sewell Moulton, Chelsea, Mass.

Claim.—The sliding catch L bifurcated at its end *f*, with the spring N, both arranged within one of the arms K of the yoke B, and operated by a thumb-piece, M, in combination with the bar E and knife F, substantially as described.

116,211.—DYEING AND COLORING FURS.—Adolph Müller, San Francisco, Cal.

Claim.—The process herein recited for dyeing furs, consisting of, first, the employment of the frames; second, the employment of the blue vitriol in conjunction with the prussiate of potash; third, the employment of pyrogallic acid; all in the manner and for the purposes substantially as set forth.

116,212. — TACKLE-HOOK. — Wilson Newcomb, Baltimore, Md.

Claim.—1. A tackle-hook, provided with a hinged arm adapted to connect the point to the shank, for the purpose of forming a continuous loop, both sides of which support the strain applied to the shank, substantially as and for the purpose specified.

2. A tackle-hook, having its hinged arm adapted to engage with the main shank by means of reversed shoulders *m n*, substantially as described, for the purpose specified.

3. In combination with the hinged and shouldered arm B and the shouldered shank A', the spring catch C, substantially as described, for the purpose specified.

116,213.—MANUFACTURE OF ARTICLES FROM PULVERIZED HORN.—William F. Niles and Seth G. Pitts, Leominster, Mass.

Claim.—1. The process, substantially as above described, of manufacturing articles from pulverized or ground horn or hoof.

2. A martingale-ring made from pulverized horn or hoof, substantially as described.

116,214.—DOOR-LOCK.—Tannis A. Olson, Beloit, Wis.

Claim.—1. The combination of the pivoted rods D, sleeves E, arms G, guide J, and stem H, with the hub B, all constructed and arranged to operate the latch-bolt, substantially in the manner herein shown and described.

2. The combination of the dog M, lock-bolt L with slot O, dog N pivoted on pin *o*, and springs P R, all constructed and arranged to be operated by the same key and in a single operation, as described.

116,215, antedated June 10, 1871.—COMPOUND FOR CURLING HAIR.—Emogene L. Parsons, Grand Ledge, Mich.

Claim.—The compound, when made and employed as and for the purposes herein set forth.

116,216. — CLIPPING-SHEARS. — George H. Pratt, Boston, Mass.

Claim.—1. The shallow ribs *e e* and *f f* of plates E and D, substantially as and for the purpose set forth.

2. The arrangement of the adjustable gauge F,

the swinging arms G G, the ledge J, the inclined bearing k, and the stops i i, substantially in manner and for the purposes specified.

116,217.—Combined Wooden and Concrete Pavement.—Shubeal C. Prescott, Jersey City, N. J., assignor to Howard Smith and Dora E. Brown, New York city.

Claim.—A pavement, composed of series of blocks having their intermediate spaces filled with concrete, the concrete being caused to extend downward below the lower line of the blocks into the road-bed for the purpose of forming water-stops, as described.

116,218.—Machine for Forming Spiral Grooves on Metallic Rods.—Treat T. Prosser, Chicago, Ill., assignor to himself, Charles E. Ramus, Lawrence, Kan., and Henry Waller, Chicago, Ill.

Claim.—As an improvement in machines for forming screw-threads or spiral grooves upon long sections of wire or metallic rods, the combination, with the mechanism shown and described for feeding the wire or rod to the machine, of two pairs of grooved rolls, the axis of one pair being arranged perpendicular or nearly perpendicular to those of the other pair, the cavities in the peripheries of such rolls being provided with spiral grooves by which to produce the spiral projections upon the wire, substantially as and for the purpose set forth.

116,219.—Machine for Making Metallic Shoe-Pegs.—Treat T. Prosser, Chicago, Ill., assignor to himself, Charles E. Ramus, Lawrence, Kan., and Henry Waller, Chicago, Ill.

Claim.—1. In a machine for severing shoe-pegs or brads from wire, the combination, with the cutters and the rotating feed-roll, of the grooved friction-roller and lever on which the friction-roller is located, substantially as and for the purpose set forth.

2. In combination with the subject-matter of the first clause of claim, the drum or reel B, substantially as and for the purpose set forth.

3. In combination with the subject-matter of the first clause, the levers F F^1, cam G^2, and springs H H', substantially as and for the purpose set forth.

116,220.—Bench-Hook.—Henry Marshall Putnam, Fitchburg, Mass.

Claim.—The socket B, tubular shank D provided with hook E, and screws F I, combined and arranged to operate substantially as and for the purposes described.

116,221.—Means for Transmitting Motive Power.—James Richmond, Lockport, N. Y.

Claim.—The arrangement, with a series of workshops, C C^1 C^2, &c., of the wire cable G, main driving-pulley B, driving-pulleys D D^1 D^2, &c., auxiliary pulleys F F, and guide-pulleys H H for transmitting power from the prime mover to the various workshops, substantially as hereinbefore set forth.

116,222.—Spectacle-Frame.—Martin Reisley, Springfield, Mass., assignor to Samuel D. Burbank, same place.

Claim.—1. A spectacle-frame, having the temples A and transverse trunnions B formed of drawn wire and secured together in the manner described, and with the said trunnions working in bearings cut through the ears or lugs C, substantially as shown and for the purpose set forth.

2. The temples of spectacles, having the trunnions or pivots B attached thereto and arranged to turn in the eyes or bearings in the parts C, substantially as specified.

116,223. — Station-Indicator. — Amos Charles Rodgers, Suffield, Conn., assignor to himself and James A. Hamilton, same place.

Claim.—The combination of the wheel H, its pins and notches, the frame or bar L sliding as described, the spring-bolt g and its pin g', and the pawls e e', retaining-hooks f, and arm h, the whole being arranged and operating together as and for the purpose specified.

116,224.—Lamp-Supporter.—Edwin Russell and Francis W. Platt, Waterbury Conn.

Claim.—1. A series of tubes closing within each other on the telescopic plan, when said tubes have their upper ends slotted and spread so as to impinge against the inside of the next larger tube, the force being maintained substantially by the means and for the purposes herein set forth.

2. In combination with a series of tubes, constructed and arranged as herein described, the collars b b screwed on the lower ends of the tubes to hold the next smaller one in its place, substantially as set forth.

3. The combination of the sliding tubes A^1 A^2 A^3 with slotted end, adjusting-screws a a, and pin D, substantially as and for the purposes herein set forth.

4. The combination of the tubes A A^1 A^2 A^3, screw-cap B, screw C, pin D, screws a a, collars b b, arms G G, and holders H H, all constructed and arranged substantially as shown and described, and for the purposes herein set forth.

116,225. — Breech-Loading Fire-Arm.—George W. Schofield, United States Army.

Claim.—1. The hook or latch A, having the legs b b' working in the slots E, and pivoted in rear of the vertical plane midway of the convex shoulder I on the tail of the barrel V, and provided with the concave locking-notch m, arch d, notch x, and spring H, as and for the uses shown and described.

2. The combination of the hammer with the latch or hook A when the front face of the hammer impinges upon the arch in the latch, thereby fixing the latch immovably in its locked position, and preventing the opening or closing of the piece when the hammer is down, substantially as shown and described.

3. The combination and relative arrangement of the latch or hook A, tail of barrel V, and hammer, whereby the possibility of the discharge of the piece by the hammer is prevented until the barrel is securely locked and held down; also preventing premature discharge by the closing of the piece when loaded, as shown and described.

4. The combination of the lug L and tail V of barrel, provided with the mortise Z, and shoulders t fitting into corresponding recesses o in the recoil-shield, whereby the barrel is held against lateral and longitudinal strains, as shown and set forth.

5. The combination of a latch or hook, A, hammer, lug L, and tail V of barrel, provided with the mortise Z, whereby the piece is locked, as shown and described.

6. The sight and cylinder-stay M, constructed of one piece, and operating as shown and described.

7. The ejector-spring stop, as shown and described.

116,226. — Spittoon-Tongs.—Abraham H. Seipt, Philadelphia, Pa.

Claim.—The broad flat hooks a a', in combination with the spring tongs, substantially as described, and for the purposes specified.

116,227, antedated June 8, 1871.—Fire-Proof Safe.—William Hamelton Short, Montreal, Canada.

Claim.—The rod A, in combination with the arm f and stuffing-box N', as described, for the purpose set forth.

116,228.—Method of Fastening Pulley and Wheel-Hubs to Shafts.—Edward G. Shortt, Carthage, N. Y., assignor to himself, Levi Wood, Minor Guyot, George Gilbert, and A. Irving Stemberg, same place.

Claim.—The hub a combined with the wedges c, slotted key d, pins f g, and recesses e, as specified.

116,229. — Grain-Separator. — Martin Shreiner, Carlisle, Pa.

Claim.—1. The concave fan-case extension D, wind-regulating board E, and wings G G, when said parts are constructed and arranged substantially as herein set forth.

2. The side slides H, provided with wings I, substantially as and for the purposes herein set forth.

3. The construction and arrangement of the shoe L with the grooves 1, 2, 3, 4, 5, 6, and 12, openings 7 8 10, blocks 9 11, door n, and spouts O, O^1, O^2, and y, all substantially as shown and described, and for the purposes set forth.

4. The screen T, having a coarse sieve on its upper face and a fine sieve on its inner surface, the latter provided with a metal plate, and curved upward in the center, and so constructed as to allow an end discharge and two side discharges, substantially as and for the purposes herein set forth.

5. In combination with the shoe L, provided with the grooves, openings, and spouts as herein described, the rakes d h, sieves T V, and interchangeable screens, as and for the purposes set forth.

116,230.—Carrier for Unloading Hay.—George Smith, New York, assignor to John C. De Lany, Detroit, Mich.

Claim.—1. The combination of the pulley grooved as at e e', the chain N on the hoisting-rope R, the pawl notched at g', carrier-frame B, and stationary inclined tripping-catch F, all constructed and arranged to operate substantially in the manner herein described.

2. The combination of the tube K, the shoulder l of the hook H, chain N, pivoted dog E i, and catch F, substantially as and for the purpose described.

3. The carrier-frame B B, contracted laterally beneath the track A, braced and otherwise constructed, substantially as described.

116,231. — Sling for Hay-Elevator.—George Smith, Rochester, N. Y., assignor to John C. De Lany, Detroit, Mich.

Claim.—1. A sectional hay-sling, which is composed of parallel ropes and cross-bars, in combination with loops or rings which are applied to the cross-bars a a so as to swivel thereon, substantially as described.

2. The locking and unlocking device, consisting of a headed male portion, B, combined with spring pivoted jaws P P', embracing ends n' n' and a tripping cam-lever l, constructed substantially as described.

116,232.—Lifting-Jack.—James U. Smith, Orion, assignor to himself and Joseph Maseth, Wyandotte, Mich.

Claim.—The arrangement of the standard A, rack C, dog C', arms D, and lever-pawl E, when each part is constructed as described and shown, and connected to operate substantially as set forth.

116,233.—Stove-Pipe Shelf.—Milo Smith, Clinton, Mich.

Claim.—The extension E, constructed and arranged as shown, in combination with the disk A having a dependent rim, as described, slot B, studs D, and section C having lateral projections D^1 D^2, as and for the purpose set forth.

116,234.—Street-Lamp.—Roland H. Smith, Pittsburg, Pa.

Claim.—1. The arms f f, hinged between ears d d on the frame D, and locked by means of the pins e e, substantially as and for the purposes herein set forth.

2. The combination of the sections E E', provided with flanges a a', L-shaped frame D, with ears d d, arms f f, and pins e e, supporting-arms C C, and collar B, all substantially as and for the purposes herein set forth.

116,235.—Machine for Molding, Pressing, and Cutting Sugar.—Peter Spreckels and James Peterson, San Francisco, Cal., assignors to Claus Spreckels and Peter Spreckels, same place.

Claim.—The employment, in a machine designed for transforming loose granulated sugar into lumps, of, first, the belt, and also the curbs F in combination with it; second, the feed-knives; third the press-head, consisting of or carrying the three several things, to wit, the press, die, and the two sets of cutters; fourth, the entire structure as a new machine, each and all jointly and severally constructed in the manner and for the purpose substantially as set forth; fifth, the process of forming and drying the sugar by one continuous operation, substantially as set forth.

116,236.—Propulsion of Vessels.—John S. Stites, Baltimore, Md., assignor to himself and Abraham S. Stonebraker, same place.

Claim.—Inclined cylinders, provided with the reciprocating pistons, arranged in the central portion of a vessel and passing through the bottom of the same, as herein shown and described, for the purposes specified.

116,237.—Bed-Bottom.—Moses B. Towslee, Pewamo, Mich.

Claim.—The combination, with a bedstead, of the blocks B B, rubber bands C C, and slats D D, with or without the cross-bar E, all constructed and arranged substantially as and for the purposes herein set forth.

116,238.—Car-Coupling.—Harvey Trefry, Winfield, Mich.

Claim.—The combination of the spring G, lug H, and slide I with the draw-bar A, link C, pin D, buffer E, and spring F, when each part is constructed and arranged to operate substantially as and for the purposes set forth.

116,239.—Whiffletree-Iron.—William Wallace Urquhart, Bay City, Mich.

Claim.—The arrangement, within the walls C and D of the socket A, of the stud E, latch F, and spring G, constructed and operating substantially as described and shown, for the purposes set forth.

116,240.—Stove-Leg.—William H. Van Cleve, Ypsilanti, Mich.

Claim.—The wire D, in connection with the groove b in the plate a of the stove-leg, substantially as described, for the purpose specified.

116,241.—Call-Bell.—Charles Volger, Wilmington, Del.

Claim.—1. A coiled-spring shank for a bell-clapper, substantially as described.

2. The four-armed clapper and its flexible rod, in combination with the bell, as and for the purpose specified.

116,242.—Pen.—Michael Wagner, Cincinnati, Ohio.

Claim.—A fountain-pen, constructed with taper elastic jaws or nibs, b b b, and exterior sliding ring

or band C, substantially as and for the purpose specified.

116,243. — METAL-PLANER. — William H. Warren, Worcester, Mass.

Claim.—The wheel J, shaft I', pinions i', and racks i'' M, in combination with the rock-shaft E, applied to a planing-machine for the purpose of increasing the travel of the work-table, substantially as and for the purpose set forth.

116,244.—TAP FOR LIQUID PACKAGES.—Albin Warth, Stapleton, N. Y.

Claim.—The tap for liquid packages, constructed, as described, of the valve B formed on the head of the wood screw *c*, and the sheet-metal disk A, provided with spout C, and the bridge *d* forming the nut for the valve-moving screw, all as herein set forth.

116,245.—TAP FOR LIQUID PACKAGES.—Albin Warth, Stapleton, N. Y.

Claim.—The tap for liquid packages, consisting of the perforated screw-shank B, forming both the discharge-valve and vent, the sheet-metal disk A, and the soft-metal nut *e* formed on the disk A to receive the tube B, all as herein set forth and shown, for the purpose specified.

116,246.—MOLD FOR CASTING CAR-WHEELS. Nathan Washburn, Worcester, Mass.

Claim.—The improved mold as made, with the cavity for the holding of the re-enforce, the matrix for the casting of the body, and with the series of sprue-holes, radial ducts, and central receiver, arranged substantially as described.

116,247, antedated June 15, 1871.—FLOOD-GATE.—Henry O. Way, Thorntown, Ind.

Claim.—A flood-gate wherein the posts A, gates B, pintles C, springs D, and fenders E are constructed, arranged, and operating substantially as and for the purposes set forth.

116,248.—GOVERNOR FOR STEAM-ENGINES. Horatio B. Weaver, Hartford, Conn.

Claim.—1. The shaft *b*, made to revolve synchronously with the pulley *c*, but free to move with reference thereto in the direction of its length, and engaging with the conical pulley *d* by means of a male and female screw, substantially as described, for the purposes set forth.

2. The combination of the pulley *c*, pulley *d*, shaft *b*, gear *h*, gear *i*, shaft *j*, with the common ball-governor attached thereto, arm *m*, shaft *n*, arm *o*, and shipper *e*, the whole constructed, arranged, and operated substantially as and for the purposes set forth.

116,249.—STAIR-ROD.—Joseph Wilks, Trenton, N. J.

Claim.—The clasp B, slide C, having the slots D and H H H H and the grooves E E, when arranged, constructed, and combined, substantially as herein shown and described, for the purpose set forth.

116,250.—SPRING BED-BOTTOM.—Edwin L. Wright, Sterling, Ill.

Claim.—The combination of the cross-bars or rests B B, springs C C, slats D D, clips *d d*, and springs *e e*, all constructed and arranged substantially as and for the purposes herein set forth.

116,251.—LOOM PICKER-MOTION.—John C. Fisher, Providence, R. I., assignor to himself and Robert F. Walsh.

Claim.—1. The combination of the combined strap-lever and convex rocker-plate C with the picker-staff and the concave bed-plate, substantially as described.

2. The combination of the combined strap-lever and convex rocker-plate C, the picker-staff rigidly connected thereto, and a vertical slide, substantially as described, for the purposes specified.

3. The strap-lever C, bed-plate, picker-staff, and vertical slide, all combined substantially as described.

REISSUES.

4,427.—SKIRT-SUPPORTING CORSET.—Catherine Allsop Griswold, Willimantic, Conn. Patent No. 56,210, dated July 10, 1866.

Claim.—1. A corset open before and behind and adjustable in the back, provided with shoulder-straps attached directly to the metallic back-supports extending from the top to the bottom of the back edges, substantially as and for the purposes herein described.

2. A bodice made upon a metallic form, opening before and behind, adjustable in the rear, and having shoulder-straps and fastenings for the support of the skirts, substantially as shown and described.

4,428.—COOKING-STOVE.—Levi Hermance, Lansingburg, N. Y.—Patent No. 99,436, dated February 1, 1870.

Claim.—1. In combination with a cooking-stove, a dead-air chamber, formed by an extension of the stove and the water-reservoir, for the purpose of heating the water in the same, substantially as herein set forth.

2. The dead-air chamber D, formed on the outside of a cooking-stove, as described, for the purpose of heating the water in a water-reservoir, substantially as herein set forth.

3. The combination of a stove with the reservoir C and dead-air chamber D, substantially as and for the purposes herein set forth.

4. A reservoir or water-tank attached to a cooking-stove, when said reservoir or tank is placed upon or within a chamber or hot-air space formed outside of the walls of a stove, substantially as herein set forth.

5. Attaching or securing the reservoir C to the rear of a cooking-stove by means of lugs, flanges, or projections *a a* fitting into corresponding notches or recesses *b b* cast in the back part of the top plate of the stove, substantially as herein set forth.

4,429. — FEEDING PAPER TO PRINTING-PRESSES.—Richard M. Hoe, New York, N. Y., for himself, and assignor to Robert Hoe, Peter S. Hoe, Stephen D. Tucker, William L. Colby, and Robert Hoe, Jr.—Patent No. 25,199, dated August 23, 1859.

Claim.—1. The combination of the feeding mechanism, cutting apparatus, and the printing-machine, or their equivalents in the said combination, for feeding the paper from a roll to a printing-machine, and cutting or partially cutting it into sheets as it passes along to be printed, substantially as set forth and specified.

2. Constructing the cutter so as to leave the several sheets united in certain places, substantially as described, in combination with the conducting-tapes, or the equivalents thereof, as described, so that the conducting-tapes may pass around the cylinder, substantially as described and set forth.

3. The combination of the cutting-cylinder and the grooved cylinder, or the equivalents thereof, of the two pressure-rollers, or their equivalents, for keeping the sheet distended, substantially as described and specified.

4,430.—MACHINE FOR SEPARATING ORES.—Stephen R. Krom, New York, N. Y.—Patent No. 81,794, dated September 1, 1868; antedated August 5, 1868; reissue No. 3,182, dated November 3, 1868.

Claim.—1. Introducing the material upon the bed I in a thin stratum close to the surface of the bed, substantially in the manner and for the purposes herein set forth.

2. Traversing the material across the perforated bed I transversely to the length of the machine—that is to say, extending the bed I longitudinally of the length of the frame-work A, and causing the material to traverse across its narrowest dimensions, substantially as and for the purpose herein set forth.

3. In combination with a perforated separating-bed and a device for producing intermittent puffs to effect the separation of the granular substance on the bed, a rotating or traveling delivery device, arranged to regulate the discharge from the passage which carries off the heavier grades or particles passed below the separating-bed, substantially as specified.

4. The positive discharging means L Y' or their equivalents, controlling the discharge of the heavy material from a separating-bed by a positive motion, as specified.

5. The roller L, arranged and operating as represented relatively to the discharge-passage J, for the purposes herein set forth.

6. So gearing the mechanism or device which induces the intermittent puffs, and the device which regulates the discharge of the heavier material, that said devices are made to work at certain determined velocities to each other during all variations in the general speed of the machine, essentially as and for the purpose herein set forth.

7. In combination, the ore-bed I with its feeding and discharging devices, the adjustable oscillating bellows D, the trip-wheel C and its connections, and suitable means for varying the rate of discharge through the passage J, all arranged for joint operation, substantially as and for the purposes herein set forth.

8. In combination with the perforated bed I, and with means for introducing and removing the material, as specified, the bellows D, mounted on a rocking shaft, S, and operated by an adjustable vibrating motion, substantially as and for the purposes herein specified.

9. The trip-wheel C, arranged and operating relatively to the bellows D and to the perforated bed I, and its connections, as and for the purposes herein set forth.

10. The spring E, arranged and operating relatively to the intermittent puffing means D and the bed I and the hopper M, so as to puff the air suddenly through the bed with the same velocity at all speeds of the machine, as herein set forth.

11. The lever F and roller or striking-pin G, arranged, as shown, on the shaft S, distinct from the bellows D, so as to allow the action of the trip-wheel C, or its equivalent, to cause a positive motion of the bellows D in one direction and allow the automatic action of the spring E to carry it suddenly in an opposite direction, as specified.

12. The adjustable gates N and K, or either of them, so arranged as to allow the separate changes in the thickness of the stratums on the ore-bed I and the rate of delivery from the hopper M, substantially as and for the purposes herein set forth.

13. The within-described arrangement of the operating parts C F and their connections at the end of the frame-work A, so that they may operate by a direct connection through the rocking-shaft S with the bellows D, and that the closed end of the frame shall form one entire side of an inclosing-case to protect the working mechanism, all as and for the purposes herein set forth.

14. The flexible strap O and graduating fastening O', arranged, as shown, relatively to each other and to the lever F and roller G, or their equivalents, so as to regulate the extent of the motion of the bellows and to arrest its motion noiselessly, as specified.

4,431.—MACHINE FOR MAKING WIRE FERRULES. — Henry O. Lothrop, Milford, Mass., assignor of one-half interest to Albert H. Gilman.—Patent No. 95,918, dated October 19, 1869.

Claim.—1. The process of dipping or passing wire through molten solder, in the manufacture of wire ferrules, in order that the wire shall take up some of the solder, and then winding the wire on a mandrel, so as to coil and solder the same at one operation, as herein set forth.

2. The combination, in machines for making wire ferrules, of a rotating coiling mandrel, a movable collar, or equivalent device, having a projection on its face, substantially as described, and mechanism to impart to the said collar at every revolution of the mandrel a quick percussive movement against the coil, in order that the said projection may thereby create a short lateral bend in each successive coil and at the same time force, to a slight extent, the coil thus made toward and off the mandrel, substantially as set forth.

3. In coiling-mandrels, the combination of the tapering form, grooves *f f*, and groove *e*, all arranged and operating as set forth.

4. The combination of the beater *a* with the mandrel I, as herein set forth.

5. The mechanism by which the arbor and knife are operated, at the time and in the manner set forth.

6. The combination of devices, as herein set forth, for making soldered wire ferrule, as described.

4,432. — BEDSTEAD-FASTENING. — Ann M. Rodefer, Hamilton county, administratrix of Joseph Rodefer, deceased; assignor to James L. Haven & Co., Cincinnati, Ohio.—Patent No. 12,693, dated April 10, 1855; extended seven years.

Claim.—A bedstead-fastener, adapted to be held in place by being let into an annular groove on the side of the rail or post, substantially as described.

4,433.—SPARK-ARRESTER.—Edward Waud, for himself, and Benjamin F. Dorris, assignee of Edward Waud, Eugene City, Oreg.—Patent No. 99,378, dated February 1, 1870.

Claim.—1. The combination of the wheel I, revolved by the ascending gases, with the worm G, arranged substantially as shown and described, and for the purpose specified.

2. The combination of the horizontal tube F provided with a rotary worm, G, discharge-pipe E, inclined plate D provided with a flange, *a*, and inverted cam C, when operated together, as described.

4,434.—MANUFACTURE OF IRON AND STEEL. Richard Yeilding, Detroit, Mich., assignor to Frank W. Isham and Elizabeth Yeilding.—Patent No. 83,119, dated October 13, 1868.

Claim.—1. The process herein described of fusing and refining metal and decarbonizing iron.

2. The process herein described for converting iron into carbonized steel.

3. The converting of iron into unannealable steel, by the use of the foregoing articles, in the manner and for the purposes herein set forth, and the general combination of the principles and the use of the articles, combined and separately, and the use of the oil alone, in the manner and for the purposes set forth in the foregoing specifications.

4. The manufacture of unannealable-steel tools direct from the molten metal, treated with oxide of copper, oxide of zinc, and corrosive sublimate, substantially in the manner herein described, by casting the same in special metal molds for the special tools required, all substantially as described.

4,435.—LAMP-BURNER.—William H. Gray, St. Louis, Mo., assignor of part interest to Samuel Ross.—Patent No. 113,876, dated April 18, 1871.

Claim.—In combination with the wick-tube A, which is extended below the cap A' so as to reach down into the fluid in the lamp-bowl, the dome C,

when constructed with an elongated neck, C', to form an air-passage around and to or nearly to the top of the wick-tube, substantially as and for the purpose set forth.

DESIGNS.

5,007.—COFFIN.—William G. Algeo, Rochester, Pa.

Claim.—1. A curve-ended top frame *c*, substantially as described.

2. A curve-ended cover *d*, substantially as described and shown.

3. A raised coffin-top having square ends, and on each side three faces, substantially as described and shown.

5,008.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,009.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,010.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,011.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,012.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,013—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,014.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,015.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,016.—CARPET.—Robert R. Campbell, Lowell, Mass., assignor to Lowell Manufacturing Company, same place.

Claim.—The configuration of the design hereunto annexed when made by being inwrought into two or three-ply, ingrain, or other carpeting in the form similar to the photographic prints accompanying this specification.

5,017.—PIPE-WRENCH.—Thomas K. Cook, New York, N. Y., assignor to himself and Edward H. Hotchkiss, same place.

Claim.—The design for a wrench, as herein shown and described.

5,018.—CARPET.—Albert Cowell, Kidderminster, England, assignor to James Humphries & Sons, same place.

Claim.—The design for carpets, as shown.

5,019.—CARPET.—Albert Cowell, Kidderminster, England, assignor to James Humphries & Sons, same place.

Claim.—The design for carpets, as shown

5,020.—CARPET.—Albert Cowell, Kidderminster, England, assignor to James Humphries & Sons, same place.

Claim.—The design for carpets, as shown.

5,021.—CARPET.—Albert Cowell, Kidderminster, England, assignor to James Humphries & Sons, same place.

Claim.—The design for carpets, as shown.

5,022.—WOOD-INCASED CAN.—J. G. Evenden, Chicago, Ill.

Claim.—The design for a wood-incased can, herein shown.

5,023.—WOOD-INCASED CAN.—J. G. Evenden, Chicago, Ill.

Claim.—The design for a wood-incased can, herein shown.

5,024.—FOUNTAIN.—Joseph W. Fiske, New York, N. Y.

Claim.—The design for a drinking-fountain, as shown.

5,025.—FOUNTAIN.—Joseph W. Fiske, New York, N. Y.

Claim.—The design for a drinking-fountain, as shown.

5,026.—STEAM-PUMP.—William W. Hancom, San Francisco, Cal.

Claim.—The design for a steam-pump, herein set forth.

5,027.—DISPLAY-CARD.—Stillman Houghton, Worcester, Mass.

Claim.—The design for stocking-supporter cards, substantially as above described, and shown in the accompanying drawing.

5,028.—GRATE-HEARTH.—John G. Ils, San Francisco, Cal.

Claim.—The design for a grate-hearth, as shown.

5,029.—CARPET-PATTERN.—James C. Johnston, New York, N. Y.

Claim.—The design for a carpet, as shown.

5,030.—CAKE-PAN.—George W. Ketcham, New York, N. Y., assignor to E. Ketcham & Co., same place.

Claim.—The design for a cake-pan, as shown.

5,031.—WATER-COOLER AND REFRIGERATOR.—John Liming, Philadelphia, Pa., assignor to himself and Charles C. Savery, same place.

Claim.—The design for a portable water-cooler and refrigerative-vessel combined, substantially as described.

5,032.—CARPET.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, Clinton, Mass.

Claim.—1. The design of the foliage border B, as shown.

2. The design for a carpet, as shown.

5,033.—CARPET.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, Clinton, Mass.

Claim.—The design for a carpet, as shown.

5,034.—CARPET.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, Clinton, Mass.

Claim.—The design for a carpet, as shown.

5,035.—CARPET.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, Clinton, Mass.

Claim.—The design for a carpet, as shown.

5,036.—CARD-SUSPENSION CLIP.—George W. McGill, New York, N. Y.

Claim.—The design for a card suspender, as herein shown and described.

5,037.—CARPET.—Elemir J. Ney, Dracut, Mass., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,038.—CARPET.—Thomas Pennell, Melrose, N. Y., assignor to Bigelow Carpet Company, Clinton, Mass.

Claim.—The design for a carpet, as shown.

5,039.—TWINE-REEL.—Cornelius H. Tiebout, New York, N. Y.

Claim.—1. The design for the bed-plate of a twine-reel, as shown and described.

2. The design for the side frame B, as shown and described.

3. The design for the side frame B' with its cap D, as shown and described.

5,040.—CARPET.—Lyman A. Upson, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

TRADE-MARKS.

EXTENSIONS.

JAMES D. SARVEN, of New Haven, Conn. Letters Patent No. 17,520, dated June 9, 1857; reissue No. 3,079, dated August 11, 1868; reissue No. 4,116, dated September 6, 1870.

"Improvement in Carriage-Wheel."

Claim.—A carriage-wheel constructed with the spokes combined with the wooden hub, by tenons entering mortises in said hub, and with each other, in such manner that a solid belt is formed around the said hub, substantially as before set forth.

Also, a carriage-wheel constructed with a mortised wooden hub, with tenoned spokes, and with flanges which embrace the faces of the spokes in the immediate vicinity of the hub, and are connected together so as to form a metallic band, through which the spokes extend into the mortises in the wooden hub, substantially as before set forth.

Also, a carriage-wheel constructed with a mortised wooden hub, with tenoned spokes combined with each other, so that a solid belt is formed around the hub, and with metallic flanges which embrace the faces of the spokes in the immediate vicinity of the hub, and are connected together so as to form a metallic band, through which the spokes extend into the mortises in the wooden hub, substantially as before set forth.

JAMES A. BURDEN AND I. TOWNSEND BURDEN, of Troy, N. Y., executors of Henry Burden, deceased.—Letters Patent No. 17,665, dated June 30, 1857; reissue No. 1,998, dated June 13, 1865.

"Improvement in Machines for making Horse-shoes."

Claim.—1. The above-described feeding apparatus, and in connection therewith the mode set forth of cutting off the rod, and the combination of the same with the devices for bending and swaging the shoe, by which combination the rod is cut into suitable lengths and fed into the machine automatically, and also the self-acting device for stopping the feeders and the mode of renewing their action at the proper time.

2. In machines for making horse and mule-shoes with rolling swaging-dies, the placing the blank in advance of the central elevated part of the die so as to make a space sufficient for the iron to be spread backward toward such central elevated part of the die in the act of swaging, substantially as described.

3. A flange on the upper die, when said die and flange are used independently of any mechanism for creasing and punching the shoe, such flange being formed by casting it with and as part of the die, substantially as described.

4. The combination of a revolving creasing-and-punching die with the revolving swaging-dies, by which both operations are successively and automatically performed.

5. The device set forth for taking the shoe from the upper and confining it to the lower dies, and finally taking it from the lower dies and conducting it to the flattener.

6. The means described for flattening the shoe, and their combination with rolling swaging-dies, by which the flattening of the shoe is automatically performed.

7. The combination and arrangement of machinery by which the several processes above described are performed successively by one machine, and without aid from attendants.

8. Those devices, or their equivalents, which shall effect the same purpose in substantially the same way.

ISSUE OF JUNE 27.

PATENTS.

116,252.—GUN-LOCK.—Joshua Albright, Pleasant View, Mo.

Claim.—The hair-trigger mechanism G I K H J, the dog E, springs F and C, bridle D, and hammer B, arranged, in connection with the lock-plate A, to operate as shown and described.

116,253.—APPARATUS FOR DIVIDING POWDERS.—George P. Allen, Woodbury, Conn.

Claim.—A powder-dividing apparatus, consisting of a plate or table provided with holes or pockets, and each hole provided with an adjustable bottom, all arranged to vary the depth of the pockets simultaneously and uniformly, all substantially as specified.

116,254.—HORSE HAY-RAKE.—Francis Andrews, Galesburg, Ill.

Claim.—The combination and arrangement of the levers N and R, pawl P, and cord *r*, and bars L L L′ with frame A, slotted bars I I, swinging bars E E, and carrying-bars J J, substantially as described, and for the purpose set forth.

116,255.—STEAM-BOILER.—Josiah F. Antisdell, George W. Cronk, and John H. Haviland, Janesville, Wis.

Claim.—Boiler V, pipes C and D, and circulating-pipe F, all in combination, substantially as and for the purpose described.

116,256.—CLAPBOARD-GAUGE.—William E. Babcock, East Pembroke, N. Y.

Claim.—The combination of the bar A and the slide B, substantially as and for the purpose hereinbefore set forth.

116,257.—BLIND-FASTENER.—Asahel G. Batchelder, Lowell, Mass.

Claim.—The improved blind-fastener, consisting of the auxiliary series *e* of teeth, or the equivalent thereof, the lever-latch, its operative spring, the toothed segment, and the bracket, all being combined and to operate as set forth.

116,258.—MACHINE FOR CUTTING SEGMENT-PATTERNS.—John Bean, Jr., Pent Water, Mich., assignor to himself, William H. Williams, and Bennett Goodsell, same place.

Claim.—1. Bed-piece A, arms C and H, with knives D, E, and I, arranged and operated substantially as described.

2. Bed-piece A, with hollow punches L, arranged substantially as described.

116,259.—SECTIONAL BOILER.—Benjamin F. Bee, Harwich, Mass.

Claim.—1. The grouped tubular boiler-section, consisting of upright tubes arranged side by side crosswise with the fire-box, united by transverse passages, the said section being fitted with nozzles for the passage of steam and water, and adapted to form a transverse rib of the roof of the fire-box, substantially as before set forth.

2. The combination of the said tubular boiler-section with tubular flues extending through the upright tubes, substantially as hereinbefore set forth.

3. The combination of a series of grouped tubular boiler-sections in couples, each couple arranged crosswise with the fire-box, and connected with the adjacent couple, the said couples constituting transverse ribs of the roof of the fire-box, substantially as before set forth.

4. The said grouped tubular boiler-section, constructed with a nozzle having flanges at its sides, which flanges are fitted to abut and form a wall to prevent the passage of flame, substantially as before set forth.

5. The combination of the series of grouped boiler-sections with the connecting-pipes by means of lugs and screw-clamps, substantially as before set forth.

6. The combination of the boiler, composed of said grouped tubular sections arranged in couples crosswise with the fire-box, with a casing constructed of removable sections, substantially as before set forth.

116,260.—PROCESS FOR BOLTING FLOUR.—Lemuel G. Binkly, Baughman, Ohio.

Claim.—The improved process in flour-bolting herein described, which consists in drawing off the thoroughly-clean flour from the first bolt, passing the residue into the second bolt, again drawing off the clean flour therefrom, and conveying it into the first bolt and the residue of the tail of the second bolt, again into the head of the said second bolt, and so on, with a series of any number of bolts, as herein shown and described.

116,261.—DEVICE FOR WORMING AND SERVING RIGGING.—Isaiah W. Bowden and Joseph D. Leach, Penobscot, Me.

Claim.—1. A device for worming rope, consisting of a channeled head, D, attached to a handle, A, and having adjustable guides *f f′*, straps *e e′*, and reels *a a′*, or their equivalents, substantially as herein set forth.

2. The truck *f*, attached, as specified, to the end of a serving-mallet, and having a lateral adjustment by means of the thumb-screws *m m*, or other equivalents, as specified.

116,262.—HAND CORN-SHELLER.—Ole Anderson Bryhn and William Theodor Farre, Montreal, Canada; said Farre assigns his right to said Bryhn.

Claim.—The improved hand corn-sheller herein described, consisting of the straight handles A B, pivoted together at one of their ends, as at *c*, and formed at their other or free ends with the curved jaws C, armed with shelling-teeth E, centrally inclined, as shown, with or without the intermediate spring D, as and for the purpose substantially as specified and set forth.

116,263.—FEEDING DEVICE FOR WOOD-SCREW MACHINES.—Ansel Buckminster, Boston, Mass., assignor to Daniel M. Robertson, same place.

Claim.—1. The combination of the sliding carrier G, having the recess *r*, groove *z*, and spring *s*, with the clamping-plate *e* and mechanism to operate said devices, in the manner substantially as described.

2. In combination with the subject-matter of the preceding claim, the plate N for pushing forward the screw-blank into the recess *r*, as specified.

3. The combination, with a sliding carrier of a screw-machine, of the clamp *e*, springs *e f*, stub *b*, and dog *d*, constructed, arranged, and operating as and for the purpose stated.

116,264.—TUYERE.—John Cappon, Rochester, N. Y.

Claim.—The lateral extension of the air-chamber, and the semi-spherical socket at the extremity thereof, combined with the semi-spherical socket in the hearth-plate and the semi-spherical protuberance on the lever, substantially as and for the purpose set forth.

116,265.—BLOWER.—Enoch Carleton, Cape Elizabeth, Me.

Claim.—The arrangement, herein shown, of the circular walls C D E, fans G, partitions H, shaft A, and casing I with mouth K, as herein described, for the purposes set forth.

116,266.—MODE OF TEMPERING SPRINGS.—Alanson Cary, New York, N. Y.

Claim.—The method of tempering furniture or other coiled springs, substantially as hereinbefore described.

116,267.—TEMPERING-OVENS.—Alanson Cary, New York, N. Y.

Claim.—In combination with the shaft or drum D and arms E, the detaching-rods G, arranged to operate substantially as specified.

116,268.—CURRY-COMB.—Jules Chaumont, Woodhaven, N. Y., assignor to Lalance & Grosjean Manufacturing Company, New York city.

Claim.—The combination of the strips of metal toothed at an edge only, the cross-bars, and the rivets passing through single strips and the cross-bars, substantially as before set forth.

116,269.—SAW-FRAME.—William Clemson, Middletown, N. Y.

Claim.—1. The saw-frame above described, composed of end pieces A and A′, stretcher B, strain-rod C, and sliding block D, arranged to operate in the manner and for the purposes described.

2. The sliding strain-block D, with the hole *a*, through which strain-rod C passes, at different distances from the plane of the different sides of said block, substantially as shown and described.

116,270.—BOLT-MACHINE.—Daniel S. Coe, Pine Meadow, Conn., assignor to himself, R. E. Holmes, and Philip E. Chapin, same place.

Claim.—The combination of the dies *a*, heading-die *c*, pouch *c*, and mechanism to cause said punch *c* to supplement the action of the heading-die *c*, for squaring the shank of the bolt, substantially as specified.

116,271.—EXTENSION CHAIR.—Nicholas Collignon, Claudius O. Collignon, and Adam Collignon, Closter, N. J.

Claim.—The seat A and rear legs C C rigidly connected together, the chair-back and front legs B B, the jointed arms D D pivoted to back and seat, the cross-supports F F, foot-piece I, and supporting-legs H H pivoted together, and the connecting cross-bar K, all constructed, arranged, and applied together, as and for the purpose specified.

116,272.—LOCOMOTIVE HEAD-LIGHT.—Andrew Collins and John Hardy, Galesburg, Ill.; said Hardy assignor of his right to said Collins.

Claim.—The glass B and rubber C when arranged to operate with the flange A and cap D, substantially in the manner described and for the purpose specified.

116,273.—AUTOMATIC APPARATUS FOR OPENING AND CLOSING VALVES BY THE EFFECTS OF TEMPERATURE.—Andrew Ainslie Common, South Bank, Regent's Park, London, England.

Claim.—The chamber A, with slightly-domed part B, in combination with the connecting-rod D, or its equivalent, substantially as and for the purpose hereinbefore set forth.

116,274. — PRESERVING AND SEASONING WOOD.—Silas Constant, Peekskill, and John Smith, Brooklyn, N. Y.

Claim.—1. The movable gate U, in combination with the radiators T T T, the hot-air chamber W, and wood-chambers E E, arranged as and for the purpose specified.

2. The combination of the diffuser S with the radiators T T T, arranged and operating as described.

3. The combination of the radiating-pipes, of the form described, with the other elements of the apparatus, substantially as and for the purpose specified.

116,275.—MECHANICAL FIRING. — Samuel Danks, Cincinnati, Ohio.

Claim.—The hopper H, located at the side of the grate, and having the auger A in the bottom thereof, by which the fuel is fed directly to the grate without the aid of a blast or other auxiliary, substantially as described.

116,276. — PENCIL-SHARPENER. — Samuel Darling, Providence, R. I.

Claim.—As a new article of manufacture, a pencil-sharpener, composed of two separate stocks, removable from each other, substantially as described, the one being furnished with a cutter which acts upon the wood only, and the other with a cutter which acts upon the lead and the remaining part of the wood together.

116,277.—IRONING AND STRETCHING BOARD. Jacob W. Davis, Reno, Nev.

Claim.—1. In combination with the adjustable sliding block B, the clamping-block *g*, held in place by the lever *f*, with its flange *i* and rack-bar *h*, substantially as and for the purpose above described.

2. In combination with the ironing-board A, the blocks B and K, and clamping-blocks g g^2, secured as above described, for the purpose specified.

116,278.—MACHINE FOR PULVERIZING THE SOIL.—George P. De Yo, Groton township, Ohio.

Claim.—The herein-described soil-pulverizing machine, consisting of the frame on bateau A provided with an overlapping bottom consisting of the pieces D, to which are secured the ribbed and grooved plates E, all arranged and combined in the manner substantially as described, and for the purpose specified.

116,279.—DRIER.—Ernest Drevet, New York, N. Y.

Claim.—A hose-rack, A B, having at its ends air-tight closets C E provided with one or more openings for the ingress and egress of air, substantially as herein shown and described, and for the purpose set forth.

116,280, antedated June 17, 1871.—EGG-CARRIER.—Watson Duchemin, Charlottetown, Prince Edward Island.

Claim.—The sectional transportation-box A A^1 A^2 A^3, when the said sections are constructed with the partitions L L, straps H H E E, and cords K K M M, substantially as described and shown, and for the purpose set forth.

116,281.—PROPULSION OF CANAL-BOATS.—William T. Duvall, Georgetown, D. C.

Claim.—1. The vertically-sliding frame L or L′, in combination with the well E or G and traction or trail-wheels H or I, substantially as specified.

2. The steam-cylinder *f* and its piston, in combination with the sliding frame L and wheel H, substantially as set forth.

116,282.—DREDGING-MACHINE.—John Ebbert, Chicago, assignor to himself and John Clark, Marengo, Ill.

Claim.—1. The hinged parts A and A′ of the carrying-basket, substantially as and for the purpose described.

2. The adjustable fender-plate B, in combination with the part A′, arranged as described, whereby the opening C is formed, substantially as and for the purpose described.

3. In combination with the parts A and A′, the shear-pointed levers F and F′ and auxiliary wheels E and E′, the whole arranged to operate substantially as and for the purpose described.

116,283. — ROTARY STEAM-GENERATOR.—Nathaniel T. Edson, New Orleans, La.

Claim.—1. The spiral tubes K, connecting the hollow boiler-heads, substantially as and for the purposes hereinbefore set forth.

2. The pipe P, in combination with the elongated opening formed in pipe N, and with the pipe L or its equivalent, substantially as and for the purpose hereinbefore set forth.

116,284.—VEHICLE.—Clark Elliott, Woodland, Cal., assignor to himself and Nathan Elliott, same place.

Claim.—1. The curved brace E, in combination with the vertical standard I having the horizontal plate J and India-rubber spring K attached, as described, for the purpose specified.

2. In combination with the curved brace E, the horizontal bar O, Fig. 2, and bed-piece *u*, together with the interposed rubber blocks *p*, guiding-plates *q* or pins *s*, and the steadying slotted plate *t*, all combined and arranged substantially as and for the purpose above described.

116,285.—DYNAMOMETER. — James Emerson, Lowell, Mass.

Claim.—The combination and arrangement, substantially as described, of the carrier or frame O with the standards D D, the driving-wheel A and train, the wheel C, and the spider B combined with the wheel C, by means, and provided with mechanism, substantially as described, for indicating the resistance of such wheel C, as set forth.

116,286.—ATOMIZER.—James J. Essex, Newport, R. I.

Claim.—The combination, with the suction-tube A of the atomizer, of the attached external tube D, between which and the suction-tube there is a channel, *c*, serving as the vent or drip-return passage, and adapted for use in connection with an ordinary cork or other stopper, substantially as herein described.

116,287. — BURGLAR-PROOF SAFE. — John Farrel, New York, N. Y.

Claim.—The combination, with the recessed door and jambs and the seamless angled frame, of hinges, operating as as described, for the purposes set forth.

116,288.—PUNCHING-MACHINE.—Daniel Anderson Faulkner, Centreville, Cal.

Claim.—1. The block *l* with its vertical guide-stem *m* and punch-stem J, in combination with handle P carrying the cam *s*, and arm *r* with its projection *t*, substantially as and for the purpose set forth.

2. The block *l* with its vertical guide-stem *m*, punch-stem J, and circular die-plate C provided with different-sized holes *f* and with slots *v*, in combination with the spring-ratchet *g*, handle P carrying the cam *s*, and arm *r* with its projection *t*, substantially as and for the purpose described.

116,289.—MOVABLE STANDARD IN WAGONS. William D. Fink, Windsor, Ill.

Claim.—A standard for bolsters of wagons, arranged to be adjusted laterally, substantially as shown and described.

116,290.—RING-DRIVER.—Alexander Fisher, Whitinsville, Mass.

Claim.—The ring-driver B, (pivoted at *e* to the slide A, and operated by such and the rack and pinion *a* and *b*,) the tubular projection C, ring-carrier D, and centering-cone D′, arranged together and with the bed-frame E and the roller-supporter F, all being constructed substantially in the manner and for the purpose as described.

116,291. — FLESH-FORK. — Paul Fisher, Brooklyn, N. Y.

Claim.—The tine C, square in cross-section, and fitting in a socket of the middle tine A′, substantially as shown and described.

116,292.—LAMP-BURNER.—Samuel W. Fowler, Brooklyn, N. Y.

Claim.—1. The combination of the filler-tube E with the base-plate B and perforated plate B′, substantially as and for the purposes herein specified.

2. The new article of manufacture of a lamp-burner composed of the body A, base-plate B, perforated plate B′, wick-tube C, ratchet-wheels and shaft, tubular filler E, perforated disk F, cone G, and chimney-holding springs D, substantially as herein specified.

116,293.—ROTARY STEAM-ENGINE.—Samuel B. Freeman, Ashland, Ohio.

Claim.—An oscillating engine-valve operated directly by the piston, and having a partition-arm arranged in the central portion of the valve-chest, and two piston-arms, each of a greater length than the partition-arm, arranged one at each side of the partition-arm, as is herein specified, for the purpose of obtaining a reverse motion of the engine by simply throwing over the valve and changing the steam-entrance, as well as to secure steam-packing on the valve during either motion, substantially as described.

116,294.—HOT-AIR REGISTER.—D'Alembert T. Gale, Fort Wayne, Ind.

Claim.—1. Air-pipe *d*, in combination with register-box *a*, as described, and for the purpose set forth.

2. Register-box *a*, pipes *b* and *d*, cocks *p*, burner *f*, reservoir *h*, shield *l*, and surface plate N, in the manner described, and their adaptation for heating rooms, cars, &c., substantially as set forth.

116,295.—LAWN-MOWER.—Emery R. Gard, Chicago, Ill.

Claim.—A lawn-mower, constructed with the transversely-vibrating pivoted arms D D, cutter-bar C, connecting-rod E, driving-wheel G, and handle B, all arranged and operating together in the manner and for the purpose herein specified.

116,296.—LIFTING-JACK.—Emery R. Gard, Chicago, Ill.

Claim.—1. The two sets or pairs of pawls D D and E E on the lever C, substantially as and for the purpose herein specified.

2. The lever C, provided with the two pairs of pawls D D and E E, and having a permanent handle, *c*, at one end, and a socket for a removable handle, *d*, at the other end, for the purpose set forth.

3. The guides G G, arranged and operating in combination with the pawls E E, substantially as and for the purpose herein specified.

4. The slide H, in combination with the guides G G, substantially as and for the purpose herein set forth.

5. The auxiliary socket-base I, with its adjusting-bolt *i* and holes *l l*, or their equivalent, in combination with the main standard A, for the purpose herein specified.

6. A lifting-jack, constructed and arranged so that it can be caused either to lift or lower the weight by the same movement of the operating-lever, as herein specified.

116,297. — ROTARY SPADING-MACHINE.—Lucius H. Gibbs, Brooklyn, assignor to himself and Philo Remington, Ilion, N. Y.

Claim.—1. The rotary-propelling spade-drum, which is composed of pairs of rings having spades pivoted to them, and operated substantially as described.

2. A support or stop, O, in combination with pivoted spades and yielding mechanism, substantially as described.

3. Clearers *d e*, in combination with pivoted spades applied to a rotary drum, substantially as described.

4. The rotary spading-drum, which is applied to an independent vibrating frame, and is driven independently of the carriage or supporting-wheels, and is propelled by the contact of its spades with the soil, all substantially in the manner herein set forth.

5. The locking-down device G G^1 G^2, in combination with a vertically-vibrating frame carrying a rotary-propelling spading-drum, substantially as described.

6. The pivoted arm L, carrying the stop O, having combined with it an adjustable rod, *f*, and a lever, *g*, substantially as described.

116,298.—PROCESS OF ROASTING COFFEE.—James W. Gillies, New York, N. Y.

Claim.—The within-described process of roasting coffee by subjecting it to two roasting operations, with an intervening cooling operation.

116,299.—PROCESS OF TREATING COFFEE.—James W. Gillies, New York, N. Y.

Claim.—The within-described process of treating coffee before roasting, by subjecting it to the action of the heat.

116,300. — HAY ELEVATOR. — Charles E. Gladding, Towanda, Pa.

Claim.—1. The inclined beam A of a hay-elevator, having the steep declivity Y, stop Z, and block A′ relatively placed, as and for the purpose specified.

2. In combination with a traveler, rope, hooks, and knot, the yoke N, tongue O, and pawl P, arranged as and for the purpose specified.

116,301.—SPINDLE FOR SCREW-MACHINES.—Dearborn P. Glines, Manchester, N. H., assignor to Daniel M. Robertson, Boston, Mass.

Claim.—1. The combination of the head M, rod P, nut N, and spring *i* with the toggle-levers S and T, and mechanism for connecting the same with the griping-jaws, in the manner and for the purpose described.

2. The combination, with the adjustable and yielding rod P, of the arms S′ S′ T T′, rod U, arms V V, and jaws W W′, in the manner and for the purpose specified.

3. In combination with the rotating mandrel and system of toggles, levers, and jaws, as set forth, the dogs *e* and sliding collar F, in the manner described.

116,302.—SASH-BALANCE.—Lewis Goodwin, Bangor, Me.

Claim.—1. The combination of cord C and its hollow rod *b*, substantially in manner as and for the purposes specified.

2. The combination of bar *g* and tube *b*, when constructed and arranged to operate substantially as and for the purposes specified.

3. The combination of bar *b*, spring *h*, and stud *j*, when arranged to operate substantially in manner as and for the purposes specified.

4. In combination with cord C, the elastic buffer *e*, substantially in manner as and for the purposes specified.

116,303.—FAN ATTACHMENT FOR SEWING-MACHINES.—Thomas Green, Brooklyn, N. Y., assignor to himself and Henry A. Bowdoin, same place.

Claim.—In combination with a sewing-machine, the fan mechanism, consisting of the socket B,

slotted arm D, and pivoted bell-crank lever F, all operating substantially as herein shown and described.

116,304.—STEREOTYPE-MOLD.—Louis Guex, New York, N. Y., assignor to R. Hoe & Co., same place.

Claim.—As an improvement in stereotype-molding cases, the use of soap-stone plates *a a*, constructed substantially as and for the purposes set forth and specified.

116,305.—ADJUSTABLE SHIELD FOR SHAFT-COUPLINGS.—Charles S. Hall, Rochester, N. Y.

Claim.—In combination with a shaft having a universal-jointed coupling, the shield A, made adjustable longitudinally upon the shaft, substantially as and for the purposes set forth.

116,306.—SHOW-CASE.—George A. Hearn, Jr., New York, N. Y.

Claim.—The arrangement of the glass-covered compartments A, substantially as shown in Figs. 1 and 2, as and for the purposes described.

116,307.—CLOTHES-CLAMP.—Eder Hedge, Liverpool, and Thornton H. Fleming, Canton, Ill.

Claim.—1. The block A, with its recess or inclined surface *b c f*, meeting the slot *a* at an acute angle, and the slot *a* in combination with the cam B, substantially as and for the purposes described.

2. The combination of the tubular cam-pivot C or riveted tube with cam B and block A, substantially as and for the purposes described.

116,308.—ADJUSTABLE AND FOLDING WAGON-BED.—Samuel Heffley and James D. Pettit, Rochester, Ind.

Claim.—The combination of the jointed bottom H H with the stay-plates G G on top of the bottom of the wagon-bed, and the stay-plates J J on the under side of the bed, having oblique apertures E E, with their iron curved supports D D and center joints or hinges K K K, as herein described, and for the purposes set forth.

116,309.—BRACKET FOR WATER-CONDUCTOR.—Leonard B. Hill, Albany, N. Y., assignor to himself and Peter Clark, same place.

Claim.—The combination of the grasping-arm A, spike C or equivalent, as described, and body D provided with the opening O, lip *a*, recess *a'*, and bearing *b* with the grasping-arm B, and angle-piece E provided with the lip *c*, substantially as and for the purpose set forth.

116,310.—MEDICAL COMPOUND OR BITTERS.—Moritz Holst, Memphis, Tenn.

Claim.—The above-specified medicinal compound for the cure of ague, as set forth.

116,311.—MANUFACTURE OF SPRING-HEADS.—George Hopson, Bridgeport, Conn.

Claim.—1. The within-described method of welding the clips to the spring, forming the several projecting ribs thereon, and imparting to the spring-head the proper finished shape by the dies M N and S T, as described.

2. The clips B, of the shape described, jointly with the implacement and attachment of them to the leaf A, as described.

116,312.—STEAM-ENGINE.—John Houpt, Springtown, Pa.

Claim.—1. The elevated vessel F and pipe *f'* in combination with the valve-chamber *c'* and reservoir-pipe E, the said parts being constructed and arranged to operate substantially as and for the purpose hereinbefore set forth.

2. In combination with the steam-heating chamber *b'''* around the steam-cylinder B of an engine, a pipe, *d'*, which forms a communication between the said chamber and the exhaust-steam pipe of either a steam-cylinder, a superheater, or the hot well of a condenser, substantially as described, for the purpose of keeping up the heat of said steam-cylinder by the waste steam of the engine, as described.

116,313, antedated June 15, 1871.—MODE OF PROPELLING SLEIGHS.—Charles H. Hudson, New York, N. Y.

Claim.—1. The combination, with a sleigh or wagon, of the rockers E E, which are attached to the said sleigh or wagon by means of the pins *e* and slotted brackets *d*, or their equivalents, and furnished with the pawls F and G, substantially as set forth.

2. The combination, with the running-gear, arranged and connected as shown in Fig. 3, of the rockers E E and pawls F and G, substantially as described.

3. The combination, with the rockers E E and pawls F and G, of the springs *h h'*, substantially as specified.

4. The shoe or pad, consisting of a frame, *g*, filling *i*, covering *k*, and locking-plate *j*, substantially as described.

116,314.—REVERSIBLE PLOW.—Edwin Jennings, Candor, N. Y.

Claim.—The cross-head bolts F and G, either or both, in combination with the beam A and perforated arms c^1 of the standard-frame C, substantially as herein shown and described, and for the purpose set forth.

116,315.—MOWING-MACHINE.—Samuel Johnston, Brockport, N. Y., assignor to James S. Thayer, New York city.

Claim.—1. The double or cross-acting stop-hinge G, constructed substantially as described, in combination with the main shoe and main or vibrating frame D, substantially as described.

2. The hinge G and pendent loop I, in combination with the main shoe E for connecting said shoe to the main or vibrating frame D and permitting its rocking and vibrating movements, substantially as described.

3. The main shoe, connected with the frame as described, in combination with the adjusting-rod or rack J, arranged and operating substantially as described.

116,316.—CALENDAR-WATCH.—Alfred Courvoisier Ionais, Chaux-de-Fonds, Switzerland.

Claim.—1. The wheel *h* provided with the pinion *i*, wheel *j*, bearing-pins or an escapement, *k*, and wheels *m* and *n*, when combined, arranged, and operating together as described.

2. The combination and arrangement of the wheel *m*, metal piece *o*, springs *p*, and wheel *g*, when operating together as and for the purpose herein described.

3. The arrangement of a dial operated substantially by the mechanism described in the foregoing claims, and showing the days, months, and dates, with a dial indicating the hours and minutes, when so constructed as to permit of the isolation of the works of the one from the works of the other.

116,317.—JOURNAL-BEARING.—Alfred F. Jones, New York, N. Y.

Claim.—The journal-bearings A B, provided with projecting lateral sides *a b*, conically shaped, threaded on the outer ends, and locked by nuts C C, when combined with a loosely-revolving shaft, as specified.

116,318.—SAFETY-POCKET.—Elias Jones, Grand River, Iowa.

Claim.—The combination of the armored cover C with the burglar-proof pocket A, substantially as herein shown and described.

116,319.—RAILROAD-CAR VENTILATOR.—Nathaniel Jones, Buffalo, N. Y.

Claim.—1. The projecting-frame A, revolving-plate B, and window D attached to the cross-bar C by the bolt E, as shown and described, to operate as specified.

2. The employment of the three-bladed valve I in the openings in the upper part of the car, substantially in the manner specified.

116,320.—EARTH-CLOSET.—William A. Jordan, New Orleans, La.

Claim.—The combination of the earth-dumper C, adjustable slide-gate I, pivoted lever E, seat C having slotted bar *e* attached, and hopper B, substantially as described.

116,321, antedated June 17, 1871.—GAS-REGULATOR.—Peter Keller, New York, N. Y., assignor to himself and Charles A. Martin, same place.

Claim.—In combination with the receptacle A, rod *r*, guide *k*, spiral spring *o*, and nozzle B provided with holes *c*, the valve C provided with the slots *f* and ring *g*, so arranged that when the valve is clear down the holes will all be open, but when the valve is raised the ring will partially close the holes, as and for the purposes set forth.

116,322, antedated May 29, 1871.—RUBBER COMPOUND FOR BEARINGS, &c.—Peter J. Kelly, New York, N. Y., assignor to Elizabeth Thompson, same place.

Claim.—A composition, formed of India rubber and a soft metal finely powdered, and applied in a molded or rolled form, for bearings, packing, and analogous purposes.

116,323.—PUNCHING-MACHINE.—Charles Keniston, Somerville, assignor to himself, C. E. Woodman, and William Butterfield, Boston, Mass.

Claim.—1. The pivoted arm G with its slotted plate J, provided with lugs V and adjustable slotted plate I, in combination with plunger D and lug F, substantially as described.

2. In combination with the subject-matter of the first clause, the slotted plate L, finger M, notched disk P, pawl R, pins *r*, and spring K, substantially as described.

3. The pivoted vibrating arm G, having the slotted plate L, finger M, notched disk P, and pawl R, in combination with spring K, as and for the purpose set forth.

116,324.—FURNACE FOR ROASTING ORES.—Frank Kesseler, San Francisco, Cal.

Claim.—1. A roasting-furnace, in which a stationary and a revolving hearth are employed in succession, both being heated from the same fireplace, in the manner substantially as described.

2. The beaters J J and lifters K K, substantially as and for the purpose above described.

3. The hollow upright shaft F, supported as described, and carrying the revolving hearth C, in combination with the beaters J J and lifters K K, substantially as and for the purpose above described.

116,325.—HAND-TRUCK.—Thomas F. Kiff, Fairbury, Ill.

Claim.—The combination of frame-work, axle E, and adjustable-clamp hooks D K, for the purposes set forth and described.

116,326.—FAUCET.—John Knoche, Cincinnati, Ohio.

Claim.—The arrangement of plug J, stem B *r*, coiled spring S, and pin T, when used in connection with the valve-chamber G and detachable cap G', as herein explained.

116,327.—SEED-PLANTER.—William Knowland and Kearnes Collings, Henryville, Ind.

Claim.—In a seed-planter, the roller *i*, crank-shaft F, and axle A, combined, as described, with a frame, H, as and for the purpose set forth.

116,328.—FLAX-BRAKE.—Jacob C. Kurtz, Wooster, Ohio.

Claim.—1. In combination with toothed drum J, the pair 1 of fluted rollers having surface motion slightly less than that of J, and pair 2 of fluted rollers having surface motion greater than that of J, as and for the purposes specified.

2. In combination with the aforesaid rollers 1, drum J, and rollers 2, the series of rollers 3, 4, 5, and 6, as and for the purposes set forth.

116,329.—FENCE.—John A. Kysor, Leon, N. Y.

Claim.—The inclined braces or legs B D and hooks C E, constructed and arranged in connection with the panels A, substantially as herein shown and described, and for the purposes set forth.

116,330.—PAN-LIFTER.—William H. S. Lawrence and Charles I. Collamore, Bangor, Me.

Claim.—The pan-lifter, constructed with an arm having forked shouldered under jaws, and with a gravitating forked clasp swinging on the arm, substantially as described.

116,331.—SHUTTLE FOR SEWING-MACHINES.—George H. Lenher, Elizabeth, N. J.

Claim.—The shuttle with fixed stud-screw E and bobbin with nut F, combined as and for the purpose specified.

116,332.—GANG-PLOW.—Michael Likes, Mansfield, Ohio.

Claim.—An improved gang-plow, formed by the arrangement of the frame A a^1 a^2, wheels C F, dovetailed block D *d'*, lever G *g'*, tongue H, pivoted bar I, plow-beam J, plows K, standards L, gauge-wheel M, slotted standard N, lever O, swiveled bolt P, and seat Q with each other, said parts being constructed and operating substantially as herein shown and described, and for the purposes set forth.

116,333.—CLOTHES-DRYING MACHINE.—Joseph O. Luther and Peter Staab, Grafton, Wis.

Claim.—A drying-machine, consisting of tub B, with a convex bottom, rack C, D, and E, pinions F and G, shaft H, pinions I and K, and cover N, in combination with frame A, all arranged substantially as described.

116,334.—STOVE-DOOR.—David N. Martin, Lawrence, Mass., assignor to D. N. & C. M. Martin, same place.

Claim.—Causing the door, valve, slides, or other device for affording an opening below the grate of a stove or furnace to be faced around the edge with brass or other non-corrosive metal, as above described, so that the said metal may close tightly against a similar facing upon the stove or furnace, for the purpose hereinbefore set forth.

116,335.—LITHOGRAPHIC PRESS.—Charles C. Maurice, New York, N. Y.

Claim.—1. The lithographic press, provided with the removable printing-cylinder B, substantially as herein shown and described.

2. The platform D, leather plate E, and spring 4, combined with the rollers B C of the press, as set forth.

116,336.—PISTON-PACKING.—James McAlonan, New York, N. Y.

Claim.—1. The spring-plates F F, provided with double-inclined ends, whereby they crowd the rings G G apart while expanding them, as specified.

2. The double rings G G, provided with the inclined recesses *g*, to be moved apart while expanded, as set forth.

3. The nut *d*, provided with the tubular extension *e* and with the screw-cap *f*, to regulate the sliding bar D, substantially in the manner specified.

116,337.—HOT-AIR REGISTER.—John W. McGlashan, Montreal, Can.

Claim.—The improved hot-air register and purifier and evaporating apparatus formed of the rectangular case A provided with a hinged top, the register B, inwardly-projecting air-pipe D, water-pipes F, G, and H, and the removable screen I, all arranged as shown and described.

116,338.—MACHINE FOR WASHING AND BLEACHING PAPER-STOCK.—Henry Monroe, Baldwinsville, N. Y.

Claim.—1. The washer B and reservoir A for washing and bleaching paper-stock, constructed and arranged substantially as and for the purposes set forth.

2. The process of washing and bleaching paper-stock, substantially in the manner and for the purposes specified.

116,339.—HOT-AIR FURNACE.—Hazen Moores, Chicago, Ill.

Claim.—The combination of the respective systems of pipes F, G, and J, arranged within case E, as described, the whole operating substantially in the manner and for the purpose specified.

116,340.—AUTOMATIC GOVERNOR AND CUT-OFF DEVICE FOR STEAM-ENGINES.—Charles Moore, New York, N. Y.

Claim.—1. The combination of the pistons F F', and G geared for operation together, as described, and arranged, as regards their respective cylinders, in relation with the steam-supply pipe or valve-chest and ends of the engine-cylinder, substantially as specified.

2. The hollow piston G, with its cylinder H, constructed to operate as a valve, in combination with the connected pistons F F' arranged to work in cylinders E E' and geared for operation in concert with the piston G, subject to control of a crank or eccentric pin, *f*, and pinion *e*, essentially as described.

3. The combination of the hand-valve J with the elements recited in the next preceding claim.

116,341.—BRICK-MACHINE.—Augustus Morand, Leeds, England.

Claim.—1. The combination and the arrangement with each other, as herein specified, of the horizontal shafts *h* and *n* with their connections, the worms *g* and *m*, worm-wheels *f* and *l*, shaft *e*, mold-wheel *d*, molds *d'*, followers *q q*, and inclined planes *p*, all substantially as and for the purpose set forth.

2. A sliding pusher, *t*, for delivering bricks from the mold-wheel or table *d* to a suitable carrier-belt or to a press, forced outward by a lever, t^3, actuated by projections t^1 in the periphery of said mold-wheel, and inwardly by a spring, t^2, all substantially in the manner and for the purpose herein set forth.

3. The pusher *t*, when provided with the lubricating-reservoir *u*, substantially as and for the purpose specified.

116,342.—PARING AND CHOPPING-MACHINE.—Stephen H. Morse, North Jay, Me.

Claim.—1. The fruit or vegetable-paring and chopping-machine as composed of the paring-arm M and knife O, the rotary paring-shaft L and fork, and the chopping-knife C, and the rotary receiver D, combined, arranged, and provided with mechanism, as described, for operating them in manner as set forth.

2. In the paring and chopping-machine as explained, the frame B, provided with the turn-button, and pivoted to the base A for the purpose of enabling such frame to be tipped on the base in manner to draw the chopping-knife out of the rotary receiver to admit of it being removed from the base.

116,343.—CURTAIN-FIXTURE.—Benjamin Moser, Waltham, Mass.

Claim.—1. The loose wheels *h* or *i*, or both, in combination with a spring, *k*, or its equivalent, substantially as described, for the purpose set forth.

2. The presser-wheel or wheels L, in combination with the third clause of claims, substantially as and for the object specified.

3. The spiral spring *f* having case *g*, in combination with curtain-cord E secured both to said spring and case, substantially as described, for the purpose specified.

116,344.—REFRIGERATOR.—Charles P. Munroe, Cambridge, Mass.

Claim.—1. In combination with the refrigerating or preserving-chamber D, the absorbing and evaporating-vessel or medium E and air-space K, substantially as and for the purposes described.

2. The channel-vessel E F, lining M, bottom G, and receptacle H, combined, as and for the purpose specified.

3. The top B with air-orifices L, or their equivalents, in combination with the vessel E and air-space K, substantially as and for the purposes set forth.

116,345.—DIE FOR MAKING CARRIAGE-CLIPS.—Wilson Noble, Derby, Conn.

Claim.—The process of forming a carriage-clip from a blank or bar of metal, *b*, of uniform size, by first forming the crooks *a'* and then the ends of the blanks, being confined by the clamps A', and abutments B pressing said blank down into the die A and imparting to it the form *a a b* by means of the die E, substantially as described.

116,346.—SCRUBBING-BRUSH.—Patrick O'Brian, New York, N. Y.

Claim.—The scrubbing-brush made with a zig-zag elastic strip passing lengthwise of the brush between the bristles, as and for the purposes set forth.

116,347.—BOTTLE-STOPPER.—John Park, Philadelphia, Pa., assignor, by mesne assignment, to Hale & Manley, same place.

Claim.—The combination of the spring cylindrical plate A, rod B, ball C, and knob D, all constructed and arranged substantially as and for the purposes herein set forth.

116,348.—CHURN.—Thomas Bee Parke, near Downieville, Cal.

Claim.—A churn, combining in its construction the shaft *j* and the hollow shaft *f*, revolving in opposite directions and at different rates of speed, the shaft *j* carrying the four-faced dasher *i*, and the hollow shaft *f* carrying the arms *h h*, secured by the circular brace *o*, and provided with the pendent stirrers *i i*, having cylindrical faces, and being supported by the wire braces *y y*, when all these parts are constructed and arranged substantially as and for the purpose specified.

116,349.—GAS-REGULATOR.—Charles C. Place, Boston, Mass.

Claim.—1. The cup L with its mercury filling acting as a weight and gas-tight joint, substantially as described.

2. The cup L, as described, in combination with vessel G and rod J, as and for the purpose set forth.

116,350.—FOLDING LOUNGE.—William Prufrock, St. Louis, Mo.

Claim.—The combination of the rod D and bolt E, substantially as and for the purpose hereinbefore set forth.

116,351.—COPYING APPARATUS.—William James Purcell, New York, N. Y.

Claim.—1. A box or reservoir, the inside being made non-corrosive, with wire fork attached to the lid, as described, and with rollers, one on edge of the lid and one on the edge of the box, for partly draining the moistening-sheet.

2. Making the moistening-sheet with two corners cut off, as shown in Fig. III.

116,352.—ROTARY STEAM-ENGINE.—Washburn Race, Lockport, N. Y., assignor to Warren Rowland Ingham and Nancy M. Race.

Claim.—1. The valve-abutments *h h'*, having the knuckle-joints made conical so as to fit closely in their working sockets, substantially as described, for the purpose specified.

2. The arrangement of the pipe H in the side of the case I, and the receptacle J in the piston for oiling the engine, substantially as set forth.

116,353.—STEAM-ENGINE PISTON-HEAD.—James Rees, Pittsburg, Pa.

Claim.—1. A piston-head, *n*, of taper form, combined with a series of wedge-shaped plates, the inclination of the plates corresponding with the taper of the head; and also a series of springs, *e*, arranged between the plates *d* and the packing-rings, substantially as described.

2. The wedge-shaped plates *d*, each having one or more seats, formed by ribs *s*, in which to seat the springs *e*, substantially as described.

116,354.—BED-BOTTOM.—George W. Robinson, Galesburg, Ill.

Claim.—A bed-bottom when constructed substantially as described, with main frame B B B, C C, and D D, slats E E E E secured to main frame by flexible straps I I I I I, allowing independent movement of each slat, and with springs *e e e e* and flexible connecting-strips H H H H, all arranged to operate in the manner substantially as described, and for the purpose set forth.

116,355.—PLOW.—Alfred Roden, Mumford, Ala.

Claim.—The combination, with a plow, H, of independent block G, standard-plate F, and side brace I, to hold the shovel H firmly in the position required.

116,356.—THRASHING-MACHINE.—Charles E. Roper, Canton, Ohio.

Claim.—1. A thrashing-cylinder, composed of two circular heads and of two or more cylindrical spike-staves, when said parts of the cylinder are united by tensional truss-rods which are bent up at the center, so as not only to draw the heads together, but also to draw down on the centers of the staves, substantially as and for the purpose specified.

2. The combination, with a thrashing-machine concave hung on pivot-joints at one end, of two eccentric disks working in slots in the side pieces at its other end, and each having a neck journaled in or on the machine-frame, said disks being operated simultaneously by a key-rod passing through their necks, and the several parts being constructed and arranged to operate substantially as is herein specified.

3. The combination, with the side piece of a hinged thrashing-cylinder concave, of an eccentric disk with a rim or collar on its inner end, a neck journaled in or on the machine-frame, and a clamping-nut on said neck, said disk with its several parts being constructed substantially as specified, and being arranged to support, adjust, and secure the movable end of said side piece, substantially as is herein set forth.

116,357.—ROTARY STEAM-ENGINE.—Charles F. Roth, Osceola, Iowa.

Claim.—The reversely-bucketed but single cylinder K having a flange, L, working in groove M of the case, the internally eccentric case, the double ports for separately-receiving the exhausting steam, and the valved channel way U U S, all constructed and arranged together in the manner specified and for the purpose set forth.

116,358.—GASALIER.—John H. Seaman, Brooklyn, N. Y.

Claim.—1. In combination with a fixed guide projecting downward from the fixed part of the gasalier, a sliding stem to which the branches are connected, and which has within it an internal sheath or guide cut off from the gas-way of the stem, and open at the top to receive the fixed guide, substantially as hereinbefore described.

2. In combination with the fixed guide and the sliding stem with its internal guide, the folding gas-pipe, which connects the gas-way of the stem with that of the fixed part connected with the source of supply, substantially as described.

3. The arrangement of the spring-barrel and cord-connection, in combination with the hollow fixed guide and sliding stem, substantially as described.

4. A folding gas-pipe connection, in combination with a sliding pipe and guide, when the folding pipe has a single middle joint, and is so arranged as to fold close to the stem, substantially as hereinbefore described and shown.

116,359.—GASALIER.—John H. Seaman, Brooklyn, N. Y.

Claim.—1. In combination with a pendant or chandelier for burning gas, a movable branch in combination with a sliding rod attached thereto, and a stem having an internal guide cut off from the gas-way, substantially as herein described.

2. In combination with the movable branch, sliding rod, and a stem with an internal guide cut off from the gas-way, the folding gas-pipe, whereby an extensible metallic gas-way is obtained between the gas center and the movable branch, substantially as described.

3. The arrangement of the spring-barrel and cord, in combination with the stem and its internal guide and the sliding rod, which supports the movable branch, substantially as described.

116,360.—GASALIER.—John H. Seaman, Brooklyn, N. Y.

Claim.—1. In combination with the central drop-light, the sliding side pipe, with its internal guide cut off from the gas-way, and a fixed guide projecting downward from the fixed upper part of the fixed chandelier, from which the fixed branches depend, but which forms no part of the gas-way, substantially as described.

2. In combination with the central drop-burner of a chandelier for burning gas and the chandelier, the folding gas-pipe connection, the side pipe with its internal guide, and the fixed guide, substantially as described.

116,361.—APPARATUS FOR COOLING BONE-BLACK.—Charles H. Senff, New York, N. Y.

Claim.—The series of vertical pipes, in combination with the surrounding cylinder or equivalent casing, provided with a hopper at the upper end and with an induction-pipe at the lower end, and a discharge-pipe at the upper end, substantially as and for the purpose set forth.

116,362.—WATER-METER.—Joel C. Slaughter, New York, N. Y.

Claim.—The angled buckets E E of a water-meter, connected by rods *h*, and swinging in pairs on their angles, as and for the purpose specified.

116,363. — Breech-Loading Fire-Arm.—William Tait Snedden, Johnstown, Pa.

Claim.—1. The cartridge-extractor G, when provided with the elongation or arm E, whereby the hook or point of said extractor may be passed over the flange of the cartridge so as to leave the same in the bore of the barrel when desired, as set forth.

2. The combination of the breech-block, when provided with the elongated slot or groove described, with the extractor G, as and for the purpose set forth.

116,364.—Breech-Loading Fire-Arm.—William Tait Snedden, Johnstown, Pa.

Claim.—1. The combination and relative arrangement of the operative parts herein shown and described, whereby the lock mechanism as well as cartridge-retractor are inclosed within the oscillating breech-block, as specified.

2. The metallic block I and sliding bolt K, in combination with the breech-block, for the purpose of holding said breech-block in position within the frame, and making the same readily removable, as set forth.

3. The combination and arrangement of the cocking-pawl F with the hammer B, the spring O, and retractor G operating within the breech-block and breech-frame for the purpose of cocking the hammer and withdrawing the exploded shell by means of a vibratory motion of the breech-block, as before described.

4. The combination of screw M with the hammer B and knife C, for the purpose of carrying the knife C backward and forward to explode paper cartridge.

116,365.—Base-Burning Fire-Place Heater.—George B. Snider, New York, N. Y.

Claim.—The combination of the side pipes H, dip-pipes I, up-takes J, air-heating chamber L, flue G, and escape-pipe F, all arranged with relation to the body A and fire-chamber B for operation, as shown and described.

116,366. — Oil-Tank. — Henry F. Snyder and George S. Snyder, Williamsport, and Autes Snyder, Freeport, Pa.

Claim.—1. The neck T^1 extending above the tank A, and inclosing the shaft M, which operates the valve D, as and for the purposes specified.

2. The neck T^2 extending down into the tank A around the shaft M, and arranged relatively thereto and to the valve D, as and for the purposes specified.

3. The matched valve-tops D^1 D^2, each having a concentric and eccentric hole partly coinciding, and each having an eccentric crescent-like projection adapted to match into the eccentric hole in the other, and be applied upon, and be removed from, the collared nut P P^1 P^2 and valve D, as herein specified.

116,367.—Double-Headed and Pointed Dowel-Brad. — John Sowle, Boston, Mass.

Claim.—The double-headed and double-pointed dowel-brad, made substantially as explained.

116,368.—Supporter and Pessary.—Henry Spillman, New Orleans, La.

Claim.—1. The metallic-stem pessary D, composed of two rings, E and H, the former having a flexible elastic movement by resting upon a spring within or without the stem or tube F, the latter being vertically adjustable, and the whole connected with the stem I by the universal joint *e*, all of which, when constructed substantially as described.

2. The stem-pessary herein described, in combination with the abdominal supporter, composed of the frame A, pad B, elastic belt and hip-plates C C′, pins *a a′* and *b b′*, and the elongated apertures *c c′*, substantially as herein described, and for the purposes set forth.

116,369.—School-Seat.—David I. Stagg, New York, N. Y.

Claim.—In combination with frames C, back D, and pivoted seat E, the cross-piece B, and single pedestal A, to form an improved school-seat.

116,370.—Steam-Engine Valve.—Nathan P. Stevens, Hopkinton, N. H.

Claim.—The valve, as provided with the opening *e* in its top, the branch ports *c c* leading therefrom, the exhaust-chamber *d*, and the circumscribing groove *h*, arranged as explained, in combination with the main ports *g g*, and main and auxiliary exhaust-passages *f i*, all constructed and arranged, substantially as set forth, for operation in a chest, as described.

116,371.—Drain-Pipe Machine.—John W. Stockwell, Portland, Me.

Claim.—1. The combination, with the mold-case B, Fig. 3, of latches *a b*, guides *d*, catches *e*, and plate *f*, when constructed, arranged, and operating as and for the purpose herein shown and described.

2. The combination of the spring-core C with expanding devices *i j k*, as and for the purposes herein set forth.

3. The arrangement herein shown of the spring-core C, expanding devices *i j k*, and bottom former D, all constructed and operating as and for the purpose described.

4. The combination of the spring-core C with the core-contractor E, as set forth.

5. The arrangement herein shown of the pan *o*, feeding-funnel *p*, mold-case B and its adjuncts, rollers *m*, and bed-piece *n*, when constructed and operating as shown and described.

116,372.—Die for Forming Beefsteak-Cutters.—Horace Thompson, Concord, N. H.

Claim.—The dies A^1 A^2 a^1 a^2 h^1 and B b^1 b^2 b^3, constructed and operating substantially as herein shown and described, and for the purposes set forth.

116,373.—Water-Proof Cigar-Box.—Judson L. Thomson, Syracuse, N. Y.

Claim.—The employment of paper boxes, constructed substantially as above described, for packing, keeping, and transporting cigars, as and for the purposes set forth.

116,374. — Basket. — Benjamin Franklin Tuthill, Chicago, Ill., assignor of one-half his right to Stephen V. R. Tuthill, same place.

Claim. — The basket A, constructed with the lower portion formed of the standards B B′ and base-piece C, in combination with the upper part of woven-work, substantially as described, for the purpose specified.

116,375.—Preserving Natural Flowers. Philomela T. Vining, Springfield, Mass., assignor to herself and Charles A. Wakefield, Pittsfield, Mass.

Claim.—The process of preserving natural flowers, substantially as herein described and set forth.

116,376.—Portable Power-Press.—Thomas B. Wait, Zena, Oreg.

Claim.—The sweep L P Q, vertical shaft K′ having pin N, and the crane R S, all combined as and for the purpose specified.

116,377.—Machine for Sapping Logs for Clapboards.—Elbridge Webber, Gardiner, Me., assignor of one-half his right to George W. Colburn, same place.

Claim.—1. The carriage C, constructed as described, in combination with the knife or cutter L and block I, the worm and its grooved shaft, and the rack K, when operating together, substantially as described.

2. The shaft G and levers *n o p r*, in combination with the pulley M, and their connecting-shafts and gearing, substantially as shown and described.

3. The arrangement of the carriage C and its operating mechanism, the cutter-block and cutters, the shaft, worm, and rack, the reversible gearing and the log-holder, substantially in the manner and for the purpose specified.

116,378. — Button-Hole Guide-Plate.—Albert W. Webster, Ansonia, Conn.

Claim.—1. The plates A B, connected by pins *a′*, and grooved or notched upon one or both their side edges, substantially as herein shown and described, and for the purpose set forth.

2. A plate, notched or grooved upon one or both its side edges to adapt it for use as a guide in working button-holes, substantially as herein shown and described.

116,379.—Combined Fastening and Buffer for Doors and Shutters.—Wellington C. Wendell, Philadelphia, Pa.

Claim.—The combination, with a socketed block, *b*, of an India-rubber block, *a′*, confined by a central adjustable fastening, the same being for fastening or holding doors and shutters, substantially as described.

116,380.—Presser-Foot for Sewing-Machines.—James Wensley, Philadelphia, Pa.

Claim.—The arrangement, upon a presser-foot, A, of the spring-pressed feather *a*, passing therethrough, and the eye-guide *f* projecting in front of and in line with said feather, as and for the purpose specified.

116,381. — Carriage-Lamp Support.—Thomas P. White, Bridgeport, Conn., assignor to White Manufacturing Company, same place.

Claim.—The lamp-supporting plate C, having the concave or other face adapted to fit the back of the lamp from end to end, and overlap the corners for being soldered to the back, top, and bottom, and provided with the lug E having the vertical tapered hole for the spindle F, and the binding-screw, all substantially as specified.

116,382. — Brush.—John Lake Whiting, Boston, Mass.

Claim.—The improved brush, constructed and having its parts arranged substantially as herein-before described and as shown in the drawing, the portions *c* and *e* being either permanently connected to or in one piece with the handle, and introduced into the ferrule and the butt of the mass of bristles by the aid of a separate cone or pivot, *f*, all as explained.

116,383.—Power-Press.—Moses G. Wilder, West Meriden, Conn.

Claim.—1. The combination of the shaft of the press, the sliding clutch-bolt, the clutch-bolt arm, the sang, and the movable cam-plate provided with the inclined guides, substantially as before set forth.

2. The combination of the sang, the clutch-bolt, the cam-plate, provided with two inclined guides facing each other, the eccentric, and the treadle, as before set forth.

116,384.—Iron Folding Chair.—George Wilson, Chicago, Ill.

Claim.—In iron folding chairs, the combination of the seat A provided with coiled springs *a a′*, the back B, the foot C, the legs D E F, the rest G, the radius bars I, and slotted arm-rest H, all the several parts being constructed, arranged, and operated substantially as described and shown.

116,385.—Vapor-Burner.—George H. Wilson, Mansfield, Ohio.

Claim.—The combination, with the lamp-tube A, of the adjustable tube C, sand-packing D, hot-air tubes F, the plate N and a gas-burner, the tube C having the perforations *e*, and all arranged for operation substantially as specified.

116,386.—Manufacture of Latch-Needles for Knitting-Machines.—Stephen Woodward, Manchester, N. H.

Claim.—In the construction of latch-needles for knitting-machines, &c., the employment and use of a shim of paper, or analogous substance, between the latch and the needle in riveting, which can readily be removed by heat, and thereby allow the latch to have perfect play in the needle, substantially in the manner and for the purpose described.

116,387. — Pruning-Shear. — Edwin L. Yancey, Batavia, N. Y.

Claim.—1. In a pruning-shear, the jaw A, provided with the reverse hook-blades *b b*, when combined with a centrally-hung double-acting cutter, B, operating in the manner and for the purpose herein specified.

2. In combination with the cutter B, the fulcrum-pivot *d*, open slot *f*, and jointed arms C D, arranged as described, and operating conjointly in the manner and for the purpose specified.

3. The arrangement as a whole, consisting of the double-hooked jaw A, lever A′, cutter B, connecting-arms C D, pivot *d*, and open slot *f*, and the saw E attached to hook *b*, all as herein described.

116,388.—Roller Attachment for Plows. Charles M. Young, Meadville, Pa., assignor to himself and Charles Gable, same place.

Claim.—1. The combination, with a plow or cultivator, of a roller, B, arranged in a frame, C, and applied and operating substantially as and for the purpose herein specified.

2. The combination, with the roller and its swinging frame, of a hooked catch, arranged substantially as herein described, to be operated by the feet of the plowman.

116,389.—Meat and Vegetable Sausage. John H. Zumstein, New York, N. Y.

Claim.—An improved meat and vegetable sausage prepared of the ingredients, in the proportions, and in the manner substantially as herein set forth and described.

116,390.—Machine for Dressing Stones. William Adams, Edinburgh, North Britain.

Claim.—1. The combination, in stone-dressing machinery, of stone-holding tables and cranks for actuating the same, the two being connected substantially as herein shown and described, so that the tables shall move with and follow the path of the cranks with which they are respectively connected, as set forth.

2. The combination, in stone-dressing machines, with vertically-moving tables actuated by cranks, as described, of springs for pressing together the stones as they are being dressed, substantially as herein described.

3. The combination, with the stone-supporting tables, of the jaws or gripers, constructed substantially as herein shown and described, to hold the stones upon the tables.

4. In stone-dressing machines, the combination with vertically-moving tables which support the stones, of the spiral feeder, constructed substantially as herein described, and arranged to supply sand to the surfaces of the stones being dressed, as shown and set forth.

116,391.—TWINE-CUTTER.—John Adt, New Haven, Conn., assignor to The Judd Manufacturing Company, same place.

Claim.—As a new article of manufacture, the herein-described twine-cutter, formed from cast metal, and provided with means for securing the same, substantially as set forth.

116,392.—FURNITURE-TIP.—Johan Frithjof Akerstein, Chicago, Ill.

Claim.—The combination of the tip A, plug B, screw D, and the projection C', constructed and arranged as and for the purpose set forth.

116,393.—VESSEL FOR OIL AND OTHER LIQUIDS.—George W. Banker, New York, N. Y.

Claim.—A new manufacture, consisting of the can A, the case B, and the band *b*, when constructed and combined in the manner and by the method herein described.

116,394.—STEAM-ENGINE.—James Banks, Port Blanchard, Pa., assignor to himself, Francis Flynn, and Peter Dailey, same place.

Claim.—1. The combination of the beam A, crossheads B B', with boxes *a a'*, rods C C' and D D', stationary guide E and rocking-guide H, all constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the rocking-levers *a b f*, connecting-rods *d e*, arms *h h*, and valve-stem *k*, all constructed and arranged as shown and described, to be operated by the beam A, substantially for the purposes set forth.

3. In combination with the gearing claimed in foregoing clause, the connecting-rods *m m*, L-shaped rocking-levers *n n*, and hand-lever *p*, for reversing the motion, substantially as herein set forth.

116,395.—ROTARY STEAM-ENGINE.—John Barnett, Fredericktown, Ohio.

Claim.—1. The combination and arrangement of the abutments B^1, their arms B^2, cams D D', and springs E E.

2. The construction of the double cam D D', substantially as and for the purpose set forth.

116,396.—STOVE-GRATE.—Matthew R. Barr, Erie, Pa.

Claim.—1. The grate-support or hanger D, having the resting arms deflected from the chord or center line, and a steady arm, *s*, to hold it in position.

2. A grate having a stationary center, so constructed as to be alternated and tilted independently of the center and support.

3. The trunnions O and movable ring or pieces, in combination with a stationary center piece.

4. The grate A, center piece B, ring C, support D, and steady arm *s*, arranged and combined as and for the purposes set forth.

5. The arm or shank *s*, and trunnions O, in combination with a movable ring-grate having a stationary center, substantially as and for the purposes set forth.

116,397.—CAR-COUPLING.—Joseph W. Barrett, Calhoun, Ga.

Claim.—The arrangement and combination of the link L, bolt B, open draw-heads D D', and spring coupling-bolt C, all constructed as described, with mechanism for operating the same from the top or either side of the car, in the manner set forth.

116,398.—BARREL-HEAD.—John B. Barsaloux, St. Louis, Mo.

Claim.—A barrel-head, formed of a chamfered center head, C, having packing *c*, when arranged and secured in a corresponding-shaped man-hole, B, in combination with the head or chimes A and strip A' of an ordinary barrel, substantially as and for the purpose described.

116,399.—STREET-LANTERN.—Joseph W. Bartlott, New York, N. Y.

Claim.—1. A glass, *a*, having a rib, *b*, thereon, combined with its supporting-frame or bracket and with a reflector held to place between such rib and frame, substantially as shown and described.

2. In combination with a glass shade, a metallic chimney, secured to the top of the glass, and provided with a reflector, *h*, substantially as described, and shown in Figs. 1 and 3.

3. In combination with a glass shade, a reflector directly surrounding and fitting the glass at a point beneath its top, and an auxiliary reflector surrounding the glass, at its top, substantially as shown and described.

116,400.—HEEL FOR BOOTS AND SHOES.—Horace H. Bigelow, Worcester, Mass.

Claim.—1. A boot or shoe-heel having a concavity formed upon its upper side by means of pressure, while, at the same time, the sides and bottom of the heel are retained in position by suitable pressure-dies, as stated.

2. A boot or shoe-heel in which a concavity, D, is formed in its upper side, and the nails C partially inserted, while the sides of the heel are subjected to pressure, substantially as described.

116,401.—SELF-WATERING VASE.—William M. Bingham and Henry Bemis, Rochester, N. Y.

Claim.—A vase or flower-pot, having double walls for providing a reservoir for water or air, and the necessary pipes, shown at B, D, and E, for the purposes specified, when constructed substantially as described.

116,402.—FEATHER-EDGING AND CHANNELING-MACHINE FOR BOOTS AND SHOES.—Lyman R. Blake, Fort Wayne, Ind.

Claim.—In combination with feed-wheels and an edge-guide, a cutter fixed to that frame or arm in which the shaft of one wheel is journaled, and acting on the side of the sole opposite that upon which such wheel acts.

116,403.—STEAM-TRAP.—James H. Blessing, Albany, N. Y., assignor to himself and Frederick Townsend, same place.

Claim.—The piston L L', whether constructed with its smallest part L' hollow or solid, in combination with the piston-case A and the inlet and outlet attachments thereto, substantially as described.

116,404.—SPUR.—John C. Bohn, Allegheny City, Pa.

Claim.—The combination and arrangement of the bayonet-cylinder A and the bolt or bar B secured in shank C, and provided with thumb-piece *c*, when constructed and operating substantially as shown and described.

116,405.—TURBINE WATER-WHEEL.—Jeptha G. Boyland and George Buchanan, Crawfordsville, Ind.

Claim.—A water-wheel, substantially such as described, in which each bucket D is constructed at its outer edge with a flange, E, running from the top to the bottom of the bucket, substantially as and for the purpose set forth.

116,406.—LITHOGRAPHIC-PRINTING PRESS.—Edward S. Boynton, Brooklyn, N. Y., assignor to himself and Charles Parker, Meriden, Conn.

Claim.—1. The combination of the stone D' and the holder E, arranged and made adjustable within the revolving frame F, substantially as described, whereby the surface of the stone may be set in proper relative position to the periphery of the cylinder, substantially as set forth.

2. The arrangement of the shoe 7 on the griper-shaft, the two reciprocating studs 11 12 combined with the double-acting cam 13x to introduce the fingers alternately to the operation of the griper-shaft, substantially as set forth.

3. In combination with the shoe 7 on the griper-shaft, constructed with projections 8 8 on opposite sides of the said shoe, and provided with the V-shaped cam, the lever 9, arranged upon the head of the cylinder and provided with a spring to force the said lever to act upon the said cam to throw the said shoe to either of its two extremes, the two extremes being limited by the said projections coming in contact with the rim of the cylinder, substantially as set forth.

4. The auxiliary fingers 13, having extensions 14, and attached by frictional-spring pressure to the shaft *h'*, in combination with griping-fingers h, substantially as and for the purpose set forth.

5. The arrangement of the cam 13, by which the gripers are operated, directly upon the shaft of the impression-cylinder, so that the said cam revolves with the said impression-cylinder, as described.

6. In combination with the plate or blade *i*, arranged and operating as described, the bar *i'*, provided with screws to adjust the said plate *i*, and operating to support and release the said plate, substantially as described.

7. In combination with the inking or dampening-rolls, the auxiliary or gravitation-rolls 4, arranged in the slots S, curved upward to bring the bearing of the gravitation-rolls above the bearing of the inking or dampening-rolls, so that the gravitation-rolls will force the inking or dampening-rolls, arranged below the center of the cylinder, up against the surface of the cylinder, substantially as set forth.

116,407.—STEAM-ENGINE.—Henry W. Adams, Philadelphia, Pa.

Claim.—1. An engine, to the cylinder of which steam is admitted through an open pipe, substantially in the manner described.

2. A steam-cylinder, into the opposite ends of which, alternately, steam is admitted through pipes or passages which are open to the air, and through which the steam is exhausted, all substantially as set forth.

3. Utilizing a portion of the exhaust steam from one side of the piston of a steam-cylinder by causing it to unite with a jet of live steam directed into the cylinder at the opposite side of the piston, substantially in the manner described.

116,408.—ORDNANCE.—Bashley Britten, Red Hill, England.

Claim.—A cast-metal gun, in the breech of which is embedded a breech-piece of malleable iron or bronze, upon which the body is cast, and which is bored out to coincide with the bore of the gun, as specified.

116,409.—COASTING-WAGON.—Adna Brown, Springfield, Vt.

Claim.—1. The fender J and stirrups or foot-rests *b b*, when formed of one rod or wire, and supported by a brace, *d*, substantially as herein set forth.

2. The combination of the wheels A A, axle B, bed C, seat D, collar E, post G, wheel or wheels H, tongue I, fender J, foot-rests *b b*, and brake K, all constructed and arranged substantially as and for the purposes herein set forth.

116,410.—SOLDERING APPARATUS.—Andrew J. Burke, Baltimore, Md.

Claim.—The combination of the platform A, case *b*, rail C, plate D, and platform E, as specified.

116,411.—HOOP-SKIRT.—Charles C. Carpenter, New York, N. Y.

Claim.—1. In a hoop-skirt having an upper and a lower nest of hoops with an intervening space, the lower or skirt-nest thereof, formed by the same hoop 9 which passes spirally through the space between the upper and the lower nests, and unites the two together without use of separate wires or fastenings, as described.

2. The lower portion of the bustle-nest and the knee-guards or fenders *g* of the lower nest, formed by one and the same series of wires, 5, 6, 7, and 8, in the manner described.

3. The bustle and knee-guard wires crossed and interlaced at the back, for the purpose of increasing the strength and supporting power of the skirt at the back, as described.

4. In a hoop-skirt in which the lower nest is formed of a continuous wire, which also unites it with the bustle-nest, the combination therewith of the separate wires 5, 6, 7, and 8, crossed and interlaced at the bustle or back, and the knee-guards or fenders *g*, formed thereby, crossing the front space above the lower hoops, as described.

116,412.—TABLE-KNIFE AND FORK.—Matthew Chapman, Greenfield, Mass.

Claim.—Table knives and forks having a foot or rest applied to the bolster, or therenbout, adapted to support the blade or tines in the manner described, said blade or tines being overbalanced by the handle, all substantially as specified.

116,413.—FRICTION-PAWL OR CLUTCH-MECHANISM.—Walter R. Close, Bangor, Me., assignor to himself, John E. M. Sanford, Emon C. Smart, Job Collett, Reuel W. Kimball, William Margesson & Son, and Frederick H. Coombs, same place.

Claim.—The combination, with the shaft *a*, of the pulleys *b c* loose thereupon, the clutch-wheel *m* fast thereupon, and the rolls *o p* located in peripheral recesses of the clutch-wheel, the two pulleys having flanges *k k*, which inclose the clutch-wheel and the rolls, and each pocket or recess having two rolls, one for each pulley, all substantially as shown and described.

116,414.—SCREW-PROPELLER.—John Cochrane, Wall township, N. J.

Claim.—The tongued and grooved hub-joints, in combination with the hub-bands, substantially as described.

116,415.—KITCHEN-SAFE.—Thomas Coltrane, Cedar township, Iowa.

Claim.—1. In combination with a kitchen-safe, constructed substantially as described, the chests E and F for the reception of flour and meal, respectively, as set forth.

2. The improved article of furniture herein described, composed of the meat-closet C, cupboard D, flour and meal-chests E and F, and compartments G and H beneath the chests, all supported and arranged to revolve on a pedestal, A, substantially as set forth.

116,416.—SWITCH-LOCK.—Alonzo W. Cram, St. Louis, Mo., and William B. Dunbar, Chicago, Ill., assignors to Alonzo W. Cram.

Claim.—1. The tubular bolt J *j j'*, spring-tumbler or tumblers I *i i'*, and spring-lever K *e e'*, substantially as and for the purpose described.

2. The combination and arrangement of the guide-bars F G, bolt J, tumbler I, and spring-lever K, with the switch-operating lever C, all substantially as described.

116,417.—ROWING-MACHINE.—William B. Curtis, Chicago, Ill.

Claim.—The combination, in a rowing-machine, of a seat, A, the standards B and B', the rotating friction-ratchet C provided with washer D, the arm E provided with spring-pawl *d*, and the row-lock F, all constructed, arranged, and operated substantially as described and shown.

116,418.—Reamer.—John K. Derby, Jamestown, N. Y., assignor to Daniel A. Seymour and Elias B. Stilson, same place.

Claim.—1. The combination of hollow guides E F and the notched and tubular block D with the curved cutter B and solid block A, as and for the purpose specified.

2. The reaming-cutter B having a shank with several holes therein, arranged detachably on the solid block A, and held thereto by a bolt, C, as described, so as not only to be held firmly in place, but to admit of a radial adjustment for the purpose of increasing or lessening the limit of its throw.

3. In combination with the hereinbefore-described reaming-cutter B and solid block A, the blocks D F, made in tubular form, and with notches or recesses to receive the chips, as specified.

4. The arrangement, upon a leader, A, and block D, of detachable tubular guides E F, to enable the same tool-stock to be used in boring different-sized holes.

116,419.—Dining-Table.—James H. Drane and Leonard Drane, Eminence, Ky.

Claim.—The combination and arrangement of the stationary table A, revolving table or platform B, column C, caster D, vertical shaft E, adjustable fans F F, and driving mechanism G, substantially as and for the purpose set forth.

116,420.—Punching-Machine.—James Duff, Peoria, Ill.

Claim.—The crank B and arm C, constructed with the slots *e e* and *e*, as described, in combination with the pin *d* of the toggle-joint D, carrying the guide-block E with punch *e e* and dog G, connecting by rod *f* with lever F, all arranged and operating as shown and set forth.

116,421.—Saw.—James E. Emerson, Trenton, N. J.

Claim.—A saw, having piece *a* partially slit or punched from plate A or tooth B, in the manner and for the purpose shown and described.

116,422.—Revolving Fire-Arm.—Sullivan Forehand and Henry C. Wadsworth, Worcester, Mass.

Claim.—1. The combination, with the removable base-pin in a revolving fire-arm, of a removable shell-discharging pin.

2. The combination, with the base-pin E, of the cartridge-shell discharging-pin F and spring catch-lever G, substantially as and for the purposes set forth.

116,423.—Apparatus for Storing and Discharging Naphtha, &c.—Theobald Forstall, New Orleans, La.

Claim.—1. The method, herein described, of storing naphtha or other volatile hydrocarbons in an equilibrated holder surrounded by water, into and from which the hydrocarbon is discharged, substantially in the manner and for the purposes set forth.

2. The combination of the tank, holder, and closed equilibrium-chamber covering the top of said holder, and extending down upon the sides of the same to a point below the water-line in the tank, substantially as shown and set forth.

3. The combination of the holder, equilibrium-chamber, and safety-valve, conducting any vapors generated in the holder, in the water counter-balance in the chamber, substantially as shown and set forth.

4. An apparatus for storing naphtha and other volatile hydrocarbons, consisting of the holder, inlet, and discharge-pipe, equilibrium-chamber, and tank, substantially as described, combined and operating in connection with the water contained in said chamber and tank to effect the entrance and discharge of the hydrocarbon into and from the holder, and to equilibrate the holder, substantially as shown and set forth.

116,424.—Thread-Cutting Device for Sewing-Machines.—Fred. H. Furnis, Waterloo, N. Y.

Claim.—The cutter C, spring *g*, and thumb-lever D, constructed as described, in combination with the presser-foot of a sewing-machine, substantially as and for the purpose specified.

116,425.—Combined Corn and Cotton-Cultivator.—William C. Gaines, Salem, assignor to himself and Harvey B. Varnes, Manassas, Va.

Claim.—The frame with slotted beams H H′, laterally adjusted by means of lever S, in combination with rock-shaft O, lever R, and levers N N, whereby the plows can be raised separately or collectively, substantially as set forth.

116,426.—Cooking-Stove.—Robert Gass, Troy, N. Y., assignor to Eddy, Corse & Co., same place.

Claim.—1. The means employed for pivoting the slide D to or upon the stove-front so as to permit the same to be slid or moved forward, and to one side upon the hearth B, consisting of the hinge F provided with a vertical opening, and with the recess *f*, in combination with the pintle G and lug H, substantially as and for the purpose specified.

2. The supporting-strip I, in combination with the slide or cover D and the hearth B, substantially as and for the purpose shown.

3. A draught-damper or slide, so arranged within the hearth or other equivalent portions of a stove as to bring all of its parts below the surface of the same, substantially as shown, and for the purpose set forth.

116,427.—Dentist's and Barber's Chair.—August Gebhard and John Blodan, Indianapolis, Ind.

Claim.—The toothed or notched segmental casting C attached to the hinged back B, the latch or catch D attached to the frame A, and the extension foot-rest F furnished with the hinged leaf G, all constructed and arranged substantially as set forth.

116,428.—Gang-Plow.—Samuel J. Gillham, William Capp Taylor, and James W. Stolle, Vandalia, Ill., assignors to said Gillham and Taylor.

Claim.—1. The adjustable hinge-connection *e f g*, between the fore ends of the beams and the frame, in combination with the guide-yokes H H′, connected to the axle-bar by adjustable socket-bolts *h*, substantially as and for the purposes set forth.

2. The adjustable brace-connections K *k* L I M N O *k*, in combination with the beam G, standard I, and axle C, substantially as set forth.

116,429.—Dial-Telegraph Apparatus.—Ezra T. Gilliland, Cincinnati, Ohio., assignor to Hiram D. Rogers, same place.

Claim.—1. The double-acting dial-telegraph, consisting of the shaft D E, disk F, ratchet-wheel G, forked and vibrating arm I I′ J K, and actuating-pawls H H′, when arranged to operate substantially as herein described and set forth.

2. The dial-plate A, boss B, and hub C, when cast in one piece, as herein described.

3. The described combination of notched disk Q R S, spring-conductor T, handle V, index W, pawl X, and collar Y, for the purpose described.

116,430.—Dial-Telegraph Instrument.—Ezra T. Gilliland, Cincinnati, Ohio, assignor to Hiram D. Rogers, same place.

Claim.—1. In connection with the dial-plate pointer and shaft, the pawl-arms E E′, pawls F F′, and ratchet-wheels D D′, combined and operating to move the pointer in either direction, substantially as described.

2. The adjustable stops H H′ I I′, or their equivalents, substantially as described, to limit the motion of the pawls.

116,431.—Car-Coupling.—Henry C. Gilliland, Wellsville, Mo.

Claim.—In combination, the draw-bar A, the pivoted jaw B, the coupling-pin D, and the spring F, substantially as and for the purpose shown and described.

116,432.—Scissors.—Russell S. Gladwin, West Meriden, Conn.

Claim.—In a pair of scissors, one of the blades constructed with a hook, *c*, at the end and on the cutting-edge, substantially in the manner herein set forth.

116,433.—Bottle-Stopper.—Claude Glover, New York, N. Y.

Claim.—A bottle-stopper, in which the tube A, cap C′, rubber cap or spring B, and the cap C are combined, and arranged to operate substantially as shown and described, and for the purpose set forth.

116,434.—Stamp-Canceler.—John Goldsborough, Philadelphia, Pa.

Claim.—A combined cutter and scraper for stamp-canceling machines, consisting of a wheel or plate having at the edge serrations and cutting-projections *i*, as specified.

116,435.—Loom-Shuttle.—Edmund H. Graham, Biddeford, Me., assignor to himself and Reuben W. Randall, same place.

Claim.—1. In combination with the automatic locking and unlocking device, the shuttle-arms D D, constructed and operating as described, and for the purposes set forth.

2. A shuttle, having an automatic lock, constructed in the manner substantially as and for the purpose hereinbefore set forth.

116,436.—Rotary Engine.—William A. Graham, Carlisle, Pa.

Claim.—1. The passages *d e* and groove *f* for admitting the steam behind the pistons G G, substantially as and for the purposes herein set forth.

2. The combination of the cylinder A with passages *a a′*, ports *b b′*, heads B B, passages *d e*, pipes D D′, and the cylindrical head E, with pistons G G and grooves *f f*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

116,437.—Let-off Motion of Looms.—Frederick William Graichen, Providence, R. I., assignor to Edward Barrows and Joseph Clayton, Dracut, Mass.

Claim.—My improved yarn-beam friction apparatus as composed of instrumentalities as described, arranged, and combined as set forth, such instrumentalities consisting of the single spring L, the lever K, the pawl I, the ratchet-wheel H, the wheel G, frame E, the shaft F, the bands M N, guide-wheels O O, and levers D D, provided with the friction-bands C C, applied to the yarn-beam as represented.

116,438.—Fire-Place Grate.—Alfred Greenaway and Hugh J. Needham, New Albany, Ind.

Claim.—The tile A, as above described, and the air-space D D behind it and at the ends, in combination with the open-grate back B, when made separate from the front part; also, the front C, when hung to the frame H by the hook J at the top, and held up by the pin E at the bottom, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

116,439.—Boot and Shoe-Tap.—John C. Hancock, Charlestown, and Josiah C. Richardson and Edward P. Richardson, Somerville, Mass.

Claim.—A heel or sole-tap for boots and shoes, formed of cup-piece B and plain disk C, made of rubber, and the metal plate A perforated at D and E, the whole being relatively arranged and united together in the manner and for the purpose described.

116,440.—Instrument for Ringing Hogs.—John Heesen, George Heesen, and Henry Nyland, Tecumseh, Mich.

Claim.—The two pivoted concave jaws C D, combined with the flanges *c c*, acting as lateral guides to the metal blank and stops to the jaws, for the purpose specified.

116,441.—Fire-Escape.—William Henley, Chicago, Ill.

Claim.—1. In combination, the cylinder A constructed in sections as described, brackets D provided with lugs *d d′*, steps B, rail E, and balusters F, the whole arranged substantially as and for the purpose described.

2. In combination, the cylinder A constructed in sections as described, brackets C provided with lugs *a a*, steps B, rail E, baluster F, clasps G, and swivel-jointed rods H H, the whole arranged substantially as and for the purpose described.

116,442.—Lubricator.—John Hodge, Harrison, N. J.

Claim.—In combination with the box A of a wheel or pulley, the revolving oil-cup B, having spiral conduit C, as specified.

116,443.—Water-Wheel.—Otis J. Hodge, North Adams, Mass.

Claim.—1. The gate A, provided with chutes B B, arranged spirally, substantially as shown and described, and for the purposes herein set forth.

2. The gate A, with spirally-arranged chutes B B, in combination with the arms C C, inclines D D, spiral rack E, and pinion G, substantially as and for the purposes herein set forth.

116,444.—Cooking-Stove.—Henry T. Holmes and Wallace H. Priest, Little Falls, N. Y.

Claim.—The chamber C, having cold-air inlets G N, outlet H, and passage K, with corresponding dampers, combined with the air-surrounding pots F, as and for the purpose specified.

116,445.—Water-Gate.—William C. Hopwood, Fillmore, Ind.

Claim.—The arrangement of the spanning-rod *a*, supporting-posts *c c*, beams *g*, hinges *f*, slats *h*, scantlings *i*, and braces *j*, as specified.

116,446.—Plow Attachment for Cutting Stubble.—John T. Hovis, Clintonville, Pa.

Claim.—The reciprocating cutter *a*, finger-bar *b*, pitman *d*, shaft *f*, pinion *h*, crown-wheel *i*, shaft *j*, pinion *m*, and wheel *n*, arranged, in connection with a plow, substantially as shown and described.

116,447.—Tile-Machine.—John B. Hughes, Terre Haute, Ind.

Claim.—1. The movable bottom D with longitudinal depressions *b b*, opening *d*, and bevel *e*, substantially as and for the purposes herein set forth.

2. In combination with the movable bottom D, constructed as described, the pan E, having corresponding shape, substantially as and for the purposes herein set forth.

3. The combination of the beams A A, rack-bars *a a*, box C, bottom D, and pan E, all constructed

and arranged substantially as and for the purposes herein set forth.

4. The combination of the roller G, frame H, crank I, friction-rollers *i i*, and cog-wheels A A, all constructed and arranged substantially as and for the purposes herein set forth.

116,448.—TILE-MACHINE.—John B. Hughes, Terre Haute, Ind.

Claim.—The arrangement, in the tile-machine herein described, of the bed-piece A, boxes H H with different-shaped openings *f f* and flat opening *h*, reciprocating plungers G, rack-bar D, rollers *k k*, frames J J, and rods *i i*, all constructed and operating substantially as and for the purposes herein set forth.

116,449. — MANUFACTURE OF BACKS FOR CARRIAGE-SEATS. — Benjamin Hurlburt, Fort Wayne, Ind., assignor to himself and Noble G. Olds, same place.

Claim.—1. The process herein described, of making carriage-seat backs and ends by cutting the same in one piece, and in a flaring form, from a block of timber previously bent or curved, substantially as shown and set forth.

2. As a new manufacture, carriage-seat backs and ends, obtained from a block of timber first bent, as described, and then cut longitudinally into flaring sections, substantially as herein shown and described.

116,450.—APPARATUS FOR THE MANUFACTURE OF ILLUMINATING-GAS.— Edward Jones, Boston, Mass., assignor to The American Coal Gas-Light Improvement Company, same place.

Claim.—The outlet-pipe D with its valve or cut-off, connected with the retort A, so as to conduct the gas without pressure to the desired point, in combination with the outlet-pipe E, which is also connected with the retort, and extends down into the liquid contents of the hydraulic main so as to form a "dip-seal," substantially as and for the purpose set forth.

116,451. — GALVANIC BATTERY. — Jerome Kidder, New York, N. Y.

Claim.—1. The combination of longitudinal bars B B^1 B^2 with the battery-cells and their connections, when arranged as and for the purpose specified.

2. The combination of transverse bars *v v' v''* with the battery-cells and their connections, when arranged as and for the purpose specified.

3. The longitudinal bars B B' B'' and transverse bars *v v' v''*, combined and arranged with the battery-cells and connections, as and for the purpose specified.

116,452.—DOOR-LOCK.—John H. Kinsman, Salem, Mass.

Claim.—1. The slides B with the openings *b*, acting directly upon the primary tumblers by means of the key, in combination with the pieces B' with the openings *b'*, used to separate the slides B, substantially as and for the purpose hereinbefore described and set forth.

2. The bent slide E, with its curved edge V', in combination with the primary tumblers and pin *u'* attached to the cap-plate, as and for the purpose hereinbefore described and set forth.

116,453.—MACHINE FOR JOINING TUBULAR LIGHTNING-RODS.—George S. Knapp, Winona, Minn.

Claim.—1. The combination of the sliding jaws C, radially arranged, with the cams *g*, operated by the lever E for compressing the end of the lightning-rod, as described.

2. In combination with the clamping-jaws I and *r*, the sliding conical plug *m*, arranged to operate, substantially as described, for opening the ends of tubular rods, as set forth.

116,454.—PUMP.—Lucius J. Knowles, Worcester, Mass.

Claim.—The combination, with the piston-rod E and tappet-arm I, of the jointed hand-lever K, notched fulcrum-arm L, and supporting-studs J P, substantially as shown and described.

116,455. — DIE FOR FORMING CARRIAGE-CLIPS.—Wilson W. Knowles, Plantsville, Conn.

Claim.—1. The dies A and B, provided, respectively, with the rib *a* and groove *b*, substantially as and for the purpose shown and described.

2. The hereinbefore-described carriage-clip, having a grooved or concave under surface that corresponds in shape with its upper surface, substantially as and for the purpose shown.

116,456. — DIE FOR FORMING CARRIAGE-CLIPS.—Wilson W. Knowles and Le Roy S. White, Plantsville, Conn.

Claim.—The series of dies A D I and N, for constructing saddle-clips, substantially as shown and specified.

116,457, antedated June 7, 1871.—SIFTING-MACHINE.—Benjamin N. Lampman, Rutland, Vt.

Claim.—The roller C, provided with a zigzag groove-rod *n*, sifter E, tail-piece H, and crank-wheel *m*, all arranged to form a coal or ash-sifter, substantially as described.

116,458. — SAW-MILL. — Francis Layani, Monroe, La.

Claim.—The blades D, when combined and arranged with the transverse pieces C in the rear of the saws, as described.

116,459.—FLOWER-STAND.—Charles T. Lee, Taunton, Mass., assignor to himself and Lloyd H. Dean, same place.

Claim.—1. The ribs or bars G, having hook ends *a*, in combination with the staples Q on the plate or frame K, substantially as described, for the purpose specified.

2. The ribs or bars G, in combination with the frame or ring N, relatively constructed for being interlocked, substantially as described, for the purpose set forth.

3. The brackets or arms H H^2 H^3, in combination with a shelf relatively constructed for locking the shelf thereon, substantially as described.

4. A frame, composed of ribs or bars, G, having brackets or projections H, frame K having staples, and frame N, when relatively constructed for being secured together without the use of separate fastening devices, substantially as described.

116,460.—LOW-WATER DETECTER.—Lewis L. Lee, Milwaukee, Wis.

Claim.—The nut C, connected with pipe D and case B, and containing the opening O for the test-pipe E, substantially as set forth.

116,461.—MACHINE FOR STRETCHING SILK.—John N. Leonard, Rockville, Conn.

Claim.—The grooved rollers *f f*, of uniform size, in combination with a regulating tension, substantially such as shown and set forth.

116,462.—COMPOUND FOR DYEING HAIR.—Joseph S. Letord, Sedalia, Mo.

Claim.—The manufacture or preparation of a compound for dyeing hair, composed of the ingredients and in substantially the proportions set forth.

116,463.—FILTER.—William Linton, Baltimore, Md.

Claim.—The improved filter formed of the cylindrical case A, bends D E, perforated horizontal partitions B B, vertical scrolls F F, chamber C for filtering material, nozzles G and M, cock N, nozzles H and P, and caps K Q, all constructed and arranged as shown and described.

116,464. — SEWING-MACHINE TREADLE.—Amos D. Lufkin, Cleveland, Ohio.

Claim.—The combination of the rocking-lever A, the connecting-rods B B', the connecting-rod J, and the foot-treadles H H, substantially as and for the purpose set forth.

116,465.—COLLAR-CAP FOR HARNESS.—Arnold P. Mason, Franklinville, N. Y., assignor of one-half his right to William H. Bard, same place.

Claim.—1. The combination of the sides *a a*, seam *b*, metal lining *d*, and flanges *c*, as specified.

2. In a collar-cap, a metal lining, when made in two separate pieces, placed one at each side of the cap, as described.

116,466. — PORTABLE FARE-BOX.—William L. May, Philadelphia, Pa.

Claim.—The leaves E and E', the supplementary leaves F F', the lever C, links *d d'*, and spring L, operating as specified, said lever being arranged beneath the leaves, and projecting through the side of the box into convenient proximity to the handle of the same, substantially as herein shown and described.

116,467.—MACHINE FOR FOLDING CARPET-LININGS.—John C. Mayall, Boston, Mass.

Claim.—The combination of table E with the former J, having rolls *c* and rolls *h*, relatively constructed and arranged for operation, substantially as and for the purpose set forth.

116,468.—Suspended.

116,469.—HASP-LOCK.—William C. McGill, Cincinnati, Ohio, assignor to A. J. Woodworth, Jennersville, Pa.

Claim.—1. The locking-spring E, having the key-hole stem F attached to its free end, in combination with the ring-bolt G and box C, substantially as described and shown.

2. The guard-spring D, in combination with the locking-spring E, having the key-hole stem F attached to its free end, ring-bolt G, and box C, made and operating substantially as herein described and shown, and for the purpose set forth.

116,470.—MACHINERY FOR MAKING ROOFING-FELT.—Jerome B. Melvin, Lowell, Mass., assignor to himself, James H. Pindar, and John E. Crane, same place.

Claim.—1. A sand-filling apparatus, in combination with a felt-feeding apparatus, substantially as described, and for the purpose set forth.

2. The combination, substantially as described, of a sand-filling apparatus and a felt-saturating apparatus, with a feeding and a carrying and guiding apparatus, for the purpose and substantially as specified.

3. The combination, substantially as described, of a sand-filling apparatus, a bath or saturating apparatus, and a felt-squeezing apparatus, with the feeding and carrying mechanisms.

4. A sand-covering apparatus, which covers both sides of the roofing-felt with sand simultaneously, or by a single operation or process, as shown and described, in combination with the squeezing-rolls and with the bath or saturating apparatus, and the feeding and carrying mechanism, with or without the sand-filling apparatus, as set forth.

5. The edge-forming rolls, substantially as described, in combination with the sand-covering apparatus and the saturating apparatus.

6. The combination of the edge-forming rolls with the sand-covering and the saturating and the sand-filling apparatus.

7. The combination of the edge-forming rolls with the bath and the squeezing-rolls, and with the feeding and guiding mechanisms.

8. The combination, substantially as described, of a sand-distributer, E, with the beater or felt-agitating device F, operating in connection, substantially in the manner and for the purpose set forth.

9. The combination, substantially as described, of a feeding and carrying mechanism, a sand-filling apparatus, a saturating and a squeezing apparatus, and a sand-covering apparatus operating in the manner and for the purpose set forth.

10. The combination, substantially as described, of a feeding and carrying mechanism, a sand-filling apparatus, a saturating and a squeezing apparatus, a sand-covering apparatus, and an edge-forming apparatus, all operating in the manner and for the purpose set forth.

11. The combination, substantially as described, of a feeding and carrying mechanism, a sand-filling apparatus, a saturating and a squeezing apparatus, a sand-covering apparatus, an edge-forming apparatus, and a guiding and lap-rolling apparatus, all combined, arranged, and operating substantially in the manner and for the purpose set forth.

12. The process, substantially herein described, of producing sand-filled, and saturated, and sand-covered fibrous roofing-felt.

13. The process, substantially as herein described, of producing adhesively-saturated fibrous roofing-felt, such as herein described, in continuous sheets, with both sides covered with sand, as specified.

14. The process, substantially herein described, of producing fibrous roofing-felt with a lap-jointed edge or edges, whether filled or covered, or both filled and covered with sand, as set forth.

15. As a new manufacture, sand-filled, adhesively-saturated, and sand-covered fibrous roofing-felt, substantially as described.

16. Roofing-felt with lap-jointed edges, substantially as described, whether filled or covered, or filled and covered with sand, or only saturated with the adhesive material, as specified.

17. Saturated fibrous roofing-felt such as herein described, made in continuous sheets, with both sides covered with sand, as set forth.

116,471.—BINDER'S PLATFORM FOR HARVESTERS.—Curtis Miller, Lincoln, Pa., assignor to himself and J. R. Royer, same place.

Claim.—The arrangement of the wheel-supports A A, when made adjustable between the sills *s* and the top piece *e*, in combination with the adjustable binders' platform F, hinged table E, on a car, attached to ordinary platforms of reaping-machines, in the manner and for the purpose specified.

116,472.—BODY-LOOP.—Robert R. Miller, Plantsville, Conn.

Claim.—A body-loop provided with side flanges D and D' and dependent flange E, constructed and arranged substantially as described and shown.

116,473.—PLIER.—George W. Moore, Newark, N. J.

Claim.—In pliers composed of two jaws and handles, working upon a fixed center, as described, the cylindrical or partially-cylindrical head, formed on one of said jaws, in combination with an adjustable jaw, provided with a correspondingly-cylindrical recess to fit the cylindrical head upon the axis of which said jaw is hung and oscillates, substantially as and for the purpose shown and set forth.

116,474.—COMPOSITION FOR THE CURE OF PILES. — Louis L. Moore and R. B. S. Whayre, Calhoun, Ky.; said Moore assigns his right to said Whayre.

Claim.—The pulverized burned alum, the boiled or strained honey, and the mutton-tallow, when compounded or prepared in the manner set forth.

116,475.—Bearing for Railway-Car Axles.—Eliza Dexter Murfey, New York, N. Y., assignor to The Manhattan Packing Manufacturing Company, same place.

Claim.—1. The combination of a case or hub, A, the holder D fitting in the case and adapted to the journal *x*, and a lining, I, of the material described, carried by the holder, as set forth.

2. The said lining I secured to a holder, D, by cords *a*, so as to be detachable from the holder, as described.

3. The combination of the lining and chambers *e*, as specified.

4. The springs *f* and disks *f*, in combination with the chambers *e*, for the purpose specified.

5. The detachable thrust-plate F, carrying impregnated bearing material *i*, as specified.

116,476.—Street-Lamp. — Thomas North, Cincinnati, Ohio.

Claim.—The herein-described gasoline street lamp case, in which the glass sides are secured to the frame by the grooves *a* and *b* and leaden clips F, and the apertures J J′ covered by overhanging hoods K and K′, the conical top L of the upper hood K′ being provided with an aperture, J″, at the apex, substantially in the manner and for the purposes set forth.

116,477.—School-Desk.—Henry B. Osborne and Noah W. Hammon, Des Moines, Iowa.

Claim.—1. The groove *c* or *d*, elbowed or straight, and the pin *b*, in combination with either the long arm C attached to the end frame A and book-box B, or with the short arm D attached to the end frame A and seat-arm, operating substantially as described.

2. In a school-desk, the long arm C combined with the base of the frame, the book-box A, the pin *b*, the elbowed groove *c*, and the gravitating lock *a*, all made and operating substantially as described.

116,478.—Bolt-Cutter.—Abner W. Owen and Miol E. Lilley, East Canton, assignors to themselves and A. J. Walter, Le Roy, Pa.

Claim.—The within-described bolt-cutter, consisting of jaws A A′, cam-lever D, link C, and cutters *a a′ b b′*, all arranged substantially as set forth.

116,479.—Apparatus for Tapering Ferrules. — John L. Parker, Worcester, Mass.

Claim.—1. The combination of the block B having a tapering hole in it of the diameter and taper required for the ferrule externally, the mandrel A more tapering than the hole in said die-block, a support for said mandrel, and mechanism to reciprocate die-block B, substantially as and for the purpose described.

2. The combination, with the bed C and movable head D of the power-press, of the centering-spindle A, forming-die B, discharging-pin G, and cross-bar J, substantially as and for the purpose set forth.

116,480.—Tile-Machine.—Zeno F. Parun, Baltimore, Md., assignor to Geo. C. Hicks & Co., same place.

Claim.—1. The combination of the false sectional matrix *i* with the annular collar *j*, on the bottom of the cylinder or pug-mill B, substantially as and for the purpose specified.

2. The die H, made to connect with the core-plug T and matrix *i*, and made in three or more parts, of wedge-shape in both length and depth, so that they will freely separate from the pipe when the latter is lifted from the supporting-table, as set forth.

3. The disk *l*, fitting into a recess in the platform C, in combination with its rod *m* and levers *n* and *o*, for operation, essentially as described.

116,481.—Apparatus for Sizing the Initial Coils of Cops in Spinning-Machines.—Alfred Pearson, Assonett, Mass.

Claim.—1. The combination and arrangement of the brush A, the size-holder or reservoir B, and the adjustable gauge-plate C, all as set forth.

2. The combination and arrangement of the size-reservoir A, the brush B, the gauge-plate C, and the guide-wire D, all substantially as and for the purpose as hereinbefore explained.

116,482.—Bracket for Warp-Creels.—Napoleon B. Peck, Woonsocket, R. I.

Claim.—A single-screw glass bracket for creels of warp-frames, provided with the stud C on the back of the journal-seat wall, and the buffer *z* for strengthening the screw-hole, substantially as specified.

116,483.—Mechanism for Operating Ventilators.—Abraham L. Pennock, Philadelphia, Pa.

Claim.—The combination of an adjustable rod, F, or its equivalent, with a series of hinged ventilating-frames, and with mechanism substantially as herein described, by which the horizontal adjustment of the said rod or its equivalent will be the means of simultaneously raising or lowering the said frames.

116,484.—Brick-Machine.—Julius Frederick Moore Pollock, Leeds, Great Britain.

Claim.—1. The combination, in a brick-machine, of a pug-mill, molds *e* receiving the clay from said mill, and each provided with a plunger, e^3, a slide, r^3, a lubricating-roller, *q*, and a lubricating-plunger, *n*, the whole operating substantially as and for the purpose described.

2. The combination of the series of molds *e*, the slide r^3, and the press to which the molded bricks are conducted by the action of the slide, substantially as described.

3. The combination of the movable table having molds *e*, and a supplementary lubricating-plunger *n* supplied with lubricant, and operated substantially as described.

4. The combination, with the table, its molds *e* and plungers e^3, of the lubricating-roller *q*, arranged to pass over the surface of the bricks while in the molds, substantially as set forth.

5. The combination of the plunger of the press and a lower cross-head operating with the plunger and with a block, f^6, in the die *k*, to raise the bricks from the die, as set forth.

6. The delivery-slide and lever *r*, in combination with the check or guard-lever *t* for determining the exact position of the brick to be pressed, substantially as described.

7. The combination, with the delivery-rollers *l* and the belt *m*, of the rotating cylindrical brush 23 for removing excrescences from the bricks as they leave the machine, substantially as described.

8. The arrangement of the circular table *e*, and lower disk *f* having sockets f^3 for guiding the stems of the mold-plate e^2, as specified.

9. The combination of the table *e*, disk *f*, ring *g*, its pawl and devices for operating the said ring intermittently, as described.

116,485.—Cylinder-Cock.—John Porteous, Cincinnati, Ohio.

Claim.—In the described combination with the barrel B *b*, automatically-acting valve C *c*, spring E, and discharge-pipe F, the screw-cap D *d* adjustable from the outside, as and for the object set forth.

116,486.—Shaft-Protector.—Ahira S. Porter, North Bridgewater, Mass.

Claim.—An elastic cushion or shield for protecting carriage-shafts, substantially as described.

116,487.—Crank-Motion.—Edmund Quinn, Brooklyn, N. Y.

Claim.—1. The double crank herein described, substantially as specified.

2. The combination with the double crank, having its wrists placed, with reference to the shaft, at or about one hundred and twenty degrees of the lever B, and the pitmen E E, substantially as specified.

116,488. — Washing-Machine. — Horace Larden Richardson, Lyndon, Ill.

Claim.—The cylinder B, constructed as described—that is to say, supplied with the buckets b^1 b^1 and angular ribs or projections b^2 b^2, having the side apertures b^3 b^3, as shown and described, and for the purpose set forth.

116,489.—Composition Fuel.—Ernst H. Richter, Taunton, Mass.

Claim.—The composition or fuel, as hereinbefore explained, made of a carbonaceous material and the three different kinds of clay mixed together, substantially as described, in or about in the proportions, and molded, as hereinbefore set forth.

116,490.—Buck-Saw Frame.—Edward M. Madden and Shattiece D. Roberts, (administrators of Thomas D. Roberts, deceased,) Middletown, N. Y.

Claim.—1. The metal brace D, in combination with the strain-brace B and end pieces A, in the manner and for the purpose described.

2. As a new article of manufacture, the saw-frame herein described.

116,491. — Hand-Burnisher for Boots and Shoes.—John G. Ross, Philadelphia, Pa.

Claim.—A hand-burnisher, consisting of the handle *c*, shank *b* with its projection D, and corrugated detachable cap *a*, all constructed and operating together, as described.

116,492.—Trunk.—Edward A. G. Roulstone, Boston, Mass.

Claim.—1. The trunk A, when constructed as described, and secured at the edges and upper corners by the clamps *a a* and *a′ a′*, as shown in Figs. 1 and 2, the clamps *a′ a′* extending in front sufficiently to afford protection to the door.

2. The trunk A, when constructed as described, and having fitted within it the till or tray C and drawer or drawers D with their spring-catches *e e* and *f f*, all arranged and combined substantially as and for the purpose set forth.

3. The till or tray C, fitting into the top of the trunk and having the configuration shown in Fig. 5, in combination with the pivoted arm *c′*, substantially as and for the purpose specified.

4. The till or tray C, constructed as described, in combination with the incline C′, with or without the pivoted arm *c′*, when arranged with reference to a trunk, substantially as and for the purpose set forth.

116,493.—Convertible Corn-Planter.—Andrew Runstetler, Peoria, Ill., assignor to Samuel D. Cochran, same place.

Claim.—The convertible corn-planter, consisting of beams A A, removable beam E, stationary beam D provided with the uprights *r r*, and slotted clevis *d* carrying the heel of the tongue K, axle B provided with the guides *u u*, seat-bars Z Z with shoes *w w*, constructed so as to afford a bearing for the pivots of box-lever F, all arranged and adapted to receive the parallel levers R R and foot-bars S S, and removable beam E E carrying the rotary corn-stalk cutter, substantially as described.

116,494. — Rail-Joint or Splice. — John C. Rupp, Newark Del., assignor to Simon E. Pettee, Bethlehem, Pa.

Claim.—The railroad-rail joint or splice, consisting of the parts B B′, provided with the bases *c c* and shoulders *b b*, and applied to the rails by the bolts C C, as described, whereby the tightening of the lower bolts presses the shoulders *b b* upward against the bottom of the rail to support the same, as herein shown and described.

116,495. — Knife-Sharpener. — James J. Russ, Worcester, Mass.

Claim.—The combination, with a holding-frame in a knife-sharpener provided with supporting-bevels *b b*, of the beveled-sided cutter C and pressing-screw D, substantially as shown and described.

116,496. — Planing-Machine. — James J. Russ, Worcester, Mass.

Claim.—1. The combination, with the cutter-head B and one or more pressure-rolls R, of an endless traveling feeding-bed, G, with suitably operating mechanism, and a solid planing-bed, D, substantially as and for the purposes set forth.

2. The combination, with the bed-supporting shaft J and side frame A, of the draw-screws M and holding-bosses N, substantially as and for the purposes described.

3. A planing-machine for working wood, the parts of which—B, D, E, F, F′, G, H, I, J, K, L, and R R—are constructed and combined together for operation, substantially as shown and described.

116,497. — Process of Manufacturing Cloth.—Alfred Ruzé, Gaillon, France, assignor to Simon H. Sibley, Warren, Mass.

Claim.—The process herein described of manufacturing cloth.

126,498. — Woven Cloth.—Alfred Ruzé, Gaillon, France, assignor to Simon H. Sibley, Warren, Mass.

Claim.—A fulled cloth, the surface of which consists of uniformly-arranged knobs or frizzed projections formed from the ends of cut and raised face-filling threads, introduced as and for the purposes set forth.

116,499. — Shuttle-Guard for Looms.—John Rycroft and Lucius A. White, Millbury, Mass.

Claim.—1. The combination, with the central portion of the guard-rod B provided with the flanges *b b*, of a hooked or looped central support, D G, substantially as set forth.

2. The combination, with the flanged guard-bar B, of the hooked central-supporting standard D G, and end-supporting standards C and E provided with eyes F, substantially as and for the purposes set forth.

116,500. — Comb-Cleaner.—August Sahlstrom, Chicago, Ill.

Claim.—The combination of the angular pieces A and A′, socket B, handle C, wires D, and bristles E, arranged and constructed as and for the purpose set forth.

116,501.—Egg-Detecter.—August Sahlstrom and Peter Rohdin, Chicago, Ill.

Claim.—The combination of the tube A, reflector B, plate C, and springs D, substantially as and for the purpose set forth.

116,502, antedated June 19, 1871.—Seesaw. Sarah E. Saul, Brooklyn, N. Y.

Claim.—In combination with the lever or board B, provided with the slot *a*, openings *k*, seats D, and grooves *c*, the fulcrum-block A having the angular bearing *b*, and the pole E with its pulley *a* and cord *z*, substantially as specified.

116,503. — Molding-Machine. — Conrad Schilling, Pekin, Ill.

Claim.—1. The shaft G provided with the two bevel gear-wheels H, mounted in the movable bearings *f* pivoted to the levers *g*, having their opposite ends connected to the shifting-rod *h*, substantially as described.

2. The sliding shaft K, in combination with the bar M, screw N, perforated wheel *k*, and spring-pawl *l*, all arranged to operate substantially as described.

3. In combination with the devices last above named, the reciprocating or sliding bed B, arranged to operate as set forth.

116,504.—Treating Saccharine Liquids. Adolph Schreiber, New York, N. Y.

Claim.—The within-described process of treating saccharine juices by exposing the same, while in the vacuum-pan, to the action of sulphurous acid in solution, substantially in the manner herein shown and described.

116,505. — Wagon-Brake. — F. Wilhelm Schultz, Mount Pleasant, Iowa.

Claim.—1. The combination of the lever I', rod *b*, lever S, and sliding double-tree E', substantially as and for the purposes herein set forth.

2. The combination of the single-trees G G, chains *i i* and *m m*, levers O O and R, and yoke J, all substantially as and for the purposes herein set forth.

3. The combination of the lever I or I', rod *b*, yoke J, rod *d*, bar K, rods *e e*, levers L L, rods *f f*, and brake-bar M, all constructed and arranged substantially as and for the purposes herein set forth.

4. The spring *n* and rod *p*, connected with the bar K, and operating substantially as and for the purposes herein set forth.

5. The brake-block P, constructed as described, and sliding up and down in the guide *k* on the brake-bar, substantially as and for the purposes herein set forth.

116,506.—Jewelry-Case. — Julius Smith, Philadelphia, Pa.

Claim.—1. The combination of the base A, leaf C, and lid A', hinged to the base, and composed of two sections hinged together, all substantially as set forth.

2. The combination of the said leaf C with the grooved section *b'* of the lid.

116,507.—Hoop-Skirt.—Timothy S. Sperry, Chicago, Ill., assignor to Charles C. Carpenter, New York city.

Claim.—In a hoop-skirt, in which the lower nest B is formed of a continuous wire, which also unites it with the bustle-nest, the combination therewith of the knee-guards or fenders *a* and *b*, crossing the front space above the lower hoops, as described.

116,508.—Car-Starter.—Joseph F. Stokes, Philadelphia, Pa.

Claim.—The combination of the drums B B, tubes T T, coiled springs S, flanges F F, chain-pulleys P P and P' P', endless chains C C, bevel-gearing G, G^1, and G^2, shaft E, and hand-wheel H, all arranged and operating in conjunction with the teeth *t t* of the car-wheels W W, as and for the purpose herein specified.

116,509.—Machine for Forming Lips of Auger-Bits. — James Swan, Seymour, Conn.

Claim.—In combination with the projecting crimpdies *a a* and revolving mandrel C, the sleeve N arranged upon the said mandrel and held in position by one or more trunnions, to which the lever P is attached, the said sleeve having a longitudinal movement imparted thereto, through the lever P, by means of the cam R, the internal front of the sleeve being beveled or expanded outwardly, the whole operating in the manner substantially as described.

116,510.—Cravat-Holder.—John N. Thomson, North Attleborough, Conn.

Claim.—The metal plate *a*, provided with the opening 2, in combination with the wire loop *c*, which is attached to said plate *a* by the projection *d*, and bent ends 3 in the mortises 4, and formed with the shank-bow 5, as and for the purposes set forth.

116,511, antedated June 16, 1871.—Chain-Hook.—John R. Thorne, Waldoborough, Me.

Claim.—The within-described chain-hook, consisting of the stock *d* with the open hook *c*, the hinged hook *b*, and bifurcated lever *f* carrying the catch *k*, all constructed, arranged, and operating as herein set forth.

116,512. — Mop-Head. — Joshua Todd, Webster, N. Y., assignor to himself and William R. Bancroft, same place.

Claim.—The mop-head composed of the crosspiece B, clamp C, elbow-lever D, and loop E, arranged as described, and operating in the manner and for the purpose specified.

116,513.—Propelling Apparatus for Vessels. — Charles E. Tripler, New York, N. Y.

Claim.—1. The cylindrical casing C secured to the keelson of a vessel, and provided with interior interrupting wings or vanes D D', said wings or vanes being arranged radially therein, and having little or no projection at their forward points of attachment, but gradually increasing in such projection as they extend rearward, in combination with the propelling-screw B working therein, in the manner and for the purpose herein described.

2. The arrangement of the vanes D, forming part of the series of interrupting vanes or wings of the cylindrical casing within slots in the keelson, so that they are secured in position by the same bolts which secure the semi-cylindrical plates or sheets, thus strengthening the attachment of the parts, as herein described and shown.

3. The combination of the cylindrical casing C, having its sides elongated rearward, and provided with projections D', forming, with those, D, secured to the keelson, as described, interrupting vanes or wings for altering the motion of the water in its exit from the casing, and the rudder E, the whole constructed, arranged, and operating as herein described and shown.

116,514.—Bed-Lounge.—Benjamin Franklin Walton, Philadelphia, Pa.

Claim.—The combination of the lounge constructed substantially as described, the folding seat B', the thin detachable continuous strip *a*, the sockets *c c'*, and pins *b*, or their equivalents, arranged so that the strip may be applied to extend the length of the lounge, as set forth.

116,515. — Treating Sewage. — Robert Weare, Newcastle-under-Lyme, England.

Claim.—A system or series of tanks, constructed and relatively arranged substantially as shown and described.

116,516.—Table for Invalids.—Thomas N. Webb, Baltimore, Md.

Claim.—1. An invalid-table, adjustable vertically and laterally, when arranged to be used on a bed or chair, substantially in the manner herein described.

2. The frames A A, standards C C, and bars E E, in combination with the movable table F, arranged to operate substantially as described.

3. In combination with the bars E E, the table F provided with hooks *f*, arranged to operate substantially as described.

116,517. — Adjustable Tool-Rest for Lathe. — Joshua S. Wheeler, Asa N. Wheeler, and Orange Wheeler, Worcester, Mass.

Claim.—1. The combination, with the base-piece B provided with a stationary segment-gear, G, of the puppet-block C, rack F, and adjusting-screw I, substantially as and for the purposes set forth.

2. The arrangement of the concave puppet-block upon a convex or arched base-piece, substantially as shown and described, whereby dust and dirt and other clogging substances are prevented from dropping or falling upon the working parts of the tool-rest, or from working in so as to clog the same while in use.

116,518.—Harness Saddle-Tree.—Philip H. Wiedersum, New York, N. Y.

Claim.—The combination, with a saddle and tree having square holes, as described, of the hook D with square base *d*, the screw E with square head *e* and square plate *f*, and the nut G, all constructed and arranged substantially as and for the purposes herein set forth.

116,519.—Harness Saddle-Tree.—Philip H. Wiedersum, New York, N. Y.

Claim.—The combination of the saddle-tree A, plate B, ring C, and wings D D, constructed and arranged substantially as and for the purposes herein set forth.

116,520.—Sewing-Machine. — Charles H. Willcox, N. Y., and Cyrus Carleton, Brooklyn, N. Y., assignors to The Willcox & Gibbs Sewing-Machine Company, New York city.

Claim.—1. The spool-pin or spindle, so arranged that its axis shall be in line with or inclined toward the thread-receiving eye, as described, in combination with a disk or other device for holding the spool thereon, substantially as and for the purposes set forth.

2. The inclined spool-pin, arranged as specified in the preceding clause, in combination with a bracket or other suitable holder, in which the pin is held at one end, substantially in the manner described, so that it may be removed from and replaced in said holder at pleasure.

3. The spool-pin bracket or holder, having the end which receives the pin split, substantially as described, so as to form two spring-jaws between which the end of the pin may be inserted and held, as shown and set forth.

4. The combination, with the spool-pin, so arranged that its axis shall be in line with or inclined toward the thread-receiving eye, as specified, of a spool-holding plate or disk, provided with an annular flange, arranged substantially as described, to overhang the end of the spool in contact with the disk and prevent the thread from winding upon the spool-pin.

5. The combination, with the herein-described spool-holding device, of a tension pull-off and take-up, under the arrangement and for operation as shown and set forth.

116,521. — Sewing-Machine.—Charles H. Willcox, New York, and Cyrus Carleton, Brooklyn, N. Y., assignors to The Willcox & Gibbs Sewing-Machine Company, New York city.

Claim.—1. A tension device for sewing-machines, composed of the following elements, in combination: first, a thread-rest, consisting of a support upon which the thread in its passage to the needle is held by a smooth-surfaced ring or its equivalent, resting upon the thread by mere gravity, so as to exercise a gentle but permanent pressure thereon, substantially as shown and described; secondly, a thread-clamping device, consisting of a stationary support for the thread and a movable clamping-surface, actuated by a spring to compress or firmly hold the thread, substantially as shown and described; thirdly, a thread-relieving device, consisting of an eccentric operating the movable clamping-surface at proper intervals to release its pressure on the thread, substantially as shown and described.

2. The combination, with the thread-holding rest and the support thereof, of a washer, of wool or equivalent material, interposed between the two, substantially as shown and described, for the purpose of preventing the jars which attend the action of the eccentric through the connecting-rod on the spindle or case from being communicated to the thread-holding surfaces, and thereby causing the thread to escape from between them.

3. To avoid the use of oil, and therefore render access to the interior of the tension for this purpose unnecessary, the combination, with the spindle and its supporting-tube, of washers, of leather or other suitable material, interposed between the two, keeping said parts out of contact and forming the bearings for the spindle, substantially as shown and described.

4. A complete tension device, organized substantially as shown and described, so that all its parts, excepting such as connect it with the eccentric of the sewing-machine, shall be inclosed ready to be fitted in a case which is attached to or forms part of the frame of the machine.

5. In combination with the spindle and the thread-clamping surface, and connecting-rod with which said spindle is alternately in contact, the sound-deadening washers interposed between the spindle and said parts, substantially as shown and described.

6. The combination, with the tension and the connecting-rod, of a tappet for raising the tension-spindle, made adjustable in said rod, substantially as shown and described, so that its action on the spindle may be properly timed in relation to the action of the needle and take-up.

7. The construction of the tappet which actuates the tension-spindle when moving in the tension-tube, substantially as shown and set forth—that is to say, provided at or near its upper end with a leather or equivalent washer, fitting in a tubular bearing so as to move to and from the tension-spindle, as herein described.

116,522. — Sewing-Machine.—Charles H. Willcox, New York, and Cyrus Carleton, Brooklyn, N. Y., assignors to The Willcox & Gibbs Sewing-Machine Company, New York city.

Claim.—1. The combination, with a four-motion feed proper and a smooth presser-foot or pad, of a cloth-plate having that part of its surface which lies under the presser-foot and between feed-surfaces, serrated, substantially as shown and described, so that the cloth may be prevented from receding from under the beveled end of the pad, when the feed releases its hold thereon, as set forth.

2. A feeding surface of a four-motion feed, so divided as to afford an isolated feeding-surface on each side of and in the rear and front of the needle, one of the divisions or sections having its play within an elongated needle-hole in the cloth-plate, as shown and set forth, to afford a greater grasping-surface for the feed in rear of the needle.

116,523. — Sewing-Machine.—Charles H. Willcox, New York, and Cyrus Carleton, Brooklyn, N. Y., assignors to The Willcox & Gibbs Sewing-Machine Company, New York city.

Claim.—1. The herein-described double-acting pull-off for sewing-machines, the same consisting of three pins or eyes of suitable construction, the intermediate pin or eye attached to the frame or stationary part of the machine, the two outer pins or eyes to the needle-arm or other parts moving in unison therewith, substantially as and for the purposes shown and set forth.

2. The self-threading eye of the pull-off, constructed and operating substantially as shown and set forth.

3. The arrangement, on the needle-arm, of the self-threading eye and the bent pin or hook, through and over which the thread passes, in combination with the transverse pin on the frame traversing the path of the thread, substantially as shown and set forth.

4. The needle-arm, slotted to receive the end of the transverse or intermediate pin of the pull-off, substantially as and for the purposes set forth.

5. The pull-off, consisting of the three eyes, substantially as described, when arranged upon the interior opposite sides of the frame and needle-arm, substantially in the manner herein shown and set forth.

6. In combination with the pull-off, constructed substantially as described, the spool-holder, tension, and take-up, under the arrangement and for operation, as set forth.

116,524. — EVAPORATING-PAN.—James B. Williams, Glastenbury, Conn.

Claim.—An evaporating-pan for concentrating saccharine juices or liquids, in which are compartments made either by partitions, corrugations, or crimps, and in which the metal of which the pan is made is coated on its inner side with tin.

116,525.—WASHING-MACHINE.—George L. Witsil, Beverly, N. J., assignor to himself and Thomas T. Bates; assignors to themselves and Benjamin J. Williams, Philadelphia, Pa.

Claim.—A disk or cone, to be used in washing clothing and other substances, constructed with an air-tight chamber, as shown, in its interior surface, for the purpose set forth.

116,526.—GATE.—James Agin Wood, Crosswicks, N. J.

Claim.—1. The pulley H, adapted to and having a limited independent movement upon the cylinder *g*, substantially as described.

2. The combination, with the pulley H, operating a swinging gate, of the double crank-levers J J', their arms *i* projecting downward, the pulleys *f f'*, and continuous cords *e e'*, connected to said arms and passing around the said pulleys, as specified.

3. The combination of the pulley H with the cylinder *g* fixed to the spindle F, and with the locking device I, adapted to recesses in the said cylinder, and controlled by a lug, *k*, on the pulley, all substantially as herein described.

116,527.—HAND-CAR.—Martin E. Hastings, Salisbury, Md.

Claim.—The cam-lever L, the leg F with its pulley *e*, the hooks *f f*, and frame *r r* P, in combination, when constructed, arranged, and operated substantially as and for the purpose described.

116,528. — VEHICLE. — William H. Keppel and Henry Huffsey, Tiffin, Ohio.

Claim.—The combination of the extensions J J of the fifth-wheel C, the iron cross-bar H, the springs *i i*, and T-bar *f*, when each is constructed and all arranged substantially in the manner and for the purposes described.

116,529.—SPRING BED-BOTTOM, SOFA, AND CHAIR-SEAT.—Charles Rich, Poughkeepsie, N. Y., assignor to Metallic Union Spring Company, same place.

Claim.—The combination of a series of springs having eyes, loops, or bends formed in the wire itself, and in or on the top and bottom coils thereof a series of wooden or other suitable slats, so united by clasps or links as that the structure may be rolled or folded up, as and for the purpose described.

116,530.—MEDICAL COMPOUND FOR CURE OF CANCER AND OTHER DISEASES.—Francis Baker, New York, N. Y.

Claim.—The compound herein set forth, composed of the ingredients specified.

REISSUES.

4,436.—Division A. — APPARATUS FOR REFRIGERATING AND DESICCATING.—Edwin D. Brainard, Albany, N. Y.—Patent No. 73,292, dated January 14, 1868.

Claim.—1. The condensing and refrigerating inclined metallic surfaces combined with drip-gutters, arranged substantially in the manner and for the purposes above described.

2. The method of forming the condensing inclines by uniting the sides to a cap with closed double seams, substantially as described.

4,437. — Division B. — CONSTRUCTION OF ICE-CHAMBERS, REFRIGERATING-CHAMBERS, &c.—Edwin D. Brainard, Albany, N. Y.—Patent No. 73,292, dated January 14, 1868.

Claim.—The combination of a chamber or chambers with an ice-chamber, each having attached my improved ceiling, operating substantially as described.

4,438.—STOVE-PIPE THIMBLE.—C. A. Buttles, Milwaukee, Wis.—Patent No. 95,649, dated October 12, 1869.

Claim.—1. In a stove-pipe thimble, consisting of two perforated annular heads connected by concentric hoops or bands, the employment of a conical lower head, substantially as and for the purpose described.

2. A stove-pipe thimble, consisting of two annular heads connected by concentric hoops or bands, when the upper head is provided with a series of small openings and the under head with a series of larger openings, substantially as and for the purpose herein set forth.

3. A stove-pipe thimble, consisting of two perforated annular heads connected by two concentric hoops or bands, when so constructed that the bearings of the inner band are brought nearer together than those of the outer band, whereby the bands themselves can be cut of equal length, substantially as and for the purposes specified.

4,439.—APPARATUS FOR THE MANUFACTURE OF BESSEMER STEEL.—Henry Chisholm, Cleveland, Ohio. — Patent No. 114,109, dated April 25, 1871.

Claim.—Forming or making the joint or joints of steel-converters, and for other like uses, of graphite and fire-clay or ganister, either together, or combined with other material or materials.

4,440.—LUBRICATING COMPOUND. — Henry Grogan, Flatbush, N. Y. — Patent No. 106,053, dated August 2, 1870.

Claim.—1. The combination of caustic soda, tallow, and petroleum, or their respective chemical equivalents, in about the proportion set forth, treated and compounded substantially in the manner described.

2. Combining with the compound thus produced, or its chemical equivalent, animal hair, in about the proportion and for the purpose specified.

4,441.—EMBELLISHMENT OF GLASS.—Elias Ingraham, Bristol, Conn.—Patent No. 109,626, dated November 29, 1870.

Claim.—The process of embellishing upon glass plate, substantially as set forth.

4,442. — BOILER-FLUE BRUSH. — Robert King, Brooklyn, assignor to T. Prosser & Son, New York, N. Y.—Patent No. 60,013, dated November 27, 1866.

Claim.—A helical wire brush in which the contiguous wires are constructed and arranged to form alternately long and short projections from or on the same side of the core, and present at their ends alternate wires and intervening spaces, substantially as herein described.

4,443.—FLUTING AND SAD-IRON. — Myron H. Knapp, Fulton, N. Y., assignor of one-half interest to Edgar F. York.—Patent No. 105,953, dated August 2, 1870.

Claim.—1. A combined fluting and end-iron, constructed in sections, and so arranged that the same can be used for either fluting or smoothing, as may be desired.

2. The construction of a fluting and end-iron in two sections, A A', provided with corrugations or flutes *a a'*, in such a manner that the device may be used both as a fluter and end-iron, substantially as described.

4,444.—IMITATION BRAID, TRIMMING, LEATHER, &c.—Henry Loewenberg, New York, N. Y.—Patent No. 106,068, dated August 2, 1870.

Claim.—Flexible or elastic casts, forming facsimiles of leather, straw, enameled cloth, trimmings, embroideries, or any similar article, said cast being formed of the compound and by the means substantially as herein specified.

4,445. — COMPOUND FOR TREATING CATARRH, &C., BY INHALATION. — Dana Slade, Chicago, Ill.—Patent No. 112,858, dated March 21, 1871.

Claim.—1. The use of carbolic acid in combination with chlorate of potassa in an inhalent for medical purposes.

2. The combination of carbolic acid, cochineal, and chlorate of potassa in an inhalent for medicinal purposes.

3. The combination of chlorate of potassa and cochineal in an inhalent for medicinal purposes.

4. The combination of cochineal and carbolic acid in an inhalent for medicinal purposes.

4,446.—COMBINED GRIST-MILL AND COTTON-SEED HULLER.—James W. Smith, Columbus, Ga.—Patent No. 114,215, dated April 25, 1871.

Claim.—The combination of an agitator, *a b c* separator E, and fan F, when arranged for operation, as herein described, in connection with a grist-mill, substantially as herein specified.

4,447.—PRODUCING PRICES CURRENT, BULLETINS, &c.—William Smith and Hiram D. Rogers, Cincinnati, Ohio, assignors, by mesne assignments, to Hiram D. Rogers and Lebbeus H. Rogers.—Patent No. 105,380, dated July 12, 1870; antedated January 26, 1870.

Claim.—1. A book, tablet, or pack of prepared manifold paper, having imprinted upon its leaves the columns, lines, headings, or other permanent matter, with corresponding blank spaces in register, for quotations or other transient matter, substantially as described, for the purpose of producing statements, reports, notices, &c., in manifold, by the use of carbonized paper.

2. As an improved process for producing statements, reports, notices, &c., in manifold, the use of carbonized paper for producing the transient matter in connection with printed matter prepared in permanent form in relation to spaces for the variable matter, all as hereinbefore explained.

4,448.—PUNCHING-PRESS.—Moses G. Wilder, West Meriden, Conn.—Patent No. 65,143, dated May 28, 1867.

Claim.—1. The combination of the punch-holder of the press with the eccentric, the worm-wheel, and the tangent-screw, substantially as before set forth.

2. The combination of the eccentric, the worm-wheel, and the tangent-screw with the transmitting mechanism and punch-holder of the press, substantially as above set forth.

3. The combination of the eccentric and its pin, the worm-wheel, and the tangent-screw with the stock of the press, substantially as before set forth.

4,449.—FOLDING GUIDE FOR SEWING-MACHINES.—Willcox & Gibbs Sewing-Machine Company, New York, N. Y., assignee, by mesne assignments, of Burritt C. Boyes, deceased. — Patent No. 15,402, dated July 22, 1856; extended seven years.

Claim.—A hemming-guide arranged to automatically turn the hem, and having an elastic or yielding surface adapted to operate on material of different or varying thicknesses, substantially as described and specified.

4,450.—WRENCH.—Aury G. Coes, Worcester, Mass., assignee, by mesne assignments, of Albert C. Richard, deceased.—Patent No. 27,090, dated February 7, 1860.

Claim.—1. A smooth rectangular re-enforced wrench-bar, the forward part of which, next to the stationary head, is made broader on the back edge than the rear smooth rectangular part, in the manner and form, and for the purposes set forth and shown.

2. The combination with a smooth rectangular re-enforced wrench-bar, the forward part of which, next to the stationary head or jaw, is made broader on one edge only, than the rear smooth rectangular part, of a sliding jaw provided with two clasp-bearings or rectangular openings of different sizes to fit and work directly upon the varying-sized bar substantially as stated.

3. The combination with the forward part of the back or wrench-bar, and the stationary head, of a re-enforce substantially as set forth and described.

4. The combination with the bar B, and jaw C, of the screw J, substantially as described.

DESIGNS.

5,041. — SWIVEL AND SNAP-HOOK.—Philip G. Beckley, Newark, N. J.

Claim.—The design for swivel-hook, as shown and described.

5,042.—BASIN-FRONT.—Francis Boyd, Newburg, N. Y.

Claim.—The design for a basin-front, substantially as shown.

5,043.—SHOVEL.—Patrick William Groom, Philadelphia, Pa., assignor to himself and Jonathan R. Seltzer, same place.

Claim.—The design for a shovel-blade, the rear portion of which is of the form substantially as described, and as illustrated in and by the accompanying drawings.

5,044.—GARTER AND ARMLET-CARD.—Stillman Houghton, Worcester, Mass.

Claim.—The design for garter and armlet-cards, as shown in the drawing and herein described.

5,045.—BLACK-LEAD BLOCK.—William Collier James, Plymouth, England.

Claim.—The design for blocks of black lead, having a dome, *a*, and body *b*, substantially as herein shown and described.

5,046.—TYPE.—Alexander Kay, Philadelphia, Pa., assignor to MacKellar, Smiths & Jordan, same place.

Claim.—The design for printing-type, as shown.

5,047.—CARPET.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, Clinton, Mass.

Claim.—1. The design of the carpet, figure A, as shown.

2. The design of the center figure B, as shown.
3. The design of the scroll-belt D, as shown.
4. The design for a carpet, as shown.

5,048.—BORING-MACHINE.—Charles E. McBeth, Frederick Beutel and William C. Margedant, Hamilton, Ohio.

Claim.—The design for a wood-boring machine, as shown.

5,049.—STEAM-PUMP PISTON.—John H. McGowan, Cincinnati, Ohio.

Claim.—The design for a steam-pump piston, as shown.

5,050.—PHOTOGRAPHIC-CARD FRAME.—Matthias Joslyn Rice, Boston, Mass.

Claim.—The design for a card-photograph frame, as shown and described.

5,051.—CARRIAGE-SPRING.—George B. Robinson, Derby, Conn.

Claim.—The leaves A B, with pins *a b* projecting from the faces thereof, as a new design in carriage-springs.

5,052. — BOBBIN-SCORE. — John Salisbury, Scituate, R. I.

Claim.—The cone-shaped score C, as herein shown and described.

5,053.—BUCKLE.—Louis Schindler, St. Peter, Minn.

Claim.—The design for a buckle, as shown.

5,054.—BUCKLE AND RING.—F. Augustus Schultz, Mount Pleasant, Iowa.

Claim.—The design for a buckle, with ring attached, as shown and described.

5,055.—JELLY-GLASS AND CAP.—Joseph H. Smith and Daniel C. Ripley, Birmingham, and Alois Kwocsalla, Lawrenceville, Pa.

Claim.—The design for jelly-glass and cap, of the form hereinbefore described and shown.

5,056.—TYPE.—Richard Smith, Philadelphia, Pa., assignor to MacKellar, Smiths & Jordan, same place.

Claim.—The design for printing-type, as shown.

5,057.—ALTO-RELIEF. — Ames Van Wart, New York, N. Y.

Claim.—The design for an al to-relief, as shown.

5,058.—FLOOR OIL-CLOTH.—John T. Webster, Yonkers, N. Y., assignor to Page, Wilder & Co., Hallowell, Me.

Claim.—The design for floor oil-cloths, as shown.

5,059.—FLOOR OIL-CLOTH.—John T. Webster, Yonkers, N. Y., assignor to Page, Wilder & Co., Hallowell, Me.

Claim.—The design for floor oil-cloth, as shown.

5,060. — SURCINGLE-FASTENING. — Martin Wesson, Springfield, Mass.

Claim.—The design for a surcingle-fastening, herein shown in the drawing and described.

5,061. — CARPET - PATTERN. — George C. Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,062. — CARPET - PATTERN. — George C. Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,063. — CARPET - PATTERN. — George C. Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,064. — CARPET-PATTERN.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

TRADE-MARKS.

351.—CLOTHING.—Oran S. Baldwin, New York, N. Y.

352.—MATCHES.—Bock, Genin & Co., New York, N. Y.

353.—WRITING-PEN.—Charles H. Clifton, Pittsburg, Pa.

354.—LIGHTNING-ROD.—Samuel J. Mitchell, St. Louis, Mo.

355.—WHISKY.—J. A. Monks & Sons, St. Louis, Mo.

356.—FIRE-EXTINGUISHER.—Northwestern Fire-Extinguisher Company, Chicago, Ill.

357.—MEDICINE.—E. R. Phillips & Co., Assonet Village, Freetown, Mass.

358.—NEEDLE.—Robert J. Roberts, New York, N. Y.

359.—LADIES' UNDER-GARMENTS, RUFFLES, &c.—George A. Whiting, Charlestown, Mass.

EXTENSIONS.

SALEM T. LAMB, of New Albany, Ind.—Letters Patent No. 17,685, dated June 30, 1857.

"Improvement in Self-Acting Rakes for Harvesters."

Claim.—1. In combination with a rake having the motions above described, the gyratory beam M and rock-shaft L, when the rake is attached to said rock-shaft as shown, and the whole operated in the manner herein set forth.

2. In combination with a rake operating as above described, the slotted guide *g* for regulating or governing its motions, which is combined with the beam M and shaft L, as set forth.

3. In connection with a rake having the motions above described, the combined use of the spring *h* for holding it to its work, and the set-screw *m* for regulating the extent of descent of said rake, substantially as set forth.

WILLIAM KELLY, of Louisville, Ky.—Letters Patent No. 17,628, dated June 23, 1857; reissue No. 505, dated November 3, 1857.

"Improvement in the Manufacture of Iron."

Claim.—Blowing blasts of air, either hot or cold, up and through a mass of liquid iron, (the oxygen in the air combining with the carbon in the iron causing a greatly-increased heat and ebullition in the fluid mass,) and decarbonizing and refining said iron without the use of fuel.

JOHN HAW, of Hanover county, Va.—Letters Patent No. 17,626, dated June 23, 1857; additional improvement No. 244, dated July 26, 1859.

"Improvement in Picker Sawing-Machines."

Claim.—The overhanging of the saw between braced guides *d* and *e*, the space between which is adjustable by wedges *i i* and slotted braces *l* and *m*, operating as specified.

Additional Improvement:

Claim.—Attaching the saw-guides to the overhanging bearing so as to adjust them to the sawing of small logs, substantially as set forth.

ISSUE OF JULY 4.

PATENTS.

116,531.—DRIER.—Henry W. Adams, Philadelphia, Pa., and Steuben T. Bacon, Boston, Mass.; said Adams assigns his right to said Bacon.

Claim.—1. In the apparatus above described, the open frames *k* and reel *b*, in combination with the supports *f*, substantially in the manner and for the purposes represented.

2. In the apparatus above described, the bottomless inclosure *i* with the escape-pipes *m m m m*, in combination with reel *b*, substantially in the manner and for the purpose shown and described.

3. In the apparatus above described, the escape-pipes *m m m m*, in combination with the inclosure *i*, substantially in the manner and for the purposes described.

4. In the apparatus above described, the steam-pipe *a*, in combination with the escape-pipes *m m m m* and the inclosure *i*, substantially in the manner and for the purposes set forth.

5. In the apparatus above described, the perforated trays *g*, in combination with the steam-pipe *a*, escape-pipes *m m m m*, and reel *b*, substantially in the manner and for the purposes shown and described.

116,532.—DRIER.—Henry W. Adams, Philadelphia, Pa., and Steuben T. Bacon, Boston, Mass.; said Adams assigns his right to said Bacon.

Claim.—1. The steam-pipe P, in combination with the vacuum-chamber D and the space between said chamber and its outer case, C, substantially in the manner and for the purposes shown and described.

2. The pipe p^1, in combination with the pipe P, and the space between C and D, substantially in manner and for the purposes shown and described.

3. The valve A C, in combination with the case C communicating with the space included between C and D, substantially in the manner and for the purposes shown and described.

4. The perforated pipe *e p* in the space between the case C and chamber D, in combination with the coil *e p* in the chamber D.

5. The coil *e p* communicating with the spaces between C and D, substantially in the manner and for the purposes shown and described.

6. The pipe p^4, in combination with E P and coil *e p*, substantially in the manner and for the purposes shown and described

7. The use of air entering through the valve A C into the space E, between C and D, in the manner and for the purposes shown and described.

8. In an apparatus substantially as hereinbefore described, the hot-air pipe F, provided with valve A C, all as herein set forth.

9. In the drying apparatus hereinbefore described, the flange *n n*, in combination with chamber D, and the corresponding flange on case C united together with packing by means of bolts and nuts *n' n' n' n'*, substantially in the manner and for the purposes shown and described.

116,533. — COMPOSITION FOR BLACKING STOVES.—Richard W. Bailey, New York, N. Y.

Claim.—The improved composition, composed of the ingredients hereinbefore described, substantially as and for the purposes specified.

116,534.—LIFTING-JACK. — Hamilton Ballentine, Philadelphia, Pa.

Claim.—The combination of the tubular slotted case B, the notched and guided rod or bar C, and the hand and pawl-levers D *d*, arranged to operate therewith, substantially in the manner and for the purpose described.

116,535.—FEATHER-RENOVATOR.—Charles E. Barber and William Dean, Central Village, Conn., assignors to themselves and George Loring, same place.

Claim.—The cylinder B having double bottom C, central gauze diaphragm D, and conical top E, the cylinder F thereunder having funnel-shaped door P and open at S, vertical shaft G having horizontal arms H, the tube R, and the shaft U having propelling-wheel T thereon, all constructed and arranged together, as and for the purpose specified.

116,536.—HARNESS-TRIMMING.—John Bauer, Newark, N. J.

Claim.—A terret-ring, or similar article of harness-trimming, constructed with a flattened interior surface, covered with leather, and lined with a cast-iron ring or piece, the outer periphery of which fits the interior of and is fastened in the covered ring, as specified, as a new article of manufacture.

116,537. — COMBINED STUMP-EXTRACTOR AND DERRICK.—William Q. Baxter, Maple township, Pa.

Claim.—The combination of the stump-extractor and derricks, substantially in the manner and for the purposes set forth.

116,538.—GAUGE FOR MORTISING-MACHINES.—Thomas Beach, Freeport, Pa.

Claim.—1. A gauge-board, *a*, for a mortising-machine, having lugs *b b'*, one at each end on one side one at least of which is adjustable, and a number of stops, *c*, on the other side at any desired intervals, constructed substantially as and for the purposes described.

2. The spring-lock *k*, composed of the tongues *l l*, spiral springs *r r* on the stems *n*, operated by means of levers *m m*, in combination with the devices of the previous claim, substantially as described.

116,539.—SAWING-MACHINE.—Homer Bean, Fredonia, assignor to Henry M. Wyeth, Newark, Ohio.

Claim.—1. The saw-bar *j*, saw *k*, guide-bar *p q*, frame *l*, standards D D', and lever *o*, combined as specified.

2. The hinged cross-frame E provided with feed-rollers *s* and leg *r*, and combined with the main frame A, as described.

3. The feed-rollers *s* holding-bar *t*, lever *v*, and rack *x*, combined as set forth.

4. The feed-rollers *s*, shafts *y o'*, gears *a' a*, belt *b*,

and the belt-tightener constructed of frame *d'*, rollers *e*, and levers *f' g'*, all constructed, arranged, and operating as described.

116,540.—SHIFTING BUGGY-TOP.—Beverly L. Benson, Fairview, Ind.

Claim.—1. The arms D D, having their outer ends of suitable length to receive the top joint, and their inner ends slotted and fastened to the seat by means of the swivel-bolt *d*, plate *f*, and projection *e*, substantially as herein set forth.

2. The rail C provided with the upright bars *b b*, hooks *a a*, and the arms D D, all constructed and arranged substantially as and for the purposes herein set forth.

116,541.—DIE FOR MAKING WASHERS.—George W. Billings, Chicago, Ill.

Claim.—The male die provided with the mandrel or center E, jointly with the female die provided with the flange G, substantially as and for the purposes set forth.

116,542.—PITMAN-ROD.—Edward S. Blake, Pittsburg, Pa.

Claim.—1. A pitman-rod, provided with straps, links, and set-screws, for the purpose of holding the brasses in close contact to the axis to which it may be connected, substantially as herein described.

2. A pitman-rod, consisting of the brasses *f*, straps B and C, links D D, and set-screws *e e*, so combined and arranged with relation to each other that a compensation is obtained for the wear of the brasses around its axis, substantially as herein described.

116,543.—MACHINE FOR CARVING AND MOLDING WOOD.—Myron T. Boult, Battle Creek, Mich.

Claim.—1. The mechanism consisting of the levers F G, stop *h'*, pawl *h*, and lever O, all arranged for adjusting and locking the vertically-adjustable spindle E, substantially as herein shown and described.

2. A rotary spindle, S, combined, as described, with a head having inclined slot *f*, and a sleeve having handle *e*, and pin *e*, all arranged as and for the purpose specified.

3. The adjusting-screw I, pivoted plate I', and stop *h'*, all combined as described, for the purpose specified.

116,544.—PADLOCK.—Daniel T. Brown, Plainfield, N. J., assignor to James H. McWilliams, New York city.

Claim.—The hook-ended tumblers *d h*, crossing each other and hinged together at 3, and swinging upon the stud *a* the parts being arranged and acting substantially as specified.

116,545.—LATHE-TOOL SUPPORTER.—Israel F. Brown, New London, Conn.

Claim.—The lathe-tool supporter made as described, viz., as consisting of the bar A and the three series of abutments *a a a*, and lower projections *b c*, arranged with and extended from such bar, as and for the purpose as specified.

116,546.—FIBER-CLEANING MACHINE.—James Brown, Bay Ridge, N. Y.

Claim.—1. The heckle D, composed of the series of hook-shaped teeth *d*, arranged in a continuous line, with their bases contiguous, and having tapering points, in combination with the cylinder B and the frame A, as described.

2. The cylinder B, adapted to move laterally, as described, in combination with the stationary heckles upon the frame A, as set forth.

116,547, antedated June 24, 1871.—BOLT-CUTTER.—James R. Brown, Cambridgeport, Mass.

Claim.—1. The cutter-head as made with the cylindrical bore, and with the bearing portion *d* beveled as described with respect to the axis of the head, in combination with the chisel as formed cylindrical to fit the bore and with the two bevels as and back of its cutting-edge, all substantially as represented and described.

2. The adjusting-screw C, as provided with the head *k* and neck *l*, in combination with the chisel as made with the head *d* and recess *m*, constructed to open out of one side of such chisel, in manner and for the purpose as specified.

116,548.—CAPSTAN.—John S. Brown, Schenectady, N. Y.

Claim.—The combination of the two windlass-bases with one another and with the single removable cap, which can be used on either base for varying the speed and power, all arranged so that the bases can be placed closer together, as when provided with independent caps.

116,549, antedated June 22, 1871.—GRAIN-SEPARATOR.—John D. Brunner, Doylestown, Pa.

Claim.—The combination, in the grain-separator herein described, of the screens D', provided with the cleats *k*, with the shoe C provided with the lug *g* and the shaft E, when all these parts are constructed and arranged as shown and described, for the purposes set forth.

116,550.—PORTABLE TALLYING-REGISTER.—Henry C. Buhoup, Pittsburg, Pa.

Claim.—1. In combination with a central shaft C, that is turned by a knob, D, returned by a spring, *b*, a hinged tappet, *j*, for turning the ratchet-wheel *k*, and a fixed tappet, *d*, for causing a bell to be struck through a hinged switch, *e*, when the parts are arranged to operate as and for the purpose set forth.

2. In combination with the ratchet-wheel and its shaft, and a spring-pawl, *s*, engaging therein, a cam-shaft, the protruding ends *u u* of which shafts are squared to receive a key, by which the spring-pawl may be disengaged and held out of action, and the ratchet-wheel run to reset the indicators upon the dials, as described and represented.

116,551.—PROCESS AND APPARATUS FOR THE MANUFACTURE OF SPELTER.—John E. Burrows, Newark, N. J.

Claim.—1. The apparatus above described for the manufacture of spelter or metallic zinc direct from ores of zinc.

2. The mode of condensing and heating the vapors of zinc when manufacturing spelter or metallic zinc.

3. The separation of metals by the process before described, when used in the manufacture of metallic zinc.

116,552.—CORN-PLANTER.—Samuel J. Bye, Bluff Point, Ind., assignor to himself and William C. Bye, same place.

Claim.—The arrangement of the platform H, hoppers I, slide J, cam projections L, adjustable plates K, brushes *h'*, spring M, lever Q, flexible conducting-tubes R, tubular standards S, arms U, draft-bars V, wooden pins *w*, arms W, pivoted bar X, rollers Y, and pivoted frames Z, with respect to each other and the frame C, axle B, and wheels A, substantially as herein shown and described.

116,553.—NAIL-HAMMER.—Henry Cheney, Little Falls, N. Y.

Claim.—A nail-hammer, provided with the cavity *b* which forms the supporting-shoulder *c*, substantially as and for the purpose herein shown and described.

116,554.—WHEAT-CLEANER.—Emanuel Chipman, Baltimore, Md.

Claim.—The combination, herein shown, of the frame A, outer casing B, shaft *a*, stones *c c d*, perforated case *e e*, fan-blower C, perforated floors *f f*, and funnel *g*, when said parts are arranged as shown, and for the purpose set forth.

116,555.—WINDMILL.—Ellwood Cleaver, North Wales, Pa.

Claim.—1. The combination of the vertical shaft the rods C, and vanes hinged thereon, the spirally-slotted cylinder supporting the rods, and the vertically-adjustable arms I, all substantially as specified.

2. The combination, with the arms I, of the lifter L, substantially as specified.

116,556.—COTTON-PLANTER.—James P. Clopton, Terry, Tenn.

Claim.—1. The combination of the wheel F, crank-wheels G, pivoted levers H, slide bars I, plates L, fingers R, frame O, and spring M, substantially as shown and described.

2. The arrangement of the supply-hopper or reservoir J and planting-hopper K with respect to each other and the frame A, substantially as herein shown and described, and for the purpose set forth.

116,557.—SPRING FOR SEATS, &c.—Zenas Cobb, Chicago, Ill.

Claim.—As a new article of manufacture, the annular coiled spring A A, consisting of two or more coils of flattened steel-wire, and joined together by the metallic clasp B B, substantially as specified.

116,558.—SMELTING IRON ORES.—Charles Cochrane, "The Ellowes," Upper Gornal, England.

Claim.—Deoxidizing or reducing iron ores before their introduction into the blast-furnace by first raising the ores to the requisite degree of heat, and then subjecting the same to the action of carbonic-oxide or blast-furnace gas, which has not been specially heated for that purpose, substantially as hereinbefore set forth.

116,559.—REVOLVING FIRE-ARM.—Frederic G. Cochran, St. Louis, Mo.

Claim.—The lever F, angle-link G, swiveled rod H rounded at its rear end, the ejector-disk I, and recess in the breech-block, combined and arranged as shown and described.

116,560.—SWING.—Gideon W. Cole, Canton, Ill.

Claim.—The standards A A A A, pieces B B and C C, and the cross-pieces D D and dowel-pins N N, and stay P or its equivalent, when arranged to operate substantially as described, and for the purpose specified.

116,561.—POOL-BALL RACK.—Hugh W. Collender, New York, N. Y.

Claim.—A ball-rack, composed of a plane or board of any suitable material, provided with a series of projecting ball-holders, substantially in the manner and for the purposes set forth.

116,562.—MEDICATED VOLTAIC PLASTER.—Willard C. Collins, Bucksport, Me.

Claim.—The combination of voltaic plates with medicated plasters, substantially as described and shown.

116,563.—CARBURETER FOR GAS AND AIR.—Matthias P. Coons, Brooklyn, assignor to himself, Philip Dater, New York city, and Charles N. Ayres, Brooklyn, N. Y.

Claim.—1. The large tube E, combined with a branch air-tube, E, a branch gas-tube, F, and branch discharge-tubes C D, when all are constructed and relatively arranged in a carbonizer, as and for the purpose described.

2. The wax tube operating as a safety-valve, in the manner described.

116,564.—SHOW-CASE AND COUNTER.—William Cooper, Jr., Mexico, N. Y.

Claim.—The combined detachable show-case and counter, provided with drawers and a transparent top, and set on dowel-pins E, whereby it is prevented from being moved laterally, as specified.

116,565.—TAMPING APPARATUS.—Daniel Corgan, Sugar Notch, Pa.

Claim.—A tamping-injector for use in blasting, constructed substantially as shown and described, so as to admit of the operation specified.

116,566.—CAR-COUPLING.—George E. Darling and Matthew Heus, Marytown, Wis.

Claim.—The combination of the latch-pin H I, slotted lever D G, link G, and draw-bars A, substantially as and for the purpose herein set forth.

116,567.—ADDRESSING-MACHINE.—George A. Davison, Montana, Iowa.

Claim.—1. The construction and arrangement of the hinged frame B, spring C, double-geared rack-bars D, with the relation to the case A for operating the endless paste-belt O, and slide F, substantially as described.

2. In milling-machines, the paste-box J, provided with opening *i*, and serrated distribution-plate *h*, as and for the purpose set forth.

3. The construction and arrangement of the case A, frame B, spring C, rack-bars D, intermediate gears E, shaft E', shear-bar G, drums H, K, M, N, and Q, pinion I, paste-box J, endless belt O, and cylinder P, for pasting, feeding, cutting off, and affixing the address-strip R, as herein described and set forth.

116,568.—TOY-LOCOMOTIVE STEAM-ENGINE.—Albert L. Dewey, Westfield, Mass.

Claim.—1. The construction, combination, and peculiar arrangement of parts A N Y, composing the boiler A, together with its supporting-jackets *l l l*, composing the fire-box and draught-chamber B B B, substantially as and for the purpose hereinbefore set forth.

2. The peculiar construction, arrangement, and combination of the parts composing the common steam-passage Q, connecting the two steam-chests R R', and forming one piece of casting with the engine-frame F, together with the separate pieces composing the pilot or cow-catcher H and truck-frame G, substantially as and for the purpose hereinbefore set forth.

3. The peculiar construction, arrangement, and combination of the parts composing the pipe N, throttle-valve *h*, and steam-pipe O, with the common steam-passage Q of the engine-frame F, substantially as and for the purpose hereinbefore set forth.

4. The arrangement and combination of the parts composing the boiler A with the furnace and draught-chamber B B B, engine-frame F, throttle-valve *h*, and steam-pipe O of a steam-working toy locomotive-engine, as herein described and set forth.

116,569.—SAWMILL.—Albert M. Dexter, Mattapoisett, Mass.

Claim.—1. The slide E and pin *u*, in combination with the bar O and screw *p*, as and for the purpose hereinbefore set forth.

2. The springs F F' and latches *h h'*, in combination with the levers I and 4, substantially as and for the purpose herein specified.

116,570.—BINDING ATTACHMENT FOR SEWING-MACHINES.—George E. Dolton, Monee, Ill.

Claim.—The self-acting device, for binding garments, described, consisting of the plate *a*, furnished with the guide-hooks *e* and *t* and slot *n*, in combination with the adjustable slide-gauge *m*, all arranged, operating, and constructed substantially as and for the purposes set forth.

116,571.—Swivel Rocking-Chair.—John W. H. Doubler, Darlington, Wis., assignor to himself and William Logue, same place.

Claim.—A chair having rockers *c c* with pulleys *f f* thereon, combined with a swivel-stool, *f f g*, having guard-rails *i i* thereon, as and for the purpose specified.

116,572.—Steam Pumping-Engine.—Patrick Doyle, New Comerstown, Ohio.

Claim.—The angular valve-plate L, forming the valve-seat and supporting the valve, and made removable, in combination with a pumping-engine, substantially as and for the purposes described.

116,573.—Vapor-Burner.—Michael B. Dyott, Philadelphia, Pa.

Claim.—1. The apartments 3 3, in combination with the vapor-jet holes 6 6, when the said apartments are each formed so as to open only at the perimeter of the burner-head and the said vapor-jet holes each arranged so as to discharge its jet of vapor horizontally through its particular apartment, substantially as and for the purposes hereinbefore set forth.

2. The fresh-air-supplying holes 7 7 in the apartments 3 3, in combination, respectively, with the radiating jet-holes 6 6 in the head A, substantially as and for the purposes hereinbefore set forth.

3. The annular guard C, when constructed and applied substantially as and for the purposes hereinbefore set forth.

116,574.—Mop and Brush-Holder.—David Edward, Montreal, Canada.

Claim.—The hook or curved bar D, hand-nut E, plate A, and hollow shank B, having a slot formed in its lower part and a screw-thread upon its outer surface, in combination with each other, whether the plate C be used or not, substantially as herein shown and described.

116,575.—Ice-Creeper.—Edward S. Ellis, Trenton, N. J.

Claim.—An ice-creeper or foot-safe provided with the elastic strap A, the plate G H, clamps B C D, and the pointed projections E F J, when arranged and constructed as herein described.

116,576, antedated June 20, 1871.—Water-Meter.—George D. Emerson, Calumet, Mich.

Claim.—1. The combination of the bell-cranks S, links W, plates X, and springs A′, T-headed lever C, rods R, and piston-rod for moving the lever C′ alternately in opposite directions.

2. The combination of the bell-cranks S, links W, plates X, springs A′, T-headed lever C′, rods R, and piston-rod for storing up the power in the springs and operating the said arm alternately in opposite directions, while the springs move in the same direction when imparting the movement of the said arm, substantially as described.

3. The attachment of the rods R to the pistons by a sleeve, P, pin, and slot, for allowing the pistons to be set in motion before encountering the resistance of the valve-operating gear, substantially as described.

4. The attachment of the described valve, operating-levers, and springs, to the meter-case, by means of the plate N², for moving the same, substantially as specified.

5. The meter-case, composed of the cylinder C, plate D, and oval top E, and having the ports K, L, and P², arranged all substantially as specified.

116,577.—Music-Leaf Holder.—Achille Extein and Jesse C. Mills, Springfield, Mass.

Claim.—1. As an improved article of manufacture, a leaf-holder, made substantially as herein shown and described.

2. The combination of an elastic cover, B, with the knob A, substantially as and for the purpose herein set forth.

3. The crook *f* and the spring *e*, made and operating substantially as described, for the purpose of holding up and clasping the leaf.

116,578.—Preparing Seal-Skin.—Louis Falkenau, San Francisco, Cal.

Claim.—1. The use of gum catechu in tanning seal and other fur-skins as a mordant for coloring and dyeing the same.

2. The method of coloring and dressing seal and other fur-skins by the combined use of gum catechu and the salts before mentioned, substantially as and in the method described.

3. The combination of the several operations herein described, so as to constitute a method of preparing the furs, substantially as described.

116,579.—Nickel Plating.—Moses G. Farmer, Salem, Mass.

Claim.—The formation of the double sulphate of nickle and ammonia in a solution of sulphate of ammonia by the agency of the electric current, substantially as herein described.

116,580, antedated June 20, 1871.—Measuring-Funnel.—Robert T. Fisher and George F. Waldron, Boston, Mass., assignors to George F. Waldron.

Claim.—The tube *c* with its openings 3 4, in combination with a valve-ping, *b*, spring *m*, valve-rod *d*, lever C, hooked rod *k*, and projection *l*, the whole arranged and operating substantially as and for the purpose set forth.

116,581.—Hasp-Lock.—Jacob Fisler and George Crompton, Jersey City, N. J.

Claim.—The revolving slotted locking-disk D, in combination with the cap C attached to the hasp-plate B, and with the headed pin G attached to the stationary plate E, substantially as herein shown and described, and for the purpose set forth.

116,582.—Rotary Engine.—Ransome N. Francis and Russel Francis, Girard, Pa.

Claim.—The arrangement of the steam-chests G G, valves I, abutments L, eccentric grooves J and *m*, casing B, piston-wheel N, and shaft O, substantially as and for the purposes described.

116,583.—Canal-Lock.—John W. Gentry and George W. Barcus, Peytona, W. Va.

Claim.—In canal-locks, the arrangement of long rods B and supporting-plates E in the recesses *c* of walls A, to act, in combination with the snubbing-ropes D, as and for the purposes specified.

116,584.—Ice-Cream Freezer.—Charles Gooch, Cincinnati, Ohio.

Claim.—1. The knife-edge or scraping-blade E, in combination with two or more elastic metal springs attached to the outer edge of dasher D, when constructed substantially in the manner and for the purpose specified.

2. The concave bottom of the can B, of sheet or cast metal, made so that the central pivot upon which the can revolves shall not project below the level of the outer edge of the can, so that the can will stand steady upon a level surface.

116,585.—Corset.—Cathrine A. Griswold, Willimantic, Conn.

Claim.—As an improved article of manufacture, a corset, made substantially as shown and described.

116,586, antedated June 24, 1871.—Umbrella.—Gouvion Gholson Griswold, Brooklyn, N. Y.

Claim.—1. The within-described combination of the runner C, springs *c c*, when inclosed within the eccentric shield B, in the manner and for the purpose herein set forth.

2. The combination of the rubber, cloth, leather, or other fibrous lining *d* with the runner C, shield B, and springs *c c*, in the manner and for the purpose herein described.

3. The rim D, in combination with the shield B, in the manner and for the purpose herein described.

116,587.—Brick-Machine.—Francis L. Hall, Oneida, N. Y.

Claim.—1. The follower G, in combination with the frictional roller g^6, lever g^5, and spring g^7, constructed and arranged to operate substantially as shown and described, and for the purpose set forth.

2. The lever K, weight *k′*, eccentrics J J, and hinged or pivoted platform E, combined, arranged, and operating substantially as and for the purpose set forth.

3. The combination of the follower G, frictional roller g^6, spring g^7, lever g^5, spring g^4, lever K, weight *k′*, eccentric J J, and hinged or pivoted platform E, all arranged to operate substantially as herein shown and described, and for the purpose set forth.

4. The eccentric e^1, frame *e*, and handle e^2, in combination with the shaft D^1 and follower *d*, constructed and arranged to operate substantially as shown, and for the purpose described.

116,588.—Harvester.—William H. Harman, Westminster, Md.

Claim.—1. The forked draft-bar *n*, connected with the frame *m*, curved at its front end and carrying the friction-roller *p*, and the segment or curved socket-piece *o*, attached to the side of the case, as herein shown and described.

2. The cutter-bar D, swinging or hinged frame *m* supported on wheel *f*, forked bar *n*, segment *o*, connected or arranged with the case A, as shown and described, to operate as specified.

116,589.—Support for Mirrors and Picture-Frames.—Dominikus Hartmann, Mansfield, Ohio.

Claim.—The mirror-frames G G, yokes F F, and arms C C, provided with screw-bolts and nuts, and arranged in connection with a single bracket, A, as specified, whereby the said parts may operate as set forth.

116,590.—Reversible Seat.—Frank M. Hawkins, Indianapolis, Ind.

Claim.—The cam C, as connected with the reversible back B, in combination with an oscillating seat, S, by means of cam-rods R or their equivalent, all as shown and described, substantially, in the foregoing specification.

116,591.—Watchmaker's Chuck.—Harrison H. Heskett, Le Roy, Ill.

Claim.—The arrangement of the cylinder A, collar *B* upon the screw-threaded cap-springs D, jaws *F*, and face-plate C, substantially as hereinbefore described, and for the purposes set forth.

116,592.—Wheel for Animal-Traps.—Benjamin B. Hill and John R. Hill, Worcester, Mass.

Claim.—1. The combination of the plate A, having a hub and rim, *a*, with the wires and corrugated band inside the wires, as set forth.

2. The combination of the solid head with its hub, and pivot with the bent wires, as above described.

116,593.—Revolving Fire-Arm.—Freeman W. Hood, Boston, Mass.

Claim.—The arrangement and combination of the wedged slide-piece E with the rotary magazine A, its swinging arm B, and the abutment or cam *b* for operating the wedged slide-piece, as explained, all being substantially as specified.

116,594.—Needle for Sewing-Machines.—Orin L. Hopson, Waterbury, and Heman P. Brooks, Wolcottville, Conn., assignors to The Excelsior Needle Company.

Claim.—A sewing-machine needle possessing the peculiarities specified, and forming a new article of manufacture.

116,595.—Car-Coupling.—Henry R. Howe, Hartwick, N. Y.

Claim.—The construction of lever H and tongue J, combined with buffer A, block B, pin E, and link G, arranged as described and set forth, for the purpose specified.

116,596.—Governor for Steam-Engines.—Reuben K. Huntoon, Boston, Mass.

Claim.—1. The improved governor, composed of the rotary ribbed case A, as described, and the wheel or series of paddles *g* applied to separate shafts *b c*, with the driving-power drum or pulley or actuating device *w* fixed to the shaft *b* of the wheel, and with the valve-operating machinery applied to that *c* of the case, whereby the wheel, while in revolution in a fluid when in the case, will be caused to put the case in revolution and thereby operate the valve mechanism connected therewith, all being substantially as described and represented.

2. The combination of the scroll or fusee D and weight *l*, suspended therefrom, as set forth, with the engine-governor, as described, the valve-case C, valve or valves thereof, and the operative mechanism of the latter, all being substantially as specified.

3. The arm *q* and shaft *o*, as arranged and combined with the valve-stem *s*, the case C, and the induct E thereof, substantially as explained.

116,597.—Manufacture of Potato Starch.—Carleton B. Hutchins, Ann Arbor, Mich.

Claim.—The process of separating the starch from the pomace by a pressure either before or after the pomace has been rinsed over the sieve, substantially as set forth in the foregoing specification.

116,598.—Furnace for Puddling Iron, &c.—Richard Jenkins, Newark, Ohio.

Claim.—An oscillating puddling-box or hearth, which is supported upon bearings by means of hollow trunnions arranged in line with the flue leading from the fire-chamber on one side, and with the chimney on the opposite side, substantially as described.

116,599.—Garden-Syringe.—William J. Johnson, Newton, Mass.

Claim.—The double-chambered garden-syringe, constructed and operating substantially as described.

116,600.—Corn-Popper.—William J. Johnson, Newton, assignor to himself and Henry A. Hildreth, Lowell, Mass.

Claim.—1. The screw-shank, with malleable tines *a* and brace *b*, substantially as described.

2. The binding, crimped or corrugated at its corners, substantially as set forth.

3. The combination of binding, wire brace, and screw-shank, severally constructed and arranged in relation to each other, substantially as shown.

4. The corn-popper, with body, binding, wire, brace, and screw-shank combined, when severally constructed and arranged substantially as described.

116,601.—Harvester.—Dennis A. Kellogg, Valparaiso, Ind.

Claim.—In combination with the rocking tubular drag-bar, as described, having the crank-shaft passing through it, the shoe S and the covering-plate M, constructed as set forth.

116,602.—Machine for Laying out Sash. John N. Kikendall, Jr., Virginia, Ill.

Claim.—1. The combination, with the table A, having gauges B and C, of the rods D and adjustable cutters C thereon, constructed to move reciprocally toward or from each other and the table, substantially as specified.

2. The rods carrying the cutters mounted in a pair of curved arms, E, pivoted together and to the table at each end, and operated by a treadle, H, and a spring, all substantially as specified.

116,603.—Crutch-Handle. — Simon Kreger, Philadelphia, Pa.

Claim.—A crutch-handle, stationary on the staff when in use, but detachable therefrom at pleasure, and composed of a non-elastic shoulder-piece fitting under the arm-pit, and superimposed on springs held in place by rods or otherwise, and a base-piece, into which are inserted the ends of the side pieces that form the staff of the crutch.

116,604.—Desulphurizing and Volatilizing Lead and Silver Ores.—George T. Lewis, Philadelphia, Pa.

Claim.—The vaporizing and desulphurizing of lead ores bearing silver, or silver lead ores, and separating the silver therefrom by pulverizing the ore and submitting to the direct action of a flame, and separating the silver by its gravity and solubility, and collecting the oxide or salts of lead in bags.

116,605.—Exhaust-Nozzle.—James Lewis, Chicago, Ill., assignor to himself and Edward J. Cuyler, same place.

Claim.—The bisected conical valve D provided with projections *e e*, in combination with plate A provided with recesses *f f*, and arranged to operate substantially as and for the purpose described.

116,606. — Clothes-Drier. — Charles F. Linscott, Chicago, Ill.

Claim.—The folding frames A, arranged as described, in combination with the ropes C C′ C″, substantially as and for the purpose described.

116,607.—Hoisting-Machine. — William M. Lloyd, New York, N. Y.

Claim.—The cars E, stands or guides D D D, ropes I I, pulleys J and K, and drum L, constructed and arranged to operate substantially as and for the purpose hereinafter shown and described.

116,608.—Hot-Water Heater. — William H. Lungren, Baltimore, Md.

Claim.—1. The valve X working in cage A, substantially as and for the purpose hereinbefore set forth.

2. The receiver and condenser B B, substantially as and for the purpose before set forth.

116,609. — Shuttle for Looms. — James Lyall, New York, N. Y.

Claim.—1. The rollers *b* and links *c c*, in combination with the shuttle-carrier *a* and rollers *e e*, as and for the purposes set forth.

2. The receiver *i*, made removable from the shuttle, and containing the eye or eyes for the weft-thread, and adapted to contain the bobbin, cop, or spool, substantially as set forth.

3. The spring-holding clamp *r*, in combination with the removable receiver and the shuttle, substantially as set forth.

4. The eye or eyes *u* and extension *t* upon the removable receiver *i*, substantially as and for the purposes set forth.

116,610. — Steam-Plow. — Mirabeau N. Lynn, New Albany, Ind., assignor to himself and Edward H. Mann, same place.

Claim.—1. The reciprocating toothed yoke G, constructed as described, in combination with the spur-wheel J, pitman D, slide E, and pushing-legs C C, substantially as and for the purposes described.

2. The foot *t*, constructed as shown in Fig. 4.

116,611. — Water-Gauge with Feeder Attachments.—Mirabeau N. Lynn, New Albany, Ind., assignor to himself and Edward H. Mann, same place.

Claim.—1. The combination of the metal plate B B, glass plate C, elastic packing *c c*, and bollow-valved plugs T extending into the boiler, all constructed to form a water-gauge with a chamber, X, and inlet-passages from the boiler, substantially in the manner and for the purposes described.

2. The plate E, having formed on it perforated screw-tapped and shouldered bosses T^2, in combination with tubular valve-seated screws T^1 and their valves V, substantially as described.

3. The automatic feed-water attachment, consisting of a cylinder, D, float E, stem *e*, crank-stem *g*, and valve *g′*, in combination with pipes *d*, communicating with the boiler through a chamber, X, having a glass face, C, substantially as described.

4. The hollow plugs T, with spring-valves applied at the back of the chamber X and opposite a glass plate, C, said tubes with valves being located within the boiler when the gauge is applied, substantially as and for the purpose described.

116,612. — Grain-Drill. — Robert Marks and Andrew Christian Behne, Connersville, Ind.

Claim.—The combination and arrangement of the guard-plate N having the lugs or cut-offs *a a′ a″*, the feed-wheel P, provided with teeth *p* for conveying the grain to the dropping-apertures, bed-plate M, spouts O O′ O″, rock-shaft G, lever H, and gearing D E F I, substantially as and for the purpose specified.

116,613. — Pulley-Block. — Robert Marsden, Sheffield, England.

Claim.—1. The frame, as shown in the drawing and described in the above specification, in which the hook for suspending the same and the other working parts are contained.

2. The combining together the worm-wheel and the chain-pulley by means of clutches, by which they can be geared or ungeared into each other as occasion may require.

116,614. — Washing-Machine. — Moses S. Marshall, Somerville, assignor to John T. Folsom and John S. Folsom, Boston, Mass.

Claim.—The perforated basket G and perforated partition E, in combination with cylinder A, provided with two hinged or sliding doors, F, one on each side, all arranged and operated substantially as described.

116,615.—Cotton-Gin.—Orren Webb Massey, Macon, Ga.

Claim.—1. The central rib, made gradually wider above the peripheries of the saws to the top, so as to incline the grooves or spaces between the ribs each way from the center, substantially as described.

2. The side ribs, made to incline each way from the center toward the ends of the feed-box above the periphery of the saws, substantially as described.

3. A feed or roll-box for cotton-gins, made to flare gradually from the periphery of the saws to the top, so that it will be about one inch wider at the top than at the periphery of the saws.

116,616. — Griper for Cylinder Printing-Presses. — Victor F. Manger, New York, N. Y.

Claim.—1. The printing-cylinder, perforated in rows to receive the adjustable gripers, as set forth

2. The radial gripers C C, riding on cams D and guided in movable tubes *b*, substantially as herein set forth and described.

116,617.—Mechanical Movement.—James H. McCamey, Wytheville, Va.

Claim.—1. The oblong wheels A A, constructed substantially as and for the purpose hereinbefore set forth.

2. The curved racks B B, in combination with oblong wheels A A, substantially as described.

3. The oblong pinions A A, the curved racks B B, with the cam-wheel C, arranged together substantially as and for the purpose hereinbefore set forth.

116,618.—Clutch for Feeding Mechanism for Sewing-Machines. — Ephraim McDonald, Boston, and Nathan H. Cole, Swampscott, Mass.

Claim.—1. The arm B, constructed as described, with a rising hub, *c*, and arranged to swing on the center of the axis of the wheel, in the manner and for the purpose set forth.

2. The clutch E, constructed and applied as described, in combination with and pivoted to the lever D, and operating in connection with the rising hub *c* on the arm B, and with the flange *d* of the wheel, in the manner and for the purpose specified.

116,619.—Valve.—Edward McSteen, Pittsburg, Pa.

Claim.—The long screw-nut *e* furnished with arms *b b*, duplex wedges *c c*, the permanent incline B, valve *i*, screw on the stem *h*, in combination with each other and the inclosing-shell A, when said parts are constructed, arranged, and made to operate together in the manner shown and set forth.

116,620. — Hot-Water Heater.—Nathan Middleton and Stephen Morris, Philadelphia, Pa.

Claim.—1. The combination and arrangement of the hollow staves B having water-spaces E, the said spaces receiving their supply of water through a suitable feed-pipe or pipes, and having communication with exit hot-water or steam-pipes, substantially as described.

2. The combination and arrangement of the tank C with the chambers E by means of the pipes F, as and for the purpose set forth.

3. The combination and arrangement of the feed-pipe D and short pipes D′ with the tank C and the lower ends of the chambers E, substantially in the manner and for the purpose specified.

116,621.—Door-Fastener.—James A. Morris, Greenbush, N. Y.

Claim.—A door-fastening, formed of two pieces, E I, clamped by a screw, *d*, hinged at D, slotted at E, and having spurs F, shoulder G, and head L thereon, when applied to a door and its casing, as specified.

116,622.—Hay-Elevator and Carrier.—William T. Neil, Greensborough, Pa.

Claim.—The arrangement of the rope I, pulleys J K, car C D E F G H, as shown and described, whereby part of the load suspended from the hook L is sustained by the cord I, as specified.

116,623.—Framing-Joint.—Jonah Newton, New York, N. Y.

Claim.—1. The improved framing-joint herein described, consisting of a mortise having the end and bottom walls formed on a circular line and the edges and end of the tenon shaped to correspond, or both partly circular and partly straight, the said straight parts converging toward the axis of the tenon, and the curvature of the tenon being greater than that of the mortise, all substantially as specified.

2. The mortise having the tongue *a* in the curved or partly-curved and partly-straight walls, and the tenon having the groove *b* therefor, all substantially as specified.

116,624.—Curtain-Fixture.—James Norman, New York, assignor to Leah Anna Norman, same place.

Claim.—The fastening-hook or ratchet-bar B and holding-screw D, constructed and arranged to operate substantially as and for the purposes herein shown and described.

116,625. — Circular-Saw Mill. — Samuel M. Palmer, Glen's Falls, N. Y.

Claim.—A gang-saw shaft, having a pulley, D, at each end, and the feed-rolls E T located as described, combined with the mechanism herein shown and described for operating the same, all constructed and arranged as and for the purpose specified.

116,626. — Tanner's Sleeper.—Lewis K. Parsons, Charles E. Getchell, and Samuel W. Fairfield, Salem, Mass.

Claim.—The combination of the sleeper S, the valve P, and screw B, and the yoke A, or its equivalent, constructed and arranged substantially as described.

116,627.—Corn-Sheller.—Asahel H. Patch, Hamilton, Mass.

Claim.—1. The disks K K, when combined and arranged to incline toward each other at the top, as shown, in the manner and for the purpose substantially as specified.

2. The guide R on shaft N, stud V, and disks K K, when arranged to operate together, substantially as and for the purpose specified.

116,628. — Sash-Holder. — Alexander W. Pennington, Rochester, N. Y., assignor to Sarah A. Pennington and Chauncey Perry, same place.

Claim.—1. The combination of a rocking stop, *f*, a sliding stop, *e*, and an actuating spindle, *d*, common to both, arranged to operate substantially in the manner set forth.

2. The movable spindle *d*, provided with an arm, *g*, in combination with the spring *p* and stops *e* and *f*, whereby the spring acts to return both stops to their locked position, substantially as described.

116,629.—Tilting Chair.—Charles R. Peters and William P. Taylor, San Francisco, Cal.

Claim.—The combination of the base A having its rear portion inclined, and provided with the socket-plate D, with the seat F having the plate G′ constructed as described, as and for the purpose set forth.

116,630.—Setting Steam-Boilers.—Orrin Ranney, Corry, Pa.

Claim.—The fire-grate and the bottom wall behind the grate arranged on a regular ascending grade, the walls D E inclining toward the ends of the boiler, and the breeching graduated, as described, all in connection with a smoke-stack having greater capacity than the arch and the flues for creating a rapid draught through the arch and flues, all substantially as specified.

116,631.—Binnacle for Mariners' Compasses.—George W. Richey and Horace E. Bixby, St. Louis, Mo.

Claim.—1. The arrangement of shades E F, side pieces *e e′*, and circular shade G, in combination with a binnacle, B, formed with inclined sides B B′, hinged cover C with slot H, and slide I, con-

structed and colored substantially as and for the purpose set forth.

2. The improved binnacle B with shades or deflectors, in combination with a marine compass, A, and light or lamp D, substantially as set forth.

3. The compass-chart with printed list of landings, places, and objects, together with points of compass indicating their magnetic direction and position, substantially as and for the purpose set forth.

4. The compass-chart or river-guide I, constructed as described, when arranged on reels J J', in combination with a box or housing, K, constructed as and for the purpose set forth.

116,632, antedated June 28, 1871.—CLOTHES-LINE SUPPORTER.—Thomas Riley, Williamsburg, N. Y.

Claim.—The adjustable line-supporter B, constructed and applied substantially as shown and described.

116,633.—SEED-PLANTER.—Benjamin Saunders, Claverack, N. Y.

Claim.—1. The combined potato and small-seed planter herein described, when the two devices for measuring and dropping are constructed as set forth, and are made detachable and adapted to be operated within the circular frame or curb A by means of and in combination with vertical shaft O, wheel C, pinion P, axle N, and wheels T T, substantially in the manner and for the purposes described.

2. Curb or frame A with its detachable measuring-and-dropping devices, arranged and operated as above described, in combination with spout D, marker E, coverers H H, and roller F, substantially as and for the purposes herein set forth.

116,634.—DEVICE FOR FASTENING HANDLES TO SATCHELS, &c. — Morris Schwerin, Newark, N. J.

Claim.—A handle-fastening composed of the flanged tube B, flanged cup C, and spring-clasp E, arranged and applied substantially as described.

116,635.—KNIFE-CLEANER. — Joseph Seeberger, West Troy, N. Y., assignor to himself and Alexander Shiland, same place.

Claim.—The arrangement of the roller B, springs G G, part A A, and frame D, as set forth.

116,636. — MACHINE FOR TURNING THE FLANGES ON THE HEADS OF OIL-TANKS. George Selden, Erie, Pa.

Claim.—The herein-described method of concaving and flanging iron plates or disks.

116,637.—SHINGLE-MACHINE.—Charles Shelmidine, Summit, N. Y.

Claim.—1. In a shingle-machine, the jaws B B, constructed and arranged to operate as herein shown and described.

2. The combination of the gauging-knives D D and circular cutters F F in the jaws B B, arranged to operate substantially as and for the purposes described.

3. The incline planes G G and curved pieces or levers E E, in combination with the jaws B B, substantially as described.

116,638.—DEPILATING HIDES AND PRESERVING WOOD.—John E. Siebel, Chicago, Ill.

Claim.—1. The use of refuse gas-lime as a depilatory, especially for the use of tanneries, substantially as set forth.

2. The use of refuse gas-lime in connection with either one of the three following substances, viz.: sulphate of zinc, ferrous sulphate, or ferric sulphate, for the impregnation and preservation of wood, substantially as set forth.

116,639. — CLOTHES-DRIER. — Dow Carlos Smart, Cambridgeport, Mass.

Claim.—The improved combined spindle and pedestal-cap for clothes-driers, as composed of the journal *a* and its prolonged arm or shank *b*, the frusto-conic support and cap C, the screw-rods *c*, and nuts *f*, or their equivalent, the whole being formed and applied, or to be applied, to the pedestal D, in manner and for the purpose set forth.

116,640. — SHOT-CARTRIDGE FOR BREECH-LOADING FIRE-ARMS.—Charles Edward Sneider, Baltimore, Md., assignor to himself, Josias Pennington, Jr., and Nicholas G. Penniman, same place.

Claim.—A shot-cartridge, made of two or more sections or pieces, united by metal, paper, or cement to withstand handling but readily separable at their line of union when the cartridge is fired, substantially as and for the purpose described.

116,641.—CART-BODY FASTENING. — Enos Spalding, Plainfield, N. H.

Claim.—The pivoted bar D, having one or more notches, *d'*, formed in its forward end, bolt E having a long slotted projecting head, and spring F, said parts being constructed and arranged to operate in connection with the frame-work of a cart, substantially as herein shown and described, and for the purpose set forth.

116,642.—BREECH-LOADING FIRE-ARM.—George R. Stetson, New Haven, Conn.

Claim.—1. The locking-pin G and connecting cam-slotted levers C, combined with the breech-pin A and operating-lever B for actuating and locking the breech-pin, substantially in the manner described.

2. The cartridge-ejecting levers O P, arranged as shown and described, and actuated by the breech-pin through the medium of catches R S, substantially as specified.

3. The arrangement of the cover A' and spring B' with the aperture Y, substantially as specified.

116,643.—DRAIN-PIPE MACHINE.—John W. Stockwell, Portland, Me.

Claim.—1. The tip-former A, in combination with the flange *f* of the core *g'*, as herein described.

2. The improved joint for cement pipe, as shown in Fig. 12, plate 2, and as herein described.

3. The chains, sockets, and inclined pins, or their equivalents, as shown, in combination with the case, as described.

4. The trowels, as shown in Fig. 11, provided with projections *b'*, in combination with the collar A, when said parts are cast in one piece, as set forth.

116,644. — DOOR AND GATE-SPRING. — M. Frank Taber, Salem, Ohio.

Claim.—1. In combination with the vibrating arm E, spring C, shell D, and link G, the stop *D'*, substantially as and for the purpose described.

2. The combination of the vibrating arm E, spring C, shell D, link G, stop *D'*, and set-screw *d'*, substantially as and for the purpose set forth.

3. In combination with the link G, the loop *g* and screw-eye *g'*, substantially as described.

116,645.—SEWER-TRAP.—Stevenson Towle, New York, N. Y.

Claim.—1. The metallic basin A, constructed with two passages in one of its sides, a lateral extension-nozzle chamber B *g* in communication with the chamber formed by the basin A, and a movable valve, D, covering the upper one of said passages, all arranged and operating substantially in the manner and for the purpose described.

2. The depressed seat *b* for the stone E, formed on the basin A, in combination with the dovetail recesses formed in the basin for receiving cement to fasten the stone in place, all substantially in the manner and for the purpose described.

116,646.—SLOVE-DOOR.—John Van, Cincinnati, Ohio.

Claim.—The arrangement of the plates B, notched, raised, and slotted guard-plate C *c c'*, vertical gravitating bolt D *d d' d''* G, and catches E F, substantially as and for the objects designated.

116,647.—METHOD OF DRAWING PATTERNS FOR FLARING VESSELS.—Orlando B. Vandenburg, Findlay, Ohio.

Claim.—The method of drawing patterns for cutting sheet metal, substantially as herein shown and described.

116,648.—ROLLER-SKATE.—George Vincent Stockton, Cal., assignor of two-thirds his right to William H. Van Vlear and Charles D. Ladd, same place.

Claim.—1. The pivoted standards *a a* and plate B, in combination with the crank C, the rod E, and the axle A, substantially as and for the purposes hereinbefore set forth.

2. The plate or rod F, and the pad or cushion *a*, substantially as and for the purposes hereinbefore set forth.

116,649.—LATHE-CHUCK.—Alfred H. Wagner, Prairie City, Ill., assignor to himself, William J. Randolph, Levi Day, and Adam Harshberger, same place.

Claim.—In combination with the box A and screw B, the jaws C C, each working on its own center and into each other by one or more cogs, *b*, and regulated by the screw D, spring *d*, and nut E, all constructed and arranged substantially as and for the purposes herein set forth.

116,650.—BALING-PRESS.—Isaac P. Walker, Milwaukee, Wis.

Claim.—1. The combination of two or more pairs of toggle-levers linked together and operated from one and the same source, as and for the purpose described and represented.

2. In combination with the pairs of toggle-levers herein shown, linked together and operated from one and the same source, and a double set of rack-bars or ratchet-notches, the spring-pawls pivoted to said levers, and catching and working in said bars or notches, all constructed and operating substantially as and for the purpose described and represented.

3. In combination with the toggle-levers herein shown, ratchet-bars, and spring-pawls, an engaging-and-disengaging mechanism, substantially as described, whereby all the pawls may be simultaneously thrown out of or into action with the ratchet-teeth, as and for the purpose described.

116,651.—CEMENT FOR COATING OIL-BARRELS AND TANKS. — Isaac Waterman, London, Canada.

Claim.—The barrel cement, herein shown and described, consisting of alum, iodide of potassium, glue, plaster of Paris, and water, compounded in the manner and about the proportions specified.

116,652. — INSECT-TRAP. — Lyman I. Way, Annawan, Ill.

Claim.—The funnel A B, having recess E, collar C, and bag D, the whole combined, arranged, and applied as and for the purpose specified.

116,653.—SHOE-FASTENING.—Edward Webb, Norfolk, Va., assignor to himself, C. B. Ford, same place, and Benjamin F. Ford, Washington, D. C.

Claim.—In combination with the flaps of a boot or shoe, the cord C, series of eyelets or equivalents E E, buttons D D, and corresponding clasps F F, all constructed, arranged, and operating substantially in the manner and for the purpose herein set forth and described.

116,654, antedated June 22, 1871.—DOOR-STOP.—Isaac J. Wells, Willmar, Minn.

Claim.—The shouldered casting *a b*, let flush into the door A, and the casting *c* provided with the notch *c*, and secured to the floor by countersunk screws passing through the springs *g g*, as shown and described.

116,655.—VALVE DEVICE FOR STEAM-POWER AIR-BRAKE COUPLING.—George Westinghouse, Jr., Pittsburg, Pa.

Claim.—A rigid inflexible stem, *f*, arranged in one part of a pipe-coupling, in combination with a valve in the other part, the two being so arranged that when the couplings are united the valve shall be unseated by being brought in contact with the stem, substantially as described.

116,656.—SAFETY ATTACHMENT FOR HOISTING-CAGES.—William C. Williamson, Philadelphia, Pa.

Claim.—The arrangement of the pawls E, levers F, weight G, and spring J, in connection with each other and with the cross-bar D, hoisting-rope or chain I, and guides A, substantially as herein shown and described, and for the purpose set forth.

116,657.—FENCE.—Timothy C. Wood, Augusta, Mich.

Claim.—1. The two posts, having arms G G and seat E on each, the post N and the rods H, combined, constructed, and arranged as described, to support the panel in a vertical position.

2. The two iron posts, the two wooden posts, the top and bottom rails, the four braces, and the wires, all combined, constructed, and arranged as described, to form an improved panel of fence.

116,658. — NICKEL PLATING.—Isaac Adams, Jr., Boston, Mass.

Claim.—The application of heat to the solution of sulphate of ammonia in forming the double sulphate of nickle and ammonia by the battery process, substantially as herein described.

116,659.—FIRE-ESCAPE.—Ezra Ale, Clearfield, Pa., assignor to himself and J. Blake Walters, same place.

Claim.—The combination of the flexible metal ladder, the box B' within the window-casing or room, and the cover or block C, substantially as and for the purpose herein described.

116,660.—MAGNETO-ELECTRIC GAS-LIGHTING APPARATUS.—Almon N. Allen and Rodney H. Dewey, Pittsfield, Mass.

Claim.—1. The method, substantially as herein described, for admitting gas to a burner, and igniting the same, by a magneto-electric machine connected with the burner and actuated by a current of air, which also serves to open the gas-valve, as set forth.

2. The air-pipe *e* and bucket-wheel *d*, in combination with the arbors *e f*, magneto-electric machine D, gas-valve C, and burner A, substantially as shown and described.

3. The arbor *r* and bucket-wheel *t*, in combination with the arbor *l*, valve C, and burner A, substantially as set forth.

4. The toe *m* and spring *n*, in combination with the valve C, arbor *l*, arms *o s*, and pins *p q*, projecting from the arbor *e*, substantially as described.

5. The method, substantially as described, of extinguishing gas-flames by means of a current of air acting on the valve which controls the flow of gas to the burner, as set forth.

116,661. — BAG-HOLDER.—Ira Allen, Manchester, N. Y.

Claim.—1. The hopper G, hinged at its upper

rear side to the platform or back E, and provided at or near its lower rear side with link i, said link extending through the back E, all as and for the purpose set forth.

2. The hopper G, link i, rock-shaft m, provided with lever n and hook k, all combined and arranged substantially as shown and for the purpose set forth.

116,662. — PAINT-MILL. — William R. Axe, Rockton, Ill.

Claim.—1. The center plate C, in combination with the revolving plate E and stationary grinding-plate b, when constructed and operated substantially as and for the purposes set forth and described.

2. The shaft D, miter-wheel P, and set-screw f', in combination with center plate C, when constructed and operating substantially in the manner and for the purposes specified.

3. The shaft D, miter-wheel P, set-screw f', and center plate C, in combination with hollow shaft F, miter-wheel P', and set-screw i, when constructed and operating substantially in the manner and for the purposes described.

116,663.—CAR-COUPLING.—David H. Ball, Sinnamahoning, Pa.

Claim.—The combination of the draw-head a having square hole a, pin b, and slot i, with the link A having guards g and g' and f f, of the pin m having its upper shank square and notched at the throat and provided with a square cam-head, substantially as specified.

116,664.—MANUFACTURE OF BICARBONATE OF SODA.—William Henry Balmain, St. Helen's, Great Britain.

Claim.—The process of treating bicarbonate of soda and its salts, substantially as described.

116,665. — CLOTHES-WRINGER. — Elbridge G. W. Bartlett, Providence, R. I., assignor to Providence Tool Company, same place.

Claim.—1. The journal-casing, consisting of the parts A and B, provided with stop-joints d and b c, substantially as described.

2. The journal-casing, Fig. 2, provided with the lower stationary bearing, the upper sliding journal-box D, and the stop-joint at g, substantially as shown and described.

116,666, antedated June 29, 1871.—THILL-COUPLING.—Alma Bedford, Cold Water, Mich.

Claim.—Pole or thill-couplings for vehicles, the joint of which is provided with a projecting lip, c, on the thill-iron E extending back of the draft-pin or pintles f f, in combination with the yielding substance g secured in the recess a of the clip-iron A for supporting the thills or pole in any desired position, substantially as herein shown and described.

116,667.—BAGGAGE-CHECK.—Francis Xavier Bellerive, Plattsburg, N. Y.

Claim.—The baggage-check case herein described, made of leather, and provided with the guard-strap c and attaching-strap B, substantially as specified.

116,668. — DRAIN-TILE MACHINE.—Hiram Bissell, Hartford, Conn.

Claim.—1. In combination with a water or steam-cylinder, B, the hollow piston I and hollow plunger O, constructed and arranged substantially as and for the purposes set forth.

2. The former-collar G, constructed substantially as described, and arranged to operate in combination with the table C having a chambered recess, D, plunger O, and matrix E, and with or without the disk K and rods L, substantially as and for the purpose set forth.

116,669.—STEAM-GAUGE.—Richard C. Blake, Cincinnati, Ohio.

Claim.—In a diaphragm steam-gauge, the combination of the annular groove a in the face C of the case, metallic gasket H, diaphragm F having an annular bead G, and follower E, to form a steam-joint, substantially as set forth.

116,670.—STAVE-JOINTER.—Samuel C. Blinn, Tecumseh, Mich.

Claim.—The bed-plate E, standard F, rod F, arms G, spring h, screws a', and slots a, in combination with the concave cylinder B and frame A, the several parts being constructed substantially as and for the purpose specified.

116,671. — STEAM-PACKING.—Augustus O. Bourn, Providence, R. I.

Claim.—The improved packing described, consisting of the core formed by alternating layers of textile fabric and rubber surrounded by successive layers of the fabric saturated in rubber solution, as and for the purposes specified.

116,672, antedated June 24, 1871.—JACK-POST FOR PEGGING SHOES. — Daniel Bowker, Boston, Mass.

Claim.—1. The bed B, constructed as above described, in combination with a jack-post.

2. The combination of the jack-post A, clamp C, and base D, constructed as above described, and all arranged together as and for the purpose specified.

116,673. — TRACK-CLEARER FOR RAILWAY CARS.—Michael Croll Boyer, Norristown, Pa.

Claim.—1. The wheels J, suspended by swinging arms G so as to be maintained in contact with and operated by the flanged wheels of a car, as specified.

2. The combination of the above with the drum K on the shaft I.

116,674. — HEATING-STOVE.—Nathaniel A. Boynton, New York, N. Y.

Claim.—1. The detachable supplemental base D E, constructed of largest diameter in its central part, converging upward and downward to openings of equal or nearly equal diameter, to adapt it for application to stoves already made, and provided in its upper part with illuminating-windows d, all substantially as herein set forth.

2. The combination of the vertical grate or basket H with the aforesaid supplemental base D d E, as and for the purpose specified.

3. The combination of the horizontal grate G with the supplemental base D E, constructed as described, for the purpose stated.

116,675.—STOVE-PIPE DAMPER.—Nathaniel A. Boynton, New York, N. Y.

Claim.—1. The damper B, shaft b, and connected sleeve and plate C G, when constructed and combined, substantially as herein shown and described, to support the damper firmly in position while permitting its free rotation.

2. The combination of the handle D, divided shaft d b, and damper B, when applied, substantially as herein described, so as to retard the communication of heat to the handle D, as set forth.

116,676.—FOLDING CHAIR.—Charles Brada, New York, N. Y,

Claim.—1. The frames A A, shaft A, cross-piece A^2 and A^3, and the seat-piece C, constructed and arranged for joint operation, as specified.

2. The within-described construction of the cyn b b, embracing the shaft a and partially embracing the upper portions of the frames B, and arranged to serve relatively thereto and to the frames A A and seat C, as herein specified.

3. The within-described combination and arrangement of the frames A A with their several cross-pieces A^2 A^3, the shaft a, connected by the hinges or eyes b b with the frames B B, the seat C, and the hook-brace M, the whole forming the improved folding chair herein described.

116,677.—STOP-MOTION AND CREEL-STAND FOR KNITTING-MACHINES. — Horace C. Bradford, R. I.

Claim.—1. The combination of the yarn-levers, the actuating or tripping-lever, and the shifting weight, when arranged and operating substantially as described.

2. The combination of the spring-spindle P provided with an arm, p, and capable of a partial rotary movement, the cam a on the main shaft, the controlling-lever O provided with an arm, m, and the spring-shipper N so arranged that the depression of the spring-spindle will cause the shipper to be released, substantially as described.

3. The combination of the spring-spindle, the shipper, and the intermediate operative mechanism with the yarn-levers, the actuating or tripping-lever, the shifting weight, and a suitable connecting device, so arranged that the weight, when released by the breaking of a single yarn, will be directed to and allowed to exercise its deflective force upon the spring-spindle, and thereby release the shipper, substantially as described.

4. The combination of the posts D, the vertical sliding creel E, and the balance-weights D^3, substantially as and for the purposes specified.

116,678. — COMBINED CORN-PLANTER AND CULTIVATOR.—Edward Braggins, Mount Vernon, Ohio.

Claim.—The arrangement, upon one frame, of the seed-drill device D G' L, the corn-dropper device E G, the movable plows I I', and the rake J' f, all substantially as herein set forth.

116,679. — WINDOW-BLIND. — William E. Brock, New York, N. Y.

Claim.—The pivots C C, formed with slits, in combination with the jog a of the slats, substantially as herein described.

116,680. — BASE-BURNING FIRE-PLACE HEATER. — John H. Burtis, Brooklyn, N. Y.

Claim.—1. In combination with the air-heating passages A L k, the arrangement of the fire-pot eccentrically to the magazine, substantially as and for the purposes set forth.

2. The arrangement of an enlarged cold-air receiving-chamber occupying the entire space immediately surrounding the ash-pit except in front, in combination with the air-heating chamber 3 and the flue-space 4, arranged as set forth.

3. The enlarged cold-air receiving-chamber immediately surrounding the ash-pit except in front, extending back to the outer casing, and the fire-pot with the tubes g g which convey the admitted air through the combustion-chamber, in combination with the downward passages e e and flue-chamber 4 for the escape of the products of combustion, whereby the air to be heated is conducted, in passages which are surrounded through their whole course by heating-surfaces, until it enters the reservoir G, arranged substantially as set forth.

4. I do not claim, broadly, sliding doors; but I claim, in combination with a cylindrical front curved inwardly as at a', Fig. 1, and a fire-pot eccentric to the reservoir, making the frontal converging portion in sliding sections to expose the open fire and insure more general radiation and illumination therefrom, substantially as set forth.

5. In combination with the air-heating passages A L k, the oblique or inclined mouth of the magazine, and the branches A k which form a heat-receiving surface inclined upwardly from the rear of the combustion-chamber to the front thereof, as and for the purposes set forth.

6. A fuel-magazine, the walls of which are formed of tubes e e or equivalent hollow upright sections, substantially as set forth.

7. I do not claim an annular air-heating space at the base of a magazine; but I claim, in a fire-place heater, conveying the air from the chamber G in the rear by the branch k and annular passage L around the base of the magazine, and discharging it either through a register in front of the case or by passing it through the tubular sides of the magazine, returning it to the chamber G in a superheated state, substantially as set forth.

8. The combination, with the conductor or passages A L k, of tubes or branches w w and e e forming a part or the whole of the side of the magazine, and conveying and discharging the air heated in its course from the rear to the front of the heater through the top thereof into the hot-air chamber G, substantially as set forth.

9. The combination of said air-heating passage or passages A L k, receiving at the rear and discharging both at the front and top of the heater, with the reversible flues c c, which so control the products of combustion that their course is around the exterior surfaces of said conductors in ascending and descending currents, substantially as set forth.

10. Supporting the sides of the magazine on the annular trunks L and its branches A k, substantially as and for the purpose set forth.

11. The pendulous support o, in combination with the vertically-hinged cover F and step p, as and for the purpose set forth.

12. In combination with the damper-arm s and rod r, the stop t, arranged and operating as and for the purpose set forth.

13. The combination of the air-admitting chamber in the base surrounding the ash-pit except in front, and communicating with the chamber G at a' with the air-heating passages A L k, whereby a portion of the cold air pursuing the course of the arrows 2 2 is superheated and discharged at l or added to the warm-air reservoir G, substantially as set forth.

14. The register w, in combination with the tubes e e which form the walls of the magazine, as and for the purposes described.

15. Forming a portion of the side of the magazine of the separate air-conducting branch k of the annular tube L, substantially as set forth.

116,681.—COOKING-RANGE.—John H. Burtis, Brooklyn, N. Y.

Claim.—The platform-extension projecting from the body of the range, and forming a part thereof on the side nearest the fire-chamber, and arranged, at or near the level of the grate, to form a substitute for a warming-closet, said platform and the side of the range from which it projects being formed without doors, dampers, air-passages, or other openings, to prevent the access of dust and ashes, substantially as set forth.

116,682.—SLIDER FOR WAGONS.—Vosco M. Chafee, Clay City, Ill.

Claim. — The semicircular slider C, having its ends resting on the axle and secured thereto by hoops D, and also united with the hounds, as shown, when constructed and arranged substantially as specified.

116,683.—ANIMAL-POKE.—Harlow F. Chapin, Rochester, N. Y., assignor to himself and Pollock, Weaver & Co., same place.

Claim.—1. In an animal-poke, the arrangement of the arms A A, legs D D, and cross-bar G or equivalent, said arms being attached to the legs, and the latter projecting up within the arms so as to present several points of attachment for the cross-bar, as herein described.

2. The combination of the two cross-heads H I, each arranged to have a motion toward the other, and connected by the pivoted levers f g h or equivalent, as herein described.

116,684.—Package for Butter and Lard. John L. Cone, Waterloo, assignor to himself and Henry Churchill, Rochester, N. Y.

Claim.—1. The fastening, consisting of the ears C D, the swing-bar E with cam G and lever H, and the cross-bar I with claw *d*, open slot *g*, and socket *f*, all arranged as described, for the purpose of compressing the packing, thereby forming an air-tight joint.

2. The combination of the vessel A, cover B, packing *a*, ears C D, cross-bar I, swinging lever E, cam G, and lever H, arranged and operating together substantially as and for the purpose set forth.

116,685.—Bolting-Reel.—Sherman Corsett and Oliver D. Lowe, Middleville, Mich.

Claim.—The arrangement, herein described, of the two sectional ribs B of a flour-bolt and the strips *e* of bolting-cloth, whereby the edges of the adjacent strips are brought together in the clamping-joint, thus forming a continuous lining of cloth capable of bolting throughout its entire length.

116,686.—Safe-Door.—D'Estaing S. Covert, Chicago, Ill.

Claim.—The safe-hinge, consisting of the leaf C, provided with head *c*, which fits over pintle *d*, which latter slides on a projection, *e*, formed on leaf E, and lever D, all arranged to operate substantially as described.

116,687.—Shirt-Bosom Expander.—Calvin Crowell, Syracuse, N. Y., assignor to Daniel D. Smith, same place.

Claim.—A shirt-bosom expander, composed of the longitudinal strip A and transverse pieces *a a* attached thereto, the device being provided with buttons B *b* for securing it to the shirt-band and bosom, all constructed and arranged substantially as shown and described.

116,688.—Safe-Door.—D'Estaing S. Covert, Chicago, Ill.

Claim.—The combination of the lever C provided with opening *g* and slot *h*, with the leaf A provided with slot *e* and pin *d*, and leaf B provided with pintle *c*, substantially as and for the purpose set forth.

116,689.—Rocking-Chair.—George Caapp, New York, N. Y.

Claim.—1. The pedestal D, provided with legs *j*, in which casters *k k* attached to springs *i i* are secured, when the said legs and spring-casters operate in connection with the rocking mechanism and seat, as and for the purpose specified.

2. The chair B, mounted, by means of the tongue *g* and socket, on the levers C, oscillating on a pivot, *p*, which rests in the socket *c*, and rendered elastic in their movement by springs *e*, in combination with the pedestal and its parts, the whole constructed and arranged substantially as set forth.

116,690.—Roller-Skate.—George S. Curtis, Chicago, Ill.

Claim.—In a roller-skate having central driving-wheels, the combination therewith of one or more independent caster-wheels, operating substantially as described.

116,691.—Preparation of Wheat for Food.—Ira T. Curtis and J. Willard Smith, Rochester, N. Y.

Claim.—As a new article of food, crushed wheat prepared by being passed through rollers substantially as herein described.

116,692.—Butteris.—Samuel Davis, New Trenton, Ind.

Claim.—The combination of the knife A, bar B, and claw C, when the latter is pivoted at some point between the ends of the bar, and in relation to the knife, substantially in the manner and for the purpose set forth.

116,693.—Boiler-Tile Support.—William Dillon, Wheeling, W. Va.

Claim.—The boiler-tile supports *b b*, substantially as and for the purposes herein set forth.

116,694.—Cotton-Picker.—Bartholdt J. Dreeson, Schleswig, Germany, and James L. Buskett, St. Louis, Mo.

Claim.—1. The combination of the frame A B E D and the casing composed of the sheet-metal top F and the cloth sides G, all constructed, arranged, and connected together substantially as described and shown.

2. The combination of the frame A B E D and the shield P, pivoted on the rod J, for the purpose of pivoting said frame nearly at equipoise upon said shield, substantially as described and shown.

3. The arrangement of the guide-rod V, in connection with the frame A B E D and the pivoted shield P, for the purpose of directing the machine, substantially as described and shown.

4. The pivoted shield P provided with straps S T, and W, combined with the frame A B E D provided with the straps R, constructed, arranged, and operated substantially as described and shown.

116,695.—Electro-Medical Apparatus. Luis Drescher, New York, N. Y.

Claim.—1. The double or U-shaped cells for a galvanic battery, each cell being formed with distinct yet communicating compartments to receive its positive and negative plates, substantially as and for the purpose herein set forth.

2. A metallic needle or finger, traversing upon a metallic bar or plate parallel to the electro-magnet of a Faradic instrument, and connected with one of its electrodes so as to bear with its point upon the outer spiral layer of the induction-coil of the magnet, said layer being so exposed as to permit a direct contact of the finger with each convolution of its coil, substantially as and for the purpose herein set forth.

3. The combination of each of the loops by which the several layers in the helix or induction-coil of an electro-magnet are united to form one continuous length of wire, with one of a series of insulated points arranged in order upon a suitable plate or table within reach of a metallic pivoted switch-lever connected with one of the electrodes of the instrument or with a separate galvanic battery, so that a current passing through said switch-lever may be directed to either of the layers or coils of the helix at pleasure, substantially as and for the purpose herein set forth.

4. The combination of one or more suitable rods with the case of a galvanic or electro-magnetic instrument or the handles of its electrodes, and with the electrode cords or wires of the instrument to wind or coil them up neatly and compactly, substantially as and for the purpose herein set forth.

116,696.—Car-Coupling.—Henry William Earl, Baltimore, Md.

Claim.—1. The shackle F, constructed with the flange or shoulder *r*, substantially as shown, in combination with the spring-slide G engaging with said shoulder to lock the shackle against elevation by jolting.

2. The notches *p* in the shackle F, in combination with the spring-slide G for locking the shackle below level, substantially as represented and described.

3. The notches *q* in the buffer-heads *p* of the spring-slide G, in combination with the flange or lip *r* on the shackle F for locking the shackle above level, substantially as shown and set forth.

4. The combination, with the heads A E, of a horizontal shackle-coupling of the hooks S, arranged as shown and described, to attach links Q by chains R for coupling with common heads.

116,697.—Reversible Knob-Latch.—Henry H. Elwell, South Norwalk, Conn., assignor to The Norwalk Lock Company, same place.

Claim.—The arrangement of a bearing, *d*, substantially as described, upon the inside of the plate B, combined with the latch-bolt and case, so that by turning the said plate as set forth the latch-bolt is free to be reset, substantially in the manner specified.

116,698.—Smelting or Blast-Furnace.—William Ferrie, Monkland Iron and Steel Works, Great Britain.

Claim.—1. The forming of retorts, chambers, or spaces 1 in the upper part of a smelting or blast-furnace, substantially as and for the purpose hereinbefore set forth.

2. The forming of flues 6 7 in the upper sides of the furnace and of inlets for air into such flues, substantially as and for the purposes hereinbefore set forth.

116,699.—Coal-Scuttle.—Bridget Fielding, Cincinnati, Ohio.

Claim.—A coal-scuttle or bucket, constructed with side openings *a a* in the base B, and with extension wings D D from the bottom C passing through said openings and firmly secured to the bucket sides, in the manner and for the purpose specified.

116,700.—House for the Management of Bees.—Martin A. Glass, Independence, Iowa.

Claim.—The arrangement of the shelves C, boxes D, pans I, hive-board K, jack H, bar *b*, and wires *a a* within the house A, all operating substantially as and for the purposes set forth.

116,701.—Hot-Air Furnace.—Bartholomew Gommenginger, Rochester, N. Y.

Claim.—1. Constructing the water-jacket in two or more separate rings, capable of being placed one upon another, and each having a separate system of pipes, in the manner and for the purpose specified.

2. The combination of the water-jacket I, water-pipes K K′, steam-cock K″, branch pipes *g h*, and water-tank L, substantially as and for the purpose set forth.

116,702.—Axle-Box.—Albert Goodyear, 2d, Hamden, Conn.

Claim.—As a new article of manufacture, the herein-described axle-box, consisting of the wrought-metal tube A and malleable-iron neck B, the two united by the process of welding, substantially in the manner described.

116,703.—Pump.—Daniel J. Gorton, Quincy, Ill.

Claim.—The within-described pump, consisting of the cylinder A, valve-chambers B C, air chamber E, suction and discharge-pipes G H, ports *a a*′ and *b b*′, openings *a*² *b*², and the plunger D formed in double-cup shape by means of the flanges *i i*, and provided with packing *e e*, followers *f f*, and nuts *k k* on the plunger-rod I, all of said parts being constructed, combined, and arranged substantially in the manner and for the purposes herein set forth.

116,704.—Lubricating Compound.—Henry Grogan, Flatbush, N. Y.

Claim.—1. A lubricating compound, made of tallow, petroleum, caustic soda or other alkali, and plumbago or other mineral producing the same effect, as herein set forth.

2. A lubricating compound, made of tallow, petroleum, caustic soda, or other alkali, plumbago or other equivalent mineral, and animal hair, as herein described.

116,705.—Carriage-Spring.—Edwin Hall, Oxford, N. Y.

Claim.—1. The arrangement of the springs B, B′, and C, as described and shown, for the purpose of sustaining the weight in the first instance directly upon the upper centers of the springs B and B′, as explained and set forth.

2. The combination of the springs B, B′, and C and the bearing D, the several parts being constructed and arranged substantially as described and shown.

3. The combination of the springs B, B′, and C, the bearing D, and the spring-braces J, all constructed and arranged substantially as described and shown.

4. The spring draft-bars H, constructed, arranged, and operated substantially as described and shown.

116,706.—Sash-Holder.—Herrick R. Halsey, La Fayette, Ill.

Claim.—The face-plate A, constructed with lugs C and recessed lugs B, into which is fitted the end *F f* of the binder E, combined with the spring H, parts A and E cast in two pieces and secured only by the temper-screw J, substantially as described.

116,707.—Exhaust-Valve.—Robert W. Hamilton, Hartford, Conn.

Claim.—The screw *k*, arranged inside of the valve, in combination with the screw-threaded wedge *i*, packing-ring *h*, and rod *e*, substantially as set forth.

116,708.—Flower-Bracket.—William Hichborn, Charlestown, Mass.

Claim.—The above-described pendent flower-pot stand, as made with the series of arms A, the disk or table B, the spindles or rods C C′, and either with or without the slider or clamp *f*, the whole being constructed, arranged, and applied together and provided with means of suspension, substantially as set forth.

116,709.—Pressing and Stuffing Machine.—Ephraim S. Holloway, Columbiana, Ohio.

Claim.—The gate A, guides B, operating-gear C, D, and E, in combination with screw F and follower A, constructed, arranged, and operating with relation to each other, substantially as herein described, and for the purpose set forth.

116,710.—Hat.—Charles A. Hopkins, Charles H. Reid, George N. Raymond, and John S. Meeker, Danbury, Conn.

Claim.—The series of springs *a*, substantially as described, formed of successive loops, a portion of which is secured to the body of the hat, and the remainder of which projects to form an elastic cushion for the sweat-leather *b*.

116,711.—Apparatus for Evaporating Saline and other Liquids.—John Howarth, Salem, Mass.

Claim.—1. The combination, with an evaporating-pan or drying-table, of a steam pan-boiler, substantially as described, placed immediately under the pan or table and over the furnace-fire, and, when in operation, containing water and steam under pressure, substantially as and for the purposes herein shown and set forth.

2. In combination with the pan, pan-boiler, and furnace, arranged and operating as specified in the preceding clause, the system of pipes connected with the boiler, substantially in the manner herein shown and set forth, to insure free circulation of the contents of the same.

116,712.—Spring Bed-Bottom.—William C. Hubbard, Hubbardston, Mich., assignor to himself, Jerome J. Robbins, and William W. Carner, same place.

Claim.—The mortise D through the slat S, through

the head and foot cross-pieces H H, with wooden supporting-pin P resting in countersunk on top of cross-pieces, and wooden supporting-pin crossing mortise on under side of sled, substantially in the manner and for the purpose as herein described and set forth.

116,713. — LEAD-PENCIL. — Philip Hufeland, New York, N. Y.

Claim.—A lead-pencil having attached to one of its ends a paper tube forming a continuation of the pencil, and containing in its outer end a piece of India rubber, substantially as and for the purposes herein shown and described.

116,714. — FRAME FOR SASHES, ROOF SKY-LIGHTS, &c. — James L. Jackson, New York, N. Y.

Claim.—The combination of the rib A, constructed with gutters or shoulders for the support of the glass, substantially as described, and the covering-strip C secured to the rib, clamping the glass thereon and inclosing the putty or cement, substantially as and for the purpose specified.

116,715. — RUFFLING-AND-HEMMING ATTACHMENT FOR SEWING-MACHINES. — William Johnson, Haverhill, Mass., assignor to himself and Hosea B. Carter, East Hampstead, N. H.

Claim.—1. The combination and arrangement of the adjustable ruffler E and the hemmer F with a sewing-machine, substantially as and for the purpose set forth.

2. The improved ruffler, as formed with the inclined seam-slot *d*, as and for the purpose set forth.

116,716. — HARROW. — Benjamin Johnston, Sterling, Ill.

Claim.—The lever *j*, supported in a horizontal position, or nearly so, on the pivot-arms *k* and *l*, and connected with the hinged portions of the harrow, as specified.

116,717. — GRIST-MILL. — Charles Kaestner, Chicago, Ill.

Claim.—1. The means employed for sustaining the fixed stone O and for adjusting the same to position, consisting of the studs P secured radially to or upon said stone, the blocks Q, the housings R provided with the set-screws *r*, and the hinged bar S provided with the nuts *s* and passing through the brace T, substantially as and for the purpose specified.

2. The studs A′ provided with the wheels B′, and the studs P pivoted within the blocks Q, in combination with the stones M and O and with the rails D, substantially as and for the purpose shown.

3. In combination with the step U, lever V, stud W, and wheel X, the clutch-rod Z caused to embrace the spindle L and resting within the ears Y, the collar Z′, and the nuts *z*, substantially as and for the purpose set forth.

116,718. — FRUIT-GATHERER. — John C. Kearns, Lewistown, Pa.

Claim.—The sliding ring C *c*, in combination with the bar A, stationary ring *a*′, spring E, rod D, bag B, and handle *e*, arranged and operating substantially as shown, and for the purpose set forth.

116,719. — GRAIN-DRILL. — Benjamin Kuhns, Dayton, Ohio.

Claim.—In combination with the oscillating bar D, to which the changeable drag-bars are hitched, and its arms D^1 D^1, the studs *e* and *e*′ which play through the side beam of the frame, and are retracted and projected by means such as described, or equivalent means, all operating in the manner set forth.

116,720. — PRODUCING COLORED PRINTS ON PAPER AND OTHER FABRICS. — Moritz Lassmuel, Bay Ridge, N. Y.

Claim.—1. A block for printing many colors at one operation, said block being produced of sections made of resin, colored as required, and brought in the required shapes, all as set forth.

2. The method, herein described, of printing many-colored designs at one operation by means of a block made in sections, each section corresponding to one of the colors of the design, substantially as herein set forth.

116,721. — CAR-AXLE BOX. — John Joseph Lahaye, Reading, Pa.

Claim.—1. An axle-box, provided with a detachable partition, J, arranged above the bottom to form an oil-chamber, and so fitted within the box that the escape of oil from the chamber, except at the outlet provided for the same, is prevented, all as set forth.

2. The said detachable partition, in combination with the inclined lugs *g* and ledge *g*′ of the box, by which it is raised to and supported in a horizontal or nearly horizontal position, as specified.

3. The cork or other packing at the rear end and sides of the said detachable partition, in combination with the flange *f*′ and inclined inner edge *f* of the box.

4. The tubular wick or roller K, arranged so as to be revolved in the opening *m* of the detachable partition and extending into the oil-reservoir H, as described.

5. The partition J, constructed and fitted to the box so as to leave between the front end of the partition and the box a passage, *l*, which communicates with the passage in the lid, as specified.

6. The packing at the rear of the box, consisting of wooden strips *q q*, adapted to the recess *a* and axle, faced with leather or other suitable material *r*, hinged together at the point q^1 and acted on by a spring, q^2.

7. The combination of the said detachable partition, provided with packing at the side and back, and the lid of the box by which the partition is forced back into its place, as specified.

116,722. — REVOLVING CASTER. — Cyrus H. Latham and John S. Lugg, Lowell, Mass., assignors to Edward P. Woods, Daniel Sherwood, and Cyrus H. Latham, same place.

Claim.—1. Constructing the base D of the caster of the series of wires *k* and uniting them to the nut *b*, substantially as described and specified.

2. Constructing the handle C of twisted wire, substantially as described and specified.

3. The combination, with the base D and nut *b*, handle C, and screw *c*, of the revolving plate E, provided with bottle rings B, constructed and operated substantially as described and specified.

116,723. — HOT-AIR FURNACE. — James A. Lawson, Troy, N. Y.

Claim.—1. In a heating-furnace, a dome, provided with upper and lower outlets for the heated escaping products of combustion, when said outlets are at or near the outer side of said dome and within the line vertically of its base, substantially as and for the purpose shown.

2. The dome I, provided with the openings *k* and *m*, in combination with the annular flue L, provided with the openings *l* and legs M, substantially as and for the purpose set forth.

3. The means employed for admitting air to the combustion-chamber, consisting of the concave metal ring G, resting upon the flange D′, provided with the lugs *d*′ and openings *s*′, when said parts are combined with the sections D and E, substantially as and for the purpose shown and described.

116,724. — HOT-AIR FURNACE. — James A. Lawson, Troy, N. Y.

Claim.—1. The side flues G, provided with diverging and converging passages, and having their vertical sides formed upon lines diverging horizontally from a common center, so as to give to said flues a general wedge-shape in plan view, substantially as and for the purpose specified.

2. The exit-flue L and side flue G, when combined in the manner and for the purpose substantially as shown and described.

3. The single side flues G′, substantially as and for the purpose set forth.

4. The side flue G, provided with the diaphragm *f* or *f*′, substantially as and for the purpose shown.

5. The general construction and relative arrangement of the fire-pot D, the dome F, the side pipes G, and the annular flue H, substantially as and for the purpose specified.

116,725. — HAME. — George J. Letchworth, Auburn, N. Y.

Claim.—The combination of the draft-eye *b*, hold-back-ring C, bolt D, and the lip *a*, constructed and arranged as described.

116,726. — PUNCHING-MACHINE. — George W. Lewis, Danville, N. Y., assignor to himself and John Hyland, same place.

Claim.—1. The pivoted holder M, formed with the opening *r*, in combination with the punch F and punch-block I, as and for the purpose herein set forth.

2. The punch-block I, formed with the flanges *f*, in combination with the clamp-frame K and the bed A′, substantially as described.

3. The pivoted holder M, punch F, punch-block I, gauge-plate L, and bed A′, combined and operating as set forth.

4. The pivoted holder M, punch F, punch-block I, bed A′, and clamp-frame K, combined and operating substantially as set forth.

5. The combination of the pivoted holder M, punch F, levers B D, connecting-links C E, punch-block I, clamp K, bed A′, and gauge-plate L, substantially as and for the purpose set forth.

116,727. — HEATING FEED-WATER FOR STEAM-BOILERS. — William A. Lighthall, New York, N. Y.

Claim.—1. The combination and arrangement of the superheating device C with the surface-condenser or heater B, whereby to render available the products of combustion escaping through the uptake of the steam-generators, in imparting additional heat to the feed-water or steam-boilers, substantially as herein described.

2. The arrangement of the superheating-coil in the up-take of a steam-generator with the surface-condenser or heater B, pipes *c*, *d*, and *b*, substantially as and for the purpose set forth.

116,728. — COMPOUND SURFACE-CONDENSER. — William A. Lighthall, New York, N. Y.

Claim.—1. The perforated plate M, combined with the receiving-chamber D and tubes *a a a*, substantially as and for the purposes specified.

2. In combination with the above, a compound surface-condenser, consisting of a number of tubes exposed externally to a refrigerating medium, and combined with partitioned chambers communicating with the interior of the tubes, and arranged in such manner that the steam or vapor to be condensed or the fluid to be cooled is conducted back and forth through different sections of the tubes within one case, when constructed and arranged substantially in the manner and for the purposes specified.

116,729. — DRYING AND PRESERVING FRUITS. — James Lowe, Guilford county, N. C.

Claim.—The washing of the peeled and sliced fruit in a solution of salt and water before drying.

116,730. — PISTON-FACING MACHINE. — William W. Lowerree and George A. Sanderson, Albany, N. Y.

Claim.—The combination and arrangement of head-block P, sleeve D, bracket E, tool-carrier e F, divided rings c^1 and c^2, and independent rings G and H with any suitable driving mechanism, substantially as and for the purpose herein shown.

116,731. — HAIR-CURLER. — Isaac S. Marcy, Nashua, N. H.

Claim.—1. A hair-curler, formed wholly or in part of soap-stone, substantially as specified.

2. The combination, with the handle D and bolt B, of the tubular soap-stone sections A, substantially as specified.

116,732. — COMBINED KNIFE AND PENCIL-SHARPENER. — Jacob McClure, Nashua, N. H.

Claim.—1. The cone-cutting recess *b*′ formed in or through the handle of a pocket-knife in such a manner that the ends of the recess shall be even with the sides or edges of the handle, substantially as specified.

2. A knife-blade provided with a file-back, *c*, having a central tapering smooth space between the slightly-inclined filing-surfaces, substantially as specified.

116,733. — COTTON-PRESS. — Alexander B. McGonnigil, Helena, Ark.

Claim.—The cotton-press herein described, constructed with frame D, slide-posts F, blocks E E′, G, and M, screw N, and boxes K and T, arranged to operate substantially as specified.

116,734. — WOOD PAVEMENT. — Edgar McMullen, Montreal, Canada.

Claim.—1. The sections for wood pavement, consisting of the rectangular blocks A united by means of the flanged keys B, as herein described, for the purpose of producing a pavement the sections of which may be taken up and replaced when desired, as set forth.

2. The combination of the keys B and F or staples C with the blocks A, when constructed and arranged in rows and sections of pavement, substantially as herein described.

116,735. — CORN-HARVESTER. — James I. Mettler, Mendota, Ill.

Claim.—1. The vertical picking-rolls D D′, when so placed that a line passing through their axes will form an obtuse angle with the row of corn, so that the ears, when severed from the stalk, will fall into the proper receptacle to one side, substantially in the manner specified.

2. In combination with the vertical picking-rolls, the wheels F^1, F^2, and G′ for feeding the stalks singly to the picking-rolls, substantially as set forth.

3. The combination of the vertical picking-rolls, the wheels I I^1 for straightening up leaning stalks, wheels H H′ for gathering the stalks, and wheels F^1, F^2, and G′ for feeding the stalks singly to the rolls, substantially as set forth.

4. The roll D′, countersunk around its lower journal *d*, in combination with the raised box of the step *d*′ and the dished wheel G′, all arranged with reference to one another, substantially as and for the purpose set forth.

116,736. — WEEDING-TOOL. — Philip Michael, Frostburg, Md.

Claim.—The herein-described weeding-tool, consisting of the curved blade B with tines B′ and handle A, all constructed and used as and for the purpose specified.

116,737, antedated June 23, 1871. — PERMUTATION LOCK. — D. K. Miller, Reading, Pa.

Claim.—The tumbler J, driving-disk E, its spindle and disks F, all constructed and operating together, substantially as described, so that the tumbler is partly elevated in notches in the disk F by the rotation of the disk E, and is further elevated

the head and foot cross-pieces H H, with wooden supporting-pin P resting in countersink on top of cross-pieces, and wooden supporting-pin crossing mortise on under side of clasp, substantially in the manner and for the purpose as herein described and set forth.

116,713. — LEAD-PENCIL. — Philip Hufeland, New York, N. Y.

Claim.—A lead-pencil having attached to one of its ends a paper tube forming a continuation of the pencil, and containing in its outer end a piece of India rubber, substantially as and for the purposes herein shown and described.

116,714. — FRAME FOR SASHES, ROOF SKY-LIGHTS, &c. — James L. Jackson, New York, N. Y.

Claim.—The combination of the rib A, constructed with gutters or shoulders for the support of the glass, substantially as described, and the covering-strip C secured to the rib, clamping the glass thereon and inclosing the putty or cement, substantially as and for the purpose specified.

116,715. — RUFFLING-AND-HEMMING ATTACHMENT FOR SEWING-MACHINES. — William Johnson, Haverhill, Mass., assignor to himself and Hosea B. Carter, East Hampstead, N. H.

Claim.—1. The combination and arrangement of the adjustable ruffler E and the hammer F with a sewing-machine, substantially as and for the purpose set forth.

2. The improved ruffler, as formed with the inclined seam-slot *d*, as and for the purpose set forth.

116,716. — HARROW. — Benjamin Johnston, Sterling, Ill.

Claim.—The lever *j*, supported in a horizontal position, or nearly so, on the pivot-arms *k* and *l*, and connected with the hinged portions of the harrow, as specified.

116,717.—GRIST-MILL.—Charles Kaestner, Chicago, Ill.

Claim.—1. The means employed for sustaining the fixed stone O and for adjusting the same to position, consisting of the studs P secured radially to or upon said stone, the blocks Q, the housings R provided with the set-screws *r*, and the hinged bar S provided with the nuts *s* and passing through the brace T, substantially as and for the purpose specified.

2. The studs A′ provided with the wheels B′, and the studs P pivoted within the blocks Q, in combination with the stones M and O and with the rails D, substantially as and for the purpose shown.

3. In combination with the step U, lever V, stud W, and wheel X, the clutch-rod Z caused to embrace the spindle L and resting within the cone Y, the collar Z′, and the nuts *z*, substantially as and for the purpose set forth.

116,718. — FRUIT-GATHERER. — John C. Kearns, Lewistown, Pa.

Claim.—The sliding ring C *c*, in combination with the bar A, stationary ring *a′*, spring E, rod D, bag B, and handle *a*, arranged and operating substantially as shown, and for the purpose set forth.

116,719.—GRAIN-DRILL.—Benjamin Kuhns, Dayton, Ohio.

Claim.—In combination with the oscillating bar D, to which the changeable drag-bars are hitched, and its arms D¹ D², the studs *c* and *c¹* which play through the side beam of the frame, and are retracted and projected by means such as described, or equivalent means, all operating in the manner set forth.

116,720.—PRODUCING COLORED PRINTS ON PAPER AND OTHER FABRICS. — Moritz Laemmel, Bay Ridge, N. Y.

Claim.—1. A block for printing many colors at one operation, said block being produced of sections made of resin, colored as required, and brought in the required shapes, all as set forth.

2. The method, herein described, of printing as many-colored designs at one operation by means of a block made in sections, each section corresponding to one of the colors of the design, substantially as herein set forth.

116,721. — CAR-AXLE BOX. — John Joseph Lahaye, Reading, Pa.

Claim.—1. An axle-box, provided with a detachable partition, J, arranged above the bottom to form an oil-chamber, and so fitted within the box that the escape of oil from the chamber, except at the outlet provided for the same, is prevented, all as set forth.

2. The said detachable partition, in combination with the inclined lugs *g* and ledge *g′* of the box, by which it is raised to and supported in a horizontal or nearly horizontal position, as specified.

3. The cork or other packing at the rear end and sides of the said detachable partition, in combination with the flange *f* and inclined inner edge *f* of the box.

4. The tubular wick or roller K, arranged so as to be revolved in the opening *m* of the detachable partition and extending into the oil-reservoir H, as described.

5. The partition J, constructed and fitted to the box so as to leave between the front end of the partition and the box a passage, *l*, which communicates with the passage in the lid, as specified.

6. The packing at the rear of the box, consisting of wooden strips *q q*, adapted to the recess *a* and axle, faced with leather or other suitable material *r*, hinged together at the point *q¹* and acted on by a spring, *q²*.

7. The combination of the said detachable partition, provided with packing at the side and heel, and the lid of the box by which the partition is forced back into its place, as specified.

116,722.—REVOLVING CASTER.—Cyrus H. Latham and John S. Lugg, Lowell, Mass., assignors to Edward P. Woods, Daniel Sherwood, and Cyrus H. Latham, same place.

Claim.—1. Constructing the base D of the caster of the series of wires *h* and uniting them to the nut *b*, substantially as described and specified.

2. Constructing the handle C of twisted wire, substantially as described and specified.

3. The combination, with the base D and nut *b*, handle C, and screw *c*, of the revolving plate E, provided with bottle rings B, constructed and operated substantially as described and specified.

116,723. — HOT-AIR FURNACE. — James A. Lawson, Troy, N. Y.

Claim.—1. In a heating-furnace, a dome, provided with upper and lower outlets for the heated escaping products of combustion, when said outlets are at or near the outer side of said dome and within the line vertically of its base, substantially as and for the purpose shown.

2. The dome I, provided with the openings *k* and *m*, in combination with the annular flue L, provided with the openings *l* and legs M, substantially as and for the purpose set forth.

3. The means employed for admitting air to the combustion-chamber, consisting of the concave metal ring G, resting upon the flange D′, provided with the lugs *d′* and openings *e′*, when said parts are combined with the sections D and E, substantially as and for the purpose shown and described.

116,724. — HOT-AIR FURNACE. — James A. Lawson, Troy, N. Y.

Claim.—1. The side flues G, provided with diverging and converging passages, and having their vertical sides formed upon lines diverging horizontally from a common center, so as to give to said flues a general wedge-shape in plan view, substantially as and for the purpose specified.

2. The exit-flue L and side flue G, when combined in the manner and for the purpose substantially as shown and described.

3. The single side flues G′, substantially as and for the purpose set forth.

4. The side flue G, provided with the diaphragm *f′* or *f″*, substantially as and for the purpose shown.

5. The general construction and relative arrangement of the fire-pot D, the dome F, the side pipes G, and the annular flue H, substantially as and for the purpose specified.

116,725.—HAME.—George J. Letchworth, Auburn, N. Y.

Claim.—The combination of the draft-eye *b*, hold-back-ring C, bolt D, and the lip *a*, constructed and arranged as described.

116,726.—PUNCHING-MACHINE.—George W. Lewis, Danville, N. Y., assignor to himself and John Hyland, same place.

Claim.—1. The pivoted holder M, formed with the opening *o*, in combination with the punch F and punch-block I, as and for the purpose herein set forth.

2. The punch-block I, formed with the flanges *f*, in combination with the clamp-frame K and the bed A′, substantially as described.

3. The pivoted holder M, punch F, punch-block I, gauge-plate L, and bed A′, combined and operating as set forth.

4. The pivoted holder M, punch F, punch-block I, bed A′, and clamp-frame K, combined and operating substantially as set forth.

5. The combination of the pivoted holder M, punch F, levers B D, connecting-links C E, punch-block I, clamp K, bed A′, and gauge-plate L, substantially as and for the purpose set forth.

116,727. — HEATING FEED-WATER FOR STEAM-BOILERS.—William A. Lighthall, New York, N. Y.

Claim.—1. The combination and arrangement of the superheating device C with the surface-condenser or heater B, whereby to render available the products of combustion escaping through the uptake of the steam-generators, in imparting additional heat to the feed-water or steam-boilers, substantially as herein described.

2. The arrangement of the superheating-coil in the uptake of a steam-generator with the surface-condenser or heater B, pipes *c*, *d*, and *b*, substantially as and for the purpose set forth.

116,728.—COMPOUND SURFACE-CONDENSER. William A. Lighthall, New York, N. Y.

Claim.—1. The perforated plate M, combined with the receiving-chamber D and tubes *a a a*, substantially as and for the purposes specified.

2. In combination with the above, a compound surface-condenser, consisting of a number of tubes exposed externally to a refrigerating medium, and combined with partitioned chambers communicating with the interior of the tubes, and arranged in such manner that the steam or vapor to be condensed or the fluid to be cooled is conducted back and forth through different sections of the tubes within one case, when constructed and arranged substantially in the manner and for the purposes specified.

116,729.—DRYING AND PRESERVING FRUITS. James Lowe, Guilford county, N. C.

Claim.—The washing of the peeled and sliced fruit in a solution of salt and water before drying.

116,730.—PISTON-FACING MACHINE.—William W. Lowerree and George A. Sanderson, Albany, N. Y.

Claim.—The combination and arrangement of head-block P, sleeve D, bracket E, tool-carriage F, divided rings *c¹* and *c²*, and independent rings G and H with any suitable driving mechanism, substantially as and for the purpose herein shown.

116,731.—HAIR-CURLER. — Isaac S. Marcy, Nashua, N. H.

Claim.—1. A hair-curler, formed wholly or in part of soap-stone, substantially as specified.

2. The combination, with the handle D and bolt B, of the tubular soap-stone sections A, substantially as specified.

116,732.—COMBINED KNIFE AND PENCIL-SHARPENER. — Jacob McClure, Nashua, N. H.

Claim.—1. The cone-cutting recess *b′* formed in or through the handle of a pocket-knife in such a manner that the ends of the recess shall be even with the sides or edges of the handle, substantially as specified.

2. A knife-blade provided with a file-back, *c′*, having a central tapering smooth space between the slightly-inclined filing-surfaces, substantially as specified.

116,733. — COTTON-PRESS. — Alexander B. McGonnigil, Helena, Ark.

Claim.—The cotton-press herein described, constructed with frame D, slide-posts F, blocks E E′ G, and M, screw N, and boxes K and T, arranged to operate substantially as specified.

116,734.—WOOD PAVEMENT. — Edgar McMullen, Montreal, Canada.

Claim.—1. The sections for wood pavement, consisting of the rectangular blocks A united by means of the flanged keys B, as herein described, for the purpose of producing a pavement the sections of which may be taken up and replaced when desired, as set forth.

2. The combination of the keys B and F or staples C with the blocks A, when constructed and arranged in rows and sections of pavement, substantially as herein described.

116,735. — CORN-HARVESTER. — James I. Mettler, Mendota, Ill.

Claim.—1. The vertical picking-rolls D D′, when so placed that a line passing through their axes will form an obtuse angle with the row of corn, so that the ears, when severed from the stalk, will fall into the proper receptacle to one side, substantially in the manner specified.

2. In combination with the vertical picking-rolls, the wheels F¹, F², and G′ for feeding the stalks singly to the picking-rolls, substantially as set forth.

3. The combination of the vertical picking-rolls, the wheels I I′ for straightening up leaning stalks, wheels H H′ for gathering the stalks, and wheels F¹, F², and G′ for feeding the stalks singly to the rolls, substantially as set forth.

4. The roll D′, countersunk around its lower journal *d*, in combination with the raised box of the step *d′* and the dished wheel G′, all arranged with reference to one another, substantially as and for the purpose set forth.

116,736.—WEEDING-TOOL.—Philip Michael, Frostburg, Md.

Claim.—The herein-described weeding-tool, consisting of the curved blade B with tines B′ and handle A, all constructed and used as and for the purpose specified.

116,737, antedated June 23, 1871.—PERMUTATION LOCK.—D. K. Miller, Reading, Pa.

Claim.—The tumbler J, driving-disk E, its spindle and disks F, all constructed and operating together, substantially as described, so that the tumbler is partly elevated in notches in the disk F by the rotation of the disk E, and is further elevated

above the said disks on the longitudinal movement of the spindle, for the purpose described.

116,738. — Car-Coupling.—Thomas Morgan, Marquette, Mich.

Claim.—1. The lever B, constructed with socket A, in combination with rod E, lever G, and handle H, all arranged to operate pin D, substantially in the manner and for the purpose set forth.

2. In combination with the subject-matter of the above, pins D *b* and draw-head, all constructed and arranged to operate as described.

116,739, antedated June 28, 1871.—Griddle-Lifter.—Michael D. Murphy, Watkins, N. Y.

Claim.—As a new article of manufacture, a griddle-lifter, provided with a shield, D, to protect the hand from heat while using, substantially as set forth.

116,740.—Elevated Railway. — John B. Newbrough, New York, N. Y.

Claim.—1. A series of rollers or wheels, *d*, arranged substantially as described, so as to afford a bearing for flanges extending over said rollers from the top of a suspended car or truck.

2. The combination, with a beam, A, of straps *a*, or their equivalents, suspended from the beam and carrying the rollers *d d*, as set forth.

3. The combination, with the said straps and beam of keys and wedges *c' c'* or other retaining and adjusting devices, as and for the purpose specified.

4. The car B, with its flanges *f f* arranged to traverse the rollers *d*, substantially as described.

5. The combination of a car, suspended from a beam, A, and driving-pulley or pulleys I I bearing against the beam A, and operating substantially as set forth.

116,741.—Combined Cotton-Planter and Chopper.—Abel R. Nixon, Polo, Ill.

Claim.—The main frame A, sliding bar L, plows M M, hooks *f*, and pivoted handles I I, in combination with the axle B, gear E, shaft G, and wheel *a*, adapted to receive and operate the planting mechanism or choppers, substantially as described.

116,742.—Bottle-Fastener.—George Otto and George W. Bauer, Washington, D. C.

Claim.—As a new article of manufacture, the bottle-fastening, consisting of the arms *c c*, right-angular portion B, and horn or projection *b*, substantially as set forth.

116,743. — Mouse-Trap. — Amos Ovaitt, Unionville, Conn.

Claim.—In combination with the yoke D and spring-bar E, the lever F and bait-hook I, constructed and arranged as herein described, so that by depressing the spring-bar onto the lever the trap is set.

116,744.—Welt and Rand for Boots and Shoes.—Henry F. Packard, North Bridgewater, assignor to Asa B. Keith, Braintree, Mass.

Claim.—As a new article of manufacture, a welt and rand-strip or ribbon formed of pieces united end to end, substantially as shown and described.

116,745.—Device for Transmitting Motion.—Peter Palmlund, Brooklyn, N. Y.

Claim.—1. The combination, with the shafts A and B, jointed together as described and the latter of which has a conical revolving motion in addition to a rotating one on its axis, of the wheel D and fixed circular rack E having an equal number of teeth in them, substantially as specified.

2. The pitman C, and sleeve *d* connected therewith by universal joint, in combination with the universally-jointed or attached shafts A and B, the wheel D, and stationary rack E of unequal diameters, essentially as herein set forth.

3. The circular base or runner *b* at the foot of the conically-revolving shaft B, in combination with the wheel D, the fixed circular rack E, and the shafts A and B, substantially as specified.

116,746.—Sleeping-Car.—Francis W. Parsons, Cleveland, Ohio.

Claim.—1. The arrangement of the seats B, sliding panel D, cap E, bed-bottoms F J, curtains I, and wire-gauze K, substantially in the manner as described, and for the purpose specified.

2. The swinging brackets Q, curtains L, and wire-gauze K, as arranged in relation to the windows B and sliding panel D, in the manner as and for the purpose set forth.

3. The slide H and the hooks G, as arranged in the cap of the sliding panel D, and operated in the manner substantially as and for the purpose set forth.

116,747. — Nail-Machine. — Archibald W. Paull and John Morgan, Jr., Wheeling, W. Va.

Claim.—The construction and combination, as herein described, of the rotary disk X with the concentric and cam-shaped flanges upon its side, the swivel-cutters A B extending across from one flange to the other, and placed at angles relative to one another and to the radiuses of the disk, as described, and the oscillating anvil-cutter, for the purpose set forth.

116,748. — Rotary Sod-Cutter. — Josiah Pool, Rio Vista, Cal.

Claim.—In a sod-cutter provided with a series of rotating disks, the series of beams A having curved bearing-surface, as and for the purpose described.

116,749. — Water-Wheel. — Ezra Poole, Gouverneur, N. Y.

Claim.—1. The tapering bottom D', as described, in combination with the wheel C, spiral buckets C', case A, shaft D, and lever F, substantially as and for the purpose specified.

2. The gates J J hinged within or at the mouth of the opening I, bars L L, cross-head M, and bar N, combined and applied to a water-wheel, substantially as specified.

3. The combination and arrangement of the sleeve E, lever F hinged to the pen-stock B, spring H, and rod G, applied in connection with the tapering bottom D' of a water-wheel, substantially as specified.

4. The wheel C with spiral buckets C', case A, and shaft D, when combined together, substantially as specified.

116,750.—Boot-Crimper. — Eleanah Powell, New London, Ind.

Claim.—1. The clamp I, consisting of two hinged plates, with bolt *b*, nut *d*, and spring *e*, constructed and arranged substantially as and for the purposes herein set forth.

2. The blocks E E^1 E^2 provided with clamps I I, as shown and described, and operated upon the back of a crimping-board by means of the screws G G^1 G^2, substantially as and for the purposes herein set forth.

116,751.—Automatic Steam-Pump.—William Edgar Prall, Washington, D. C.

Claim.—1. The construction of a hot-water drum, R, having two or more flanges to prevent the agitation or mixing of the hot and cold water, and operating, as shown and described, for the purpose of preventing condensation of the steam, as set forth.

2. The movable diaphragm P, when combined with a water-elevator, operating substantially as and for the purpose set forth in the specifications.

3. The valves E and F and connecting-pipe D, when said pipe is made to contain water for connection at an elevation above steam-cylinder A, as shown and described.

4. The pipes G, H, and I, connecting-pipe D with cylinder A, as shown and described.

5. The pipe I, valve K, pipe D, and cylinder A, as shown and described, and operating substantially as set forth.

6. The combination of the cylinder A, constructed as shown and described, dome N, pipe D, and valves E, F, and K, operating as set forth.

7. The combination of pipe V, valve W, and cock X, with dome N, pipes I, G, H, and I, and pipe D, as shown and described.

116,752.—Device for Supplying Locomotive-Tenders with Water.—William E. Prall, Washington, D. C., assignor to himself and J. M. Blanchard & Co., same place.

Claim.—In combination with a locomotive-tender, an air-chamber, carried with the locomotive and tender for receiving and retaining atmospheric air under pressure, a sunken reservoir containing water, pipes for conveying the air to the water-chamber and communicating its pressure to the surface of the water, and for conveying the water to the tender, and means for conveniently forming the connection of said pipes with the air and water-chamber respectively.

116,753.—Farmer's Boiler.—William M. Pryor and Robert Ludwick, Kellogg, Iowa.

Claim.—1. The combination of the reservoir A with flanges or rims *a b*, the cover C with flange or rim *b'*, and the rubber packing *d*, all substantially as and for the purposes herein set forth.

2. The combination of the reservoir A with flanges or rims *a b*, faucet B, cover C with flange or rim *b'*, rubber packing *d*, adjustable escape-valve D, and tube or pipe E, with nozzle G or G', all constructed and arranged substantially as and for the purposes herein set forth.

116,754.—Railway Gate.—Robert Ramsey, New Wilmington, Pa.

Claim.—1. The sectional worm-shaft A, provided with the continuous flange B, partly spiral and partly straight, in combination with the segments C C', arranged as described, and connected by a chain or wire rope, *b*, substantially as and for the purposes herein set forth.

2. The blocks E G and pin *f*, in combination with the gate and worm-shaft, substantially as shown.

3. The arrangement, in a railroad gate, of worm-shaft A with flanges B B, pins *f f*, segments C C' D, chains *b d*, blocks E G, and spring *e*, substantially as shown.

116,755. — Constructing Wire Fence.—Joshua W. Rappleye, Farmer Village, N. Y.

Claim. — 1. The combination of the movable weight D, windlass E, cross-tree G or its equivalent, with the wires *e e e' e'* for maintaining equitable tension and adjustment to the taking up of the wire, substantially as and for the purpose set forth.

2. The double-tree or "evener" G, in combination with the windlass E, for obtaining uniform tension on the two sets of wires *e e e' e'*, as set forth.

3. The sheath or holder *i*, in combination with the open-headed spike or hook J and wires *e e*, substantially as set forth.

116,756.—Spring Vehicle.—Adam Reichert, West Lodi, Ohio.

Claim.—The combination of the bars D and D', pivoted under the wagon-body and connected with the axles, with the springs B B, hinged levers C C, axles *a a*, and ears *b b*, all arranged substantially as herein set forth.

116,757. — Book-Binding Apparatus.—Ira Reynolds, Dayton, Ohio, assignor to Reynolds & Reynolds, same place.

Claim.—1. The clamping-frame A, made in two parts, each part having cross-openings corresponding with those in the other, and having marks to indicate the points at which the sheets are to be perforated, substantially as shown and described.

2. Such clamping-frame, in combination with the table C and its rabbeted cross-bar B, or with the table G and its cross-bar *u*, substantially as shown and described.

3. The combination, in a book-making apparatus, of the adjustable revolving bits, a work-supporting table, and the clamping-frame A, substantially as shown and described.

4. The preparatory forming-jaws *h h'*, each formed with a bevel at its upper inner surface, combined with the vertically-adjustable back-rest, substantially as shown and described.

116,758.—Reversible Boot-Heel.—Frederick Richardson and Francis Hacker, Providence, R. I., assignors to "Reversible Boot-Heel Company," same place.

Claim.—The reversible metallic heel-tap B, provided with the solid, cylindrical, or corrugated frictional surface *e*, *f*, and *g*, as and for the purposes specified.

116,759.—Paper-Pulp.—Peter F. Schlicker, Baltimore, Md., assignor to himself and A. Clinton Plant, Washington, D. C.

Claim.—1. The process of preparing asbestus for use as a paper-pulp, by pulverizing, washing, and admixture with chlorine water, substantially as herein set forth.

2. A paper-pulp, consisting of pulverized and washed asbestus mixed with chlorine water, when prepared in the manner and proportions set forth.

116,760. — Traveling-Bag, &c. — Charles M. Shutz, East Cambridge, Mass.

Claim.—1. The locking-clasp F, made as described, with the catch *c* and the two lips *b b*, arranged as shown.

2. The clasp G, as explained, as provided with the tongue or part *t*, to extend underneath the locking-clasp.

3. The combination and arrangement of the locking-clasp F, as described, with the mouth-frames A B and lock E of a traveler's bag or valise.

4. The combination and arrangement of the locking and auxiliary clasps F G, as described, with the two mouth-frames and lock E of a traveler's bag or valise, all being substantially as specified.

116,761. — Binding-Guide for Sewing-Machines.—Jerome B. Secor, Chicago, Ill.

Claim.—The combination, with the presser-foot of a sewing-machine, of a binder composed of the body A, adjustable curved guiding-plate *c*, with its arms *d* and *e*, adjustable holder *i*, and projection *k* on the body of the binder, when all are constructed and operate in the manner described and represented.

116,762.—Oven.—Isaac H. Shaver, Cedar Rapids, Iowa.

Claim.—1. The above-described frame-work of iron running upon the guides H H, substantially as and for the purpose set forth.

2. The system of oven-plates *a b c d e f*, constructed of soap-stone or its equivalent, and arranged as set forth and described.

3. The combination of the frame-work in each section of the oven with the pulleys P P and chain C to bring the plates to the oven-doors, in the manner and for the purpose herein set forth and described.

4. The combination of the frame-work and oven-plates with the system of flues K and openings *e*, substantially as herein described.

116,763.—Apparatus and Process for Separating, Concentrating, and Amalgamating Ores. — William Crowther Shaw, Philadelphia, Pa.

Claim.—1. The within-described process of treat-

ing ores and minerals—that is to say, mixing the same with water and causing the mass to pass gradually downward to the bottom of a vessel or chamber while being overturned and agitated, and to then pass upward through another chamber, or through tubes or channels, to the point or points of discharge.

2. An apparatus for treating ores or minerals, in which are combined two casings, A and F, and a shaft, G, the said casings and shaft being armed with agitators and blades, arranged and operating substantially as herein described.

3. The perforated top H of the inner casing F of the apparatus, when curved in the peculiar manner described, so as to form an annular recess or hopper, A, for the purpose specified.

4. The said annular hopper H, formed with oblong perforations, and consisting of a number of radial plates bolted together and to the casing F, substantially as specified.

5. The combination of the said hopper with the arms *f* affixed to the frame B.

6. The perforated and curved bottom *e* of the inner casing, arranged in respect to the similarly-curved bottom of the outer casing, and having blades *b* extending into and arranged to revolve in the said outer casing, all substantially as specified.

7. The combination of the curved bottoms of the inner and outer casings, when formed with a grinding-surface or surfaces, and arranged to be adjusted from or toward each other, substantially as herein set forth.

8. The combination of the blades *g* of the inner casing with the rings or collars *t* of the outer casing.

9. The arrangement, substantially as described, of the outlet-passages *s*, s^1, s^2, and s^3, in the outer casing.

10. The combination of the within-described apparatus with another similar apparatus, or with a vessel or vessels in which a mass of ore or mineral can be treated, substantially in the manner described.

116,764.—COTTON-CLEANER.—Zachariah B. Sims, Bonham, Tex.

Claim.—1. The rotary breaker C′, stationary breaker B′, shaft D, curved chute G formed of a series of bars not contiguous to each other, in combination with the opening H, cylinder J, and shaft E bearing the cleaner-shaft F, substantially as and for the purpose set forth.

2. The rotary breakers C′ and C″, arranged upon each side of the bevel-wheels *b* and *d* of the revolving shaft D, in combination with the fixed cutters B B′ on the stationary shaft C, arranged and operating substantially as described, for the purpose set forth.

3. The inclined way or chute provided with the flanged or straight bars K K, in combination with the breakers B and C′, and cleaner-shaft F, substantially as described.

4. The cylinder provided with the flanged bars K K, in combination with the cover provided with the opening N.

5. The cylinder J, composed of a series of separate flanged bars, K, and provided with one or more openings, as described, in combination with the gear-shaft E, cleaner-shaft F, bevel-wheels *b d*, and breakers C′ B′.

116,765.—APPARATUS FOR PHOTOGRAPHING CHILDREN.—William Winston Sloan, Jefferson, Tex.

Claim.—The swing B, in combination with the seat C and rest D, substantially as and for the purpose set forth.

116,766.—TAN-VAT.—Noah Smith, McAllisterville, Pa.

Claim.—A series of tan-vats, A B C D, provided with movable and adjustable bottoms E E, and so arranged that the tanning-liquid may flow from the top of one to the bottom of the next vat, substantially as herein set forth.

116,767.—UMBRELLA-RUNNER OR NOTCH.—Orren Mark Smith, Philadelphia, Pa.

Claim.—The head of an umbrella-runner or notch, composed of two metal disks, cut, bent, and secured to a tube, substantially in the manner described.

116,768.—COOKING-STOVE.—Jakob Speaker and William Dorn, Chicago, Ill.

Claim.—1. The combination of the exterior hollow body A, the interior cooking-stove E, and the flues I, K, and M, provided with the valves *b* and *c*, when constructed and arranged to operate substantially as and for the purpose set forth.

2. Providing the iron doors of a cook-stove with two or more sheets of glass or other transparent material, arranged parallel with and a short distance from each other, substantially as and for the purpose set forth.

116,769.—HOISTING APPARATUS.—George Sprague, South Addison, N. Y.

Claim.—1. The upright guide I provided with the groove *f* and plates *g g*, in combination with the pulleys D F and the endless belt or chain E with its hooks *e e*, substantially as and for the purpose set forth.

2. The adjusting-block L, bearing the pulley F, in combination with the endless chain E, hooks *e e*, guide I, and pulley D, arranged and operating substantially as and for the purpose set forth.

116,770.—ELECTRO-MAGNETIC FAN.—George Stevens and James W. Moyle, Cincinnati, Ohio.

Claim.—1. A pair of magnets, B C, having inwardly-projecting legs D E, which terminate in the inclined faces F, when used in connection with the vibrating armature H A and fan-operating devices I J L, as herein explained.

2. The combination of the supporting-table A *a*, electro-magnet B C, inwardly-projecting legs D E, inclined faces F, vibrating armature H, lever I J, vibrating fan-rods L N, arms O P *p p*, tappets B B′, circuit-breaker U *u w* T *t*, spring-plates V V′, and wires *v v′* W W′ X, for the object stated.

116,771.—PHOTOGRAPHIC APPARATUS.—John Stock and Jacob Stock, New York, N. Y.

Claim.—1. The box A, with the plate C, brackets E E, pins G G, and rod D, arranged and constructed substantially in the manner and for the purpose as hereinbefore described.

2. The bevel *z* or enlargement of the forward end of the box A, when arranged with an expanding-plate C, substantially as and for the purpose hereinbefore set forth.

3. The developing-box J, with drawer K, observing-glass L, trough N, and pipe M, in combination with a box, A, constructed as above described, substantially as and for the purpose hereinbefore set forth.

4. The combination of the box A with the silver-bath H, constructed and operating substantially as and for the purpose specified.

5. The combination of the developing-box J with the water-bath P, substantially in the manner and for the purpose hereinbefore set forth.

116,772.—MACHINE FOR DISTRIBUTING PITCH IN BARRELS AND CASKS.—Benjamin J. Stukenborg, Cincinnati, Ohio.

Claim.—1. The frame C and clamping-frame J J′ J″, when the former is provided with journals D D′ upon which it revolves, and journal-bearings K K′ at right angles to journals D D′, upon which the cask revolves centrally within the frame C, substantially as and for the purpose specified.

2. The combination of journaled bars T T′, right- and left-hand screw-threaded rods S S, and clamps J J′ J″, as and for the purpose specified.

3. In the described combination with the revolving frame C and the revolving cask-frame J J′ J″, the air-pipe *c*, connected substantially in the manner and for the purpose specified.

116,773.—HUMMING TOY.—Metcalf B. Sumner, Boston, Mass.

Claim.—The humming toy, consisting of the hour-glass-shaped hollow instrument A, provided with orifices B, substantially as and for the purpose set forth.

116,774.—RAILROAD-CAR VENTILATOR.—Anthony B. Sweetland, Fitchburg, Mass., assignor to himself and James Daley, same place.

Claim.—1. The device D formed of two parallel wires with circle *d* and dividing-wire *e* at one end and bow *f* at the other, in combination with the slotted plate *b*, ring A and screw *k*, all substantially as and for the purposes herein set forth.

2. The combination of the window-frame A, auxiliary frame B, window C, device D, plate *b*, and screw *k*, all substantially as and for the purposes herein set forth.

116,775.—REPEATING ORDNANCE.—James Patton Taylor, Elizabethton, Tenn., assignor to himself and Nathaniel G. Taylor, same place.

Claim.—1. The slotted breech-plate E, constructed with perforations through the rear plate, as herein specified.

2. In a repeating gun, the stationary cradle or guide-frame O for holding the magazine-box L, substantially as described.

3. The combination of the brace O′, the frame O′ and upper stationary parts, whereby the parts are rigidly connected together and a convenient bearing for the shaft is afforded, as explained.

4. The magazine-box, constructed with concave ends, and provided with buttons *n* for securing the caps M, substantially as described.

5. The combination of the slotted and perforated breech-plate E, the revolving breech-piece K adapted for the use of flanged cartridges, the magazine-box L, and the feeder N *n*, all constructed and arranged to operate substantially as herein described, for the purposes set forth.

6. The combination of the lever P, pawl *p*, shaft Q, and ratchet-teeth *q*, operating substantially as described to revolve the breech-piece at one motion of the said lever, and to be released therefrom on the return motion.

7. The combination of the lever K and catch K′, operating substantially as described to automatically lock the revolving breech-piece each time it reaches the proper position for firing.

8. The combination of the lever P and spring-catch p^2 with the segment-lever K and catch K′, to release the breech-piece when it is to be moved, as explained.

9. The shaft Q, constructed with cams or ratchets q^1 q^2, in combination with the lever P and the simultaneous firing devices, as described.

10. The combination and relative arrangement of the plungers *i*, rod S, and head S′, to operate simultaneously on the cartridges, as described.

11. The cap s^2, combined with the lever R and rod S to cause the said lever to act upon the said rod or disconnect it therefrom, as described.

12. The pinion *v*, disk V, hammer s^3, and cam surfaces s^4, combined to effect a successive discharge of the cartridges, substantially as described.

13. The ejecting devices Y′ *y′* Z Z′, operating substantially as described.

14. The combination of the recessed and perforated breech-plate E, the barrels G screwed into said breech-plate, the casing J fitting at back within a flange or recess in the front of the breech-plate, the head E fitting upon the ends of the barrels and within the casing J, and the rod F and nut *f* securing the parts together, the whole being arranged substantially as herein described to admit of circulating water around the barrels to keep them cool.

116,776.—CULTIVATOR.—James J. Thompson, Columbus, Ohio.

Claim.—1. The boxes *g*, composed of cells *y* and flanges y^1 y^2 y^3 y^4, in combination with shovel-standards, beams, and the confining-bolts *s*, substantially as described.

2. The combination of the draft-pole A, side-beams B B, joints *t t*, sectional arch C C, joints *u*, standards D D, and loosely-connected brace E, all constructed, arranged, and operating substantially in the manner and for the purpose described.

3. The combination of the removable diagonal braces P P, brace E, hinged arch C C, beam A, and swinging side beams B B, substantially as and for the purpose described.

116,777.—BAG-HOLDER.—Thomas Jefferson Trapp, Williamsport, Pa.

Claim.—1. The combination of the standard *c*, slot *d*, block *e*, bolt *h*, nut *f*, and bag-holder *g h*, constructed and arranged as specified.

2. The combination of the base *a*, platform *j*, and treadle *i*, constructed and arranged as set forth

116,778.—INK-FOUNTAIN FOR PRINTING-PRESSES.—William V. Wallace, New York, N. Y.

Claim.—The scraper C hinged to the bottom of ink-reservoir A, and provided with the elastic packing H and set-screw D, substantially as and for the purpose herein set forth.

116,779.—FEEDING MECHANISM FOR SEWING-MACHINES.—Elliott P. West, Jersey City, N. J.

Claim.—The feed-regulating mechanism, substantially as herein described, when arranged in connection with an opening of the cloth-bed, whereby it can be operated by pressure to vary the feed, as herein set forth.

116,780.—DINNER-PAIL.—George Wetzler, Peoria, Ill.

Claim.—In combination with the dinner-can or pail A, the detachable wire-holder or bail B B, rings or ears *l l*, boxes C C, and springs *k k*, the whole constructed and operating substantially as described.

116,781.—COPYING-PRESS.—Alonzo Whitcomb, Worcester, Mass.

Claim.—1. In combination with the stationary bed B and the movable bed C, the eccentric G, arranged to operate substantially as described, whereby the movable bed is automatically locked in position, when elevated by the foot-lever, as set forth.

2. The combination of the beds B C, eccentric G, adjustable rod E, and foot-lever D, all constructed and arranged to operate substantially as herein set forth.

116,782.—CIGAR-BOX.—Thomas A. Wiley, Lancaster, Pa.

Claim.—The arrangement of a revenue cigar-box provided with a cross slat or slats for the reception of the revenue-stamp, substantially in the manner shown, and for the purpose specified.

16,783.—SEWING-MACHINE.—Charles H. Willcox, New York, and Cyrus Carleton, Brooklyn, N. Y., assignors to the Willcox & Gibbs Sewing-Machine Company, New York city.

Claim.—1. In a four-motion feed, the combination of a feed-bar with a single eccentric and intermediate mechanism, substantially as herein shown and described, the said bar being held by spring pressure in unbroken contact with said eccentric, deriving its up-and-down movement directly from

the eccentric, and its back-and-forth movement through the intermediary of the said mechanism operated by the eccentric, substantially as set forth.

2. In combination with an eccentric imparting to the spring feed-bar by direct contact with it the up-and-down motion of the feed, and with a stitch-cam regulating the length of stitches, the link connected with the feed-bar at a point below the axis of vibration, bearing with yielding pressure on a rocker operated by said eccentric to impart the back-and-forth motion of the feed, substantially as shown and described, so that the feed shall be noiseless at all adjustments of the stitch-cam, and whether the parts be worn or not.

3. In a four-motion feed mechanism, when operated by a revolving eccentric and a rocker, forming upon that portion of the rocker which is in contact with the eccentric a bevel, as shown and described, or equivalently inclining that portion so that the feeding-surface may continue its forward movement until after it shall have receded below the table out of contact with the cloth.

4. The combination, with the rocker, of the adjustable bearing on the link, substantially as and for the purposes herein set forth.

5. The link and stitch-regulating cam, adapted to operate together, substantially as described, and combined with the feed-bar and rocker so that the link may be adjusted on the rocker to regulate the feed, substantially as set forth.

6. The combination of the rocker with the link jointed at one end to the feed-bar and grooved or slotted at the other end to engage with the pin on the stitch-regulating cam, substantially as shown and described.

7. In the device herein described for regulating the back-and-forth movements of the feed-bar by means of a link, rocker, and cam, the groove or slot of such curvilinear form that that portion of the groove or slot which has its play around the pin on the cam shall be parallel with the table, or nearly so, in all positions of the cam.

8. The stitch-regulating cam, bearing on its eccentric peripheral portion numbers indicating the stitches to an inch, and arranged, as to said portion, tangentially to the cloth-plate, so that the number which is upon the tangential portion of the cam may show through a slot formed for that purpose in the cloth-plate.

9. The recessed stitch-regulating cam, when constructed and combined with the cloth-plate, as claimed in the preceding clause, in combination with a stop-pin in the frame to limit the play or movement of the cam within the compass of the series of numbers on the edge of the same, substantially as shown and set forth.

10. The combination, with a stitch-regulating cam indicating through the cloth-plate the number of stitches to the inch, of a table permanently attached to the sewing-machine indicating the number of thread or silk and needle corresponding with the number of stitches to the inch shown by the stitch-regulating cam, substantially as herein set forth.

11. The box surrounding the pin on which the feed-bar vibrates, as a bearing to the spring and to the feed-bar, substantially as herein shown and described.

116,784.—Iron Folding Chair. — George Wilson, Chicago, Ill.

Claim.—1. The seat-section B of an iron folding chair, constructed substantially as described, when suspended from the arches E by the pendulums F, as set forth and shown.

2. The combination, with the seat-frame B and an arch, E, of the lever L, link M, and arm N, as and for the purpose set forth.

3. The combination, with the seat-frame B and one or both arches, E, of one or two notched bars, *g*, as and for the purpose set forth.

4. The construction and arrangement of the arm-levers J and hook-braces I with the arm-pieces K, back-frame A, seat-frame B, and foot-frame C, substantially as described, for the purposes specified.

116,785.—Saddle-Tree. — George Woods, St. Catharine's, Canada:

Claim.—The scroll-yoke constructed with the branching arms *a a* and flanges *c c*, the pad-plates C C, and the blocks D D, attached by the screws *g g* and springs H H, said yoke and pad-plates having the openings *h h* for the attachment of the harness direct to the yoke, the whole arranged as described and operating in the manner and for the purpose specified.

116,786. — Toilet Paste.—Julio Desmarques Young, San Francisco, Cal.

Claim.—The manufacture or preparation of a compound, which is denominated "Elixir de Beaumond aire," of the ingredients, in the proportions, and for the purposes set forth.

116,787. — Bridge-Truss. — Albert Fink, Louisville, Ky.

Claim.—The auxiliary trusses (supporting the intermediate points $y\ y'\ y''\ y'''\ y^4\ y^5\ y^6$) in an ordinary triangular truss, substantially as described in the above specification.

116,788.—Apparatus for Operating Fans. William M. Bruton, Baltimore, Md.

Claim.—1. In an automatic-fan apparatus, the holder *f* provided with the elastic receivers *h h*, and shaped as and for the purpose specified.

2. The treadle-board, hinged in a recess formed in a block which is detached or disconnected from other parts of the apparatus, as specified.

REISSUES.

4,451.—Division A.—Process for Decorticating Grain.—Wilson Ager, Washington, D. C.—Patent No. 92,556, dated July 13, 1869; reissue No. 3,788, dated January 11, 1870.

Claim.—The improved process of decorticating grain by repeatedly abrading the surface of the grain and cooling it in alternate succession, substantially in the manner as hereinbefore set forth.

4,452.—Division B.—Machine for Decorticating Grain. — Wilson Ager, Washington, D. C.—Patent No. 92,556, dated July 13, 1869; reissue No. 3,789, dated January 11, 1870.

Claim.—1. In combination with a revolving stone or stones arranged to rotate vertically or nearly vertically in a bed of grain, a revolving screen and mechanism for producing and forcing a current of air into said screen and through the mass of grain, for the purpose of cooling the grain and the abrading-surfaces of the machine, substantially as set forth.

2. In combination with a revolving stone or stones, a grain-holder, a series of elevators, and means for producing and directing a blast or current of air into and through the machine, whereby the grain is repeatedly and alternately abraded and cooled, substantially as set forth.

3. In combination with a revolving stone or stones arranged to rotate vertically in a bed of grain, and a grain-holding screen, an air-pipe arranged to direct a blast or current of air into the screen through the end thereof, substantially as set forth.

4. In combination with a revolving stone or stones arranged to rotate vertically in a bed of grain, and a grain-holding screen, an air-pipe arranged to direct an induced blast or current of air against and through the periphery of the machine from outside thereof, substantially as set forth.

5. In combination with a revolving stone or stones arranged to rotate vertically in a bed of grain, and a revolving screen, a grain-pipe or spout arranged to feed the grain into one end of the screen, and an air-pipe arranged to direct a blast or current of air into the opposite end of the screen, substantially as and for the purpose described.

6. In combination with a revolving stone or stones arranged to rotate vertically in a bed of grain, a screen constructed with an impervious head and impervious portion of the periphery contiguous thereto arranged in such relation to the air-induction-pipe opening through said head that direction shall be given to the blast or current of air, substantially in the manner set forth.

7. In combination with a revolving stone or stones arranged to rotate vertically in a bed of grain, and a revolving screen, a series of adjustable discharge-apertures in a head of the screen, whereby the depth of the bed of grain may be regulated and the passage of the grain through the machine accelerated or retarded, substantially as set forth.

8. In combination with a revolving stone or stones arranged to rotate vertically in a bed of grain, and a rotating screen provided with a series of adjustable discharge-apertures, a grain-feeding pipe which admits of a constant supply of grain into the machine, substantially as and for the purpose set forth.

4,453. — Capstan and Windlass.—David N. B. Coffin, Jr., Newton Centre, Mass., assignor, by mesne assignments, to himself and Benjamin Woodward.—Patent No. 98,032, dated December 21, 1869.

Claim.—1. The combination of the gear-wheels *h i j k* with the horizontal windlass-shaft and the chain or rope-barrel of a windlass, substantially as and for the purpose set forth.

2. The combination and arrangement of the center gear *y*, its axial shaft *z*, the lever-head, and the barrel of a capstan, substantially as shown and described.

3. The drainage-channel Z, when so constructed, in connection with the lever-sockets, (or barholes,) as to deliver water from them through the joint between the lever-head and the adjacent part, (see Fig. 10,) substantially as described.

4. The automatic bolt or bolts *m*, in combination with the center gear-ratchet and lever-head, substantially as described.

5. The automatic bolt *n*, in combination with the ratchet *q* on the barrel, and the lever-head, substantially as described.

6. The combination of the capstan, windlass, double-acting cam, and the rocking-shaft, substantially as described.

7. The combination and arrangement of the capstan-head *a*, double-acting cam *c*, rocking-shaft *d*, and vibrating arms *f f*, the parts being constructed substantially as set forth and operating as described.

8. The combination of the oscillating lever having in its ends sockets for the reception of levers, and the vibrating arms *f f*, they being connected by rods, as shown, and arranged substantially as and for the purpose set forth.

9. The arrangement of the flanged intermediate gear or gears *s*, in combination with the space between the teeth of the center gear and its ratchet-plate or other adjacent part, substantially as described.

10. The construction of the locking or sliding bolts of a capstan (see Figs. 13, 14, and 19) with expanded ends, substantially as and for the purpose set forth.

4,454. — Edge-Plane for Shoemakers.—Isaac A. Dunham, North Bridgewater, Mass.—Patent No. 18,237, dated September 22, 1857.

Claim.—1. The above-described sole or welt-trimmer as composed of a cutting-blade, *c'*, a guard, *d d*, and stock *e e*, constructed, arranged, and combined together, substantially as set forth.

2. In combination with the cutter *c'* and guard *d d*, the nipple or projection *s*, as and for the purpose set forth.

4,455.—Drawers.—H. G. Fisk, Thomas R. Clark, and Thomas J. Flagg, New York, N. Y., assignees of Henry Heath.—Patent No. 73,975, dated February 4, 1868.

Claim.—1. The combination of the pointed waistband of the drawers with a full leg having triangular portions removed from its upper end so as to obtain the requisite fullness at the hips and waist without the necessity of gather.

2. The combination of the ankle-band of the drawers with a full leg having a triangular portion removed from its lower end so that the requisite fullness of the leg is secured without a surplus of material in the vacinity of the ankle.

3. The combination of the pointed waistband of the drawers, ankle-band, and full leg having triangular portions removed at both ends, substantially as before set forth.

4. The combination of the leg of the drawers with a curved ankle-band, as before set forth.

4,456. — Manufacture of Artificial Stone, Stucco, &c.—George A. Frear, Chicago, Ill., assignor to Charles Holland, George A. Frear, and John M. Wilson.—Patent No. 73,965, dated February 4, 1868.

Claim.—1. The use of an aqueous solution of shellac in the production of artificial stones, stuccoes, &c., for useful and ornamental purposes.

2. In the manufacture of artificial stone with the within-described compositions, bringing the molecules of the mass in close proximity one to the other by means and with the use of a suitable tamping-tool applied systematically to successive layers of the composition, substantially as herein set forth.

4,457.—Manufacture of Illuminating-Gas.—Ferdinand King, Richmond, Va.—Patent No. 74,230, dated February 11, 1868.

Claim.—1. A retort containing coke or other equivalent material, so combined with a fire-furnace as to be subjected to a high degree of heat, with a steam-jet and a jet of liquid hydrocarbon simultaneously discharging therein, the whole being so constructed and arranged that the steam will force the gas rapidly from the retort, substantially as described.

2. The improved gas-generator herein described, constructed to operate substantially as set forth.

3. In combination with a retort, A, and a hydrocarbon reservoir, the two vessels, D and E, and the pipe C, constructed and arranged substantially as described, for introducing the dissolved tar or other liquid hydrocarbon into the retort.

4,458.—Apparatus for Pressing, Shaping, and Drying Cigar-Bunches. — Adolph Pearl, New York, N. Y., assignor to Henry Pearl.—Patent No. 108,290, dated October 11, 1870.

Claim.—The combination of the longitudinally-divided, externally, taper-mold and the table-rack or stand having openings for the reception of such molds, substantially as and for the purpose herein set forth.

4,459.—Method of Holding Bristles in Brush-Stocks.—Charles D. Rogers, Utica, N. Y., and Monroe P. Wilkins, Jersey City, N. J., assignors to The Manhattan Brush-Manufacturing Company. — Patent No. 70,270, dated October 29, 1867.

Claim.—1. A bunch of bristles in combination with a flanged ferrule, and these in combination with a hole or aperture, and countersink in a brush-stock, substantially as described.

2. In combination, a ferrule, a bunch of bristles,

and an attaching contrivance substantially such as described, the combination being substantially such as set forth; and also, these elements in combination with a hole in a brush-stock.

3. In combination, a flanged ferrule, an attaching contrivance, and a bunch of bristles, the combination being substantially such as described; and these, also, in combination with a hole and countersink in a brush-stock, the combination being substantially such as set forth.

4. A ferrule or eyelet having a portion or portions of its periphery bent or crushed into a bunch of bristles or fibers, or into the eye of a loop of bristles or fibers, as described, in combination with a brush-stock.

4,460. — FRUIT-JAR. — Henry E. Shaffer, Rochester, N. Y.—Patent No. 96,490, dated November 2, 1869.

Claim.—The top of the jar constructed as described, with the two exterior shoulders *f* *m* and raised flange *h*, in combination with the cover having the vertical flange *d*, notch *p*, and interior horizontal shoulder or bearing *b*, and with the horizontal gasket, all arranged as herein set forth and shown for the purpose specified.

4,461.—HOE. — Edward Warren, Ceresco, Mich.—Patent No. 102,891, dated May 10, 1870.

Claim.—A hoe having the edge of its blade A shaped in curves which converge together and form the pointed tips *a a* and *a*, when such blade, in addition to being curved longitudinally, is formed with a sharp central ridge, *r*, in the same direction, and each half-section is bent back, forming a concave surface, said ridge *r* extending in front from *b* to *a*, and the blade being constructed and hung, substantially as and for the purposes set forth.

4,462.—Division A.—MACHINE FOR PAINTING WIRE-CLOTH.—Charles H. Waters, Groton, Mass., assignor to The Clinton Wire-Cloth Company.—Patent No. 84,520, dated December 1, 1868.

Claim.—1. The combination of the wire-cloth beam *b*, the paint-trough *c*, and the pressure-rolls *k k*, substantially as described.

2. The combination of the paint-trough *c*, the pressure-rolls *k k*, and a mechanism by which the wire-cloth, after being painted, is drawn off from the rolls, substantially in the manner and for the purpose specified.

3. The arrangement of the paint-trough *c*, the pressure-rolls *k k*, and the drawing-off mechanism, whereby the painted cloth is drawn from the pressure-rolls into the drying-room, substantially as described.

4. The combination of the brushing device *m*, the paint-trough *c*, the pressure-rolls *k k*, and the drawing-off mechanism, substantially as described.

5. The use, in combination with the paint-trough *c*, of the pressure-rolls *k k*, when the said rolls have their axes adjustable toward and from each other so as to graduate the amount of paint to be left upon the cloth after being drawn through them, substantially as described.

6. The combination of the paint-trough *c* and the pressure-rolls *k k*, substantially as described.

4,463.—Division B.—METHOD OF PAINTING WIRE-CLOTH.—Charles H. Waters, Groton, Mass., assignor to The Clinton Wire-Cloth Company.—Patent No. 84,520, dated December 1, 1868.

Claim.—As an improvement in the art of painting wire-cloth, dipping it into a bath of paint to fully cover all parts of its surface with the paint, and then subjecting the face of the cloth to pressure to squeeze or press off the surplus paint, substantially as described.

DESIGNS.

5,065.—RUBBER OVERSHOE.—Augustus O. Bourn, Providence, R. I., assignor to The National Rubber Company, same place.

Claim.—The above-described design for the ornamentation of rubber shoes, as shown.

5,066.—RUBBER OVERSHOE.—Augustus O. Bourn, Providence, R. I., assignor to The National Rubber Company, same place.

Claim.—The above-described design for the ornamentation of gaiter overshoe as shown.

5,067.—RUBBER OVERSHOE.—Augustus O. Bourn, Providence, R. I., assignor to The National Rubber Company, same place.

Claim.—The design for the ornamentation of rubber shoes, consisting of the raised stripe A and B and the groups of raised ribs C extending across the vamp, substantially as described and shown.

5,068. — ADVERTISING PRINT. — Joshua Brooks, Boston, Mass.

Claim.—The design for an advertising medium, substantially as shown and described.

5,069.—PLATE OF ALARM-LOCKS.—Julian M. Case, North Lansing, Mich.

Claim.—The design for plate for alarm-lock, as shown.

5,070.—SHUTTER-BAR.—Lewis Crooke, New York, N. Y.

Claim.—The design for shutter-bar, hereinbefore set forth and represented in the accompanying drawing.

5,071.—SPOON OR FORK-HANDLE.—William B. Durgin, Concord, N. H.

Claim.—The design for forks, spoons, and silverware, as shown.

5,072.—COMBINATION GAME-BOARD.—William Hearn, New York, N. Y.

Claim.—1. The design for a combination game-board, substantially as herewith described and shown.

2. The design for a combination game-board representing a chess-board centrally localized within a Polish draught-board, substantially as herewith described and shown.

3. The design for a combination game-board representing a fox-and-geese board centrally localized within a chess-board, substantially as herewith described and shown.

5,073.—CARPET-PATTERN.—Otto Heinigke, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,074.—HOT-AIR FURNACE.—James A. Lawson, Troy, N. Y.

Claim.—The design for a heating-furnace, substantially as shown and described.

5,075.—HOT-AIR FURNACE.—James A. Lawson, Troy, N. Y.

Claim.—The design for a hot-air furnace, substantially as shown and described.

5,076.—CARPET-PATTERN.—Levi G. Malkin, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,077.—SPOON OR FORK-HANDLE.—Edward C. Moore, Yonkers, N. Y., assignor to Tiffany & Co., New York city.

Claim.—The design for a handle for spoons, forks, &c., substantially as described and illustrated by the accompanying drawing.

5,078.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,079.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,080.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,081.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,082.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,083.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,084.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,085.—CARPET-PATTERN.—Elemir J. Ney, New York, N. Y., assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,086.—BANNER-PIN.—William Riker, Newark, N. J.

Claim.—1. The design of the pendent banner as applied to a breast-pin or badge, as shown.

2. The design of the pendent banner, when affixed to an upright stem, as shown.

5,087.—MUFF-AND-COLLAR BOX.—Raphael M. Seldis, New York, N. Y.

Claim.—The design for a fur-set box, as set forth.

5,088.—CARPET-PATTERN.—John H. Smith, Enfield, assignor to Hartford Carpet Company, Hartford, Conn.

Claim.—The configuration of the design hereunto annexed, when applied to carpeting in the form similar to the drawings or photographs accompanying this specification.

5,089.—GROUP OF STATUARY.—Ames Van Wart, New York, N. Y.

Claim.—The design for a group of statuary, as shown.

5,090.—GROUP OF STATUARY.—Ames Van Wart, New York, N. Y.

Claim.—The design for a group of statuary, as shown.

5,091.—BRACKET AND CHANDELIER.—Thomas Village, West Meriden, Conn., assignor to Meriden Malleable-Iron Company, same place.

Claim.—1. The design for the wall-piece, substantially as shown.

2. The design for the bracket or chandelier-arm, substantially as shown.

3. The design for the basket for a bracket or chandelier-arm, substantially as shown.

5,092.—BRACKET OR CHANDELIER-ARM.—Thomas Village, West Meriden, Conn., assignor to Meriden Malleable-Iron Company, same place.

Claim.—1. The design for the form of the arm, with the pendant *a*, and vertical projection *b c*, substantially as shown.

2. The design for the sides of the arm, substantially as shown.

3. The design for the sides of the pendant *a*, substantially as shown.

5,093.—SPOON OR FORK-HANDLE.—George Wilkinson, Providence, R. I., assignor to Gorham Manufacturing Company, same place.

Claim.—The design for spoons and forks, substantially as herein set forth.

5,094.—RUBBER OVERSHOE.—Isaac F. Williams, Bristol, assignor to The National Rubber Company, Providence, R. I.

Claim.—The above-described design for the ornamentation of rubber shoes, as shown.

5,095.—RUBBER OVERSHOE.—Isaac F. Williams, Bristol, assignor to The National Rubber Company, Providence, R. I.

Claim.—The design for the ornamentation of rubber shoes, consisting of the ribbed vamp D, surrounded by the raised ornamental strips C and B, the latter extending to the quarters, substantially as described and shown.

TRADE-MARKS.

360.—STEAM AND HYDRAULIC PACKING.—William M. Canfield, Philadelphia, Pa.

361.—SCREW-WRENCH.—A. G. Coes & Co., Worcester, Mass.

362.—MEDICINE.—Dundas Dick, New York, N. Y.

363.—Hosiery, Trimmings, and Gentlemen's Furnishing Goods.—John P. Loring, Charlestown, Mass.

364.—Glycerine Soap.—Mark & Rawolle, New York, N. Y.

365.—Gin.—Lawrence Myers & Co., New York, N. Y.

366.—Sherry Wine.—Lawrence Myers & Co., New York, N. Y.

367.—Medicine.—Marie Eulalie Perrin, Montreal, Canada.

368.—Razor-Steel.—Robert J. Roberts, New York, N. Y.

369.—Hat.—Yates, Wharton & Co., Newark, N. J.

EXTENSIONS.

Ann M. Cooley, of Ceresco, Mich., administratrix of Anthony Cooley, deceased.—Letters Patent No. 17,668, dated June 30, 1857.

"Improved Whiffletree-Hook."

Claim.—1. Providing the outer extremity of the hook-socket A with an open slot C and spring-seat D, and fitting the feather-spring F and the shank of the snap G in the same, substantially as and for the purposes set forth.

2. Furnishing internally each of the cheek-pieces of the open slot C of the hook-socket A with a scroll-slot H, and the snap G with two short journals, I, and fitting these journals in said slots and holding them in place by means of the feather-spring F, substantially as and for the purpose herein set forth.

Francis C. Lowthorp, of Trenton, N. J. Letters Patent No. 17,684, dated June 30, 1857.

"Improvement in Iron Truss-Frames for Bridges."

Claim.—The straining-plate B, in combination with the rods G and H, when the latter are connected to the plate, substantially in the manner herein set forth, and when the said plate is arranged to receive the vertical or verticals and diagonals of iron truss-frame bridges.

ISSUE OF JULY 11.

PATENTS.

116,789.—Fruit-Gatherer.—George Aldridge, Henderson city, Ky.

Claim.—In combination with the staff of a fruit-picker, the adjustable bar C and stand A, substantially as and for the purposes described.

116,790.—Hub-Centering Machine and Spoke-Guide.—King P. Allen, Homer Mich.

Claim.—1. The construction and arrangements of the standards B B' on the base A, clamps C, clamp-screws b, and clamp-plates c, substantially as described, for the purpose specified.

2. The mandrel F, constructed as herein described, and provided with the disk J carrying the leaves h, the flanged sleeve H, plate G, washer f, nut g, ordinate rod I, arm L, and guide i, substantially as and for the purposes set forth.

116,791.—Lawn-Mower.—William Allen, Worcester, Mass.

Claim.—The arrangement of the gear mechanism, the roller-gear f^3 being a ring turning on a circular flange, b^3, on a disk, f^2, fixed upon the journal of the driving-roller and meshing into a pinion, f^1, on a gear-wheel, w^2, which meshes into and drives a pinion, q^2, on the journal of a cutter-cylinder, the gear w^2 turning on a stud, pin, or bolt, fixed to the journal-plate, and said gear lapping the main gear f^3 and a flange on the cutter-cylinder gear q^2, and keeping them in position.

116,792.—Steam Water-Heater.—James Argall, Mineral Point, Wis.

Claim.—A steam water-heater, consisting of a series of concentric cylinders, with the parts connected therewith, constructed and arranged substantially as and for the purposes herein shown and described.

116,793.—Musical Instrument.—Thomas Atkins and Henry Drewer, Cincinnati, Ohio.

Claim.—1. The hook C, adapted to produce musical tones by the vibration of its prongs, constructed and employed substantially as set forth.

2. The hooks C, with two or more prongs tuned in octaves and adapted to produce musical tones, when constructed and employed substantially as herein set forth.

3. The combination of the hooks C with the frame B, substantially as set forth.

116,794.—Blacking-Brush.—Benjamin Franklin Averill, Dunkirk, N. Y., assignor to himself and Samuel James Gifford, same place.

Claim.—1. The flexible tube b attached upon the curved pipe a of the hollow cylinder C, in combination with the piston D and its operating-rod E, when constructed and arranged in relation to the brush B of the shoe-brush A, substantially as and for the purpose set forth.

2. The arrangement of the handle F, reservoir C, piston D, packed head c d, screw E, pipe a, and rubber tube b, in combination with brushes A B, all operating in the manner and for the purpose specified.

116,795.—Anti-Friction Journal-Box.—Burr C. Baker, Toledo, Ohio.

Claim.—The combination, in a cylindrical journal-box, B, of the shaft A, the series of rollers C and E, and the ring D, all constructed, arranged, and operating substantially as described and shown.

116,796.—Steam-Generator.—George A. Barnard, New York, N. Y.

Claim.—The combination of the cylinder A, semi-cylindrical lining B, exterior vertical pipes C, and interior vertical pipes D, substantially in the manner herein shown and described.

116,797.—Table, Stand, &c.—Daniel K. Barnhart, Gaines, Pa.

Claim.—1. The metallic sockets A, made with two or more projecting arms, a', at their upper ends, in combination with the top and legs of a table, substantially as herein shown and described.

2. A table, with the groove c' formed upon the under side of the top C near its edge, in combination with the rim D, substantially as herein shown and described.

116,798.—Cider-Mill.—Watson Barr, Ypsilanti, Mich.

Claim.—1. The combination of the concave B, cylinder C, and plunger E, constructed and arranged substantially as and for the purposes set forth.

2. The arrangement of the frame A, concave B, cylinder C, hopper-box D, plunger E, pulleys F H, belt G, crank-shaft I, pitman J, and apron K, when each part is constructed and combined to operate substantially as and for the purposes set forth.

116,799.—Ornamental Advertising Medium.—Jackson Ogden Belknap, New Orleans, La.

Claim.—1. The propelling-machine represented by Figs. 1, 2, 3, 4, 5, and 6, for fountains, substantially as above specified.

2. The propelling-machine herein described, in combination with an inclosed fountain to form an ornamental advertiser, substantially as and for the purposes set forth.

116,800.—Gate and Door-Spring.—Alonzo T. Boon and Lucien Mills, Galesburg, Ill., assignors to themselves, Frank Hughes, and W. S. Dewey, same place.

Claim.—In combination with the coil D, the fixed plate E having the annular groove e' and recess e'', the removable plates I' I'' having grooves i i, and the slotted plate H, substantially as and for the purpose specified.

116,801.—Car-Coupling.—Jacob H. Bull, Hereford, Md.

Claim.—In combination with a buffer-head having a spring coupling-bolt moving horizontally through it, the partition a, trigger c, and projections b and m, for the purpose of holding out and tripping and allowing said bolt to shoot into coupling position, substantially as described and represented.

116,802.—Ice-Run.—Gilbert Burhans, Rondout, N. Y.

Claim.—In combination with an ice-run, the jointed section H provided with cleats or stops, one or more, substantially as and for the purposes described.

116,803.—Evaporating Apparatus for the Manufacture of Sugar.—Francis G. Butler, Bellows Falls, Vt.

Claim.—1. A plain-bottomed battery or finishing-pan, in combination with an evaporator, the pan and evaporator both having flaring sides and communicating directly with each other, the bottoms of both being upon the same level.

2. An oscillating valve, operated by a pivoted rod or rods reaching to one or both sides of an evaporating-pan, substantially as shown and described.

116,804.—Stock-and-Freight Car.—James B. Calkins, Pacific, Mo.

Claim.—1. The partitions C, sleeve c, horizontal rods E, when arranged within a stock-car, substantially as set forth.

2. The arrangement of a sheave, E, in combination with horizontal rods E, substantially as and for the purpose set forth.

116,805.—Combined Gauge and Try-Square.—Frederic Castle, Montana, assignor to himself and Louis Burges, Boone, Iowa.

Claim.—The combination of the stud B, bracket C, and set-screws I and J, constructed and arranged substantially as and for the purposes set forth.

116,806.—Anchor.—Charles A. Chamberlin, Pittsburg, Pa.

Claim.—1. The combination of the flukes, connected by a curved or angular bar, b, extending beyond the center of oscillation, the bifurcated shank a and guiding device d located between the connecting-bar and center of oscillation, substantially as and for the purposes set forth.

2. The weighted head b or connecting-bar of the flukes, in combination with the shank a loosely pivoted thereto in such manner, substantially as described, as that the superior gravity of the connecting-bar shall give the flukes a vertical position in weighing or dropping anchor.

3. In combination with the devices described in the second claim, the guiding-bars d and braces d^3, attached by a screw-bolt so as to be readily folded upon the shank, for the purpose described.

4. A shank having flaring bifurcated arms a', each of which is loosely pivoted to one of the flukes, substantially as described.

116,807.—Knife-and-Fork Rest.—Le Roy Jones Cherrington, Boston, Mass.

Claim.—The construction and arrangement of the several parts, namely, the base A, the rests B and C C, and the protection D D, in a manner substantially as and for the purpose or purposes hereinbefore set forth.

116,808.—Oil-Can.—Paris Childs, Northampton, Mass.

Claim.—1. The wire C, connected with the bottom of an oil-can, A, in combination with the tube B having a long screw, b', formed upon its lower end, substantially as herein shown and described, and for the purposes set forth.

2. The combination of the stuffing-box D and screw-plug E with the wire C and bottom of the oil-can A, substantially as herein shown and described, and for the purpose set forth.

116,809.—Sewing-Machine Table.—John C. Cochran, Ripley, Ohio.

Claim.—A cover, E, and table F, combined with plate A B C, screw D, rods G, and slide I, all constructed and arranged as and for the purpose specified.

116,810.—Vent-Bung.—Benjamin R. Cole, Buffalo, N. Y.

Claim.—1. The arrangement, with a vent-bung under a valve at the lower end thereof, of a rubber string attached to said valve and arranged in the vent-passage of the bung so as to retain the said valve in contact with its seat, substantially as hereinbefore set forth.

2. The combination and arrangement, in a vent-bung, of an automatic spring-valve and a throttle-valve, stop-cock, or plug operated by hand, for rigidly closing the vent, substantially as and for the purpose hereinbefore set forth.

3. The thimble-valve seat C, provided with flange c and ledge c' arranged in the vent of a wooden bung, as hereinbefore set forth.

116,811.—Folding Chair.—Nicholas Collignon, Claudius O. Collignon, and Adam Collignon, Closter, N. J.

Claim.—The seat A, formed of bent slats mortised into a surrounding frame, G, and reversely curved, the pieces C C reversely curved and placed under the front bar of frame G, and the pieces B B reversely curved from the middle to give an easy position to the back, all combined, constructed, and arranged together in the same chair, as and for the purpose specified.

116,812.—Grate-Bar.—Henry Collinson, Boston, Mass., assignor to himself and Nathan W. Hazen, same place.

Claim.—1. The arrangement of the props or fuel-supports b b alternately on either side of web A, and projecting upward from it, substantially as and for the purpose described.

2. The arrangement of said fuel-supports b b with web A, having inclined planes d d from the interior vertical surface of said fuel supports to the opposite exterior of web A, substantially as and for the purpose described.

3. The web A, formed on its top by the extension and continuation of said inclined planes d d from the lines e e on either side of web A, so as to form a sharp ridge between the alternate opposite

arrises of the adjacent inclined planes, substantially as and for the purpose described.

116,813.—Baby-Walker, Hanging Chair, &c.—Leighton O. Colvin, Newark, N. J.

Claim.—1. The combination of the suspension-cord C, the double cord F F, and the roller-block *g*, containing two rollers, D F, when the whole are arranged in connection with a chair, swing, or baby-walker, substantially as herein set forth.

2. In combination with the suspending-cord of a baby's chair, swing, or baby-walker, the spring S, connected with the cord, as herein described, whereby the range of the spring is limited.

116,814.—Automatic Car-Brake.—Joseph R. Crabill, La Crosse, Ill.

Claim.—1. The suspension of the brake from supports pivoted directly above the axle of the wheels to which the brake is to be applied, so that the movement of the said supports in either direction will apply the brake to the wheels, substantially as herein shown and described.

2. The pivoted brake-frame F G H, pivoting supports I, and arm J, in combination with the sliding bar C, car-body A, and wheels D, substantially as herein shown and described, and for the purpose set forth.

116,815.—Spring Bed-Bottom.—Delos V. Crandall, Chicago, Ill.

Claim.—The combination of rail D, clasps *d d'*, and springs A A', the whole constructed and arranged substantially in the manner and for the purpose specified.

116,816.—Joining for Watch-Chains.—Charles Croselmire, Newark, N. J., assignor to himself and Alfred V. C. Genung, same place.

Claim.—The blank link, Fig. 2, as and for the purpose specified and shown.

116,817.—Mill-Pick.—Jotham Cummings, West Charleston, Vt.

Claim.—A mill-pick, composed of the wedge-bar G with its head H and teeth *a a*, &c., and the reducing-blade K with its sloping end, the two being inserted within the orifice of the pick-head and operating therewith and with each other to produce results herein explained.

116,818.—Electro-Magnetic Car-Brake.—Henry S. Daggett, La Fayette, Ind.

Claim.—1. The magnet S, combined with a brake-shaft, I, working in the slotted bearing K L, to raise or allow the shaft to fall, as and for the purpose specified.

2. A fast pulley, M, on the rotary brake-operating shaft I, combined with a fast pulley on one of the car-axles, and a bolt, N, upon and between them, tightened to enable the car-axle to apply power to the brake mechanism, and loosened when that is not desired.

116,819.—Manufacture of Rubber Cushions for Billiard-Tables.—Mathew Delaney, New York, N. Y.

Claim.—1. The vulcanising-mold, provided with the slotted or perforated ends, and with the wire or string which can be stretched on the shafts C, as set forth.

2. The herein-described method of forming straight smooth apertures through rubber billiard-cushions by drawing a wire or string through them during the vulcanizing process, as specified.

116,820.—Oil-Pump Valve.—Trouson Draper, Petrolia, Canada.

Claim.—The adjustment of the leather packing-rings for expanding them by means of the metal rings, the vertically-adjustable part F of the stock, the bolt H, notched springs I, and the grooved barrel A, all arranged and operating substantially as specified.

116,821.—Soap.—Francis Marion Ellis, Brooklyn, N. Y., assignor to Joshua Beatty, New York city.

Claim.—The preparation of a compound which is deodorized sulphur-soap, of the ingredients, in the proportions, and for the purposes set forth.

116,822.—Carpet-Protector.—Henry W. Eskildsen, Boston, Mass.

Claim.—1. The molding B and the strip of rubber E, constructed and arranged together as and for protecting and securing a carpet in manner substantially as described.

2. The molding D and the strip of rubber E, constructed and arranged together and with a carpet, B, floor A, and base-board C, as and for the purpose set forth.

116,823.—Tube-Cleaner.—Philip Farley, Philadelphia, Pa.

Claim.—The bifurcated scrapers C, constructed substantially as described, in combination with the washers B and rod A, in the manner and for the purpose above set forth.

116,824.—Copying-Press.—John Fensom, Toronto, Canada.

Claim.—The application of a ratchet-wheel and spring in any form to the screw and handle in copying-presses, as herein set forth.

116,825.—Treating Rubber and Other Vulcanizing Gums.—Perry Finley, New York, N. Y.

Claim.—1. The combining of caoutchouc or other vulcanizable gums and amber or linseed or other drying-oil, either or both combined, for the purpose of converting those substances into hard and inflexible or hard and flexible materials, known as hard rubber or vulcanite, or for converting the same into japans, lacquers, and varnishes, when the same is subjected, or not, to a high degree of heat, substantially as specified; and this whether the said compound of caoutchouc, amber, and oil be or be not mixed with the other ingredients, as set forth.

2. Combining this substance with pyroxyline, for the purpose of producing a substance or manufacture possessing the qualities or properties substantially such as described, when the same is subjected or not to heat, as set forth.

3. The new manufacture or substance hereinabove described, and possessing the substantial properties herein described, and composed of caoutchouc or other vulcanizable gums and amber, and drying-oil, either or both combined, in the proportions substantially such as described, and when incorporated, subjected or not to a high degree of heat, as set forth; and this whether combined or not with pyroxyline.

116,826.—Printing-Telegraph.—David Flanery, New Orleans, La.

Claim.—1. The keys M and N applied to the main wire of an electric apparatus to control the current through the same, substantially as herein shown and described.

2. In combination with wheel F, the cushion G, vibrating lever H, armature-plate *e*, and coils I I, all arranged as specified, and for the purpose set forth.

3. The paper-feeding device C D and the wheel *i*, having pins *g h*, both connected by intermediate mechanism to the common spring-drum B, combined with the notched pallet *f* on the end of lever *e*, the armatured lever H, and the coils I I, for the purpose of causing the feed to move the paper just before the cushion reaches it.

4. In combination with paper-feeding and printing mechanism, the one main battery at the terminus of a circuit, the one series of wires, the resistance-coils, and the keys, all arranged and operated as described.

5. The printing-lever E, combined with the lever *e* and pallet *f*, substantially as and for the purpose herein shown and described.

116,827.—Corn-Planter.—John T. Force, Henry county, Ky.

Claim.—1. The marking-wheel R with its double-pointed cams O O, in combination with the lever S which operates the dropping-slides, substantially as and for the purpose set forth.

2. The share J with its covers L L and rib K on the bottom, substantially as and for the purpose hereinbefore set forth.

116,828.—Shoe.—Charles C. Geller, Albany, N. Y.

Claim.—The vamp of a laced shoe, provided with the projecting tongue or stay *a*, substantially as herein shown and described.

116,829.—Refuse-Burning Furnace.—George Goodsell, Bennett J. Goodsell, and John Been, Jr., Pentwater, Mich.

Claim.—1. A refuse-burning furnace, built of brick, the fire-box A of which is surrounded on three sides by a water-jacket B, connecting with an open metallic pan, B', substantially as and for the purposes set forth.

2. The combination of a brick furnace provided with fire-box, ash-pit, doors, water-jacket, deflecting-plate, and smoke-stack, with an open water-pan, when the parts are arranged to operate substantially as and for the purposes set forth.

116,830.—Treadle for Sewing-Machine.—James W. W. Gordon, Newport, Ky.

Claim.—The foot-piece A, rock-shaft B, and spring E, when constructed and arranged together, as described, to enable the ankle-joint of the operator to be always held in line with the center of motion of the treadle to save the waste of power in moving the entire lower limb at every vibration of the crank-shaft.

116,831.—Railway-Signal Apparatus.—William Green, Yonkers, N. Y.

Claim.—The combination of ropes arranged in sections along a line of railroad, and signals operated by the same to work in opposite directions, in the manner substantially as specified.

116,832.—Cooking-Stove.—Seth Gregory, South Norwalk, Conn.

Claim.—The damper-plates J, arranged in connection with the slides H, so as to be moved forward and backward therewith, and to be operated by hinged rods or bars, substantially as specified.

116,833.—Carpet-Sweeper.—Don C. Hall, Hannibal, Mo.

Claim.—1. The circular brush A, shaft B, box C, handle D, tubular sockets *a a*, ears *b b*, shaft E, pulleys *f e d h*, and cords *e g*, all combined, as described, to form an improved carpet-sweeper.

2. The pivoted and arc-slotted plates *l l*, lock-screw *n*, and arc-slotted box C, combined, as described, with the brush-shaft B, to embody a new way of adjusting the brush down as it wears away.

3. The box C, having the metal bottom *i*, provided with an adjustable metal dust-guide, *p*, which may be sprung into different positions, combined, as described, with an adjustable brush, A B, to enable the guide to be always brought into contact with the brush as it is used up and moved down.

116,834.—Keyed Musical Instrument.—Emmons Hamlin, Winchester, assignor to Mason and Hamlin Organ Company, Boston, Mass.

Claim.—1. In combination with the key-board, tipping and sliding on the rod *d*, the lifters *i* depending from the front of the key-board through slots or openings at the rear of the front board *l*, substantially as shown and described.

2. In combination with the lifting and sliding key-board, the stop-pin A and the stop-holes *x*, the construction being substantially as described.

116,835.—Can for Roving.—Ezra Haskell, Dover, N. H.

Claim.—A roving-can, made substantially as specified, viz., of a leather-board or pasteboard body, a wooden bottom, metallic top and bottom flanges, and a strengthening-band of leather board or the equivalent, all arranged and combined substantially as specified.

116,836.—Locomotive-Boiler.—Samuel J. Hayes and Edward T. Jeffery, Chicago, Ill.

Claim.—The crown-bars extended over the furnace to the sides of the boiler-shell and resting upon bars of angle or other iron, F, bolted or riveted to the shell, the ends of the said bars and the shell of the boiler being bolted together, all substantially as specified.

116,837.—Boring-Bit.—Daniel Kelly, Muskegon, Mich.

Claim.—A bit, having a conical point, *a*, provided with two cutting-lips, *b*, and its stock A with a spur, B, and cutter C, both spur and cutter terminating in the form of a screw-thread about the stock, the upper ends of said convolutions terminating in enlargements D E, the former being provided with cutter E and the latter with spur G, substantially as and for the purposes set forth.

116,838.—Corn-Ground Marker.—Francis B. Kendall, Monmouth, Ill.

Claim.—The wheels C C' C'' pivoted to the frame A A' A'' by bolts *c c' c''*, constructed and operated in the manner substantially as and for the purpose specified.

116,839.—Drain-Pipe Machine.—Charles W. Kennedy, Brooklyn, E. D., N. Y.

Claim.—1. The mold, composed of the truck-like bottom, the vertically-divided flask hinged to said bottom, and the sectional core, all combined substantially as herein described.

2. The combination of the turn-table, the mold bottom, the flask, the core, and the central pin, substantially as herein described, whereby the said pin serves to center the core in the mold and the mold on the turn-table, and to secure the mold from running off the turn-table.

3. The combination of the rammer W with the slotted lever-like dog A*, the sliding block or reciprocating carrier Z, and the stop *t*, substantially as and for the purpose herein described.

116,840.—Feed-Regulating Mechanism of Cotton-Lapper.—Richard Kitson, Lowell, Mass.

Claim.—1. The slide A, constructed, as described, with an under recess, *g*, and a rising hub, *d*, in and above the oil-chamber, in the manner and for the purpose specified.

2. In combination with the slide constructed with the under recess, as described, the rocking-box B, arranged in the manner and for the purpose set forth.

116,841.—Waste-Picker.—Richard Kitson, Lowell, Mass.

Claim.—1. The combination, with the cylinder A, of the screen-cylinder and feeding apparatus or feed-rolls *f*, the last interposed and operating between the screen-cylinder and the working-surface of the main cylinder and at the rear side thereof, substantially as specified, for the purpose of increasing the working capacity of the machine, substantially as described.

3. The flange or plate P, arranged in the bonnet B, in combination with and operating to guide the material onto the surface of the rotating screen-cylinder, in the manner and for the purpose set forth.

3. The adjustable rear bonnet B, in combination with and covering the screen-cylinder and feed-rolls *f*, when provided with a guide-plate, P, and otherwise arranged as described.

116,842.—PAPER-BAG MACHINE.—Margarett E. Knight, Boston, Mass.

Claim.—1. The follower I', constructed and operating as and for the purpose specified.

2. The plate-knife-holder F, constructed, arranged, and operating as set forth.

3. The guide-finger N', or equivalent device, whether fixed or movable, the function of which is to hold or push back a portion of the edge of the paper tube while the fold represented in Fig. 10 is being formed.

4. The combination of a guide-finger with mechanism or a device for pushing the paper tube under said guide-finger, for the purpose of forming the fold represented in Fig. 10.

5. The side-folders Q' R', constructed, arranged, and operated by the means described, as and for the purpose specified.

116,843.—HORSE-POWER.—Francis Marion Chester Liles, Roanoke, Ala.

Claim.—1. The combination of the wheels D D' and the rollers *k* H, substantially as herein set forth.

2. The wheels D D', J, G, and F, in combination with the wheel V on belt-wheel shaft T, the adjusting-screw *y'*, and the adjusting-nuts *n n*, all arranged substantially as set forth.

116,844.—BUTTER-KETTLE.—John Liming, Philadelphia, Pa., assignor to himself and Charles C. Savery, same place.

Claim.—A butter-kettle, A, provided with a refrigerative lid or cover, B, constructed and applied to operate substantially as and for the purpose hereinbefore set forth.

116,845. — ROOFING-BRACKET. — James H. Look, Jr., Rochester, Mass.

Claim. — The improved roof-staging bracket, formed by the combination of a bar, B, screw D, claw C, and arms E E provided with a head, F, substantially as shown and described.

116,846.—MEDICAL COMPOUND OR BITTERS. Abram M. Loryea, East Portland, Oreg.

Claim.—1. The ank-weed remedy, consisting of the above compound, substantially as specified.

2. The combination of the ank-weed, hypophosphate of potassa, and the compound tincture of cinchona, substantially as specified.

116,847.—RATCHET-DRILL.—James W. Mahlon, Brooklyn, N. Y.

Claim.—In combination with the stock or spindle of a drill, the polygonal ratchet-wheel A with rectangular pawl-recesses, the lever C D with its projecting rectangular pawl-teeth, one on each side, and the yoke B, substantially as hereinbefore described.

116,848.—ATTACHMENT FOR RATLINS.—Joseph P. Manton, Providence, R. I.

Claim.—The combination of the clamp A, socket-strap C, and ratlin O, substantially as and for the purpose specified.

116,849. — HOUSEHOLD IMPLEMENT.—Reuben A. McCauley, Baltimore, Md.

Claim.—As a new article of manufacture, a combined household-tool, having its several parts constructed and arranged as shown and described.

116,850.—FOLDING SOFA.—James W. McDonough, Chicago, Ill.

Claim.—1. The combination of the folding section of the head B C D with the permanent section G E I H, when so constructed and arranged as to project over said permanent section in such a manner as to cover the joint across the same, when folded, thus forming a finished head, substantially as specified.

2. The combination with the folding frame J provided with the loops N, the legs K having their upper ends curved and provided with the stops M and shoulders L, when arranged, as herein described, for the purpose of supporting the frame when in a vertical position and for supporting themselves when in a horizontal position, as set forth.

116,851.—HINGE FOR GATES, &c.—Alonzo D. McMaster, Rochester, N. Y., assignor to himself and Orrin Morse, same place.

Claim.—1. The construction of the leaf and knuckle of the hinge in two separate parts, connected together by a wedging and dovetailed slot and lug, or equivalent, as herein described.

2. The combination of the dovetailed plate A with the slot *a*, pintle C, spiral oval incline *f f*, of the knuckle B and its dovetail or lug *b*, substantially as set forth.

116,852.—CONVERTING THE RESIDUUM OF PETROLEUM INTO OIL.—Charles C. Mengel, Brooklyn, N. Y., and Alois Pöhr Von Pöhrnhoff, St. Catharine's, Canada.

Claim.—The conversion of the tarry residuum of petroleum distillation into illuminating oils by dropping into it water in a liquid state, or liquids containing water, while it is subjected to a high degree of heat in a still, substantially as herein described.

116,853.—STEAM-PISTON. — Edward Merriman, Allegheny, assignor to himself and Hugh Coll, Allegheny county, Pa.

Claim.—A relief-valve or valves, arranged in one or both ends of a steam-piston in such a way as to open only from within by steam-pressure when the pressure inside is in excess of that outside of the exhaust end, substantially as described.

116,854.—WATER-GATE.—David J. Moffitt, Thorntown, Ind.

Claim.—The combination of the float I, the levers D, the rock-shaft E pivoted in the slot *b* in the posts G, and the gates J, all constructed, arranged, and operating substantially as described and shown, for the purposes set forth.

116,855.—CHURN.—Oscar F. Monfort, Dearborn, Mich.

Claim.—The arrangement, in a churn, of the tubular shaft E, hollow arms F, solid arms F', and spiral beaters G, the sleeve H, arms K and K', spiral blades L, and pinions I and J rotated by the gear D, all constructed and operating substantially as described and shown.

116,856.—FOLDING CRADLE. — Thomas W. Moore, New York, assignor to Elric L. Nichols, Plattsburg, N. Y.

Claim.—1. The double joint F, for fastening the sides to the ends of a cradle or crib, substantially as described.

2. The bracket-support G, for supporting the bottom and holding the side in position, substantially as shown and described.

3. The cradle A B C E, jointed at F, and having two ends, D, beneath the bottom, combined as described, with the cord H, for the purpose specified.

116,857.—PRINTER'S GALLEY-REST.—John M. Murphy, Olympia, Wash. Ter.

Claim.—The combination of the socket-plates B

b' provided with longitudinal slots *b⁴* and cross-slots *b⁵ b⁵*, one or both, and the brackets C D E provided with pins, lugs, or projections *c'* with each other, to adapt them for attachment to a printer's case-stand, substantially as herein shown and described, and for the purpose set forth.

116,858.—WATCH-CHAIN FASTENING.—Daniel F. Myers, New York, N. Y.

Claim.—A watch-chain fastening, composed of a case, A, containing a spring, *e*, provided with a guard, F, a hinged hasp, *d*, having at one end a hook, *c*, for locking the same, when brought in contact with the spring *e*, substantially as and for the purposes specified.

116,859.—LIQUID-METER.—Hiram B. Nickerson, Boston, Mass.

Claim.—1. A meter having two measuring-chambers, K and K', of known capacity, and furnished with tanks B and B' for actuating the valves, all arranged and operating substantially as described, and for the purpose set forth.

2. The said measuring-chambers, in combination with the two pipes H H' and E E' provided with valves *f f'*, arranged to operate substantially as described, and for the purpose set forth.

116,860.—TASSEL.—James Norman, Brooklyn, N. Y.

Claim.—As a new article of manufacture, the tassel herein described, consisting of the block A, provided with a flange, B, and combined with a removable skirt, D, and cord or band, E, as and for the purpose specified.

116,861.—INVALID BEDSTEAD. — Mansel A. Ormsbee, Fair Haven, Vt.

Claim.—The sheet-frame C suspended by bands *a a* having hooks *b b*, and the mattress D suspended by bands *c c* from rollers *d e*, which have crank mechanism attached thereto, combined as described with the bedstead-frame A, for the purpose specified.

116,862. — BRACKET. — George W. Peirce, Boston, Mass.

Claim.—In the bracket, as specified, the back as made with the straight slots, and the shelf and brace as provided with the eye-headed screws, all as described, arranged, and applied together, as explained.

116,863.—MEDICAL COMPOUND FOR TREATING DISEASES OF THE LUNGS, CHEST, &c. Marie Eulalie Perrin, Montreal, Canada.

Claim.—The medical compound composed of lard, animal pancreas, alcohol, and bitter-almond oil, mixed together, substantially as and for the purpose set forth.

116,864.—CHIMNEY-CAP. — Walter J. Pettingell, Lowell, Mass.

Claim.—The construction and arrangement of the chimney-cap A having either slots or buttons, in combination with the brackets C C, said brackets being made in such a manner as to be adjustable in their places upon the cap, as set forth.

116,865.—APPARATUS FOR AMALGAMATING GOLD AND SILVER.—Ira M. Phelps, Chicago, Ill.

Claim.—1. The central discharge-tube J, in combination with rack K, pinion K', shaft L, wheel M, pinion M', and shaft N, or other equivalent mechanism, whereby a vertical movement may be imparted to said tube, substantially as and for the purpose described.

2. The hollow shaft E, in combination with the pipes H and H', substantially as and for the purpose described.

3. In combination, the hollow shaft E, wheel D', pinion D, shaft C, and cone-pulley C', the whole arranged to operate substantially as and for the purpose described.

116,866.—STOCK-CAR.—Amos Rank, Salem, Ohio.

Claim.—1. The combination of the rolling-stall partition with spring-bolts to hold the partition in place, as set forth.

2. The combination of adjustable stall-partitions, spring-bolts, and inclined boards, automatically to lock the partitions, as set forth.

3. The inclined boards which hold the partitions, constructed with removable sections opposite the door-ways, as hereinbefore set forth.

4. The combination of the partition-roller with the swinging lever-pawl and ratchet to work the rollers from either the outside or inside of the car, these members being constructed and operating as hereinbefore set forth.

5. The combination, with a stock-car, of a sliding swinging feed-rack, substantially as set forth.

6. The relative arrangement, as set forth, of the feed-bin, the outwardly-swinging door-way in the roof outside of the bin, and the feed-rack in the car.

7. The relative arrangement, as set forth, of the rolling partition, the feed-rack, and the opening in the roof, for the purposes set forth.

116,867.—BOOT AND SHOE-HEEL TRIMMING AND BURNISHING-MACHINE. — Timothy K. Reed, East Bridgewater, assignor to Arza B. Keith, North Bridgewater, Mass.

Claim.—1. In combination with a rotary trimming or burnishing-wheel, an adjustable rest, *f*, upon which the tread of the heel of a boot or shoe is supported horizontally while the edge of the heel is held up to the periphery of the wheel by hand, substantially as described.

2. In combination with the wheel *e* and heel-rest *f*, the spring-gauge *l*, having a point, *m*, to enter the crease between the counter and heel, and made self-adjusting to heels of varying thickness, substantially as described.

116,868.—MANUFACTURE OF SHEARS AND SCISSORS. — Robert Renz and Andrew Renz, Naugatuck, Conn.

Claim.—The method hereinbefore described of preparing the two parts, the handle and the blade, and of uniting the same together.

116,869.—PRESS FOR HAY, &c. — William Henry Reynolds, New Orleans, La.

Claim.—1. The arrangement, in a cotton-press, of the crank V, pinion T, pawl W, gears S S, arm or crank Z, and eccentric X, all constructed and operating as shown and described.

2. The arrangement, with the tube C, screw A, and detachable nut B, of the gear-wheels P S and pinion T, the said pinion being provided with a holding-pawl and one of the wheels S being mounted on an eccentric, all substantially as specified.

3. The improved press herein described, composed of the several parts specified, constructed and arranged to operate as set forth.

116,870.—SWIVEL-HOOK.—Celius E. Richards, North Attleborough, Mass., assignor to himself, William H. Robinson, and Daniel H. Robinson, same place.

Claim.—The combination of a rigid hook, A, hollow cap B, and ring C, substantially as described.

116,871.—CHURN.—Jacob L. Rust, Keithburg, Ill.

Claim.—1. The oscillating churn-vessel A and the rotating dasher D, when arranged to operate substantially as and for the purposes described.

2. The bar C, cords H H, and pulleys F F, arranged in combination with a churn-dasher, substantially as described.

116,872.—Boot and Shoe.—François Senn, Forestville, N. Y.

Claim.—The seam, composed of the upper, welt, lap *a*, and sole, being first stitched and then secured by thread or peg, as set forth.

116,873.—Blast-Protector for Exhaust-Nozzles.—John H. Setchel, Cincinnati, assignor to himself and John Durand, Xenia, Ohio.

Claim.—1. The provision, at the blast-issues of a locomotive or other engine, of conical stoppers F, released from said issues by the action of the live steam, substantially as set forth.

2. In the described combination with the blast-issues, the arrangement of the conical stopper or stoppers F, rock-shaft I H G, rods J K, piston L, and cylinder M, which communicates with the live-steam pipe.

116,874.—Knapsack.—Charles W. Schaefer, Philadelphia, Pa.

Claim.—A military knapsack in two longitudinal halves, A and A′, connected together by the articulated supporting-frames *a″ a‴* and having the sling-straps B B′ secured to the middle *b″ b‴* of the upper and lower parts, respectively, of the back of the knapsack, all as and for the purposes hereinbefore set forth.

116,875.—Medical Compound.—Albert F. Shannon, Quincy, Ill.

Claim.—The medical compound, herein described, when compounded of the ingredients, and used in the manner, and for the uses and purposes herein set forth.

116,876.—Submarine Excavator.—George V. Sheffield, Boston, Mass., assignor to himself and Lyman A. Cook, Woonsocket, R. I.

Claim.—The machine, substantially as described—that is, as composed of the scoops A A, the arms B B, the rack C, the pawl D, the piston F, and cylinder E, combined and arranged in manner and so as to operate as and for the purpose specified.

116,877.—Sawing-Machine.—Ira Shepard, Dowagiac, Mich.

Claim.—The arrangement of the oscillating frame H with the curved arms I I and saws *j* and *k*, as and for the purposes set forth.

116,878.—Automatic Fastener for Meeting-Rails of Sashes.—Henry Smiley and William T. Loughead, Boston, Mass.

Claim.—Our improved self-locking sash-fastener, as described, the same consisting of the two movable levers *e n*, constructed as described, and provided with actuating-springs, as specified, the pivoted lever *h*, its stud *k*, and hinged portion *r*, socket *m*, and incline *r′*, the whole being arranged and operating together, substantially as set forth.

116,879.—Musical Instrument.—Kilburn Smith, Lowell, Mass.

Claim.—The adjusting-lever C, constructed as described, with an end fulcrum, *f*, and varying string-slots *e*, *e′*, &c., applied to the tail-piece A, or to that part of the instrument which holds the knotted ends of the strings, and actuated by a screw, or its mechanical equivalent, for the purpose of adjusting all the strings simultaneously.

116,880.—Machine for Making Screws.—Luther Southworth, Jr., and Sewell Gibson Cushing, Stoughton, Mass.

Claim.—The combination of the driving-shaft *d*, the train of three gears, *a b c*, the two arbors E F, and separating-cutter carriage H and its tool-posts *i i′*, and the rotary cutter-head I, all constructed, arranged, and applied to a supporting-frame, A, substantially in the manner and so as to operate as and for the purpose as described.

116,881.—Flier for Spinning, &c.—Thomas Stibbs, Wooster, Ohio.

Claim.—The horizontal bar *o* and its enlargement *l*, in combination with the thread-carrier *m*, whirl-shaft B, and whirl C, all constructed and arranged as and for the purposes set forth.

116,882.—Lady's Elastic Supporter.—G. C. Stillson, Derby, Conn.

Claim.—1. A catamenial supporter, which combines in its construction two triangular pieces, A and B, two elastic straps, C C, two buckles, *a a*, and two elastic rings, B′ B², substantially as described.

2. The elastic rings, stayed and covered by cloth, and attached to the front and back pieces A B, the latter being connected together by elastic straps which are adjustable, to allow said rings to be kept in the median line of the body, substantially as described.

116,883.—Well-Auger.—William H. Stone, Pattonsburg, Mo., assignor to himself and Newton J. Smith, Omaha, Neb.

Claim.—The plates A A, when their lower ends are curved into lips D D, bent nearly together and cut off at the corners E E, combined with the twisted bar B, constructed to form a point, as and for the purpose specified.

116,884.—Memorandum-Book.—Isaac N. Swasey, Yonkers, N. Y.

Claim.—The combination of cover B B and blank leaves C, each leaf being folded in upon itself, and each succeeding fold being extended beyond the line of the preceding leaf and folding therein, as and for the purpose specified.

116,885.—Shearing-Machine.—Felix W. Tally and Michael Ryan, Philadelphia, Pa.

Claim.—1. In an animal-shearing or clipping-machine, the hinged cutter-case, composed of bottom plate H, top or cover H″, both deeply slotted or toothed at their forward ends, the points of the teeth in the two parts projecting alike, held in close contact, and fitted to receive and have work within it the vibrating cutter I′, in the manner and for the purpose herein described.

2. The vibrating cutter I′, pivoted upon stud *h″* and having arms *i″* and *i²*, connecting-link *i³*, crank-pin *g″*, collar *g′*, and tumbling-rod G′, in combination with the plate H having teeth *h⁴* at its forward end, in the manner and for the purpose described.

3. The combination of the standing cylinder F′, cylinders G G made flexible by joints *g*, with the tumbling-rod G′ revolving within and protected by said cylinders, in the manner and for the purpose herein described.

4. The combination of the slotted driving-wheel C, connecting-rod D and its guide-blocks, wheel C′, and band *c*, with the band *c′*, pulleys E. E′, E″, and E‴, standing cylinder F′, jointed protecting-cylinders G, jointed tumbling-rod G′, and vibrating cutter I′ with its intermediate connecting parts, the latter devices supported by and attached to the balanced and revolving beam F, in the manner shown and described.

116,886.—Composition for Dressing and Coloring Leather.—Zalmon A. Taylor, Haverhill, assignor to himself and Alonzo P. B. King, Lawrence, Mass.

Claim.—The manufacture or preparation of the above-described compound, of the ingredients and in the proportions substantially as and for the purposes hereinbefore explained.

116,887.—Chimney-Cowl.—George G. Thomas, St. Louis, Mo.

Claim.—1. The ventilator described, consisting of the tube A with flaring top *a*, caps B and D, shells C and E, combined and arranged as described.

2. The combination of the shells C and E with the cap B, the shells being separated from each other to form an air-passage, and the cap B being arranged to protect the opening of the tube A, as described.

116,888.—Combined Shovel and Post-Hole Digger.—Joseph Thompson, Decatur, Mich.

Claim.—The combination of the shank *m* of either blade of a divided detachable tubular cutter or post-hole digger with an aperture, *f*, in its handle, and with a key or wedge, *t*, for securing the same in position at right angles to said handle, substantially as and for the purpose herein set forth.

116,889.—Safety-Shaft for Vehicles.—Jonathan S. Tibbets, Brazil, Ind.

Claim.—1. The shafts A B, made in two parts or pieces, detachably connected with each other, substantially as herein shown and described, and for the purpose set forth.

2. The connection C, whether made in one or two pieces, in combination with the parts A B of the shaft, substantially as herein shown and described, and for the purpose set forth.

3. The eyes *e′*, draft-bar E, and levers F, provided with points or pins *f* upon their forward ends, in combination with the parts A B of the shafts, and with connections C and cross-bar D, substantially as herein shown and described, and for the purpose set forth.

4. The slotted and notched tubular arms H, guide-stems J, and nibs or catches I, springs K, and guard-plates L, in combination with the draft-rod E, levers F, connections C, and parts A B of the shafts, substantially as herein shown and described, and for the purposes set forth.

5. The combination of the strap G with the cross-bar D and stationary parts B of the shafts, when said shafts are made in two parts, A B, substantially as herein shown and described, and for the purpose set forth.

6. The double-looped strap N, attached to the under side of the middle part of the detachable parts A of the shafts to receive the holdback-strap and the strap O, substantially as herein shown and described.

7. The straps O, in combination with the double-looped strap N and detachable part A of the shafts, to secure the said parts A to the shaft, tug, or loop, substantially as herein shown and described, and for the purpose set forth.

116,890.—Pipe-Cutter.—George W. Tower, Cambridge, Mass.

Claim.—The frame or holder A, constructed with an opening, C, having flanges *a* cut away at E, in combination with the closing-piece K applied to the holder A and secured thereto by set-screw L and with blocks O and G, the latter carrying cutting-tool H, substantially as described, for the purpose specified.

116,891.—Mode of Attaching Car Basket-Racks.—Morton Tower, Boston, Mass.

Claim.—A car-basket provided with dovetailed tapering projections or studs *a*, adapted to fit in correspondingly-dovetailed sockets attached to the side of the car, substantially as and for the purpose shown and described.

116,892.—Inking Apparatus for Printing-Presses.—Nathan F. Turner, Williamsburg, N. Y.

Claim.—In an inking apparatus, consisting of inking-rollers L L and distributing-disk G operated as described, the short ink-fountain Q A′ T located at one side thereof, substantially as and for the purpose set forth.

116,893.—Sewing-Machine.—Sidney S. Turner, Westborough, and Isaac S. Craig, Boston, Mass., assignors to I. S. Craig.

Claim.—The auxiliary take-up C′ and its operating devices, all constructed, arranged, and operating substantially as described and shown, for the purpose of measuring off sufficient thread to form a loop for the shuttle, and preventing the winding of the thread by the impact of the hook, as set forth.

116,894.—Potato-Bug Destroyer.—John B. Turney, Inkster, Mich.

Claim.—1. In a machine for catching potato-bugs, the whips D, constructed, arranged, and operated substantially as described and shown.

2. The arrangement of the axle A, wheels B, ratchet-wheels C, whips D, arms E, springs F, and pans G, all constructed substantially as described, and combined to operate as and for the purposes set forth.

116,895.—Rectum-Bathing Apparatus.—Cornelious B. Veronee, Athens, Ga.

Claim.—The combination, with the chair having a hole through the bottom, of the water-tank and pipe, the latter being provided with a stop-valve, and all arranged substantially as specified.

116,896.—Apparatus for Pitching Beer and Other Barrels and Casks.—William Vogt, Louisville, Ky.

Claim.—1. The nozzles H, provided with orifices so made with and arranged that the flames issuing from them shall be of unequal length, substantially as herein described, for the purpose explained.

2. The slide L in the opening M, in combination with the barrel-stand and its elevating mechanism, whereby the said stand is made both vertically and horizontally adjustable, substantially as and for the purposes set forth.

3. An apparatus for heating barrels, composed essentially of the furnace B D E F G, with a nozzle, H I, and blow-pipe C, and a barrel-stand, R′, vertically adjustable and movable toward and from the furnace, all mounted upon a bed or frame, A, and operating substantially as hereinbefore described.

116,897.—Manufacture of Soap.—David Hibbard Warren, Montreal, Canada.

Claim.—1. The method or process of saponifying fatty matters by a concentrated solution of caustic soda, substantially as is described in my first operation.

2. The process of making soap by the four successive operations, substantially as described.

3. The soap produced by the described process, substantially, as a new manufacture.

4. The saponification of resin by sal-soda, in combination with the saponification of fat by caustic soda in the manufacture of soap, substantially as described.

116,898.—Thill-Coupling.—Edward Warren, Ceresco, assignor to himself, Isaac S. Peters, Silas Peters, and William B. Peters, Marshall, Mich.

Claim.—1. The combination, with each other and with the carriage-clip B, of the joint-head C, thill-iron head E, cap F, and elastic block G, arranged, connected, and operated substantially as and for the purposes set forth.

2. In suitably-arranged carriage-thill couplings, a ridge, *n*, groove, or other equivalent device, behind or into which the thill-heads may be sprung to automatically lock the thills or pole at a suitable angle of elevation to be out of the way when not in use and unlock the same when needed, substantially as described.

3. The T-headed bolt I, in combination with a

concave seat in the cap F, substantially as and for the purpose specified.

116,899. — UMBRELLA. — Walter Watson, Fayetteville, N. C.

Claim.—1. A sleeve, having apertures *e* and slotted enlargement *e*, combined with detachable conical ring *d*, screws *f*, stick A, and ball-ended ribs C, all constructed as and for the purpose specified.

2. The movable slide D, having apertures and enlargements *e*, combined with ring *i*, pin *j*, stick A, and ball ended braces E, all constructed as and for the purpose described.

116,900.—STOVE-PIPE DRUM. — Benjamin Webster, Kingfield, Me.

Claim.—The air-heating chamber shaped in the form of an inverted cone, the small cold-air-inlet pipes *b* near the apex, the larger hot-air-outlet pipes near the base, and the double damper C C over the top, all combined, constructed, and arranged in a stove-pipe, as and for the purpose specified.

116,901.—GAUGE FOR COUNTERSINKS.—Asa Wheeler, Brattleborough, Vt., assignor to G. B. Wheeler, same place.

Claim.—The adjustable gauge C c^1 c^2 D, constructed substantially as herein shown and described, in combination with a countersink, A *a'* B, as and for the purpose set forth.

116,902.—STEAM-ENGINE. — James Davenport Whelpley, Boston, Mass.

Claim.—1. The means, substantially as herein described, for giving the balance-wheel or abutment-ring and the cylinder revolving upon its trunnions a synchronous movement or equal velocity of revolution.

2. The substitution of friction-surfaces upon cross-heads and balance-wheel in apposition, with or without friction-rollers, permitting a lateral reciprocating motion of the cross-heads, in place of a permanent connection by pin, joint, or crank, substantially as and for the purposes described.

3. The introduction of friction rollers attached to the balance-wheel in contact with the cross-heads or heads of the piston-rod, permitting the lateral reciprocating motion of the same, substantially as and for the purposes described.

4. The combination between the devices described for the maintenance of the synchronous movements described and the friction-cradle, substantially as and for the purposes described.

116,903.—TREATMENT OF ORES BY MEANS OF FUEL, CHEMICALS, AND FLUXES.—James D. Whelpley and Jacob J. Storer, Boston, Mass.

Claim.—1. The method of burning solid fuel in a finely-divided state, while floated on an air-blast, either alone or in connection with fluxes or reducing agents, to eliminate the impurities in the fuel or the substance to be treated, and the employment of the feeding apparatus described in connection with the fan-blower, or of the comminuting apparatus described, combined with a fan-blower, for the purpose of furnishing to the air-blast "floated fuel" for aerial combustion.

2. The process of treating ores with fluxes and chemical re-agents, by combining the ore and flux or re-agent in fine powder, and floating them into the furnace by means of an air-blast or steam-jet, substantially as described.

3. The apparatus shown in Figs. 1 and 2, consisting of a hopper with feeding device, a fan-blower, a flue or flues, and combustion-chamber, all substantially as shown.

4. The apparatus shown in Fig. 3, consisting of hopper G, feeding-cylinder N, and blast, so as to carry the fuel into the furnace, as described.

116,904. — HARNESS-TRIMMING. — Simon Wiener, Newark, N. J.

Claim.—A harness-ring or hook covered with leather, having the seam beneath and protected by the metallic lining, as a new article of manufacture.

116,905.—COOKING-STOVE. — John Wilder, Detroit, Mich., assignor to himself and Alexander Toil, same place.

Claim.—1. The extension D of the plate C over the entire combustion-chamber B, said extension being provided with openings E and dampers F, substantially as and for the purposes set forth.

2. In combination with said extension D, constructed as described, the vertical flange G, substantially as and for the purposes set forth.

116,906.—COMPOSITION FOR HEALING-PLASTERS.—David G. Williams, Boston, Mass.

Claim.—The new manufacture or composition for a plaster, such being made of *calendula* and the compound solution of isinglass, in the manner and for application to a case substantially as set forth.

116,907. — LOCK FOR DOORS, &c. — John Theophilus Williams, Chicago, Ill.

Claim.—The plate D, provided with the holes *n* and the tumbler-wires *w* capable of being moved in all directions, in combination with the pinion *e*, rack R, bolt B, and key, substantially as and for the purpose set forth.

116,908. — HOT-AIR FURNACE. — Charles Wood, Worcester, Mass.

Claim.—1. The relative arrangement of the inclined air-tubes J, air-chambers A B, and walls D D', substantially as and for the purposes set forth.

2. The relative arrangement of the fire-pot or grate Q and dome P as respects each other, and the cold and hot-air chambers A and B, with their connecting-tubes, substantially as shown and described.

3. The relative arrangement of the inclined air-tubes J and division-plates L M N O, as shown and described.

116,909. — STEAM-CONDENSER. — William Wright, New York, N. Y.

Claim.—1. The arrangement, within the conduit or pipe A, up which the steam or vapor to be condensed passes, of the cold-water conduit or conduits E and return-water conduit or conduits B, or either, in combination with a chamber, C, above, with which said conduits are made to communicate, substantially as and for the purpose or purposes herein set forth.

2. The combination of the inner water-conduits or tubes B E, the outer conduit or steam-pipe A, the steam-inlet G, the condensed-water outlet H, the cold-water inlet I, and the jet-chamber C, in communication with the pipe A and tubes B and E, essentially as described.

3. The combination of the cap F and openings *b d* with the pipe A, the jet-chamber C, and tubes B E, substantially as specified.

116,910.—WAGON-BRAKE. — Joseph J. Adgate, Stevensville, N. Y., assignor to himself and Raymond M. Welles, Towanda, Pa.

Claim.—1. The combination of the spring K, pivoted lever J, and pivoted lever brake-shoe I with each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the stop-block M and spring N with the pivoted cross-bar H, to one end of which the brake-shoe L is attached, and to the other end of which is attached the brake I J K, substantially as herein shown and described, and for the purposes set forth.

116,911.—TWINE-HOLDER.—John Adt, New Haven, Conn., assignor to "The Judd Manufacturing Company," same place.

Claim.—A twine-holder, A, provided with a ball for suspending the said holder, arranged and combined with the holder so that the ball is retained in a defined position, substantially as described.

116,912.—FRUIT JELLIES.—Charles Alden, Newburg, N. Y.

Claim.—1. A jelly, made from fruit or parts thereof from which the moisture has been evaporated, substantially as herein set forth.

2. The within-described process for producing jellies from fruits or parts thereof by treating the same substantially in the manner herein described.

3. A fruit marmalade, made from the residuum obtained from treating fruit substantially in the manner above described.

116,913. — COMBINATION OF WATCH-KEY, SWIVEL, AND HOOK.—John P. Allen and Henry Croft, Springfield, Ohio.

Claim.—A combined open hook, swivel, and key, constructed, arranged, and operating as herein described and represented.

116,914.—RAILROAD-CAR HEATER.—Joshua G. Allen, Philadelphia, Pa.

Claim.—1. The method herein described of ventilating a railway car by means of the vacant space or spaces A' between its walls, whereby said space is utilized as flues and the space between the walls is also thoroughly ventilated and dried.

2. In combination with the foregoing, the tubes C, having their open ends arranged to receive the outgoing air at or near the central aisle of the car and conduct it into the space or spaces A', substantially as described.

3. A car-heater, substantially such as is herein described, having a partition, V, dividing its hot-air chamber into two parts separate from each other, from both of which the hot air is conveyed into the car simultaneously, whereby the car is heated at both ends, irrespective of the direction in which it is moving or in which the wind may chance to be blowing.

4. The arrangement in a car of the ventilating and heating devices in such a manner that the incoming hot and fresh air shall enter at the bottom and the outgoing foul air shall also be taken from the bottom or near the bottom, substantially as described.

116,915.—SPOKE-SAWING MACHINE.—George F. Almy, Toledo, Ohio.

Claim.—1. The bar E, provided with head and tail-blocks C D, and hung or pivoted, at points *a a'*, on a line with the top of the saw, substantially as and for the purposes herein set forth.

2. The combination and arrangement of the screw G with pinion *b*, wheel H with fastening *d*, and the crank I with pinion *e*, all substantially as and for the purposes herein set forth.

116,916.—PNEUMATIC HOISTING-MACHINE. Joseph R. Anderson and Phillip C. Harlan, Freeport, Pa.

Claim.—1. The air-pump C and its operating parts, in combination with the pipe A and its inlet-pipe and cock, air-cylinder G, pressure-valve *g*, rope or chain *g''*, pulley G', and platform *a*, constructed and arranged to operate in the manner and for the purpose described.

2. The stop-cock A', in combination with the connecting-pipe A, open-pipe *h''* having stop-cock *i*, with the air-cylinder G and valve *g*, arranged in the manner and for the purpose described.

3. The hoisting-machine herein described, when composed of the parts recited in the claims above, and they arranged with relation to each other to operate as a whole, in the manner as shown and set forth.

116,917.—LIQUID FOR GALVANIC BATTERIES. Victor Barjon, New York, N. Y.

Claim.—A liquid for galvanic batteries, prepared substantially in the manner herein set forth.

116,918. — BRONZING-MACHINE. — Edward F. Benton, Buffalo, N. Y.

Claim.—1. The combination, with the endless belt or carrier of a bronzing-machine, of spring-gripers attached to the belt for clamping and holding the sheets of paper thereon, substantially as hereinbefore set forth.

2. The gripers P, stop-bars r r^1 r^2, and grooves R R' in the rollers D D', arranged and operating substantially as set forth.

116,919.—FAN ATTACHMENT FOR TABLES.—Thomas S. Binkard and Robert H. Boal, Urbana, Ohio.

Claim.—1. The combination and arrangement of the standard B C, armed shaft E F, racks H, retaining fingers A, and adjustable vanes G *g*, substantially as and for the purposes set forth.

2. The combination of the elastic clamp D *d d'* with the fan attachment, constructed and operating as specified.

3. The combination of the treadle M N, arms L J J, rods I, and clamp D *d d' d''* with the fan attachment, substantially as described.

116,920. — DRAIN-PIPE MACHINE. — Hiram Bissell, Hartford, Conn.

Claim.—The cylinder A, hollow piston and rod M N, and plunger J, in combination with former-ring L, cylinder B, mold-case D, and cap F, constructed and arranged substantially as set forth.

116,921.—CHANNELING SOLES FOR BOOTS AND SHOES. — Lyman R. Blake, Fort Wayne, Ind.

Claim.—1. A sole-channeler knife having the straight cutting-edge *l* and curved groove-cutting edge *m*, formed as one edge, substantially as shown and described.

2. The method of forming and filling the channel, consisting in cutting the slit with the groove below it, leaving the ridge on the flap, and compressing the ridge into the groove against the stitches, substantially as described.

3. A channeled sole in which the flap is formed with the displaced leather from the groove, substantially as described.

116,922.—MACHINE FOR THREADING SHEET-METAL SCREWS.—Edward C. Blakeslee, Waterbury, Conn.

Claim.—1. In combination with the two threaders C E, the hopper H, plunger L, and mechanism to cause said hopper and plunger to move toward and from one of the threaders, as and for the purpose described.

2. In combination with the subject-matter of the first clause of the claim, the edging-tool *n*, arranged to operate in the manner and for the purpose substantially as set forth.

116,923. — MACHINE FOR CUTTING SHEET METAL. — Seymour A. Bostwick, Waltham, Mass.

Claim.—1. The combination of the cutter C^1, the spindle C^2, the yoke C^3, the frame B B^1, and screws c^4 and c^5, when the same are arranged substantially as described, and for the purpose set forth.

2. The adjustable tube D, in combination with the yoke D^1, disks E^1 E^2, and frame B, substantially as described, and for the purpose set forth.

116,924.—COTTON-GIN.—William F. Bowen, Stark, Fla.

Claim.—The combination of the cam-wheels C, blocks or rollers D, levers E, thumb-screws F, springs I and R, either or both, set-screws J, and connecting-rods K, with the roller B, clipper N, and frame A, substantially as herein shown and described, and for the purpose set forth.

116,925. — Tie for Metallic Bands or Hoops used in Baling Cotton.—George Brodie, Plum Bayou, Ark.

Claim.—A tie for cotton-bales and other analogous uses, having beads or ribs *a a* and a slot, *c* in combination with intervening webs which taper toward the side in which the said slot is constructed, in the manner and for the purpose hereinbefore described.

116,926.—Glass-Press.—Aries P. Brooke, New York, N. Y.

Claim.—1. The combination, with the spindle K and screw-plunger L, of a mechanism for pressing said plunger into the molten glass by a direct longitudinal movement of the plunger, and for turning the same out after the glass has set, substantially as set forth.

2. The sliding head *i* on the plunger L, substantially as described.

116,927.–Heating-Stove.–Lorin A. Brooks, La Porte, Indiana.

Claim.—1. The arrangement, within a heating-stove, of the radiating-chamber D, flue *e*, damper *f*, air-pipes *g h*, and smoke-duct *i*, as and for the purpose set forth.

2. The construction and arrangement of the base A, top B, shell C, radiating-chamber D, damper *f*, air-pipes *g h*, and smoke-duct *i*, substantially as herein described, and for the purpose specified.

116,928.—Telegraph Apparatus.—Hugh Swinton Leguré Bryan, Liberty, Mo.

Claim.—1. The key-board B, properly arranged, with the keys *i* passing through the comb-guide H and leading to the cylinder A, connected and operated as described.

2. The key-raising lever C, slide D, wedge *d*, arm *d'*, and roller *e*, arranged and operated as set forth.

3. The circuit-breaker E, upright lever F, its spring *u* and tube *s*, and handle K, properly arranged, as and for the purpose set forth.

116,929. — Curtain-Fixture. — Chauncey Buckley, Meriden, Conn.

Claim.—In combination with a fixture, substantially as described, having a movement independent of the pulley I, the ratchet *d* arranged to revolve with or fixed to the curtain-roll, and the pawl *h* arranged upon the said pulley to engage the ratchet in one direction and leave the pulley free in the opposite direction, substantially as herein described.

116,930.—Molding Cigar.—John Charter, Sterling, Ill.

Claim.—The block A with said mortise therein, the said block B with said groove therein, the said block C with said groove therein, the said sliding block D fitted to and operating in said block C with the groove in said sliding block, and the said hooks G and staples F, all combined and operating substantially as and for the purpose above set forth.

116,931.—Machine for Seaming Cylindrical Tin Boxes.—Jonah R. Cole, New York, N. Y., assignor to himself, Thomas G. Browne, and Charles Herring.

Claim.—The rollers *m m*, adjustable upon the shafts *b* and *g* of the tinman's crimping-machine, in combination with the rollers *l l* at the ends of said shafts, substantially as and for the purposes set forth.

116,932.—Vise.—Alexander Crease, Cleveland, Ohio.

Claim.—1. The brackets H I, as arranged in relation to and in combination with the slide D, in the manner substantially as described, and for the purpose specified.

2. The slotted jaw B, slide D, brackets H I, jaw A, screw C, and nut F, all arranged to operate in the manner as and for the purpose set forth.

116,933.—Manufacture of Paper-Pulp from Straw.—Charles M. Cresson, Philadelphia, Pa., assignor to Robert P. Dechert, same place.

Claim.—The production of a pulp from straw by a process in which two branches or treatments solely are combined, namely, the preliminary boiling in water in the manner described, followed by subjecting the product to caustic or carbonated alkali, as set forth.

116,934.—Chair for Boats. — Richard H. Cutter, Cleveland, Ohio.

Claim.—The frames A and B, straps *c d*, hooks and screws *b b*, cushions F and *g*, when all are constructed and combined as shown, and for the purposes set forth and described.

116,935.—Skate.—Charles T. Day, Newark, N. J.

Claim.—The eccentrically-pivoted lever E, combined and arranged with the heel and toe-clamps of a skate, substantially as specified.

116,936.—Combined Shears and Button-Hole Cutter.—Samuel W. Eastren, Tremont, N. Y.

Claim.—1. The shear-blades A A, pivoted together at *x*, and extended in rear of said pivot-point, forming the graduated blades B B, all substantially as and for the purposes herein set forth.

2. The handles C D C D, pivoted independently on the same pivot that connects the shear-blades, and provided with headed swivel-pins *b b*, substantially as and for the purposes herein set forth.

3. The combination of the shear-blades A A, graduated blades B B, handles C D C D, and the headed swivel-pins *b b*, or other suitable device for attaching the handles to either set of blades, all constructed and arranged substantially as and for the purposes herein set forth.

116,937.—Water-Wheel.—Daniel Ehrhart, Bel Air, Md.

Claim.—1. The arrangement, substantially as described, of the gates for a water-wheel so that the mechanism for opening and closing the gates will operate directly on the rods or pins which, rigidly attached to said gates, pivot said gates in the casing, as set forth.

2. The combination of the grooved wheel H, slotted arms I I, pins *a a* and *b b*, and gates J J, all substantially as and for the purposes herein set forth.

3. The combination of the wheel A B, rims C C', plate D, sleeve E, spindle G, wheel H, arms I, gates J J, and pins *a b*, all constructed and arranged substantially as and for the purposes herein set forth.

116,938.—India-Rubber Shoe.—Lewis Elliott, Jr., New Haven, Conn., assignor to L. Candee & Co., same place.

Claim.—The corrugations in an India-rubber shoe made upon a last, with a cord interposed between the lining and sheet-rubber, as and for the purposes set forth.

116,939. — Universal Joint for Shaft-Couplings.–Joseph F. Emmert, Waynesborough, Pa.

Claim.—1. The connecting-block A, constructed with the two eccentric grooves *a a'*, substantially as and for the purposes set forth.

2. The forked plates B B, with their forked ends curved toward each other, and their opposite extremity adapted to be fastened to the shafting, substantially as and for the purposes set forth.

116,940.—Churn.–Francis Marion English, Evansville, Ind.

Claim.—The dasher B, constructed of a disk having a series of paddles or boards, *b b*, of a curvilinear form, and arranged radially upon said disk with reference to its center, substantially as herein shown and described.

116,941.–Attaching Knobs to their Spindles.—William A. Fenn, Rochester, N. Y.

Claim.—The spindle A, constructed to receive the screw E, combined with the knob B having the nut L arranged therein, so that the head of the screw may be drawn hard down upon the said nut to fix the position of the said knob, substantially as described.

116,942.—Brick-Machine.–Alexander Ferguson, David Ralston, and George Hildreth, Troy, N. Y.

Claim.—1. The packing-plates *e e*, constructed as described, and attached to the plunger or piston D, substantially as and for the purposes herein set forth.

2. The spring-plate *f*, attached to the box A, and operating upon the plunger or piston D, substantially as and for the purposes herein set forth.

3. The socket H, rod H' with notch *i*, and the lever L with tooth *m*, constructed and arranged to operate substantially in the manner and for the purposes herein set forth.

4. The combination of the connecting-rod H H', crank K with enlarged and slotted end, shaft I, arms J J, and rod *k*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

116,943.—Apple-Parer and Slicer.—Calvin A. Foster, Fitchburg, Mass., assignor to Sewall K. Lovewell, David Huntoon, and Cyrus A. Foster, same place.

Claim.—1. An apple-parer, having a rotating cutter and a fork which is moved from position to permit the cutter to complete its rotation after the apple is pared.

2. The combination and arrangement of the gears and cutter-wheel *g*, cutter-arm *x*, fork-arm *p*, and swing-plate *r*, substantially as shown and described.

3. In combination with a slicing mechanism, the bent knife *f*', operating to cut the apple, substantially as described.

4. In combination with a paring-knife and a slicing-knife, a swinging fork, that is continuously rotated in one direction for the paring operation and is intermittently rotated in the opposite direction for the action of the slicer.

116,944.—Electro-Magnetic Apparatus. Samuel Gardiner, Jr., New York, N. Y.

Claim.—1. Two or more electro-magnets placed opposite each other, and so connected as to be operated by one circuit, in combination with the ratchet-wheel I, the pawls or catches *m*, spiral springs H, adjustable collar-screws *n*, rods E and retaining-springs *g*, for turning on and off the gas of street-lamps or other gas-fixtures by electricity, arranged as described, for the purpose set forth.

2. Two or more pairs of electro-magnets arranged in one circuit, and operating simultaneously upon a ratchet-wheel or its equivalent, as and for the purpose set forth.

116,945.—Bridle-Bit. — Algernon Gilliam, Pittsburg, Pa.

Claim.—1. The combination of the cheek-pieces A A with the lever B, when the latter is attached to the bit proper, and pivoted in the manner and for the purpose herein described.

2. The construction and arrangement of a bridle-bit in the manner herein described, so as to admit of the arm to which the bit is attached being raised or loosened within a slot contained in the cheek-piece concentric with the point of attachment of said arm.

116,946.—Harness-Saddle.—Algernon Gilliam, Pittsburg, Pa.

Claim.—1. In a harness saddle-tree, the flanges D D formed upon the inner side thereof, in the manner and for the purposes herein set forth.

2. The combination of the spring or plate B with the slot E formed in a saddle-tree, and the flanges D D, in the manner and for the purposes herein set forth.

3. The combination and arrangement, as herein described, of the straps or stiffener C, spring B, and saddle-tree with its flanges and slots, in the manner and for the purpose herein set forth.

116,947.—Sewing-Machine for Boots and Shoes.—Charles Goodyear, Jr., New Rochelle, N. Y.

Claim.—1. The combination, with a curved vibratory needle, as described, of a feed-dog having a back-and-forth rectilinear motion, and a rocking out-and-in motion, the latter motion being concentric with that of the needle, substantialy as shown and described.

2. The combined feed-dog and channel-gauge, constructed and operating substantially as herein shown and described.

3. The combination of the curved needle and the combined feed-dog and gauge with the mechanism for operating the same, under the arrangement, substantially as described, whereby the work is held in position by the needle while the combined feed-dog and gauge releases the work and takes a fresh hold thereon preparatory to producing the feed, as set forth.

4. The combined feed-dog and gauge operating in the channel as described, and curved inwardly at its lower end so as to move laterally in the channel in the sole to effect the feeding movement without lifting up the lap over said channel, substantially as shown and described.

5. The combination, with the curved needle, of the combined feed-dog and gauge made adjustable, substantially as herein described, so that the part which enters or rests in the channel in the sole may be raised or lowered with reference to the needle.

6. In combination with the vibratory edge-gauge, operating substantially as specified, the mechanism herein described, or the substantial equivalent thereof, for locking or rendering rigid the said gauge at the proper intervals, as set forth.

7. The edge-gauge and the rock-shaft upon which it is mounted, in combination with the system of levers and spring and slide-bar, constructed and arranged substantially as herein described, for actuating and locking said gauge at the proper intervals, as set forth.

8. The combined edge-gauge and welt-guide, when mounted concentrically with the needle and operated by the rock-shaft and locking mechanism, as herein shown and described.

9. The combination of the vibratory edge-gauge and the sliding auxiliary edge-gauge with the mechanism herein described for actuating and locking the same, whereby both gauges are held rigidly by the operation of the same locking mechanism.

10. The auxiliary pressure-gauge arranged to bear at the proper time upon the top of the seam in the sole on the opposite side of the needle from the feed-dog, substantially as shown and described, to prevent the needle from lifting the sole from the last when drawing up the loop.

11. The auxiliary pressure-gauge mounted upon the same rock-shaft or axis with the vibratory edge-gauge, and actuated to move in unison with the same toward or away from the work, as set forth.

12. The combination, with a needle-shield mounted and operating concentrically with the needle, of the devices herein described, or their substantial equivalent, for keeping said shield at all times as near the needle-barb as possible both before the needle enters and after it withdraws from the work.

116,948.—Paper Collar.–Solomon S. Gray, Boston, Mass.

Claim.—As a new article of manufacture, a collar made of paper, or paper and cloth combined,

having the ends of the turn-over portion thereof made double by folding the part C under the part B, the said double ends being embossed or struck up, as at *d*, so as not to obstruct the neck-tie space, substantially as described.

116,949.—MANUFACTURE OF COMPOSITION PIPES FOR WATER, GAS, &c. — James Rent Griffin, Watertown, Canada.

Claim.—1. The combination of a composition pipe, as described, with a pipe of cement, concrete, clay, or artificial stone, or their equivalents, placed within the said composition, substantially as described.

2. The combination of the said composition pipe with the said cement pipe, when the said composition pipe is incased within the said cement pipe, substantially as described.

3. The composition pipe interposed between the cement pipes, substantially as and for the purpose set forth.

4. The clamp *v*, moving in guides, and operated as described, in combination with the clamp v^1, substantially as set forth.

5. In combination with the clamps v v^1, the guides *m m*, core *n*, feeding-roller *i*, vat D, and the driving mechanism, as set forth.

6. The self-adjusting pressure-roller *p*, core *n*, feeding-roller *i*, and vat D, in combination with the guides *m m* and the clamping mechanism, substantially as described, and for the purpose set forth.

7. The improved method of manufacturing a composite pipe by intermixing in a vat the fiber, in a pulpy state, with the adhesive and preserving compound, and feeding them unitedly to the core of the pipe, substantially as described.

116,950.—BILLIARD-TABLE.—Louis A. Grill, New York, N. Y.

Claim.—In a billiard-table bed, the combination with the frame A and paper covering E, of a filling of plaster or other suitable material supported on a bottom B, substantially as described.

116,951.—FABRIC FOR BEDS OF BILLIARD AND OTHER TABLES AND FOR OTHER PURPOSES.—Louis A. Grill, New York, N. Y.

Claim.—The within-described fabric, composed of wooden strips enveloped in a plastic substance or compound and covered by paper facings, substantially as specified.

116,952.—BEARING FOR JOURNAL-BOXES.—Henry Grogan, Flatbush, N. Y.

Claim.—The journal-box or bearing herein shown and described, the surface of the same formed with a series of broad spiral sections B B, and flaring grooves C C with open ends, constructed and arranged, as herein shown, for the purpose specified.

116,953.—REFLECTOR FOR LAMPS.—John W. Haines, Cambridge, Mass.

Claim.—A concave glass reflector, molded and pressed into suitable form, and having a central eye, *b*, and a connector, *a*, the connector and glass being fastened together by a pin or bolt, all substantially as shown and described.

116,954.—BURGLAR-PROOF SAFE.—Edward K. Hall, Louisville, Ky.

Claim.—1. A safe, having its body built up of the plates *a* and *b*, constructed as herein described, in combination with the corner pieces *c*, all arranged as herein set forth.

2. The plates *a*, having a flange, *e*, formed along one edge, and having a recess or rabbet formed along their remaining three edges on the opposite side from the flange, substantially as set forth.

3. In combination with the plates *a*, the back plate *b*, recessed along its four edges, as described.

116,955.—RATCHET-DRILL.—Ira S. Hamilton, Hamilton, Ohio.

Claim.—1. A ratchet hand-drill, constructed substantially as herein described, in which the intermediate wheel J and the wheel E have each a handle-socket N and N', respectively, and the loose frame H, which supports the intermediate wheel, is provided with the means shown, or their equivalents, for holding it stationary, all in the manner and for the purposes set forth.

2. In a ratchet hand-drill, constructed substantially as herein described, the automatic feeding mechanism composed of the screw-threaded spindle a^1, nut K *c*, sleeve L *b d*, and stud *e* of the wheel D, operating in the manner set forth.

116,956, antedated July 4, 1871.—GANG-PLOW.—William Hay and Thomas B. Freeman, Hillsborough, Oreg.

Claim.—1. The frame F having the plows G attached, in combination with the axle A having the arms *f* attached, the frame and axle being connected by the hinged rod or stirrup I, substantially as described.

2. The axle A, having the plates *e* secured to each end, in combination with the bent arms C having the lever E and catch *c* rigidly attached thereto, said arms being pivoted one to the upper and the other to the lower side of the axle, substantially as set forth.

116,957.—WAGON-BRAKE.—Dorus Healy, South Danville, N. Y.

Claim.—1. The combination of the bar F, having the rod I attached, with the bar E, rock-shaft G with its arms *i d*, and rod H, constructed and arranged to operate substantially as described.

2. The plates *a* attached to the bar E, in combination with the T-shaped lugs *c* attached to the sliding bar F for holding the latter in place and guiding it in its movements, as set forth.

116,958.—CARPET-BEATER.—James Hothersall and Joseph Banks, New York, N. Y.

Claim.—1. The rigid beaters C, secured to the ends of elastic arms A, in combination with trip-wheels *d*, tappet-levers *e*, rods *f*, belt *g*, flexible platform D, and feed-rollers G, all constructed and operating substantially as shown and described.

2. The oscillating front brush I and revolving back brush H, in combination with the rigid beaters C, flexible platform D, and feed-rollers G, substantially as set forth.

116,959.—SHOE.—George C. How, Haverhill, Mass.

Claim.—1. The instep part *a* of the shoe upper, as connected to the side portions or next adjacent parts of the upper or vamp of the shoe by elastic gores *d d*, arranged substantially as described.

2. In a shoe, the instep portion *a*, arranged to extend outside of and down each of the quarters *b b*, and connected with the vamp or part of the shoe below each instep portion by elastic gores *d d*, arranged as set forth.

3. In a shoe, the instep portion *a*, arranged to extend outside of and down each of the quarters *b b*, and connected with the vamp or part *c* of the shoe below each instep portion by elastic gores *d d*, as set forth, and having ribbons or gore-covering strips *e e* arranged with such gores in manner as described.

116,960.—CHILD'S NURSERY-GATE.—Eugene Howard, Milford, Mass.

Claim.—1. The right-and-left-hand screws *h h*, in combination with the frame *c c* for the purpose of adjusting a nursery-gate, substantially as herein-before specified.

2. The combination and arrangement of the double sliding rails *c c*, the center rail *g*, and the frame *c c*, substantially as and for the purposes herein-before set forth.

3. The combination and arrangement of the hard rubber pieces *d d*, or their equivalent, the frame *c c*, the rails *c c*, and the center rail *g*, the whole being combined, constructed, and arranged substantially as and for the purposes hereinbefore described.

116,961.—CAR-WHEEL.—Lewis B. Hunt, New York, N. Y.

Claim.—A car-wheel, combining an independent rim, a hub, and an irregular row of elastic cylinders interposed between them, when constructed as described—that is to say, having the hub made in two parts, B B', each bearing upon the axle, one of said parts, B, supporting the whole width of the rim C, and also supporting the rim laterally on the inner side at *b*, and the other part B' supporting the rim laterally on the other side, substantially as described.

116,962.—DRAUGHT-REGULATOR.—Albert L. Ide, Springfield, Ill.

Claim.—In combination with a reciprocating piston actuated by the pressure of steam within a boiler, and with suitable intervening mechanism, an alarm-bell so arranged as to sound when said steam-pressure falls below a fixed limit, substantially as and for the purpose specified.

116,963.—THILL-COUPLING.—John Henry Jennings, New Bedford, Mass.

Claim.—The separate metallic concave plate G, provided with the vent-lug *g* arranged as specified, in combination with the movable piece E and rubber cushion F, substantially as described.

116,964.—COTTON-BALE TIE.—Charles G. Johnson, New Orleans, La.

Claim.—The cotton-bale tie herein described, provided with the closed slot F and open slot C, having the projections *c* and *c*, and the strengthening-bar D, when all are constructed and arranged as shown, for the purpose set forth.

116,965.—HAY AND COTTON-PRESS.—David Knowles, Philadelphia, Pa.

Claim.—In the press herein described, the combination of the supplementary box *a* and head-block E, with cross-beam J provided with sheaves *d d*, the rope or chain *c* and P, sheaves d' d', windlass *g*, wheels N N', screw I, and clutch-pin *f*, when all are constructed and arranged substantially as shown and described, for the purpose set forth.

116,966.—COMBINED SKID AND TRUCK.—James M. Lane, South Norwalk, Conn.

Claim.—The combination of the skids and truck, as herein described, the said truck provided with a tilting-table, F, the whole constructed as herein set forth to carry the truck up and down the skids.

116,967.—STENCH-TRAP.—Samuel Lawrence, New York, N. Y.

Claim.—The combination of a valve, E e' F f', with the discharge-pipe of a stench-trap, substantially as herein shown and described, and for the purpose set forth.

116,968.—STEAM-ENGINE GOVERNOR.—Benjamin S. Lawson, Brooklyn, N. Y.

Claim.—1. Operating the pump of a Pitcher governor from the valve-motion of a steam-engine by means of the rod *b*, or its equivalent, directly connecting the two, substantially as and for the purposes herein specified.

2. The Pitcher or pump-governor and its regulating means L, so arranged and operating relatively to the variable cut-off mechanism of a steam-engine, by which it is operated, that the governor shall adjust the point of cut off correctly to maintain a uniform or approximately uniform speed, while the mean speed is itself increased or diminished at will by adjusting the piece L, or its equivalent, all substantially as herein set forth.

3. The within-described construction and arrangement of the valves and passages of the pump of the Pitcher governor, whereby all the four valves and their controlling springs are secured by a single plate, and may be got at for repairs by the removal thereof, as set forth.

116,969.—PRESERVING, COLORING, AND SEASONING WOOD.—Frederick Lear, St. Louis, Mo.

Claim.—1. The hereinbefore-described method of preserving timber, substantially as shown and specified.

2. The hereinbefore-described method of seasoning timber, substantially as and for the purpose set forth.

3. The hereinbefore-described method of coloring timber, substantially as and for the purposes shown.

4. The concave serrated disk or head H, substantially as shown, and for the purpose described.

5. The ring N, constructed as described, and combined with the head E and the rubber plate F, or its equivalent, substantially as and for the purpose specified.

6. In combination with the head H and post C, the bar G provided with the roller *g*, and the cam I provided with the lever I', substantially as shown and for the purpose set forth.

7. In combination with the frame A and movable post C, the pawls K and racks L, substantially as and for the purpose shown.

8. The relative arrangement of the clamping-press A, B, and C, the air-pump O, and the force-pump Q, substantially as and for the purpose specified.

9. The clamping-press, composed of the heads E and T connected together by means of the chains R and rods S, the bar G, the sliding head H', and the cam and lever I, substantially as shown and for the purpose described.

116,970.—APPARATUS FOR THE MANUFACTURE OF SALT.—Robert Gilmour Leckie, Acton Vale, Canada.

Claim.—The traveling surface *u*, transverse strips u', ropes *w*, friction-pulleys or rollers t', together with the evaporating-vessel *g*, and other parts of the apparatus, working substantially as and for the purposes set forth.

116,971.—WASHING-MACHINE.—William Lewis, Webster, N. Y.

Claim.—The adjustable bar C, sliding upon the standards *k k*, and held by screws or pins, when combined with the presser B and concave A, in the manner and for the purpose specified.

116,972.—PADLOCK.—Oscar D. Madge, Washington, D. C.

Claim.—The plate A', which inclines from the center of the aperture for the staple toward each end, and has grooves a' a' at the sides of such aperture, in connection with a staple the shoulders F *f* of which overhang the aperture upon every side, and are formed substantially as described, all for the purposes set forth.

116,973.—METALLIC HEEL.—Austin S. Mann, St. Louis, Mo.

Claim.—1. The combination of the hollow metallic or shell-heel A and shank B, when the latter is attached at a pivot-center, *b*, on the front wall *a* of the heel, so as to operate substantially as described, as and for the purpose specified.

2. The combination of the metallic heel A and the detachable ring or plate C, when the latter is provided with tacks or pins *c c* for securing the pad, and is formed, in the manner described, so as to allow of the removal of said tacks or pins and the substitution of new or additional ones when the pad is required to be renewed, substantially as described, as and for the purpose specified.

116,974.—PLANT-PROTECTOR.—Isaac Mayfield, Mayfield, Ky.

Claim.—The flower or plant-protector, consist-

ing of the triangular supports A and inclined sides B provided with the projecting points C on each side of the slot or opening D, substantially as herein shown and described.

116,975.—Railroad Rail.—Almeron McKenney, Maumee City, Ohio.

Claim.—A compound rail for railroads, consisting of the hollow arched base-rail B, provided with an outward flange on each side, grooved the entire length of each flange at the lower sides of the arch walls a a, in combination with the exterior cap-rail H, overlapping the top and entire sides of the base-rail, with its extremities fitting into the grooves in the same, and secured by lateral bolts, all substantially as and for the purpose set forth.

116,976.—Composition for Preserving Eggs.—James Timmons McKim, Remington, Ind.

Claim.—The composition for preserving eggs herein specified.

116,977.—Padlock.—James H. McWilliams, New York, N. Y.

Claim.—The staple-formed shackle b made with shoulders i to take the upper part of the case a and form a stop to determine the position of the notches in the shackle relatively to the circular tumblers e, and to prevent the ends of the shackle being driven against the bottom plate f, as set forth.

116,978.—Paper-Pulp Engine.—Harrison B. Meech, Fort Edward, N. Y.

Claim.—The double-cone cylinder and double-cone shell surrounding the same, both having uneven surface-plates for grinding straw, wood, grass, and the like, substantially as described.

116,979.—Manufacture of Paper-Pulp.—Harrison B. Meech, Troy, N. Y.

Claim.—1. The process of reducing *zizania aquatica* or water-oats to a pulp for the manufacture of paper, substantially as herein described.

2. A pulp for the manufacture of paper, obtained from *zizania aquatica* or water-oats by the process herein described, or its equivalent.

116,980.—Process and Apparatus for the Manufacture of Paper-Pulp.—Harrison B. Meech, Troy, N. Y.

Claim.—1. The combination of the boiler A, double-cone grinder B, circulating-pipe C, and pump D, substantially as and for the purpose set forth.

2. The shaft *d*, distributing-disk *b*, and agitator *c*, in combination with the boiler, as and for the purpose set forth.

3. The circulating-tube C with tube C^2 and cocks J and K, as described.

4. The process, herein described, of reducing straw, wood, or other fibrous substance to pulp for the manufacture of paper, the same consisting in boiling and grinding said substances in a weak solution of caustic alkali of about 1° strength Baumé, substantially as described.

116,981.—Bag-Holder.—Charles K. Mitchell, Groenville, Mich.

Claim.—The bag-holder, constructed substantially as described, wherein the plate C and hale F are combined with base A, standard B, and set-screw D, all constructed and arranged substantially as and for the purposes set forth.

116,982.—Watch-Key.—James L. Moore, Bridgeport, Conn.

Claim.—A watch-key with socket and handle, made by grooving and bending a piece of metal as described, and having the socketed portion held together by a collar or ring, all substantially as and for the purpose set forth.

116,983.—Roofing Compound.—Harrie Morrie, Rockford, Ill.

Claim.—The manufacture or preparation of a compound for roofing purposes of the ingredients and in substantially the proportions set forth.

116,984.—Argand-Lamp Burner.—Thomas H. Mott, New York, N. Y.

Claim.—1. The combination of the hollow inverted perforated cone F with the wick-tube D E, essentially as herein set forth.

2. The combination of the perforated outer cap or shell A and inner inverted perforated cone F with the wick-tube of the burner, substantially as shown and described.

3. The combination of the flame-regulating button G with the inner inverted perforated cone F, the outer perforated cap or shell A, and the wick-tube of the burner, when arranged substantially as described.

116,985.—Shingle-Machine.—Franklin Muzzy, Bangor, Me.

Claim.—1. The combination of the latch e^1, bar *g*, and lever *h*, as described.

2. The combination of the lever *e*, tongue *i*, lever *k*, and levers *l F*, as set forth.

3. The combination of the carriage A, finger *f*, connecting-bars d^2 e^4, lever *e*, counter-weight e^3, rod *f*, and arms f^1 f^2, as explained.

4. The combination of the shaft *o*, arm o^2, pitman o^3, handle o^4, and stand *u*, as described.

5. The combination of the lever *p*, arm p^2, pawl p^4, and ratchet p^5, as described.

6. The combination of the saw-collar F′, shaft *s*, and drawing-nut s^1, as set forth.

116,986, antedated July 4, 1871.—Elastic Chain-Link.—Ephraim Myers, Creagerstown, Md.

Claim.—Yielding chain-links, constructed substantially as herein specified.

116,987.—Corn-Sheller.—George O'Connor and Haines O'Connor, Mishawaka, Ind.

Claim.—1. The cylindrical vessel A, provided with ribs C C, constructed as described and shown, and springs D D, all arranged substantially as and for the purposes herein set forth.

2. The combination of the cylindrical vessel A, ribs C C, constructed as described, springs D D, and cylinder E, provided with rib or ribs *d*, all constructed and arranged to operate as shown.

116,988.—Shingle-Machine.—Oliver A. Olmsted, Sebastopol, Cal.

Claim.—1. In the shingle-machine, the arrangement of the dog S, joining-knife U, and splitting and shaving devices, substantially as shown and described.

2. The carriage E, with the spring K attached to the pitman, and operating substantially as and for the purposes described.

116,989.—Fence.—Preston C. Pearson, Louisville, Ky., assignor to himself and T. E. C. Brinly, same place.

Claim.—The combination of the panels A B, constructed with tenoned beams C C′, post E, and castings D and D^1, substantially as and for the purpose set forth.

116,990.—Cap for Billiard-Table Bolt-Heads.—Jules Plunkett, New York, N. Y.

Claim.—A covering or cap for bolt-heads, composed of the cap *c*, made of any suitable material and design, formed with a polygonal eye in the center of its face, and provided with a securing-screw, *d*, having a polygonal portion, *e*, adapted to enter the bolt-head and clamp the cap thereon, in the manner herein described.

116,991.—Rotary Harrow.—Roland Rakestraw, Wyoming, Ill.

Claim.—1. The center disk B, constructed with the outside arms *b*′, substantially as and for the purpose set forth.

2. The disk B, in combination with the radial arms A, independently hooked to the disk to allow the vertical play, as and for the purpose set forth.

116,992.—Cooking-Stove.—Albert J. Redway, Cincinnati, Ohio, assignor to Redway & Burton, same place.

Claim.—1. The air-chambers D in the division-plates of the stove-top, provided with eduction-apertures B and induction-apertures A, whereby air is introduced into said chambers from a point below the path of the flame and discharged above the stove-top, substantially as described.

2. The fire-pot, having its rear plate H arranged to slide to and fro for the purpose of cleaning it of ashes and cinder so as to admit of the passage of air, substantially as set forth.

116,993.—Backband-Hook for Harness.—Samuel Reynolds, Pittsburg, Pa.

Claim.—The backband-fastening herein described, provided with the hook B, middle bar C, and bar C′, having the guard *d* and the lateral rigid prongs or hooks E E, substantially as specified.

116,994.—Manufacture of Hydrocarbon Gas.—Frederick A. Sabbaton, Troy, N. Y.

Claim.—1. Utilizing the heat and gaseous products of combustion by conveying them into a retort by means of and in combination with a current of dry or superheated steam for the production of hydrogen gas, substantially as described.

2. The arrangement of the steam-pipe F, the injection-tube G, the flue-tube D, and the oil-tube H, in combination with a furnace or fire-box and a gas-retort, substantially as and for the purposes described.

3. The flue D, substantially as and for the purposes shown and described, in combination with a furnace and a gas-retort.

116,995.—Fish-Nursery.—Randolph E. Sabin, West Springfield, Mass.

Claim.—1. Combined with the side of a fish-tank A, one or more compartments, constructed substantially as shown and described, containing the screens C and D, and having the removable door.

2. The combination, forming a complete nursery, of the tank A, compartments, and hatching-troughs, substantially as and for the purpose shown and described.

116,996.—Curtain-Fixture.—Lodowick L. Sawyer, San Francisco, Cal.

Claim.—In combination with the drum C upon which the cord is wound for rolling the curtain, the shaft A and ratchet D provided with suitable springs, substantially as described, to create a friction between the said drum and ratchet, and the fixed pawl *a* to act with the said ratchet to apply or remove the friction, in the manner substantially as set forth.

116,997.—Compound for Coating Textile Fabrics.—Joseph Schultz, New York, N. Y. assignor to himself and Leopold Hecht, same place.

Claim.—1. A compound made of flaxseed or Irish moss, balsam of fir, tapioca boiled in water, and a suitable coloring matter, mixed together substantially as and about in the proportions herein set forth.

2. The combination of the above-named compound with cloth or other textile fabric by applying the same to the fabric and exposing it to the action of suitable dies, substantially in the manner described.

116,998.—Seed-Tube for Corn-Planters.—Levi Scofield, Watertown, Wis.

Claim.—1. A seed-tube for corn-planters, through which the seed from the hopper drops without obstruction into an open receptacle at the back of said tube upon the upper surface of a valve hung in said receptacle, and operated by an independent oscillating lever pivoted to the back of the seed-tube so as to leave the whole upper surface of the valve exposed to view from each side, substantially as herein described, for the purpose specified.

2. The V-shaped box C, in combination with the oscillating valve and lever, all arranged outside of the seed-tube, substantially as described.

116,999.—Weighing-Scales.—George Scott, Montreal, Canada, assignor to Hubert R. Ives and Roger N. Allen, same place.

Claim.—The semi-spherical twine-receptacle *d*, provided with suitable openings for the withdrawal of the twine, in combination with the semi-spherical cover *e* with plate *f*, the latter being adapted to hold the weights and serve also as a handle for raising the cover, the holder *d e* being located beneath the balance-beam, so that the twine may be withdrawn therefrom without interfering with the movements of the scale, as described.

117,000.—Thimble-Skein for Wagons.—Albert L. Shears, St. Louis, Mich., assignor to himself, Timothy Hutchings, and John L. Sandell, same place.

Claim.—A cast-iron thimble-skein for wagons, having a wrought-iron tang, B, secured thereto, substantially as described.

117,001.—Window-Blind.—Seeley M. Sherman, Fort Dodge, Iowa.

Claim.—1. In a window-blind having wooden slats, the metallic ends formed of sheet metal, part of which is bent over to firmly clamp the ends of the slat, and provided with a projection, *a*, which is pivoted to the stile by headed pins, as and for the purpose set forth.

2. The combination of the frame-slats A′ with metal ends and washers, as described.

3. The slotted and pivoted bar, combined with the blind-rod, when operated by means of the toothed wheel, as described.

117,002.—Sewing-Machine.—John P. Sherwood, Fort Edward, N. Y.

Claim.—1. The bent-arm *w*, provided with the double-beveled slot B, in combination with the double-tapered friction-roller C, or its equivalent, as explained.

2. The combination of the bent arm *w*, vertical shaft *s*, sway-bar E, and shuttle-carrier F, all constructed as described.

3. The shuttle K, provided with the spring-tongue H, when the same supports one end of the spool I and is sunk within the plane of the outer surface of the shuttle side, as set forth.

117,003.—Meat and Vegetable-Cutter.—Albert R. Silver, Salem, Ohio, assignor to himself and John Deming, same place.

Claim.—1. The cast-metal frame A, constructed with elongated bearings *b* b^1 b^2 for the shafts of spur-wheels D D′, in combination with the vibrating knife-arm G, substantially as described.

2. The horizontally-flanged T-head formed on the curved knife-arm G, in combination with the knife-blade *g* and the set-screws and supporting-screws *y y*′, substantially in the manner described and shown.

3. The vertically-adjustable bearing J, vibrating knife-arm *g*, and meat-tub N, combined and operating substantially as described.

4. The spring S, thumb-pin *e*, and retaining-pin *y*, in combination with pitman-pivot *t* and knife-arm G, substantially as described.

5. The curved pawl or feed-bar L and its spring

S, in combination with the ratchet-wheel w on tub N, and with the vibrating knife-arm G, substantially as described.

6. The catch or stop r on the stand A, in combination with the curved feed-bar, curved knife-arm, and a removable meat-tub, substantially as described.

117,004.—WAGON.—Jacob Skeen, Mound City, Ill.

Claim.—1. The cross bearing-plate B, constructed substantially as described and shown.

2. The combination of the cross bearing-plate B and the side rails C, constructed and secured together, substantially as described and shown.

3. The side rails C, provided with the groove f^4, in combination with the hind wheels G, constructed and arranged substantially as described and shown.

4. The combination of the wheels G, the spindles H, and the journal-boxes f^3, all constructed and arranged substantially as and for the purpose described and shown.

5. The combination of the wheels G, the spindles H, and the trusses g, constructed and arranged substantially as and for the purpose described and shown.

6. The combination of the side frames E and E', constructed and arranged substantially as described and shown.

7. The combination of the side frames E and E' with the yokes F, all constructed, arranged, and connected substantially as described and shown.

8. The combination of the trucks U, the truck-boxes T, and their frames S, all constructed and arranged substantially as described and shown.

9. The combination of the trucks U, the truck-boxes T, the frames S, and shafts V and Y, all constructed and arranged substantially as described and shown.

10. The combination of the trucks U, the truck-boxes T, the frames S, the shafts V and Y, and the wheel u, the pinion W, and the gear-wheel X, all constructed and arranged substantially as described and shown.

11. The covering-plate J, provided with the frame K cast in one piece, and constructed and arranged substantially as described and shown.

12. The brake P, composed of the wheel l, the chain l', and the lever o, all constructed, arranged, and operated substantially as described and shown.

13. In combination with the covering-plate f provided with the frame K, the balance-pawl L, constructed, arranged, and operated substantially as described and shown.

14. The combination of the shaft N, the wheel Q, the cord R, the brake P, the ratchet-wheel M, the pawl L, and the lever O, all constructed, arranged, and operated substantially as described and shown.

15. The combination of the forward and rear winches in one wagon, each winch being constructed, and both arranged and operating as described and shown.

16. The body Y', constructed, arranged, and operated substantially as described and shown.

17. The combination of the body Y', the shafts N, Y, and V, and their operative devices, all constructed and arranged substantially as described and shown.

18. The wagon A, as a whole device, with its several parts constructed, arranged, and operating substantially as described and shown.

117,005.—ANIMAL-TRAP.—Barton C. Smith, Pekin, Ill.

Claim.—1. The arrangement, in an animal-trap, of two distinct and separate compartments, each with a hinged drop connected with a rocking-door, to alternately open and close the entrances to said compartments, substantially in the manner and for the purposes herein set forth.

2. The combination of the sector H, rod b, arms c c, and drops I I, all constructed and operating substantially as and for the purposes herein set forth.

3. In combination with the box provided with the drops I I and sector H, arranged as described, the lighted chamber E provided with the jagged projections h h, all substantially as set forth.

117,006.—BASE-BURNING STOVE.—David Smith, Albany, N. Y.

Claim.—1. In a stove, the flue B constructed and arranged within the base A in front, and terminating at the sides of the ash-pit C at the rear, substantially as and for the purpose set forth.

2. In a stove, giving entrance to the ash-pit C from the rear of the same, substantialy as and for the purposes set forth.

3. In a stove, the flue G running obliquely from the rear and top of the fire-box D to the bottom and front of the same, converging in the opening d' communicating with the flue B, substantially as and for the purpose set forth.

4. In a stove, the sloping division-plate d, when placed between the cylinder E and fire-box D in a manner to produce the chambers or flues G and H, having reverse directions of draught to and from the front of the stove, substantially as and for the purpose set forth.

5. Giving the grate K an inclination in the fire-pot from an elevated point back to a depressed point front, substantially in the manner set forth, for the purpose specified.

6. The plates M, in combination with the ring L, and both in combination with the cylinder E, substantially as and for the purpose set forth.

7. The combination of the dome O with the reservoir N, when arranged substantially as and for the purpose set forth.

8. Feeding air from the rear of the stove to the under side of the grate K, substantially in the manner and for the purpose set forth.

9. The dampers s, v, and s', in combination with the door P, when arranged substantially as and for the purpose set forth.

10. Constructing the drum Q in sections q, q', and q'', or in an equivalent manner, whereby the said drum may be turned from over the plates M, substantially as and for the purpose set forth.

11. In combination with the drum Q, constructed as described, the shelves t, substantially as and for the purpose set forth.

12. Operating two or more concentric groups of rings or bars in a grate, K, in opposite directions to each other, by means of the lever T operating the several groups k k', substantially as and for the purpose set forth.

117,007.—FIRE-ESCAPE.—George C. Smith and Frank M. Burrows, Baltimore, Md.

Claim.—1. The rigid braces F, in combination with the suspending-frame C and the grooved holding-bars g of the frame B, for the purpose of obtaining inflexible braces having the capacity to fold and unfold by a sliding movement with the frame, and thereby prevent all entanglement of the parts, as described.

2. The curved guard G of the frame C, hinged so as to slide and fold and unfold with the braces F of said frame, as and for the purpose described.

3. In a fire-escape having a hinged sectional folding and unfolding frame, A B C, which supports the escaping devices, the combination therewith of the folding and unfolding rigid braces F, the folding and unfolding curved guards G, stops h, grooved bars G, and the folding and unfolding feet J, the several parts being constructed and arranged as described.

117,008.—STEAM-BOILER-FLUE CLEANER.—Charles H. Stebbins, Circleville, Ohio.

Claim.—1. The bend J J' forming the water-trap K in a flue-cleaning steam-jet tube, substantially as and for the purpose specified.

2. The flaring mouth H and spiral tongue I, in combination, substantially as and for the purpose specified.

117,009.—FURNACE-GRATE.—Elijah F. Steele, Wallingford, Conn.

Claim.—The ribs c, pivoted in boxes b, combined with transverse and two-part bars d d, which are end-beveled, and overlap each other to enable the grate to hold itself in position without jamming.

117,010.—FRICTION-PULLEY.—Joseph Steger, New York, N. Y.

Claim.—1. The spider A with its shoes D mounted firmly on the shaft B, in combination with the drum C, constructed and operating substantially as herein shown and described.

2. The friction-rollers f, in combination with the spider A, shoes D, shaft B, and drum C, substantially as set forth.

117,011.—CORN-HUSKER.—Jost Stengel, Croton, and Charles C. Davey, Big Prairie, assignors to Henry B. Hershberger and Charles C. Davey, Grand Rapids, Mich.

Claim.—1. The cutter D, constructed as described, with point b, the cutting-edge serrated on the under side, and with the slot d for the purpose of adjustment on the block H, substantially as herein set forth.

2. The combination of the block A, band B, loop C, and adjustable cutter D, all constructed and arranged substantially as and for the purposes herein set forth.

117,012.—KNOCK-DOWN CHAIR.—Volney Stockton, Williamsburg, Ohio.

Claim.—The combination of the chair-legs A A' B B', seat C, rails D D' d, stretchers E E', mortises s s, and tenons F s', for the object stated.

117,013.—ICE-BAG.—Samuel Stroock, New York, N. Y.

Claim.—As a new article of manufacture, a felt bag or wallet for preserving ice, substantially as herein described.

117,014.—END-GATE FOR WAGONS.—Jeremiah L. Stropes, Bloomfield, Ind.

Claim.—1. The combination of the braces d, cross-bar B, and gate D, constructed with cam-sides E, and having spring-catches K' attached to said cams, substantially as specified and for the purpose set forth.

2. The combination, with the wagon-body having the recessed transverse bar B with staples and braces d, of the gate D, provided with the catches K', side pieces E, and bent hooks, substantially as specified.

117,015.—ENVELOPE.—Martin Taylor, Buffalo, N. Y.

Claim.—The fold and laps A' a^3 a^2 a^1, arranged with the pocket A a a^1 a^1 of an envelope, as herein-before set forth.

117,016.—DEVICE FOR OPERATING SAFE-DOORS.—William Terwilliger, New York, N. Y.

Claim.—1. The secondary frame f, hinged at one end to the stationary door-frame a and at the other end to the safe-door b, near the vertical center thereof, and arranged, substantially as specified, so as to allow of the door b being drawn bodily out from the frame a, in the manner and for the purposes set forth.

2. The bolt or stop e, in combination with the secondary frame f, door b, and hinges c i, substantially as and for the purposes specified.

117,017.—MACHINE FOR ROLLING LOGS.—John Torrent, Muskegon, Mich.

Claim.—The arrangement and combination of toothed segment, radial connecting-rod, crank, swivel-pulley, fixed sheave, chain and chain-drum, when operating together as and for the purpose described.

117,018.—MATERIAL FOR FILLING MATTRESSES, CUSHIONS, AND OTHER ARTICLES OF UPHOLSTERY.—William H. Towers, Boston, Mass.

Claim.—1. The material herein described for filling mattresses, beds, cushions, and other articles.

2. The new articles of manufacture produced from the material herein described.

3. The process herein described for treating fibrous pulp, the same consisting in drying and disintegrating so as to produce a soft, spongy, and elastic material, substantially as set forth.

117,019.—DEEP-WELL PUMP.—Thomas Jefferson Trapp, Williamsport, Pa.

Claim.—In combination with the funnel-shaped bottom b of the pump-cylinder, the sliding band h, and the cover g for closing the orifice j, as shown and described.

117,020.—PANELING-MACHINE.—Dwight F. Walker, Minneapolis, Minn.

Claim.—1. The arrangement of the knives or cutters I I provided with inclined cutting projections h h on cutter-heads H H, constructed as shown and described, so that one will cut the rabbet and the other on the same head cut the molding, substantially as herein set forth.

2. The arrangement of the bars D D, having platforms E E, shafts G G, adjustable cutter-heads H H, and adjustable cutters I I and guides J J, constructed substantially as and for the purposes herein set forth.

3. The combination of the cutter-heads H H, constructed as described, with the adjustable guides J J, stationary table B, guide K, and spring L, all constructed and arranged substantially as and for the purposes herein set forth.

117,021.—THREE-HORSE EQUALIZER.—Luther Warren, Dwight, Ill.

Claim.—An equalizer, formed of the plate A, levers C C, and rods F F, with the clevis, links, and rings, or their equivalents, connected therewith, substantially as and for the purposes described.

117,022.—BUTTER-WORKER.—William Weaver, Phœnixville, Pa.

Claim.—The within-described butter-worker, consisting of an inclined bed A with flanges a a, grooves b b, and cars c c, the shaft B, and worker C f with handles D E, all constructed and arranged substantially as herein set forth.

117,023.—COMBINED KNOB-LATCH AND LOCK.—Shepherd H. Wheeler, Dowagiac, Mich.

Claim.—In a gravitating combined lock and knob-latch, having U-shaped bolt B, case A, cam or hub D, stem G, shoulder a, and any suitable knob-handles, the use of the collar d, opening b, elongated mortise F, projection c, hook E, tumbler H, shoulders I and T, stop J, beveled latch k, keeper L having the projection s, and auxiliary bolt o, substantially as and for the purposes set forth.

117,024.—PLOW.—Edward Wiard, Louisville, Ky., assignor to Benjamin F. Avery, same place.

Claim.—1. The standard A, with extended support a and with land-side B united thereto and terminating at g, leaving a shoulder for the plow-point D', substantially as and for the purpose set forth.

2. The frame G, constructed with lugs p p, bent and adapted to receive through them bolts which secure the mold-board handles to the plow, substantially as described.

117,025.—PNEUMATIC TELEGRAPH.—Arthur McNutt Wier and Marshall Arthur Wier, Elm Lodge, Newton Road, Bayswater, Great Britain.

Claim.—1. The combination of the compressing

instrument A, the distributing and relieving-valves H H', and the operating-lever D, whether simple or compound, substantially as described and shown in Figs. 1 to 8, and for the purposes herein set forth.

2. The arrangement of the operating-lever D, whether simple or compound, whereby both the compressing instrument and the distributing-valve are operated by the same motion, substantially as herein set forth.

3. The swiveled lever D, arranged *to* as to operate both the compressing instrument and any one of the distributing-valves that may be desired, by a single movement, substantially as and for the purposes herein set forth.

4. The combination of the relief-valve 11 with the bell-crank lever 8 and connecting rod 10, in Figs. 9, 10, and 11, the whole operating substantially as and for the purpose herein set forth.

117,026.—Covered Article for Table-Service.—Horace C. Wilcox, West Meriden, Conn., assignor to The Meriden Britannia Company, same place.

Claim.—The arrangement, as herein described, of a bell in the cover of articles of table-service, the said bell being made a part of such cover and constructed to be operated substantially as set forth.

117,027.—Cotton-Press.—Uriah T. Wilson, Independence, Miss.

Claim.—In a cotton-press, the combination, with the follower B, lever D, and channeled beam F, of the lifting-arm H provided with the roller *k*, all constructed substantially as and for the purposes specified.

117,028.—Adjustable Dam.—John A. Wood, Pittsburg, Pa.

Claim.—The combination and arrangement of the adjustable walls A and B, guide R, cams C, shafts D and D', driving-pulleys *e e*, chains *f f*, friction-pulleys *g*, wheel h, endless screw *i*, and driving-wheels J and K, constructed, arranged, and operating substantially as hereinbefore described, and for the purpose set forth.

REISSUES.

4,464.—Rotary Harrow-Teeth.—John F. Chase, Westbrook, Me. — Patent No. 113,141, dated March 28, 1871.

Claim.—As a new manufacture, a rotary tooth for a harrow, said tooth being composed of the prongs *b* and the base *a*, arranged and formed in one piece of metal provided with a central pivot or bearing.

4,465.—Division A.—Car-Brake.—William H. Dunham, Hokah, Minn., and James Widney, Allegheny, assignors of part interest to Samuel P. Ross, Pittsburg, Pa. Patent No. 71,591, dated December 3, 1867.

Claim.—The levers C C', pivoted to the hangers or slotted supports A, and made inoperative by the springs 12, the whole constructed, arranged, and operated as described.

4,466.—Division B.—Car-Brake Shoe.—William H. Dunham, Hokah, Minn., and James Widney, Allegheny, assignors of part interest to Samuel P. Ross, Pittsburg, Pa.—Patent No. 71,591, dated December 3, 1867.

Claim.—The brake-shoe B, formed with the hook F and the lug G, the hook having a bearing in the slot S on the upper end of the brake-head, and the lug passing through the slot E in the lower end of the same and secured by a key, all constructed and arranged substantially as and for the purpose set forth.

4,467.—Boiler for Ranges, Stoves, &c.—William B. Semfe, Pittsburg, Pa.—Patent No. 107,817, dated September 27, 1870.

Claim.—A new article of manufacture, viz., a wrought-iron boiler for kitchen-ranges, stoves, &c., one or both ends of said boiler being a section of a sphere provided with a flange, the outer surface of which is parallel to the vertical axis of the spherical portion of the end, said flange being fitted in and secured by rivets to the cylindrical portion of the boiler, and afterward made water and steam-tight, as hereinbefore described, and for the purpose set forth.

4,468.—Drying Fruits, Vegetables, and Meats.—Francis H. Smith, Baltimore, Md., assignor of one-half interest to Isaac Simmons.—Patent No. 31,566, dated February 26, 1861; reissue No. 3,017, dated June 30, 1868.

Claim.—1. The process of preserving and drying fruits, vegetables, and meats, by first exposing them to the action of heated air of a comparatively low temperature and subsequently subjecting them to a gradually-increasing heat, substantially as specified.

2. Dried fruit, obtained by exposing fruits to a progressive process, substantially such as herein described.

3. Dried vegetables, obtained by exposing vegetables to a progressive process, substantially such as herein described.

4. Dried meats, obtained by exposing meats to a progressive process, substantially such as herein described.

4,469.—Grape and Vine-Trellis.—Theron G. Yeomans, Walworth, N. Y.—Patent No. 84,154, dated November 17, 1868.

Claim.—The lever B, used in connection with the wire or trellis-bars C, the posts A, and the ring *d*, constructed and operated substantially as and for the purposes above specified.

DESIGNS.

5,096.—Eccentric Yoke.—Daniel Appel, Cincinnati, Ohio.

Claim.—The design for an eccentric yoke, as shown.

5,097. — Center-Piece for Ceilings.—Charles Autenrieth, Philadelphia, Pa., assignor to himself and E. Collins, assignors to Thomas Heath, same place.

Claim.—1. The design for the central ornamental medallion A.

2. The design for the molding B.

3. The design for the outer foliated border C.

4. The design for the whole center-piece, including the medallion A, molding B, and border C.

5,098.—Ornamentation of Rubber Boots and Shoes.—Augustus O. Bourn, Providence, R. I., assignor to National Rubber Company, same place.

Claim.—The design described and shown for the ornamentation of rubber boots and shoes.

5,099.—Stocking-Fabric. — Conyers Button, Philadelphia, Pa.

Claim.—The design for a stocking-fabric, substantially as described, and as represented in and by the accompanying drawing.

5,100.—Stocking-Fabric. — Conyers Button, Philadelphia, Pa.

Claim.—The design for a stocking-fabric, substantially as described, and as represented in and by the accompanying drawings.

5,101.—Stocking-Fabric. — Conyers Button, Philadelphia, Pa.

Claim.—The design for a stocking-fabric, substantially as described, and as represented in and by the accompanying drawings.

5,102.—Handle and Bolster for Table Cutlery.—Frank R. Chapman, Greenfield, Mass.

Claim.—1. The grooves *a b* in the bolster A, as specified.

2. The combination of the grooves *a b* of the bolster with the grooves *c d* in the handle, as described.

5,103.—Picture-Frame.—Lyman L. Dennick, Chicago, Ill.

Claim.—1. The central rectangular frame A having fret-work C around its sides, substantially as shown.

2. The ornamental design for picture-frames, consisting of the central rectangular frame A provided with ornaments *a a*, and open ornamental fret-work C around its sides, as shown and described.

5,104. — Muff. — William Ettinger, New York, N. Y.

Claim.—The design for a muff, as herein shown and described.

5,105.—Bracket.—Wilmer D. Gridley, New Haven, Conn.

Claim.—1. The design for the whole bracket, substantially as shown and described.

2. The design for the base A, substantially as shown and described.

3. The design for the shelf B, substantially as shown and described.

5,106.—Shawl-Fabric.—Joseph Hodgson, Philadelphia, Pa., assignor to Thomas Dolan, same place.

Claim.—1. A design for a shawl-fabric, having stripes A A following the course of the warp, and alternated with stripes B B of a plaid pattern, all substantially as set forth.

2. The plaid portion of the design, illuminated with stripes of silk on a woolen ground, as set forth.

5,107.—Shawl-Fabric.—Joseph Hodgson, Philadelphia, Pa., assignor to Thomas Dolan, same place.

Claim.—1. The design, composed of inclined lines, thicker at some points than at others, and arranged as set forth.

2. A shawl-pattern, in which stripe of the said inclined lines are alternated with variegated stripes, substantially as described and as illustrated in and by the accompanying drawings.

5,108.—Carpet-Pattern. — Hugh S. Kerr, Philadelphia, Pa., assignor to Israel Foster, same place.

Claim.—1. The design for the figure A, as described and illustrated.

2. The design for the figure B, as shown and described.

3. The design for the medallion C, as described and represented.

4. The design for the whole pattern, including the figures A and B, the medallion C, and minor ornamentation.

5,109. — Carpet-Pattern. — John Magee, New York, N. Y., assignor to Bigelow Carpet Company, same place.

Claim.—The design for a carpet, as shown.

5,110.—Mat.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, same place.

Claim.—The design for mats, as shown.

5,111.—Mat.—John Magee, New York, N. Y., assignor to Bigelow Carpet Company, same place.

Claim.—The design for mats, as shown.

5,112. — Oil-Cloth Pattern.—Charles T. Meyer, Lyon's Farm, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

5,113. — Floor Oil-Cloth Pattern.—Charles T. Meyer, Lyon's Farm, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

5,114. — Floor Oil-Cloth Pattern.—Charles T. Meyer, Lyon's Farm, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, and other fabrics, shown and described.

5,115. — Floor Oil-Cloth Pattern.—Charles T. Meyer, Lyon's Farm, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

5,116. — Floor Oil-Cloth Pattern.—Charles T. Meyer, Lyon's Farm, N. J., assignor to Edward C. Sampson, New York city.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, shown and described.

5,117.—Bell-Tower.—Thomas W. H. Moseley, Hyde Park, Mass.

Claim.—The design for a bell-tower, substantially as above set forth and shown.

5,118. — Blacking-Box.—Dennis O'Leary, Hubbard, Ohio.

Claim.—The design for the saucer-shaped blacking-box, provided with the pendent flange *a*, as shown.

5,119. — Carpet-Pattern. — Thomas Pennell, Morrisania, assignor to Bigelow Carpet Company, New York, N. Y.

Claim.—The design for a carpet, as shown.

5,120.—Hanging Vase.—Marcus Leonard Snow, West Sterling, Mass.

Claim.—1. The design for a vase, ornamented as shown.

2. The design for a vase, ornamented and provided with a concave base-flange, as shown.

5,121. — Carpet-Pattern.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereun-

to annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,122. — CARPET-PATTERN.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,123. — CARPET-PATTERN.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,124. — CARPET-PATTERN.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,125. — CARPET-PATTERN.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

5,126. — CARPET PATTERN.—George Curtis Wright, New York, N. Y., assignor to E. S. Higgins & Co., same place.

Claim.—The configuration of the design hereunto annexed, when made by being inwrought into tapestry, Brussels, or other carpeting in the form similar to the photographic print accompanying this specification.

TRADE-MARKS.

370.—WHISKY.—Capel & Roebuck, Cincinnati, Ohio.

371.—WHISKY.—Capel & Roebuck, Cincinnati, Ohio.

ISSUE OF JULY 18.

PATENTS.

117,029. — FRUIT-DRIER. — Judson Allen, Everett, assignor of one-half his right to William H. Crotser, Austin, Mo.

Claim.—The wooden fruit-drier case, containing the heater in a metal inner compartment, C, and the drawers in the compartment B above, and having the hot-air pipes, the smoke-pipe, and the cold-air pipes N, all arranged substantially as specified.

117,030.—EVAPORATOR FOR CONCENTRATING LIQUIDS AND BOILING FOOD FOR STOCK, &c.—Albert J. Andrews, Linden, Mich.

Claim.—1. The construction and arrangement of the shell A, internal flue B, heads C, fire-door D, and smoke-pipe E, in the manner and for the purpose herein set forth.

2. The combination, with the above-described evaporator, of the covering-plate G secured thereto, as and for the purpose specified.

117,031.—LOCOMOTIVE. — William D. Arnett, Denver, Col. Ter.

Claim.—The arrangement, on each side of a locomotive, of a pair of steam-cylinders, which receives steam through a single slide-valve bed, V, and whose piston-rods *e e* communicate motion to the crank-shaft P of the rear driving-wheels through pitmen-rods *a a* and *d d'*, substantially as described.

117,032.—RELISHING-MACHINE.—David G. Arnold, Winona, Mich.

Claim.—The stop and rest B, provided with two opposite concave surfaces, *a b*, in connection with a relishing-machine, A, substantially as and for the purposes set forth.

117,033. — HAY-LOADER. — Horace Baker, Cortland, N. Y.

Claim.—1. The revolving rake or rakes with yielding or elastic teeth, in combination with the positively-actuated endless aprons C D, substantially as and for the purpose herein specified.

2. The forward extensions of the positively-actuated co-operating endless aprons C D, said extensions being adjustable to different heights or angles and moving together, substantially as and for the purpose herein set forth.

117,034.—CULTIVATOR. — Phineas Orlando Baldwin, Spring Lake, Mich.

Claim.—1. The arrangement of the spring C provided with bolt *e* with the beam B provided with the post *m*, and the tongue D, when each of said parts is constructed to operate substantially as and for the purposes set forth.

2. In combination with the beams B K, the sectional extension guides G, lever F, and the extension of the spring E provided with latch-bolts *g* and *g'*, substantially as and for the purposes set forth.

117,035.—WATER-METER.—John S. Barden, Providence. R. I.

Claim.—1. The chambers B D D', in combination with chamber E, the latter being connected to chamber B by ports G G', substantially as described.

2. The combination of port G', valve M, ports J J' L L', passages K K', and pistons P P' S S', with chambers B, D, D', and E, substantially as described.

3. The combination of ports H H', passages *h h'*, recesses N^2 N^3, with pistons P P' S S' and valve N, substantially as set forth.

117,036.—SPRING-BED.—Benjamin Barstow, Westfield, Mass.

Claim.—The combination of the bedstead having the sides *b b* with the frame A, springs D D, and bars L L, the parts being constructed and arranged as shown and described.

117,037.—CURTAIN-FIXTURE.—John E. Baum, Philadelphia, Pa.

Claim.—The sliding cord-holder C, provided with the spiral spring E, in combination with the slide B and wedge D, constructed and arranged to operate in relation to the tightening-cord and the bracket A, substantially in the manner and for the purpose specified.

117,038.—CURTAIN-FIXTURE.—John E. Baum, Philadelphia, Pa.

Claim.—The combination of the bracket A having racks *b b*, adjustable slide B, sliding cord-holder C, and spiral spring D, constructed and arranged in relation to each other, substantially in the manner and for the purpose above set forth.

117,039. — STERN-BEARING FOR PROPELLERS.—James Boiles, New York, N. Y.

Claim.—The arrangement of the secondary bearing *b* in the extension F of the plate B, as a reenforcement to the ordinary bearing D, substantially as specified.

117,040.—GRAIN-AND-STRAW SHAKER.—William H. Bott and Peter Bott, West Manchester township, Pa.

Claim.—In combination with the perforated reciprocating bottom C^1 having elongated slots I and the double throw-crank D, the agitating-rods E when provided with the prongs H, substantially as and for the purpose described.

117,041. — COMBINED CIDER-MILL AND PRESS.—Orville M. Brock, Monroeton, Pa.

Claim.—1. The rotary knife-sections J and shaft K, with spur-wheel on one end, combined with the hopper and screw P, as and for the purpose specified.

2. The flange d^2 and dovetailed flange d^1, in combination with the ends of the plate D and with the upper ends of the sides A, constructed as herein shown and described, and for the purpose set forth.

117,042.—WOODEN TRUSS-BRIDGE.—Joseph Burke, Saginaw, Mich.

Claim.—1. In combination with the upper and lower chords of a bridge, the caps E F F' and steps *b' b''*, the lower caps F F' being provided with channels *c*, substantially as and for the purposes set forth.

2. The means employed for splicing the chords of a bridge, consisting of the splice-bars I, clamps J, plates K, each provided with tenons entering corresponding mortises in the chords, stirrups L, and tension-rods M, when the several parts are constructed, arranged, and operated substantially as described and shown.

117,043.—HYDROSTATIC PRESS.—John T. Burr, Brooklyn, N. Y.

Claim.—A hydrostatic accumulator, having the enlarged cylinder O, piston K, ram I, and water-cylinder F, constructed to operate substantially as hereinbefore shown and described.

117,044. — LADY'S WORK-STAND. — Chauncey S. Caple, Frankfort, N. Y., assignor to himself and William Gates, same place.

Claim.—The emery-bag I, spool-rack H, standard B, top plate A having hinged door *a'*, revolving plate D having bins E F, and knobs G, all constructed and arranged together upon feet C, as and for the purpose specified.

117,045.—PORTABLE WATER-CLOSET.—William Chapman, Mount Vernon, N. Y.

Claim.—The combination of the cover C provided with a deep flange, *c'*, and a spring-valve, D E, with the vessel A B, made in whole or in part with double walls, substantially as herein shown and described, and for the purpose set forth.

117,046.—CLAW-BAR.—David Christie, Chillicothe, Ohio.

Claim.—The combination of the detachable claw D, provided with the shoulder I and incline J, with the bar A formed to receive it, substantially as and for the purposes set forth.

117,047.—CONNECTION FOR IRON AND STEEL BRIDGES.—Thomas C. Clarke and Adolphus Bonzano, Philadelphia, Pa.

Claim.—1. Connecting two hollow flanged columns or sections together by means of an internal sleeve crossing the joint and serving as a tenon to both sections, in combination with external splice-plates *d*, substantially as and for the purpose described.

2. In combination with the flanged column, the lugs X, riveted thereto for the purpose of affording an attachment for lateral bracing and tie-rods, substantially as described.

117,048.—CONNECTION FOR IRON AND STEEL BRIDGES.—Thomas C. Clarke and Adolphus Bonzano, Philadelphia, Pa.

Claim.—In combination with a joint-box and with lateral struts thereon, the pins passing through the struts and through the eyes of the adjustable bolts which pass into or through said joint-box, substantially as described.

117,049.—CONNECTION FOR IRON AND STEEL BRIDGES.—Thomas C. Clarke and Adolphus Bonzano, Philadelphia, Pa.

Claim.—The attachment of lateral struts or bracing at any point of a column, and at any angle thereon, by means of a pin, eyebolt, and suitable washers, substantially as described.

117,050.—CONNECTION FOR IRON AND STEEL BRIDGES.—Thomas C. Clarke and Adolphus Bonzano, Philadelphia, Pa.

Claim.—The combination of the pins passing through the struts, and the eyebolts passing through the main column and sleeve therein, together with the splices at the outside of the column with pockets or tenons thereon to receive said struts or lateral bracing, substantially as and for the purpose described.

117,051.—PROPULSION OF VESSELS.—Keyes P. Cool, Glen's Falls, N. Y.

Claim.—The combination of floats *l*, rotary piston-rods *b*, arms *e f*, and cross-bars *d*, as described.

117,052.—APPARATUS FOR EVAPORATING BRINE AND OTHER LIQUIDS.—Leffert R. Cornell, Syracuse, N. Y.

Claim.—1. The combination of a steam-generator, a superheater, and a double-bottomed evaporating-pan, substantially as hereinbefore set forth.

2. The combination of a blower or equivalent means of producing a current of air, an air-heating chamber or flue, and a covered evaporating-pan, substantially as hereinbefore set forth.

3. The combination, with a double-bottomed evaporating-pan, of an arch or horizontal partition so arranged below it as to leave air-space between said partition and the said pan, and also air-space below said partition, substantially as hereinbefore set forth.

117,053.—FIRE-PLACE.—Mark Anthony Cushing, Aurora, Ill.

Claim.—1. The combination of my radiator and adjustable exit-flue pipe with an open-grated stove or fire-place, in the manner substantially as described, and with or without the fixed diaphragm *a*.

2. The fixed diaphragm *a*, in combination with the fire-place and radiator R and the adjustable exit-flue pipe *p*, substantially as described.

117,054, antedated July 12, 1871. — SIDE-HILL PLOW.—Daniel C. Day, San José, Cal.

Claim. — The combination, with the revolving plate E, of the band F, rod Q, pin I, rod *b*, and lever H, connected and arranged to operate together, substantially as and for the purpose herein set forth.

117,055.— HARVESTER-PLATFORM.—George E. Deardorff, Canal Dover, Ohio.

Claim. — The folding platform, spreading and closing fan-like around a pivot or center, substantially as and for the purpose herein specified.

117,056.—RECLINING-CHAIR.—William Donoghue, Philadelphia, Pa.

Claim.—A reclining-chair, composed of the back A, seat B, fly-leg C, upper and lower horizontal

bars D E, and the slotted arch L and adjusting-bolt M, the vertical links F G with their pins *c d*, the whole constructed, arranged, and operated substantially as shown and described.

117,057.–Galvanic Battery.–Luis Drescher, New York, N. Y.

Claim.—1. The within-described improved battery-jar or cell A, so formed as that its projecting neck shall constitute, substantially as herein set forth, an extension of the central portion of one side of its enlarged base or bulb.

2. The within-described non-conducting or insulating-cap C, in combination with the neck of the jar or cell of a galvanic battery and with its positive and negative reophore, substantially as and for the purpose herein set forth.

117,058. — Cotton-Gin. — John Du Bois, Greensborough, Ala.

Claim.—In a cotton-gin, the doors H and J, arranged relatively to each other and to the brush A, as described, for the uses and purposes hereinbefore set forth.

117,059. — Railroad-Car Stove. — Julien T. Evens, St. Louis, Mo., assignor to himself, William H. Meyer, and Adolph Redcrer, same place.

Claim.—The weighted bottom A, fire-box C, combustion-chamber D, upper chamber J, doors E E, shaft I, weighted frame K, and rod M, arranged to operate substantially as and for the purposes described.

117,060.—Apparatus for Pasting Lining to Paper.—Benjamin F. Field, Beloit, Wis.

Claim.—1. In combination with the paste-roller B and adjustable gauge H, the cylinder M or its equivalent, provided with the cam-groove L and the stud N, to produce a lateral movement of the roller H, as set forth.

2. In combination with the paste-roller B and adjustable gauge-roller H, the pinions I K, to cause said rollers to revolve at different rates of speed.

117,061.—Packing-Box.—John H. Foster, Chicago, Ill.

Claim.—As a new article of manufacture, a packing-box, the sides, ends, and bottom of which are composed of a series of panels, secured by cleats rabbeted upon their inner edges, substantially as and for the purpose described.

117,062.—Vault-Light.—James C. French, Chicago, Ill.

Claim.—The combination of the packing-ring *c* and packing *d* with the frame *a* and glass disks *b*, when used in the manner and for the purposes hereinbefore specified.

117,063.—Vault-Light.—James C. French, Chicago, Ill.

Claim.—The combination of the metallic plates *a* and *d* with the glass disk or lens *b* and screw-packing *c*, when made substantially in the manner and for the purposes hereinbefore specified.

117,064.—Key for Padlocks.—Edward L. Gaylord, Bridgeport, Conn.

Claim.—The rotating single-bitted key G′ having the wards g^1 upon the outer end and the wards g^2 upon the side of its bit, in combination with the tumblers B and C, arranged and operating as specified.

117,065.—Medicine for Cure of Hog and Chicken Cholera.–Margaret N. George, Evansville, Ind.

Claim.—The combination of the materials above described and the process of manufacturing the same, for the purpose set forth.

117,066, antedated July 17, 1871.—Table-Stand for Pitcher, &c.—John Gibson, Jr., Albany, N. Y.

Claim.—1. In combination with the stand A, either with or without the receptacle *b*, the flange or rim *d*, substantially as described, for the purpose set forth.

2. The combination of the supplementary stand B with the stand A, when arranged to be adjustable in height, substantially as and for the purpose specified.

3. In combination with the stand A or B, constructed with the receptacle *b*, the detachable or portable plate C, when arranged to operate substantially in the manner and for the purpose set forth.

4. In combination with the stand A or B, provided with the flange *d*, the vertical central opening *e*, substantially as and for the purpose set forth.

117,067.—Car-Coupling.—John W. Gillam, Newton, assignor to himself and H. C. Kelsey, Trenton, N. J.

Claim.—The spring-bumper J, vibrating clutch C D, and spring E, when constructed, arranged, and operating together in a car-coupling, as and for the purpose specified.

117,068. — Window-Curtain Roller.—William Gorton, New York, N. Y.

Claim.—A window-curtain-roller, formed in two parts, having their edges *a b* open and unfastened, combined with a clamping-plate, K, and screw *d*, as and for the purpose specified.

117,069. — Shirt-Stud. — Johnson G. Griswold, Hartford, Conn.

Claim.—1. An improved shirt-button or stud, constructed as described, having a cross-piece, *c*, which springs out at right angles to the shank *e* after the button is inserted, substantially in the manner herein described.

2. The combination of the spiral spring *s*, the stem *e*, and the cross-bar *c*, substantially as described.

117,070.—Churn.—George Groom, Brockville, Canada, assignor to Martin M. Reynolds, Syracuse, N. Y.

Claim.—The dasher E, weighted and plugged, substantially as described, in combination with the suspending-spring D, as and for the purpose herein specified.

117,071.—Packing Steam-Piston.—Thomas Hanson, New York, N. Y.

Claim.—Combining with a piston-head formed with grooves in its face, which are provided each with an ordinary packing split-ring, two sets of steam passages which communicate with each ring, the whole so arranged and operating that steam will be supplied simultaneously to the inner circumference of each ring to distend it and to the side of each ring to pack it laterally, substantially as herein described.

117,072.—Animal-Trap.—Elmer Hause and Libni Kelley, Tecumseh, Mich.

Claim.—The construction and arrangement of the frame C, lever D, pawl E, springs F G, treadle H, spring I, cam-latch *c*, and pin *d*, with relation to each other and the opening in the wall A, substantially as described.

117,073.—Windlass.—Oliver P. Hix, Rockland, Me.

Claim.—1. As an improvement in a windlass or capstan, the combination of its rope or chain-barrel with its shaft by one or more springs arranged to resist an effort to turn the barrel on the shaft, as and for the purpose set forth.

2. The windlass, as composed of the part A, fixed upon and so as to revolve with the shaft C, and the part B arranged to revolve on such shaft and provided with one or more springs applied to such part B and shaft C, so as to resist, by the elastic force of such spring or springs, an effort to turn the part B on the shaft.

3. The windlass-barrel or part B, as chambered at either or each of its ends, and provided with the diametric bar D, the abutment E, the curved rod *b*, and the spring or springs E or E′, arranged as set forth, the whole being applied to a shaft, as represented.

117,074.—Cotton-Gin Feeder.—Nathaniel Hoggatt, Madison Parish, La.

Claim.—The combination, with the gears C C′ C, and shafts with cranks D D, frame E, and fingers F, of a hopper, A, and bars H, substantially as and for the purpose hereinbefore set forth.

117,075. — Cider-Press. — Jonathan Holbrook, Sherburne, Mass.

Claim.—The arrangement of the base A, ledge *d*, educt *b*, slats *d d*, horizontal bars *e e*, cap-bar *f*, and straining-cloths *h h*, all substantially as and for the purpose as set forth.

117,076. — Railroad-Car Ventilator.—James Leland Howard, Hartford, Conn.

Claim.—The combination of the central raised portion of the roof of the car, the hood over the platform, and the air-passage connecting the spaces under the hood and in the raised portion of the roof, substantially as before set forth.

117,077.—Iron Rim for Wagon-Wheels.–Lucius Hubbard, Ottawa, Ohio.

Claim.—1. The malleable sockets E, provided with tenons *b*, in combination with the tubular felly C and spokes B, as and for the purpose set forth.

2. The construction and arrangement, with relation to the hub A and spokes B of a wheel, of the metallic sockets E, tubular felly C, bolt D, and grooved or concave tire F, as and for the purposes herein shown and set forth.

117,078. — Gaiter-Shoe. — Frank Henry Austin Hussey, Lynn, Mass., assignor to himself and Aaron F. Smith, same place.

Claim.—A shoe or boot as made with the stay *b*, arranged in a serpentine form in the button-hole flap, and having the button-holes and buttons arranged in or substantially in parallelism with the stay, all being as represented and described.

117,079.—Harrow and Marker Combined. — Samuel Hutchinson, Griggsville, Ill.

Claim.—The harrow, constructed, substantially as above described and shown, with the bars A, the drag-teeth B, the pivoted slats *a*, the adjustable braces C, the pivots *b*, and the detachable marker D, all the several parts constructed, arranged, and operated as described and shown, for the purposes set forth.

117,080.—Construction of Doors.—Willard C. James, Fishersville, N. H.

Claim.—The stiles C having their mortises enlarged outwardly, the tenons B correspondingly constructed, and the parallel plates E inserted between them, all combined and applied as and for the purpose specified.

117,081.—Peg-Sharpener.–Anthony Kehl, Indianapolis, Ind.

Claim.—The peg-wood sharpener herein described, when constructed substantially as set forth.

117,082.—Wood-Boring Tool.—Joseph J. Kraus, Menasha, Wis.

Claim.—The concavo-convex reamer A, provided with the cutting-lip *a*, external screw-thread *b*, and internal screw-thread *c*, as and for the purpose set forth.

117,083. — Molding-Machine. — Israel L. Lamb, Darien, Wis.

Claim.—1. The hollow mandrel, consisting of the two parts D E, arranged as described, and provided with the detachable rings or dies I K and the knife-carrying disks F G, all substantially as specified.

2. The knives mounted on the stocks pivoted to the disks, as described, and provided with the adjusting-gears Q R, substantially as specified.

3. The arrangement of the knife-stocks N and O with the dies or rings for holding them in place, all substantially as specified.

4. The hollow mandrels D and E, having a set of molding-knives or cutters mounted on their disks or heads, substantially as specified.

117,034.—Composition Steatite Pencil.–Reinhold Lanstrom, Cincinnati, Ohio.

Claim.—1. As an article of manufacture, the improved steatite pencil, composed of the ingredients herein described, mixed in the proportions and substantially in the manner specified.

2. The herein-described mode of making the pencils of the said compound, said mode comprising the several steps by which it is treated successively in the order substantially as specified.

117,085, antedated July 7, 1871.—Wheelbarrow.—Harry Lawrence, New York, N. Y.

Claim.—1. A wheelbarrow, having the sides and end pieces hinged to the frame for folding down on the bottom, or for the ends to fold down on the frame away from the bottom, substantially as specified.

2. The axle mounted detachably on the frame, and the wheel mounted detachably on the axle, substantially as specified.

3. The legs K jointed to the frame, and supported by braces U joined to them, and connected to the frame by the stud-pins V and notched and slotted bars W, substantially as specified.

4. The combination, with the folding sides C and end E, of the braces M, pivoted to the end pieces and arranged to catch on a stud-pin on the side C and on another on the frame, all substantially as specified.

5. The combination, with the folding sides and end E, of the slotted and hooked braces R pivoted to the frame and engaging with the stud on the end E and the staple on the side C, all substantially as specified.

6. The axle confined in the bearing by one fixed cap, *b*, and one spring-cap, *a*, substantially as specified.

7. The detachable wheel confined on the squared part of the axle by the springs *f* resting in the notches with the beveled walls *g*, or by the linch-pin *h*, having the smooth ends and the screw threaded part *i*, the latter screwing in a hole in the axle, all substantially as specified.

117,086. — Wheelbarrow. — Harry Lawrence, New York, N. Y.

Claim.—1. The combination of the side pieces A, bottom boards C, and rods B, all substantially as specified.

2. The improved brace for supporting the hinged end of a wheelbarrow or wagon-box, or the hinged legs of the wheelbarrow, having the lateral slotted projection M or not pivoted to the frame or box, and connected to the hinged boards or legs to be supported or locked, all substantially as specified.

3. The said brace, constructed as above described, and provided with one or more notches, *f*, substantially as specified.

117,087, antedated July 7, 1871.—Apparatus for Making Ice.—Charles P. Leavitt, New York, N. Y.

Claim.—1. The arrangement and combination of the injector D, its ingress and egress-pipes *e g* and *f b*, and valves *c c'* and *d*, with sprinklers C in the bottom of the expansion-chamber A, substantially as and for the purpose set forth.

2. The non-conducting lining *a*, of wood, within the cylinder A, substantially as shown and described.

3. The arrangement of a sprinkler, I, above the piston, and its supply-pipe *n* for injecting brine from the annular chamber *r*, substantially as and for the purposes herein set forth.

4. The combination of the low-pressure receiver F, the compressed-air receiver E with its brine-jacket E', the cylinder A with its lining *a*, the piston B with its attached plunger B', the sprinkler C I, and the injector D, for operation essentially as specified.

5. The freezing-house G, constructed with compartments S and L and attached brine inlet-and-outlet pipes h and *i*, arranged and operating substantially as specified.

6. The endless chains N, constructed or provided with double reversible rails *c'*, for operation as described.

7. The ice-pans M, provided with side wheels *d'*, in combination with the double rails *c'* of the chains N, substantially as specified.

8. The combination and arrangement of the ice-pans M having side wheels *d'* with the double reversible rails *c'* of the endless chains N and the freezing-house G with its compartments S L and attached brine-pipes h and *i*, all for operation together as herein shown and described.

117,088.—Printing-Press.—Thomas Leavitt, Everett, Mass.

Claim.—The combination of the cam J with the connecting-rods D, substantially as and for the purpose set forth.

117,089. — Reflector for Locomotive Head-Lights.—Charles S. Lee and William M. Baldwin, Troy, N. Y.

Claim.—In combination with an outer reflector, A, that receives and reflects once or twice, according to their obliquity, all the rays on one side of the lamp, the inner reflector C, which allows the horizontal rays on the other side to pass therethrough, but also reflects the oblique ones horizontally into the same pencil of rays, as and for the purpose specified.

117,090, antedated July 3, 1871.—School-Desk.—John Long and Eugene Convers, Oswego, N. Y.

Claim.—The shafts *e*, with arms *g* and studs *k*, in combination with spiral springs *i* and key *l*, constructed as described, and for the purposes set forth.

117,091.—Machine for Flanging Boiler-Heads.—Seth Lowen, Temperanceville, Pa.

Claim.—1. The rotating and bending-mandrels *g g'*, in combination with the guide-plate *n* and adjustable table *o*, having threaded rods *p* and nuts *q*, substantially as and for the purposes described.

2. The shafts *f f*, gear-wheels *b l* 1 2 3 4 5, shaft l^2, and crank l^3, in connection with the mandrels *g g'* for imparting a rotating motion to them, substantially as described.

3. The swinging arch *d* carrying the rotating and bending mandrels *g g'*, substantially as described.

4. The segmental gear-wheel A rigidly attached to the swinging arch *d*, gear-wheel l^1, and crank l^3, in combination with the swinging arch *d* for operating the same so as to make it describe the arc of a circle of which the line *x x* is the center, substantially as and for the purposes described.

5. The devices described and shown, or their equivalents, for imparting simultaneously a rotary and a radial motion to the mandrels *g g'*, for the purposes described.

117,092.—Attaching Cultivator-Teeth to Beams.—Michael F. Lowth and Orleau H. Porter, Wabasha, Minn.

Claim.—The brace *d* of the cultivator-tooth, provided with a series of holes for reception of a pin on which rests the free end of the plate-spring *f*, whereby the inclination of the tooth to the beam may be varied without changing the tension of the spring, as herein shown and described.

117,093.—Curd-Strainer. — Ralph Mason and Sidney Mason, Burgh Hill, Ohio.

Claim.—The herein-described curd-strainer, consisting of the vat A having channels C in the bottom thereof, and metal strainer D constructed with a perforated bottom, H, and frame F, in combination therewith, substantially in the manner as described, and for the purpose set forth.

117,094. — Liquid-Meter. — John Mead, Charlestown, Mass.

Claim.—1. The combination, in a fluid-meter such as described, with the wall D and connecting-rod H, of the tubular packing-piece *k*, arranged in a recess countersunk in that part of the wall surrounding the connecting-rod, as and for the purposes shown and set forth.

2. The combination, with the valve-seats in a diaphragm fluid-meter such as described, of two balanced piston-valves, connected together, and constructed and arranged to operate in the manner shown and set forth.

117,095.—Machine for Cutting Oval Tin Bottoms. — Julius Meinig, Cincinnati, Ohio.

Claim.—1. The combination, with the cutters, of the pivoted frames *d e*, the former carrying a rotating clamp for the blank sheet, as and for the purposes set forth.

2. The shaft *g*, carrying the beams *h* and *i*, having pins *s v w x*, as and for the purposes set forth.

3. The adjustable plate *t*, carrying the perforated weighted lever 5, as and for the purposes set forth.

4. The construction and arrangement of the perforated lever 5 relatively to the pins *s* and *v* in beam *h*, as and for the purpose set forth.

5. The adjustable plate *u*, carrying the notched latch 6, its pawl 7, and spring 8, as and for the purposes set forth.

6. The combination of the double pins *w* and *x* in beam *i* with the latch 6, as and for the purpose set forth.

7. The arrangement of the pawl 7 relatively to the ends of the revolving beam *i*, as and for the purpose set forth.

8. The combination and arrangement of the beams *h* and *i* and their stops or latches 5 and 6, as and for the purpose set forth.

117,096.—Cooking-Range.—Edward Mingay, Boston, Mass.

Claim.—As an improvement in cooking-stoves or ranges, &c., the adoption of a hollow, double, or tubular top plate having air-inlet orifices leading to the interior thereof and outlet-passages for the air passing through it to enter the oven, for purposes herein stated.

117,097.—Brick-Machine. — Augustus F. Mitchell, Valparaiso, Ind.

Claim.—1. The grouped molds, and connected or compound followers fitting the same, in a continuously-revolving mold-wheel, F, substantially as and for the purpose herein specified.

2. The mold-wheel F, when formed with its shaft *e* and thin radial plates or spokes cast in one piece therewith, and with the interior and exterior polygonal peripheries, as and for the purpose herein specified.

3. The adjustable segment-plates O P, in combination with the mold-wheel, substantially as and for the purpose herein specified.

4. The flanch *a*, when provided with the right-angled extension *m*, in combination with the frame of the machine, as and for the purpose herein set forth.

5. The fixed half of the pug-mill tub, when formed with the close dome-shaped top to support the upper bearing of the pug-mill shaft, as specified.

6. The transverse notch *v* in the movable pivot M of the friction-wheels L L, in combination with the transverse keys or wedges *u u*, substantially as and for the purpose herein specified.

117,098. — Drawing-Frame. — Benjamin Moon, Coventry, R. I.

Claim.—1. The combination, with the trumpet and its weight, of the pendent arm or lever D, hung as described at I, and operating in the manner and for the purpose set forth.

2. The carriage A, with the ratchet-racks *a a* and shipper C, in combination with the double-acting pawl B, and with the trumpet and its arm D, when all are arranged and operated as herein described.

117,099.—Steam-Trap.—George R. Moore, Philadelphia, Pa.

Claim.—The float B with valve D and stem *g*, constructed as shown, with lever F, counterbalancing-spring I, adjusting-nut J, and stem K, arranged within their respective cases, substantially as described.

117,100.—Button-Hole Cutter.—William A. Morse, Philadelphia, Pa.

Claim.—1. The bent U-shaped spring D D, provided with cutter guiding-slots *a a*, substantially as shown, and for the purpose specified.

2. The button-hole-cutting knife F, metallic reception-case or holder C C, U-shaped springs D D provided with cutter-guide or slots *a a*, and graduated scale, in combination, substantially as shown, and for the purpose set forth.

117,101.—Sewing-Machine.—Carl Necker, Berlin, Prussia.

Claim.—1. The combination of needle P, circular thread-taker T*b*, and angular thread-taker N, when constructed, arranged, and operated by means substantially as hereinbefore described.

2. The combination of needle P, circular thread taker T*b*, and carrier O, when constructed, arranged, and operated by means substantially as hereinbefore described.

3. The combination, with the arm C, of the arm D, link D*a*, and bell-crank D*b*, when operated substantially as described, and adapted to carry either the thread-taker N or O.

117,102. — Washing-Machine. — Philip Nichols, Troy, N. Y.

Claim.—The bearing-screw A, curved spring B, cross-bar C, in connection with the working spirally covered arms D, armatures E and E^1, shaft I, interlocking rollers H and J, all constructed, arranged, and operating within the outer frame of the machine as described and set forth.

117,103.—Arm-Revolving Shelf. — Philipp Nichols, Troy, N. Y.

Claim.—The combination and arrangement of two or more rotating or revolving shelf-arms upon the same plane, and resting upon and supported by corresponding flanged supports A' A' A' cast or constructed with the pipe-collar or clasp, when arranged as described and set forth.

117,104.—Roof.—Nelson G. Northup, Bloomington, Minn.

Claim.—The long metal caps G, constructed with a central and two side flanges to adapt it to be inserted into the joint of the roofing-plates or boards and to overlap on both sides, as and for the purpose specified.

117,105.—Hand Corn-Sheller. — Charles Melsom O'Hara, Cincinnati, Ohio.

Claim.—The improved hand corn-sheller herein described, consisting of the thumb-plate A and curved finger-plate C hinged together as shown, and provided with metallic loops B D outside, and shelling corrugations on their inner surfaces, as and for the purpose specified.

117,106.—Photographic Camera.—George W. Parker, Watkins, N. Y.

Claim.—1. The combination of the camera-box and slide H, dipper G, slide F, dipper *e*, compartments C, E, and N for containing dishes for the different solutions, and slide-cover D, substantially as and for the purpose set forth.

2. The combination with the camera-box A and door I set with colored glass, opening J, focusing-slide B, and doors M and K, all being constructed and operating substantially as hereinbefore described.

117,107.—Spool-Thread Case. — William S. Phillips, Chicago, Ill.

Claim.—1. A spooled-thread case, having the recessed or slotted fronts of its sliding drawers provided with flat or curved glass plates, for the purpose specified.

2. The sliding drawers of a spooled-thread case, provided with recessed or corrugated bottoms, substantially as described, for the purpose specified.

117,108.—Steam-Engine. — Ozi M. Pike, Chicopee, Mass.

Claim.—The valve-block O, having central hole *p* with branches therefrom, the apertured valve J, and the sliding plate R arranged between them, all combined to operate in a steam-engine, as and for the purpose specified.

117,109. — Dredging-Machine. — Edwin Platt, Charleston, S. C.

Claim.—In a dredging apparatus, the combination of boat A, anchor-staff O, wheel C, and elevator D E F G, made adjustable by cord or cords K and windlass, as shown and described.

117,110.—Sheet-Metal Key for Locks.—Titus Powers, New York, N. Y.

Claim.—A hollow lock-key fabricated from sheet metal, when the outline of the internal cavity conforms in shape to the external contour of the key, as set forth.

117,111.—Steam-Heater.—Frank H. Pulsifer, Auburn, N. Y., and William C. Wheeler, Baltimore, Md.

Claim.—1. The hollow partition B'', provided with air-passages *b b*, in combination with the grates *c c*, substantially as shown and for the purpose set forth.

2. The arrangement of the pipes *d d'*, connected in the center in the sections C D and bolted together, in the manner and for the purpose set forth.

3. The arrangement, in the heating apparatus herein shown, of the shell A, having sections B C D E, the partition B'', grates *c*, pipes *d d*, bolts *d''*, and fines E', when all constructed and arranged as shown, and for the purpose set forth.

117,112.—Cock.—Joshua Regester, Baltimore, Md.

Claim.—An elastic diaphragm, G, when compressed between the plug E' and the interior surface of the neck E, and caused to pack tighter when the cock is open than when closed, substantially as described.

117,113. — STEAM PLOWING-MACHINE.—Zerah Rider, Painesville, Ohio.

Claim.—1. The wheels M N, gearing K J, pinions H, driving-wheels B B, and plows D', all arranged to operate substantially in the manner as described, and for the purpose set forth.

2. The arrangement of the crank-wheel N, chain or band P, driving-wheel M, pinions K J and H H with the teeth G on the traction-wheel, together with the adjustable plow-beams C C, in the manner substantially as and for the purpose specified.

117,114.—CARRIAGE-JACK.—Henry L. Riouff, Pleasant Ridge, Ohio.

Claim.—In the described combination with the elements A B D E G H I J, the adjustable guide C and set-screw F.

117,115. — FLY-WHEEL. — Charles Root, Cleveland, Ohio.

Claim.—1. The combination, with the fly-wheel A having the disk B and lugs E, of the clamping-disks F O, notched disks N and K, and the elastic washers M, whether the disks F and K be grooved or plane, and the disk N conical, and O concaved, or not, all substantially as specified.

2. The combination, with the clamping-disks F and O and the wheel, of the pawls P, substantially as specified.

117,116.—MACHINE FOR CUTTING, PUNCHING, AND UPSETTING TIRES.—Hiram B. Sevey, Vienna, Me.

Claim.—The arrangement upon the frame A B and upon one another, as herein described and shown, of the punching and countersinking devices, the upsetting device, the shearing device, and the several levers and springs by which these several devices are operated, for the purposes set forth.

117,117, antedated July 7, 1871.—EXTENSION LADDER. — Elijah O. Shepardson, St. Louis, Mo.

Claim.—1. The car A A^1 arranged with guides B and levers C, and supporting the pivoted ladders D E, substantially as set forth.

2. The hooks or latches K made as herein shown and described, with a pin, *k'*, pivoted at *k* to the upper parts of the ladders, and engaging with pins *l* in the ladder next above, all arranged and operating as and for the purpose set forth.

117,118. — VENTILATED HORSE-COVER.—Stephen Sibley, Chelsea, Mass.

Claim.—The within-described ventilating horse-cover, constructed with a double portion, A B, extending partially over the back and sides, and one or more openings, *c*, in the portion A, operating substantially in the manner and for the purpose set forth.

117,119. — MOLD FOR COMPOSITION ARTICLES.—Isaac Smith, New York, N. Y., assignor of one-half his right to William Sanderson, same place.

Claim. — 1. In molding composition articles by compression, a die-clamp, constructed and operating substantially as and for the purpose set forth.

2. The holder-plates or die-plates, or both, so made that in the act of forcing the parts of the die together the material of which they are made will be sprung in the manner and for the purpose set forth.

117,120. — CARD-HOLDER.—Edward Stewart, Fort Madison, Iowa.

Claim.—The combination, with the board A, of the hinged stationary clamp B and the adjustable clamp C, substantially as shown and described, for the purpose set forth.

117,121.—FRUIT-JAR.—Leo Corly Straub Pittsburg, Pa.

Claim.—The conical collar C, applied detachably and to fit up close to the junction of the neck and breast of a fruit-jar to receive the sealing material and allow both collar and sealing substances to be removed together and again utilized.

117,122. — WOOD-PULP MACHINE. — James Taylor, Luzerne, N. Y.

Claim. — 1. The saws F F, combined with and made part of a wood-pulp machine, substantially as and for the purpose herein shown and described.

2. The grinding-shell C, made in two pieces, and provided with the elastic strips *c* between the edges, substantially as and for the purpose herein shown and described.

117,123. — EVENER. — Marvin Terrill, Star Prairie, Wis.

Claim.—The combination, with the bar C, held against vibration, and provided with the friction-rollers E, of the equalizing-bar G and the whiffletree-chains F, all substantially as specified.

117,124. — PHOTOGRAPHER'S REFRIGERATOR. — Mary A. Thornton, Perrysburg, Ohio.

Claim.—The arrangement of the compartments A, B, D, and E in a refrigerator, substantially as and for the purpose herein shown and described.

117,125. — FLAX-PULLER.—Samuel W. Tyler, Troy, N. Y.

Claim.—1. The fingers G G, in combination with the backwardly-extending swords G' G', arranged and operating substantially as and for the purpose described.

2. The swords G' G', extending back, above, and beyond the pulling-belts O O' for the purpose of supporting the flax-stalks laterally after they are pulled out of the ground until they are delivered to the carrying-belts, substantially as described.

3. The frame D^3, constructed with standards *d d'* and a rear stirrup-bearing, substantially as described.

4. The open side guards D^4, constructed substantially as and for the purpose described.

5. The sliding bearings m^2, adjusting-screws *m*, and inclined pulley-frame D^5, combined substantially as described.

6. The combination of pulling-belts O O', carrying-belts I I, and a gavel-receptacle, substantially as described.

7. The carrying-belts I I, applied around the pulleys F F^1 of the inner shaft of the rear pulling-belt pulleys, substantially as described.

8. The clearers *s s* upon the carrying-belts I, substantially as described.

9. The mechanism herein described, applied between the power-shaft C and the reel-shaft N' for the purpose of giving the reel of the gavel-receptacle an intermittent motion, for the purpose set forth.

10. The ovener-head K', in combination with the carrying-belts I and the gavel-receptacle, substantially as described.

11. The stop-arms W and stop or catch W', in combination with the revolving reel-shaft N' and a releasing device for said arms W, substantially as described.

12. A revolving tripping-arm or stud, *e*, applied on shaft C, the described clutching device and the described stopping device, in combination with the revolving shaft N' of the discharging-reel N, substantially as described.

13. The apron T, arranged between the pulling-belts O O' and the gavel-receptacle, in combination with carrying-belts I, substantially as described.

14. The combination of the gavel-receptacle and the carrying and pulling-belts, arranged in relation to the two-wheeled side-draft frame, substantially in the manner and for the purpose described.

15. Carrying-belts I I, and pulling-belts O O', and keepers J J, arranged in the manner substantially as described, so that the flax is securely held from the point at which it is pulled from the ground until it is conveyed to the point for effecting its discharge, substantially as described.

117,126.—WASHING-MACHINE.—Miner Van Auken, Utica, N. Y.

Claim.—The rod E, standards F F, slotted and offsetted arms G, rubber H, arms K, handle J, board C, and fender D, all combined, constructed, and arranged as and for the purpose specified.

117,127.—STEAM-HEATER.—Daniel Vaughan, Cincinnati, Ohio, assignor to himself, Augustus L. Helm, and John B. Mahoney.

Claim.—1. A steam-heating or vapor-condensing apparatus, composed of a series of annular chambers, A B, one within the other, connected and operating substantially in the manner and for the purpose specified.

2. In the described combination with the chambers A B C, the pipes D E F for the supply and circulation of steam, and pipes G H I for the discharge of water, the whole being connected and operating substantially in the manner and for the purpose specified.

117,128.—MACHINE FOR MAKING SPIKES.—Omar A. Wadsworth, Allegheny City, Pa.

Claim.—1. The rotating segmental feed-rolls *a a*, having working-faces of suitable length for feeding forward at each revolution the proper length of blank for the head and body of a single spike, removably attached to the rotating die-holders *b b*, in combination with the fixed guide *h* of a length equal to that of the rolled blank, said feed-rolls being arranged and adjusted to operate in relation to the operation of the clamping-dies and header, substantially as described.

2. In combination with the devices of the preceding claim, the dies *d d'*, arranged with their cavity, when they are closed, a little out of line of feed, one of the dies carrying a knife, *d''*, for cutting off the blanks, such dies being operative during the suspension of the forward feed, substantially as described.

3. A fixed guide, *h*, arranged between and in combination with the feeding and pointing-tools described at one end, and the griping-dies *d d* and cutter *d''* at the other end, whereby each blank is not only guided accurately in the line of feed, but also is held firmly against the effect of the forward thrust of the cutter in severing the blanks.

117,129.—CHIMNEY-COWL.—John Walker, Boston, Mass., assignor to Levi Chubbuck, same place.

Claim.—1. The corrugated shield B, as and for the purpose specified.

2. The combination of the flue-pipe A, corrugated shield B, and semi-cone C, as and for the purpose specified.

3. In combination with the flue-pipe A, the semi-cone C, when arranged and combined in the manner and for the purpose as specified.

117,130.—GRIDDLE-GREASER.—Lewis Ward, Poughkeepsie, N. Y.

Claim.—A device, for the purpose specified, consisting of a tube, A, wicking D, and screws E, arranged and operating substantially as described.

117,131. — CENTER-LIGHT FIXTURE FOR CHANDELIERS.—Robert F. White, Hoboken, N. J.

Claim.—1. The sleeve O and cavity M, when combined with the tube H and socket B, substantially as and for the purpose herein stated.

2. The nipple D, in combination with the socket E and bowl F, when operated and applied in combination with the tube H and sleeve O, substantially as and for the purpose herein described.

117,132, antedated July 6, 1871.—CHAIR.—George C. Winchester, Ashburnham, Mass.

Claim.—A tipping chair, having the globular feet *i* pivoted in socket-pieces *h*, and having also the lever-latch *p* for locking the seat in a tipped position, and a retractile spring, *o*, applied as shown and described.

117,133.—EASEL PICTURE-FRAME.—Rufus Wright, Brooklyn, N. Y.

Claim.—The frame A, stand B cut from the center of the frame, and brace C cut from the stand, all being thus made in a single piece, and having slots C, central space D, lugs H, and spaces I K, located as specified.

117,134.—MANUFACTURE OF PAPER-STOCK. William Adamson, Philadelphia, Pa.

Claim.—A new article of manufacture and commerce, consisting of paper-stock, made from wood or other ligneous substance by subjecting the same to the action of hydrocarbons.

117,135.—EXTRACTING RESIN AND GUM FROM WOOD. — William Adamson, Philadelphia, Pa.

Claim.—The process of extracting resinous and gummy matters from wood by the application thereto of hydrocarbon, substantially in the manner described.

117,136.—PROCESS OF OBTAINING PAPER-STOCK FROM WOOD, &c.—William Adamson, Philadelphia, Pa.

Claim.—The conversion of wood or other ligneous substance into paper-stock by subjecting it to the action of hydrocarbons, substantially in the manner described.

117,137.—BOILER-RIVET MACHINE.—Charles B. Allen, Philadelphia, Pa.

Claim.—1. The die *m*, provided with two or more holes, in combination with the cutter V, the finger W pivoted on said cutter, and the mechanism described for operating the cutter and finger to grasp and carry forward the rivets to the die, substantially as described.

2. The header E, lever F, and cam D, in combination with the subject-matter of the first claim, substantially as described.

3. The pin M, lever K provided with adjusting-screw L, and mechanism, as described, to vibrate said lever, in combination with the subject-matter of the first claim.

4. The combination of the pin M, lever K provided with the adjusting-screw L, sliding bar N, and cam D, substantially as and for the purpose set forth.

117,138.—WELT-TRIMMER FOR BOOTS AND SHOES.—Joseph H. Allen, Wadsworth, Nev.

Claim.—A welt-trimmer, constructed with bent bar *b d*, knife-holder *f*, and knife *g*, the whole being arranged and operated substantially as and for the purpose set forth.

117,139.—MANUFACTURE OF COATED SHEET-IRON TRAYS, PLATTERS, &c.—Jacob H. Armbruster, Philadelphia, Pa., assignor to himself and George Booth & Co., same place.

Claim.—1. The improved process herein described for preventing corrosion in sheet-iron platters, trays, and the like, the same consisting in forming the articles by stamping or striking up and coating with zinc, substantially as set forth.

2. A new article of manufacture, a sheet-iron tray, having its surface coated with zinc, as set forth.

117,140.—Elevator for Hods.—Leonard Atwood, New York, N. Y.

Claim.—The hod, provided with a hook at its upper end and a fork upon the shank or handle, in combination with an elevating-rope or chain, as and for the purposes specified.

117,141. — Valve-Gear for Engines. — Leonard Atwood, New York, N. Y., assignor to P. H. Walker, Boston, Mass.

Claim.—A pair of cut-off plates on the upper surface of the valve connected to cranks on the opposite sides of a shaft that is turned to control the cut-off action of such plates, substantially as set forth.

117,142.—Wheel for Vehicles.—James R. Baird, Vincennes, Ind.

Claim.—A wheel for vehicles, composed of the hub A, ring, B spokes C C with shoulders *a a* and tenons *b b*, the felly D, and felly-plate E with pin *d*, and spoke-socket G, all constructed and arranged substantially as and for the purposes herein set forth.

117,143.—Farm-Gate. — Michael Barthel, San Francisco, Cal.

Claim.—1. The wheel D with its cords C, and the eccentric pulley J with its cords I I or equivalent devices, in combination with the gate F′ and horizontal axis G, when constructed and operating substantially as herein described.

2. In combination with the wheel D and cords C, the peculiar lever E, latch *e*, and catches *e f*, when applied to a farm-gate, substantially as and for the purpose above described.

3. The crank-arm N with the eccentric rim K or an equivalent device, and the weight L, in combination with the wheel D and eccentric J, with their operating-cords, when constructed and operating substantially as herein described.

4. The gate F′ having the axis G, in combination with the wheel D and eccentric J, with their operating-cords and the holding-latch, substantially as and for the purpose herein described.

117,144.—Composition for Preserving and Coloring Leather.—Orrin F. Battey, Worcester, Mass.

Claim.—An anti-wearing preparation, compounded of the ingredients herein named substantially in the proportions specified and for the purposes set forth.

117,145.—Blacksmith's Tuyere. — John Bauer, Brooklyn, E. D., N. Y.

Claim.—A tuyere-iron, consisting of an outer case, A, and an inner box, B, constructed substantially as and for the purpose herein set forth.

117,146.—Standard for Railway Cars.—Sheldon S. Beeman, St. Albans, Vt.

Claim.—The combination of the segment B, having flange *a* and stops *b b*, standard C, collar or jacket D, with hook *f* and the square pin h inserted in the hole or mortise *i* on the segment, all constructed and arranged substantially as and for the purposes herein set forth.

117,147. — Wagon-Brake. — Washington Bryant, Batesville, Ark.

Claim.—The brake-shoes O P, pivoted on the front side of the bar L and provided with projecting forward ends, as and for the purpose specified.

117,148. — Manufacture of Nails for Horseshoes.—Alexander H. Caryl, Groton, Mass.

Claim.—As my improvement in the manufacture of horseshoe-nails, the process of taking a wrought nail finished as to shape, and then cold-rolling its edges, and its edges alone, in die-grooves, substantially as described.

117,149.—Harrow.—Joseph Chellew, Glasford, Ill.

Claim.—The arrangement of the elevated adjustable draft-bar C, provided with the holes *b b b* for attachment of draft-bolts *d d d* and blocks *a a a*, substantially in the manner and for the purpose as shown and described.

117,150.—Button.—Edward A. Cobb, Philadelphia, Pa.

Claim.—The washer D, having an inclined slot, *b*, projected from the eye *a*, in combination with the shank B of the button A, head C, and washer E, in the manner and for the purpose set forth.

117,151.—Collar-Pad. — George P. Cole, Hudson, Mich., assignor to Clemons Hathaway, same place.

Claim.—In combination with the end E of the collar and its rivet *x*, the pad A, spring-plate B, and slotted metal strap G, substantially as and for the purposes herein set forth.

117,152.—Cording Attachment for Sewing-Machines.—George A. Colton and Sylvester P. Babcock, Adrian, Mich.

Claim.—1. The adjustable welt-corder F, consisting of the tongue *d*, welt-cloth way *e*, welt-cloth separator *e′*, cord-guide *n*, and adjusting set-screw *x*, all constructed as specified.

2. In combination, the adjustable welt-corder F above described, the fingers D, bed-plate A, adjustable gauge-plate B, and the ribbed or corrugated presser-plate C, when all are constructed as specified.

117,153.—Rotary-Engine.—James M. Conkle, Beaver Falls, Pa.

Claim.—1. The openings *k m* and grooves *l* for conducting the steam from the cut-offs *i* to the rotary head or piston through the valves C, substantially as herein set forth.

2. The passages *n* through the rotary piston B, circular groove *p*, and passage *r*, for conducting the steam from the inside of the cylinder to the escape-pipe, substantially as herein set forth.

3. The piston or rotating head B, provided with recesses *i* and passages *n*, substantially as and for the purposes herein set forth.

4. The cylinder-head, composed of the three parts D, E, and G, with the various passages, arranged substantially as shown and described, and for the purposes herein set forth.

5. The combination of the valves C, recessed as described, followers *a*, and set-screws *b*, substantially as and for the purposes herein set forth.

6. The combination of the cylinder A, piston B, valves C, followers *a*, and heads D E G, all constructed as shown and described, and provided with the various passages, substantially as and for the purposes herein set forth.

117,154.—Wash-Tub.—Ambrose M. Cushing, Cambridge, Mass.

Claim.—A soap-stone wash-tub made with a washboard or plate located in the front part, said washboard being maintained in proper position by suitable stops or fastenings, and having a water-space, *i*, in rear of it, all substantially as shown and described.

117,155.—Paper for Buildings.—Francis N. Davis, Beloit, Wis.

Claim.—1. As a new article of manufacture, fire and damp-proof straw board in continuous lengths, either plain or colored with pigments, for the purpose specified.

2. The process, substantially as herein described, for treating continuous lengths of straw board to render them fire-proof and impervious to dampness, for the purpose specified.

117,156.—Draining Cellars.—Edward S. Dickinson and John L. Peake, New York, N. Y.

Claim.—1. The drain B and valve C, in combination with the open-top stand-pipe or tall casing D, arranged to operate relatively to each other and to the pit or place to be drained, and to a fluctuating water-level outside, as and for the purposes herein specified.

2. In connection with the drain-pipe B, stand-pipe D, and valve C, the cage E and lifting-rod G or their equivalents, adapted to allow the removal and return of the valve, as herein specified.

117,157.—Mold for Glass-Lamps.—Hiram Dillaway, Sandwich, Mass.

Claim.—1. In combination with the main jaws *a b*, jaws *i k*, which form a recess or recesses in the top of the article, and which have an upward as well as an outward or opening movement.

2. The levers *e*, connected to the jaws *a b* by pivots *r*, and constructed and arranged to lift the jaws *i k*, substantially as described.

3. The process of forming the top recessed lamp or other articles by means of lifting hinged top jaws and main side jaws, substantially as described.

4. The top-recessed blown lamp or other article formed by the lifting and hinged jaws, substantially as described.

117,158.—Nubia.—Thomas Dolan, Philadelphia, Pa.

Claim.—1. The combination, substantially as described, of a nubia with a head-dress.

2. A nubia plaited and puckered, substantially as described and illustrated in Fig. 2.

3. The pendent portion *m* of the nubia, in combination with the plaited and puckered edge of the same.

117,159.—Rotary Boiler.—Nathaniel T. Edson, New Orleans, La.

Claim.—1. The water-pipe E, connecting the stationary and the revolving boiler, substantially as and for the purposes hereinbefore set forth.

2. The division-partition S, substantially as and for the purposes set forth.

117,160. — Millstone-Curb. — George W. Eggleston, Monroe county, N. Y.

Claim.—1. The combination of the inlet P, sliding door G, outlets E E, stationary guard B, and stop B′ with the curb S, substantially as set forth.

2. In combination with the outlet or outlets E E, the supplemental case or shell C, and stop B′, operating as set forth.

3. In combination with the curb S, the concave metallic meal-carrier F, substantially as set forth.

4. In combination with the curb S, the metallic conducting-ring F and conductor S′.

117,161.—Decolorizing Raw Sugars.—Louis H. G. Ehrhardt, New York, N. Y.

Claim.—The process of decolorizing the raw solution of sugar by mixing the same with a suitable quantity of lime-milk and charging the mass with carbonic-acid gas, substantially in the manner herein specified.

117,162. — Apparatus for Saving Gold, Amalgam, &c.—George R. Evans, Virginia City, Nev.

Claim.—1. The upper-sluice section A, provided with transverse slots *b*, in combination with the section *c* having a fluted bottom, substantially as and for the purpose above described.

2. The corner spring-clasps *f*, substantially as and for the purpose above described.

3. A sluice, constructed in the manner above described—that is, having one or more perforated sections through which the heavier portions are precipitated, substantially as and for the purpose above described.

117,163.—Tub, &c.—Edwin Augustus Firby, East Norwalk, Ohio.

Claim.—The tub or measure herein described, constructed of staves channeled in their exterior surface for the reception of the hoop or band, substantially as and for the purpose specified.

117,164. — Water-Elevator. — Louis F. Fischer, Fennimore, Wis.

Claim.—1. The arrangement of the carriage J, wheels K K, latch *h*, bail L, and bucket M, all substantially as shown and described, and for the purposes herein set forth.

2. The combination, in a water-elevator, of the rod B, windlass E, lever I, carriage J with latch *h*, bucket M, spout or trough N, and guide-wire or tripping-device *k*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

117,165.—Preparing Wheat, Corn, and other Grains for Food.—R. Berkeley Fitts, Philadelphia, Pa.

Claim.—1. The within-described treatment of grain to the purifying and cooking by hot water, followed by dry heat for the purposes specified.

2. The product of the above-described treatment as a new article of commerce.

117,166. — Churn-Power. — Benjamin F. Frampton, Punxatawney, Pa.

Claim.—The driving-shaft *j*, fixed drum *k*, loose drum *l*, pawl *m*, ratchet *n*, gear-wheels *h i*, pulleys *q u*, small weight *s*, and large weight *v*, arranged in connection with the frame A B *r*, as shown and described.

117,167.—Scrubbing-Brush.—Stephen A. Gibson and James Binn De Haas, Clearfield; said De Haas assigns his right to William Hoover, Bradford township, Pa.

Claim.—A reversible brush and drier having the knuckle-joint K, provided with the spring-stop *c′ d* and the shoulder-stop *a′ b*, substantially as specified.

117,168.—Boot and Shoe.—Hiram Varney Gould, Dover, N. H.

Claim.—The arrangement of the stay *a* and linings *c d* and the film of caoutchouc *b* with the vamp A, all being substantially as specified.

117,169. — Adding-Machine. — Emery M. Hamilton, New York, N. Y.

Claim.—1. The combination of the disk A, bell-crank, and slide Z, the disk being provided with a spring for actuating it, either being directly applied to it or to another wheel gearing with it, also being notched and figured as described; the bell-crank being provided with the stud-pin O and the notched and figured projection; the slide being notched as described, and having a spring for working it in one direction; and all being arranged relatively to each other and operating substantially as specified.

2. The arrangement of the bell-crank on its pivot and with the disk A, for sliding the pin O from and to the said disk for releasing and engaging it when winding up the actuating-spring of said disk, substantially as specified.

3. The arrangement of the said sliding bell-crank and the spring-winding cord N, whereby the disk is disengaged simultaneously with and by the application of the power for winding up the said actuating-spring of the disk, substantially as specified.

117,170.—Machine for Boring Wheel-Hubs for Skitting Boxes.—John C. Hendry, Manchester, N. H.

Claim.—1. The sliding rack-bars D D, constructed and arranged as described, and operated by means of the annular cog-wheel E and pinions

substantially as and for the purposes herein set forth.

2. The combination of the swinging frame B, cross-head S, and swinging mandrel-holder or socket T, constructed, arranged, and adjusted as described, so as to cut any taper desired and any size without changing the taper, substantially as herein set forth.

3. The arrangement, upon one side of the revolving annular wheel E, of an upright frame carrying the mechanism for boring hubs, substantially as herein set forth.

4. In combination with the upright frame O placed upon one side of the revolving annular wheel, and carrying a mechanism for boring hubs, the screw W for raising or lowering the mandrel, substantially as herein set forth.

5. The within-described machine for boring hubs at a taper, when all its parts are constructed, combined, and arranged substantially as and for the purposes herein set forth.

117,171. — BUGGY-SPRING. — H. Harrison Hill, Pontiac, Ill.

Claim. — The spring-rest herein described for wagon-bodies, consisting of the supports E E′ and forked levers F F, connected to each other by the slot-joint *z*, and to the seat by the spring H and its regulating-swivel, substantially as specified.

117,172.—PROJECTILE.—Thomas Hill, Vallejo, Cal.

Claim.—1. The bottle *f*, containing the igniting-fluid, in combination with the plug *g* to which it is attached, substantially as described.

2. The tubes *d*, extending entirely through the chambers A and B and outside of the inner one C, and touching the outer surface of the projectile at various points, so that, in whatever position the shell strikes some one of the tubes will stand with its line nearly in the direction of the line of motion, substantially as set forth.

117,173. — METALLIC CARTRIDGE. — Alfred Charles Hobbs, Bridgeport, Conn.

Claim.—A cartridge-case, having its body and base drawn from a single piece of metal, with a solid disk, B, and the anvil-cup C secured thereto by a metallic washer, *c*, all as herein described.

117,174.—TRACTION-WHEEL.—Oliver Hyde, Oakland, Cal.

Claim.—1. The tire B, when formed with alternate elevations and circular depressions C D for traction purposes, substantially as above described.

2. The corrugated metallic tire B, in combination with the cylindrical elastic blocks E, substantially as and for the purpose above described.

117,175. — BELT-FASTENER. — Willard C. James, Fishersville, N. H.

Claim.—The clamp or clasp, consisting of parallel bars B disconnected at their ends, but connected intermediately by transverse bars C, adapted for use in connection with a notched wedge, D, all constructed and arranged to operate as herein described, for the purposes set forth.

117,176. — HOLLOW-GRATE FEED-WATER HEATER.—Griffith W. Jones, Nashville, Tenn.

Claim.—1. The perforated bolts applied to the hollow grate-bars for the purpose of securing the same to their supporting-vessels B C, and continuing the supply and discharge-channels for the same, substantially as herein shown and described.

2. The conical perforated plugs *c* arranged on the vessels B C, in connection with the tubular bolts *b* and heads *a*, substantially as herein shown and described.

3. The discharge-chamber B made higher than the supply-chamber C of the hollow grate-bars, and provided with the discharge-pipe F at its upper end, substantially as herein shown and described.

117,177.—WOOD PAVEMENT.—James Judge, New York, N. Y.

Claim.—The sleepers A, cross-pieces B, U-shaped metal bars D having flanges E, screws F, cross-pieces G, and stay-tubes H, combined and arranged with the block C, as and for the purpose specified.

117,178.—CUTTING APPARATUS FOR HARVESTERS.—William G. Kenyon, Wakefield, R. I.

Claim.—1. The combination of the finger *a*, ledger blades *s s*, and springs *s s*, constructed and operating substantially as described.

2. A yielding button, constructed and operating substantially as described, in combination with a guard finger-bar and cutter-bar, as herein set forth.

117,179. — BODY-LOOP FOR CARRIAGES.—Wilson W. Knowles, Plantsville, Conn.

Claim.—As a new article of manufacture, the hereinbefore-described body-loop, consisting of the bar A, the clip D, and the bolt C, constructed and combined in the manner and for the purpose substantially as specified.

117,180.—EARTH-AUGER.—Noah H. Lindley, Bridgeport, Conn.

Claim.—1. The cap B provided with the bail *e*, in combination with the cylinder A and the annular serrated cutter D, substantially as specified.

2. The annular serrated cutter D, provided with the inwardly-projecting points *z z*, substantially as specified.

3. In an earth-auger, the boring-case, formed in three separate parts, the cylinder A, cap B, and cutter D, all constructed substantially as shown and described.

117,181. — WINDMILL.—Thomas C. Little, Dixon, Ill.

Claim.—1. The combination of the hollow shaft A with the rod *b* of the slide-head B and the collar C, as described, the collar being rigidly united to the rod *b* by means of pins or screws moving in the slot of shaft A, as described.

2. The combination of the elements of the first claim with the bent bar *d* and its connecting-rods, as described.

117,182.—CAR-TRUCK.—William H. Little and George H. Little, Peabody, Mass.

Claim.—For wide and narrow-gauge tracks, a car-truck having wheels sliding upon the axles, when the axles for each pair of wheels are independent, and are journaled in housings upon each side of each wheel, substantially as shown and described.

117,183.—LOOM-SHUTTLE.—Joseph Lofvendahl, Woonsocket, R. I.

Claim.—1. The sheet-metal shuttle herein described, consisting of the pieces A A′, caps B′ C, and tube D, substantially as specified.

2. In a shuttle, the yarn-tube D provided with the central opening *d*, substantially as specified.

117,184. — SOLAR COMPASS. — Benjamin Smith Lyman, Philadelphia, Pa.

Claim.—1. Putting the solar apparatus on the bottom of the lower plate of a transit or compass or theodolite, or on the bottom of a plane-table or other like surveying instrument.

2. Shortening the lens-bar, or that part of it which is parallel to the natural course of the sun's rays, by means of reflection from one or more surfaces of one or more prisms or mirrors fixed to the lens-bar.

117,185. — CASK OR BARREL.—John Marshall, Brooklyn, N. Y.

Claim.—1. A wood-cased metal cask or barrel, the metallic portion of which is made in sections A A, united at the bilge, and with partially-concave ends B B, substantially as specified.

2. The bung-hole socket *c* with its ventilating-apertures *z* and tubes *f*, arranged as described, in combination with the flange-shaped screw-plug or bung, *g*, essentially as herein set forth.

117,186. — LADDER. — John Maxwell and Thomas Gray, Philadelphia, Pa.

Claim.—The improved ladder above described, constructed with the segment D operating in conjunction with levers or equivalent devices, as specified.

117,187. — PLOW-CLEVIS.—Andrew McCollam, New Orleans, La.

Claim.—The clevis A, provided with the adjusting-rings *m m*, substantially as and for the purposes specified.

117,188, antedated July 13, 1871.—WASHING-MACHINE. — William McCord, Sing Sing, N. Y.

Claim.—1. A washing-machine provided with a drum capable of receiving the clothes to be washed, and having a revolving motion imparted to it by the action of a current of water discharging on it, and produced by heating the water to its boiling point, substantially as set forth.

2. The open-work apron *i* surrounding the buckets *f*, and capable of being readily removed and refastened, substantially as described.

117,189. — NECK-TIE RETAINER. — Joseph McGee, Lancaster, N. H.

Claim.—The plate A having eye C, combined with the two-wired device D F hinged thereto, when all are constructed, arranged, and applied together, as and for the purpose specified.

117,190.—RAILWAY-CAR BRAKE.—John W. McGlashan, Montreal, Canada, assignor to E. Lyman Mills, same place.

Claim.—The groove W in the friction-wheel, substantially as and for the purposes described.

117,191. — GRAIN-DRILL. — Daniel E. McSherry, Dayton, Ohio.

Claim.—1. The tube A, composed of the two sections, divided longitudinally, having their inner lower corners *e* beveled or rounded off, and each section having a stud, *f*, formed thereon, whereby the parts can be inserted within the ring and then united with the ring attached, substantially as described.

2. The combination of the rigid spout A, pivoted ring D, and tube E, all constructed and arranged to operate substantially as and for the purposes herein set forth.

117,192.—BROOM.—William A. Middleton, Harrisburg, Pa., assignor to himself and George Winters, same place.

Claim.—The combination, with the handle C and broom B, of the metallic tube A, extending above the top of the broom-splits and down into the body of the corn, and secured to the handle C by the screw *x*, all as set forth.

117,193. — WATER-WHEEL. — Charles M. Mooney, Scotch Plains, N. J.

Claim.—1. The buckets F, hinged at their lower ends to the upper ends of the buckets C of the wheel B C, and surrounded with a curb, E, attached to the upper parts of the outer edges of said buckets C, substantially as herein shown and described, and for the purpose set forth.

2. The inner slotted curb G, adjustably attached to the upper end of the hub B of the wheel B C, in combination with said wheel B C and with the hinged buckets F, substantially as herein shown and described, and for the purpose set forth.

117,194. — STOVE-GRATE.—George Rodney Moore, Philadelphia, Pa.

Claim.—1. The annular shelf or shelves E, horizontal or inclined, perforate or imperforate, fixed or vibrating, interposed between the grate or bottom of the fire-chamber and the mouth of the reservoir or in the mass of the descending fuel, while at the same time they are open to the base of the stove to admit a direct draught to the burning fuel

2. The cleaning-stripe *n o* with the sliding shelves F G, or their mechanical equivalents, substantially as and for the purpose herein set forth.

3. The levers *j k* and sliding shelves F G, in combination with each other, substantially as and for the purpose herein set forth.

117,195.—SAFETY TRACE-FASTENER.—John F. Morley, Lansing, Mich.

Claim.—The fly-plate F with the apertures for admitting the catch C and strap H, also the catch C with its attachment M, in combination with the steel springs D and E and the strap H, substantially as and for the purposes specified.

117,196.—COMPOSITION FOR ROOFS, PAVEMENTS, &c.—Samuel G. Morrison, Williamsport, Pa.

Claim.—The use of iron carbon (black-band ore) pulverized, as a drier, when mixed with gas or coal-tar for cement, for the purposes aforesaid.

117,197, antedated July 5, 1871. — WASHING-MACHINE.—Thomas B. Neill, Philadelphia, Pa.

Claim.—1. The combination, with the shaft S, of the series of fingers F and blank flanges D D′, substantially as and for the purpose described.

2. The shaft S, carrying the fingers F and flanges D D′, and provided with flange A and projection B, in connection with the socket E and journal J, as and for the purpose described.

3. The combination, with the journal J, of the bearing T, recess *d*, flanges G G′, projection *h*, and screws P P, substantially as and for the purpose described.

117,198.—RAILWAY SWITCH.—Thomas Newman, New Orleans, La.

Claim.—The combination of an oscillating platform, arranged for operation, by the weight of the draft animals of the car, with a switch, in the manner substantially as herein shown and described.

117,199. — WELDING STEEL. — Byron W. Nichols, Coxsackie, N. Y.

Claim.—The facilitating the process of welding steel upon itself or upon iron by decarbonizing the surface of the steel to a very minute depth, leaving the balance or inner portion of the steel as it was originally or in its original state unchanged.

117,200. — MOLD FOR SHAPING CIGAR-BUNCHES. — Adolph Pearl, Brooklyn, N. Y.

Claim.—A cedar-lined mold for cigar-bunches, composed of a composition body and cedar lining, substantially as herein described, for the purpose set forth.

117,201.—HAY-RAKE AND FORK.—Thomas W. Peirce, Minneapolis, Minn.

Claim.—In combination with the ferrule B, having recess D and angular crank-stop H, the rotating head C provided with the shoulder E, substantially as specified.

117,202. — BAND-TIE. — Joseph I. Peyton, Washington, D. C., assignor to himself and J. E. F. Holmead, same place.

Claim.—The improved tie herein described and shown, constructed substantially as and for the purpose set forth.

117,203.—Sewing-Machine.—James Pitt, Joseph Pitt, Edward Pitt, and William Pitt, Cleckheaton, Great Britain, assignors to themselves and Charles Keighley, Philadelphia, Pa.

Claim.—1. The overhanging arm D with its cylindrical enlargement *a*, in combination with the block F, inclosed by and turning in said enlargement, and with the bar E, lever G, springs *g* and *h*, and sliding wedge K for operating the arm G, all as set forth.

2. The arm J, arranged and operating in combination with the bar E, sleeve K, lever G, and levers H and L, as specified.

3. The combination, with the sleeve K, of lever L and set-screw *n*, or its equivalent.

117,204.—Combined Hay-Rake and Loader.—Almon J. Preston, East Guilford, N. Y.

Claim.—1. The arrangement of the rocking-shaft K, arms L L, cog-wheel M, rack-pitman N, with frame *f* and the weighted arms O O, all substantially as shown and described, and for the purposes herein set forth.

2. The notched levers *m m* and staples *n n* for holding the forks open, in combination with the knee-screws *p' p'*, as and for the purposes herein set forth.

3. The combination of the levers P P, fork-head R, knee-screws *p p*, pins *i i*, and teeth *e e'*, all substantially as and for the purposes herein set forth.

4. In combination with the levers P P, head R, and teeth *e*, the cars A A, head R', and teeth *e'*, substantially as and for the purposes herein set forth.

117,205. — Clamping Device for Sash-Cords. — Charles R. Rand, Dubuque, Iowa.

Claim.—The clamp, consisting of the frame D having the pulley *a* arranged in its upper part, with the cam E having the spring and thumb-piece or lever *b* arranged to operate the same, substantially as set forth.

117,206.—Blower-Tube for Furnaces.—Baker W. Reynolds, Evansville, Ind.

Claim.—In combination with an ordinary blower-tube, A E, for locomotive-boilers, the jacket C H, both constructed and arranged within cap D, as and for the purpose specified.

117,207. — Sewing-Machine for Boots and Shoes. — Everett P. Richardson, Lawrence, assignor, by mesne assignment, to McKay Sewing-Machine Association, Boston, Mass.

Claim.—The reciprocating bar I, when the same is actuated with an unyielding movement from a cam or its equivalent without the intervention of a spring, and which operates in connection with a last cut away at its edges, as shown, and is adapted to bear directly on the sole near its edge, other means being depended on to hold the upper in its proper relative position.

117,208.—Apparatus for Cutting Glass Globes.—John Thomas Haden Richardson, Tutbury, England.

Claim.—1. The movable standard A, provided with the roller or rollers *i*, and combined with the spring-lever C and cutter *g*, all arranged substantially as herein shown and described.

2. The holder for the glass to be cut, consisting of the adjustable tube E, horseshoe-plate *m*, spring-rod K, and plate *n*, all arranged substantially as herein shown and described.

3. The standard A provided with casters, as described, and combined with the table B provided with the upwardly-projecting flange, substantially in the manner herein shown and described.

117,209.—Folding Chair and Life-Preserver. — J. Max Rudiger, Brooklyn, N. Y.

Claim.—A folding chair, having the buoyant seat B and the buoyant piece D of the legs combined and operating together so as to convert the chair into a life-preserver, in the manner described.

117,210.—Coffee-Pot.—Franklin I. Sage, Cromwell, Conn.

Claim.—The combination, with a Britannia-metal pot, A, of a strainer, B, applied to a rod, C, which is held in place at its extremities by pieces *a* and *g*, substantially as described.

117,211.—Anti-Friction Axle-Box.—Peter Seyl, Peter Fischer, and Philipp Brenner, Chicago, Ill.

Claim.—1. A hub for wagons or carriages, consisting of the body A with the inwardly-projecting flange *g*, and the ring E provided with a similar flange, *i*, with the friction-rollers F mounted therein, substantially as described.

2. In combination with a hub, as above described, the ring B applied thereto, as set forth.

117,212.—Wood Pavement.—William E. Shaw, Portland, Me.

Claim.—The wood pavement herein described, consisting of the lozenge-shaped blocks B B, locked together by means of alternate wedge-shaped and recessed ends, substantially as and for the purposes herein set forth.

117,213, antedated July 15, 1871.—Self-Adjusting Cart and Brake.—Isaac Showalter, Chester county, Pa.

Claim.—1. The combination of a tilting cart-body with a connecting device, K I G S S, or its equivalent, extending under the cart-body from the rear end thereof to the yoke or harness of the team, substantially as described, and for the purposes specified.

2. The combination of the sliding plates D D, the shafts S' S' hinged to the plates, the sliding bar G, the lever I, and the rod or chain K, substantially as and for the purpose set forth.

3. The combination of a cart-brake, F, and a tilting-rod, K, operating as described, with a single sliding bar, G, whereby both brake and rod are operated at the same time by the same force, substantially as described.

4. The locking device R T *t t'*, when combined with the sliding shafts, the automatic brakes, and the automatic tilting apparatus, substantially as described, for the purpose set forth.

117,214.—Halter-Buckle.—Philip A. Snyder, Butlerville, Ohio.

Claim.—The halter-buckle herein described, composed of the three wings A B C, with cross-bars *a b c* and tongues, all arranged substantially as specified.

117,215.—Cultivator.—Jacob W. Spangler, Jackson township, Pa.

Claim.—The arms I I having their lower extremities constructed with a double curve, as shown, in combination with the plow-shanks *i i* constructed with slots and slotted elbows, as described, substantially as and for the purpose specified.

117,216.—Hard-Rubber Trunk.—William C. Spellman, Hartford, Conn.

Claim.—As an article of manufacture, a trunk having a body and cover composed entirely of hard rubber lined with deodorized soft rubber, substantially as described.

117,217.—Journal-Box and Axle-Bearing.—Sylvester T. F. Sterick, Georgetown, D. C.

Claim.—1. An axle-bearing, composed of roller with movable pivots and a revolving frame, the whole constructed and operating in the manner shown and described.

2. An axle-bearing or journal-box, composed of rollers with movable pivots, a revolving frame with a flange upon said box on the inner side, the whole constructed and arranged to operate in the manner described and set forth.

117,218. — Skein-Twisting Machine.—Thomas Stibbs, Wooster, Ohio.

Claim.—The combination of the shaft *a*, pin *i*, notched or shouldered bearing or box *k*, clutch *c*, spring *h*, loose pulley *d g*, and hook *o*, substantially as shown and described.

117,219.—Printing-Press.—Robert J. Stuart, Yonkers, N. Y.

Claim.—1. The combination, with a reciprocating inking-table, A, of a series of sectionally-constructed color-rollers F F' F², arranged to rise and fall in relation to said bed and to color-fonts E E' E², arranged above the latter and provided with distributing-rollers, substantially as specified.

2. The sectionally-constructed color-rollers F F' F², composed of detachable bushes of any desired length or lengths, and faced with rubber, in combination with washers inserted between the sections to hold the rubber from spreading, essentially as specified.

3. The combination of the cams *k* and lifters L with the inking-table A, type-bed B, and inking-roller H, whereby the latter is operated by the reciprocating action of the type-bed, combined substantially as specified.

4. The combination of the adjustable tripping-toe *s* and slotted arm of cam K, substantially as specified.

117,220.—Loom-Shuttle.—Earl Amri Thissell, Lowell, Mass.

Claim.—The pivoted spring D, in connection with the arm C of the spindle B or its equivalent, substantially as described, and for the purposes set forth.

117,221.—Refrigerator.—Joseph Ramon Torres, New Orleans, La.

Claim.—The refrigerator herein described, consisting of the case C, ice-chamber B having pipe G for connection with a separable water-cooler, inclined bottom strainer H, partition C', and preserving-chamber B', all combined and arranged substantially as specified.

117,222.—Lime-Kiln.—David H. Turbett, New Bloomfield, Pa.

Claim.—In the lime-kiln A herein described, the arrangement of the lining *a*, arch D, chimney E, sliding doors *b*, and damper *c*, when all constructed and arranged as and for the purposes set forth.

117,223. — Floating-Dock. — Henry Van Keuren, Jersey City, N. J., assignor to himself and William Van Keuren, same place.

Claim.—1. The frame *a*, forming the bottom of the floating tidal dry-dock and receiving upon its upper side the planking *b*, with the stop-water plugs *i* beneath the plank-shear, for the purposes and as set forth.

2. The air-tubes *c c* between the timbers of the frame *a*, and passing up through the bottom of the dock and provided with movable caps, as and for the purposes set forth.

117,224. — Hoisting Apparatus. — Tilghman R. Vestal, Santa Fé, Tenn.

Claim.—1. The arrangement, in the shed A B, of the two pivoted rollers C D, the single rope E, and hand-wheel G, as and for the purpose specified.

2. The improved hand-wheel G, consisting of two ring-plates combined with four spokes attached to the center of the sides of the shaft and other four notched and fitted upon the corners thereof, as set forth.

3. In combination with shed A B, rollers C D, rope E, and wheel G, the sliding bar H, arranged as and for the purpose specified.

117,225.—Hot-Air Furnace.—John J. Vogelgesang, Columbus, Ohio.

Claim.—The fire-pot D, fire-basket D', grate F, openings *d'*, rod *f*, register *f' f²*, and cylinder E, constructed and arranged substantially as and for the purpose specified.

117,226. — Shutter-Worker. — Lewis H. Watson, Pittsburg, Pa.

Claim.—The shaft C, crank E, lever F, and slotted plate G, when combined to operate as described.

117,227, antedated July 13, 1871.—Sash-Cord Fastener. — George A. Wilbur, Woonsocket, R. I.

Claim.—The sash-rope fastening herein described, consisting of the cylindrical spring F, parted at *h* and perforated at K, substantially as and for the purposes herein set forth.

117,228.—Construction of Tea and Coffee-Pots.—Linus H. Williams, Cromwell, Conn.

Claim.—The cast white-metal chamber-section B, to which the tinned-copper or other analogous bottom C is connected, in combination with the tinned-metal-chamber section A, and the capping cast white-metal section D, all united by lap-joints, the inner edges of which are of cast white metal, all as and for the purpose therein described.

117,229.—Liquid-Meter.—David Williamson, New York, N. Y., assignor to himself and Eugene Bissel, same place.

Claim.—1. Two cylinders, moving one within the other, and provided with induction and eduction-ports, and connected with two moving pistons or wings, substantially as set forth, so that the induction and eduction ports to one piston shall be operated by the other piston without varying its own ports, substantially as set forth.

2. Two cylinders acting as eight-way cocks, with supply and discharge-pipes at the ends of the cylinders, and a diaphragm within the inner cylinder, in combination with the moving piston, and cases containing said pistons, substantially as set forth.

117,230.—Planing-Machine.—Solomon A. Woods, Boston, and George E. Woodbury, Cambridge, Mass.

Claim.—1. The arrangement of the mechanism by which the upper feed-roll is adjusted under the machine or in the under part of the frame, said mechanism consisting of the cross-shaft *r* and its bevel-pinions *q*, said pinions meshing into and driving the bevel-pinions *p* on the vertical screw-shafts *o*, and which, by means of vertically-sliding connecting-rods *j*, which work in grooves in the standards *e*, support and move the upper feed-roll, substantially as shown and described.

2. The weighted levers *s*, stirrups *w*, yokes *u*, bars *z*, screw-shafts *o*, nut-pieces *n*, and rods *j*, combined, substantially as shown and described.

3. The sectional feed roll *g*, furnished with feed-teeth or spurs *m*, and removably attached to the shaft *k* and main feed-roll *f*, substantially as shown and described.

4. The journal-stand e^3, combined with the frame *a* and adjustable laterally thereon, and having the inclined journal-supports d^3, upon which the journal-boxes b^3 of the cutter-cylinder are adjusted vertically, all substantially as shown and described.

5. The pressure-bar e^3, adjustably mounted on arms f^3, pivoted upon the yoke e^2, substantially as shown and described.

6. The combination, with the journal-yoke c^4, of the laterally-adjustable stand d^3 extending across in front of the cutter-cylinder to connect the journal-boxes, substantially as shown and described.

7. The adjustable shoe-pieces e^3, in combination with the slotted yoke-bar c^4 projecting from the journal-stand, substantially as shown and described.

8. In combination with the vertical cutter-cylinders, the plates or supports g^3, made adjustable with reference to the cutter-cylinders, substantially as shown and described.

9. The arrangement, shown and described, of the under cutter-cylinder h^3 and its boxes P with the wedges s^3 on the ends of screws p^3, by rotation of which screws the cutter-cylinder is adjusted vertically, substantially as shown and described.

10. The rest r^3 and swinging table d^4 at the back and front of the under cutter-cylinder h^3, each made adjustable toward or from the cutter-cylinder and combined therewith, substantially as shown and described.

11. The shoe-bar u^3, made adjustable vertically, but pivoted at one end, so that it may be swung up into vertical position, substantially as shown and described.

12. The work-supporting and adjustable swinging table d^3, in combination with the cutter-cylinder h^3, substantially as shown and described.

117,231. — SELF-ACTING MULE FOR SPINNING.—Edward Wright, Worcester, Mass.

Claim.—1. In combination with the fast pulley *c*, loose pulley *d*, and ring *h*, the pulley *e*, loose upon the shaft, but connected to and driving the shaft by means of a pin working through a slotted pawl, which is thrown out of connection with its ratchet when the belt is on the pulley *c*, substantially as described.

2. In combination with the draft-scroll, the prolonging-arm k^2 pivoted upon the scroll-shaft and jointed to the slotted arm l^2 or its equivalent, and made adjustable in position with reference to the scroll-wheel groove, substantially as shown and described.

3. In combination with the escape-lever c^2, escape-wheel d^2, and the cam-shaft, the rocking rod g^2, provided with one or more arms and arranged to be operated by the movements of the carriage to effect the movements of the cam-shaft, substantially as described.

4. In combination with the escape-lever c^2, escape-wheel d^2, and the lever e^4, the spring or its equivalent for holding the lever in position, substantially as described.

5. The slow-return lever k^2, gear n^2, pinion o^2, stud p^2, pulley s^2, chain q^2, pulley r^2, and slide-bar s^2, combined and arranged to operate substantially as shown and described.

6. The adjustable runner or shoe y^2, in combination with the slide s^2, pulley x^2, and hook u^2.

7. In combination with the slow-return gear n^2, slide s^2, and pulley x^2, the friction-washers c^4 for permitting said gear to turn on its shaft, substantially as and for the purpose described.

8. The combination of the rotary stop-rod g^2 and the movable fork-arm i^2, substantially as and for the purpose described.

9. The sliding sheave or pulley y^2, in combination with the connecting-yoke u^2 and the scroll-cord-guide sheave o^2.

117,232.—BUCKLE.—William Yost, Butlerville, Ohio.

Claim.—The buckle herein described, having frame A, bars *a b c d e f*, and tongues *c' c''*, constructed and arranged substantially as specified.

117,233. — COMPRESSION-BIB. — William Young, Easton, Pa.

Claim.—The lower valve D, provided with spring *b*, and arranged so as to be kept constantly open by the compression of the upper valve, and closed by the action of the water, aided by the spring, when the upper valve is removed, substantially as and for the purposes herein set forth.

117,234.—FRICTION-CLUTCH.—George Clisbee, Marlborough, Mass.

Claim.—1. The combination of the yoke D with the cam-shaped ways or inclined planes F, for the twofold purpose of locking the pulley A with the friction-collar C when it is desired to set the mechanism in motion, and of applying the friction-brakes when it is desired to stop it, in the manner and for the purpose substantially as herein shown and described.

2. The yoke D and the inclined planes or cam-shaped ways F, held upon the shaft by means of the collar G, and so arranged as that by the adjustment of the latter the horizontal motion of the pulley may be changed, more or less, to compensate for wear of the friction-collar, or said pulley, or for other purposes, as herein shown and described.

117,235. — DITCHING-MACHINE.—Benjamin Rhett, Abbeyville, S. C.

Claim.—1. The arrangement of the main frame A B of a ditching-machine upon the axle of its supporting-wheels in such manner as to admit of horizontal adjustment to exert the requisite degree of tension upon the driving-bands or chains operating the endless apron of the buckets when the elevation of the digging-frame is changed, as herein shown and described.

2. The arrangement of the frame E carrying both the colters I J and the endless apron of buckets F, in combination with the bracing-rods R, connecting the two frames together in the line of draft, so that the said digging-frame may be lowered by means of the rack *b* and pinion *a*, and inclined more or less, as may be desired, as herein shown and described.

3. The buckets of the endless apron F, constructed with a concave bottom, deeper in the center adjacent to the holding-rib, and becoming flush with said rib at either side and at its discharging end to discharge the dirt more equally onto the delivering-spout W, as shown and described.

4. The combination of the main frame A B, mounted upon its axle C so as to be horizontally adjusted, the frame E carrying the circular and plow-colters I J at its lower end, and the pulley K and trough W at its opposite end, the driving-chains or bands M for giving motion to the endless apron F, having buckets, as described, and the adjustable guide-wheel V, the whole arranged and operating as herein shown and described.

117,236.—CAP FOR PRESERVE-JARS.—William Taylor and Charles Hodgetts, Brooklyn, N. Y., assignors to Louis R. Boyd, New York city.

Claim.—The combination, with the cap or cover of a fruit-jar or other vessel, of a separate plate, lining, disk, or shield, of glass, porcelain, or other equivalent incorrodible material, substantially as and for the purpose described.

REISSUES.

4,470. — TRIP-HAMMER.—John C. Butterfield and James Hay, Chicago, Ill.—Patent No. 108,326, dated October 18, 1870.

Claim.—1. The combination of the frame D and springs J C with the hammer-beam H and hammer P, when made as and for the purposes hereinbefore specified.

2. The combination of the frame D and springs J C with the hammer-beam H, the hammer P, and shaft F, when made and operating in the manner hereinbefore specified.

3. The combination of the frame D and springs J C with the hammer-beam H, shaft F, and standards *g g*, when made and operating in the manner and for the purposes hereinbefore specified.

4. The combination of the frame D, the springs J C, and hammer-beam H with the adjustable sleeve R, rod or pitman U, the eccentric Y, and plate V, when made and operating in the manner hereinbefore specified.

5. The combination of the frame D, the springs J C, and hammer-beam H with the adjustable sleeve R, the pitman U, and eccentric Y, when made and operating in the manner hereinbefore specified.

6. The combination of the frame D, the springs J C, and hammer-beam H with the pitman U, strap Z, eccentric Y, and plate V, when made and operating in the manner hereinbefore specified.

7. The combination of the frame D and springs J C with the hammer-beam H, the pitman U, the adjustable sleeve R, the eccentric Y, and shaft *n*, when made as and for the purposes hereinbefore specified.

4,471. — Division A. — GUN-CARRIAGE.—James B. Eads, St. Louis, Mo.—Patent No. 93,691, dated August 17, 1869.

Claim.—1. The improved device above described, or its equivalent, for utilizing the recoil of heavy guns, consisting of the vibrating frame B, shaft C, gears I I, springs K K, pinions *b b*, shaft J, ratchet *d*, and pawl *e*, all substantially as shown and set forth.

2. The above device, in combination with springs H H arranged on the frame D, as and for the purpose specified.

4,472. — Division B. — GUN-CARRIAGE.—James B. Eads, St. Louis, Mo.—Patent No. 93,691, dated August 17, 1869.

Claim.—1. The combination of a gun with a cylinder, in which air of the natural density is used to take up and store the force of recoil for the purpose of restoring the gun again to the position for firing.

2. The combination of the gun A, frame B, carriage D, plunger L, and cylinder M, as and for the purpose set forth.

4,473.—ROLLER FOR CLOTHES-WRINGERS, &c.—John F. Holt, Providence, R. I., assignor, by mesne assignments, to The Boston Belting Company, Boston, Mass. Patent No. 49,030, dated July 25, 1865; reissue No. 3,930, dated April 19, 1870.

Claim.—1. A roll of vulcanized India rubber for wringing and other like machines, having its body secured to the shaft by means of a cord or strip of metal or other inelastic substance wound around and fastened to the shaft so as to be incapable of turning thereon, and at the same time embedded and enveloped in the roll, as and for the purposes set forth.

2. The method of binding upon the mandrel or shaft, by means of a strip or cord of metal or other inelastic substance wound around it so as to be incapable of turning thereon, a strip or layer of unvulcanized rubber, and finishing the roll upon such strip or layer so bound, substantially in the manner herein described, so that the outer portion of the roll may be united, by the act of vulcanizing, with the strip or layer bound on the shaft.

3. Constructing the roll, for the purposes hereinbefore stated, by combining, with a spirally-grooved mandrel, a preliminary thickness or layer of vulcanizable compound, bound thereon by means of a suitable inelastic cord, braid, or thong wound over said sheet or layer in the spiral groove around said mandrel, and a suitable cylindrical body of vulcanizable compound, and afterward vulcanizing the whole together, as herein described.

4. A wringer-roll, composed of a vulcanized India-rubber body fixed upon its shaft by means of a cord or thong of suitable material, which, while embedded in and forming part of the body of the roll, is wound spirally around and secured to the shaft, substantially as and for the purposes set forth.

4,474.—CULTIVATOR. — Leonard Packard, Galesburg, Ill.—Patent No. 25,037, dated August 9, 1859.

Claim.—1. The plates *a* and longitudinally-slotted plates *b*, secured to the forward ends of the beams D, and pivoted by rods F to the bar E so as to permit of the plows being moved in a vertical or lateral direction by lever G, as and for the purposes set forth.

2. The interchangeable standards M, adjustably secured to the beams D and braces N, for the purposes set forth.

3. The combination of the pivoted beams D and adjustable standards M with plates *a b*, and rods F, bar E, and lever G, substantially as and for the purpose set forth.

4,475.—HYDRANT.—Washburn Race, Lockport, N. Y., and S. R. C. Mathews, Philadelphia, Pa., assignors to S. R. C. Mathews.—Patent No. 19,206, dated January 26, 1858.

Claim.—1. The protecting-case or jacket E surrounding the stock or body of the hydrant in such a manner that both the hydrant and the case, or the hydrant alone, may be detached and removed, substantially as and for the purpose set forth.

2. The dead-air or non-conducting chamber formed between the stock *b* and inclosing-jacket E, arranged intermediately between the main pipe D and top *a*, substantially as and for the purpose set forth.

3. The annular yoke B' on the valve-rod C for steadying the rod C and centering the valve G, and also preventing any vibration of said rod or valve when the hydrant is opened, as set forth.

4. The valve G, constructed of the two parts *n o* and packing *q*, in combination with the rod C, substantially as and for the purpose set forth.

5. The annular valve B' and the disk-valve G attached to the rod C, in combination with the escape or leak-openings *j*, when arranged to operate as and for the purposes set forth.

4,476.—APPARATUS FOR CARBURETING AIR. Byron Sloper, St. Louis, Mo.—Patent No. 115,988, dated June 13, 1871.

Claim.—1. An air-gas chandelier or lamp, provided with an automatic valve for admitting and shutting off the air so that the carbureter may be heated, as and for the purposes specified.

2. The carbureter A, in combination with the automatic valve F, as and for the purpose described.

4,477.—SILVERING GLASS FOR MIRRORS AND REFLECTORS.—William Augustus Walker, New York, N. Y., assignee of Henry Balen Walker, deceased. — Patent No. 97,838, dated December 14, 1869.

Claim.—1. A mirror or reflector, consisting of any desired form of glass, having a silver coating applied thereto by the use of the silvering compounds, substantially as described.

2. A coating of shellac, dissolved in alcohol or its equivalent, applied to the silver coating for the purpose of protecting the same, as set forth.

3. The compound of litharge, red lead, and oil, applied as an outer coating for protecting the silvering and the shellac coating, as set forth.

4,478.—STEAM-PUMPING ENGINE.—Norman W. Wheeler, Morristown, N. J.—Patent No. 115,670, dated June 6, 1871.

Claim.—1. The combination and arrangement, in relation to each other, of the stand-pipe *w*, distributing-cup *s*, and exhaust-pipe Y, substantially as and for the purposes described.

2. The combination of the valve M, exhaust-pipes Y Y, and stand-pipes *w w*, substantially as and for the purposes described.

3. The combination and connection of the valve M with the working vessel P^1, and valve-thrower *h i k*, substantially as and for the purposes described.

4. The combination of the tubes *h*, barrel *i*, diaphragm *k*, and working vessel P^2, substantially as and for the purpose set forth.

5. The combination of the steam-pipe O, passages *c c*, and valve M, when they are so arranged as to

supply the boiler with water, substantially as described.

6. The combination of the automatically-operated valve M with the two working vessels P^1 P^2 and the two condensing stand-pipes w w, substantially as and for the purposes described.

7. Actuating a valve, as M, in two or more directions, by means of pressure of secondary steam generated in the manner and in the apparatus, substantially as described.

DESIGNS.

5,127.—GROUP OF STATUES.—Hans Christian Brix, Copenhagen, Denmark.

Claim.—1. The herein-described group of statuary, representing our Savior Jesus Christ and His twelve apostles, arranged as shown.

2. The above group of statuary, with a background representing a vine with its leaves and bunches of grapes surrounding the niches in which each individual figure is placed, substantially as shown.

5,128. — SHOW-CASE. — William H. Core, New York, N. Y.

Claim.—The design for a show-case, as set forth.

5,129.—CLOCK-FRONT.—William H. Griffiths, Boston, Mass.

Claim.—The design for a clock-front, substantially as shown by the accompanying photographs.

5,130.—JELLY-GLASS. — Thomas Rollason Hartell, Philadelphia, Pa., assignor to Hartell & Letchworth, same place.

Claim.—The design for a jelly-glass, as shown in and by the accompanying drawing.

5,131.—TABLE-CASTER.—Cyrus H. Latham, Lowell, Mass., assignor to himself, Edward P. Woods, and Daniel Sherwood, same place.

Claim.—The design for a table-caster, substantially as shown and described in the accompanying drawing.

5,132.—CAKE-PAN. — Adam Reid, Buffalo, N. Y.

Claim.—The design for a cake-pan, as shown and specified.

TRADE-MARKS.

372.—SALT.—Francis Baker, Boston, Mass.

373.—CASTOR-OIL.—H. J. Baker & Bro., New York, N. Y.

374.—CASTOR-OIL.—H. J. Baker & Bro., New York, N. Y.

375. — SUGAR CORN. —James P. Baxter, Portland, Me.

376.—MINERAL OIL FOR ILLUMINATING.—Bostwick & Tilford, New York, N. Y.

377.—MINERAL OIL FOR ILLUMINATING.—Bostwick & Tilford, New York, N. Y.

378.—COMPOSITION CAR AND OTHER BEARINGS.—Jackson & Wiley, Detroit, Mich.

379.—PAINT.—Oliver Johnson & Co., Providence, R. I.

380.—MEDICINE.—Simon Henry Kennedy, Johnstown, N. Y.

381. — WOOD-WORKING.—McBeth, Bentel & Margedant, Hamilton, Ohio.

382.—CRACKERS.—William N. Monies and Lewis Pughe, Scranton, Pa.

383. — CHEMICAL, PHARMACEUTICAL, AND GALENIC PREPARATION.—F. E. Suire & Co., Cincinnati, Ohio.

384.—PAINT.—The Averill Chemical Paint Company, New York, N. Y., and Cleveland, Ohio.

385. — PAINT. — George T. Young & Co., Plainfield, N. J.

386. — PAINT. — George T. Young & Co., Plainfield, N. J.

EXTENSIONS.

JOHN P. MANNY, of Rockford, Ill.—Letters Patent No. 17,798, dated July 14, 1857; reissue No. 3,580, dated August 3, 1869.—Division A.

"Improvement in Harvesters."

Claim.—1. The platform, constructed with converging sides, operating to compress the gavel while being discharged, as set forth.

2. The combination, with a rake-head, of teeth, pivoted to vibrate in a vertical plane parallel with the rake-head, but rigidly supported against lateral strains, as set forth.

3. The combination, substantially as set forth, with a platform gradually diminishing in width from front to rear, of a rake, having teeth pivoted to vibrate in a vertical plane parallel with the rake-head.

4. The combination, with a vertical rake-shaft, of a rake-head, oscillating in a vertical plane parallel to its length, and connected with the shaft by parallel bars, substantially as set forth.

5. The combination of a platform vibrating about the main axle, reel-supports vibrating with the platform, and an oscillating rake also vibrating vertically in conformity with the movements of the platform, the combination being and operating substantially as set forth.

6. The cam-guide, pivoted between the shaft and the rake-head, substantially as set forth.

7. The combination of a rake, turning on a vertical axis, with a cam-guide, vibrating vertically in unison with the movements of the platform about the main axle, the combination being and operating substantially as set forth.

8. The combination, with a pivoted cam-guide, of a rake-arm, pivoted to and turning with a vertical shaft, the combination being and operating substantially as set forth.

9. The combination, in a two-wheeled harvester, of a rake, turning on a vertical axis between the plane of the wheels, with a cam-guide, also pivoted between the plane of the wheels, the combination being and operating substantially as set forth.

JOHN P. MANNY, of Rockford, Ill.—Letters Patent No. 17,798, dated July 14, 1857; reissue No. 3,581, dated August 3, 1869.—Division B.

"Improvement in Harvesters."

Claim.—1. The combination, with a platform vibrating about the main axle of a rake, moving over the platform in the arc of a circle, the combination being and operating substantially as set forth.

2. The combination of a platform and reel-supports, vibrating about the main axle, with a rake, moving over the platform in the arc of a circle, the combination being and operating substantially as set forth.

3. The combination of a rake with a platform, suspended from a frame vibrating about the main axle, the combination being and operating substantially as set forth.

4. The combination of a frame, vibrating about the main axle, two driving-wheels, and a rake, moving in the arc of a circle over a platform suspended between the planes of the wheels, the combination being and operating substantially as set forth.

5. The combination of a vibrating frame, a platform, vibrating with the finger-beam around the main axle, and a rake, moving over the platform in a circular path, the combination being and operating substantially as set forth.

6. The combination of a platform, vibrating about the main axle, a rake, supported between the planes of the wheels, and a coupling-piece, interposed between the platform and raking mechanism, which secures the conformity of the movements of the rake with those of the platform, in passing over uneven ground, the combination being and operating substantially as set forth.

7. The combination of a rake with mechanism for adjusting the rake, finger-beam, and platform, so arranged that the driver can operate the adjusting-mechanism without stopping the machine, substantially as set forth.

JOHN P. MANNY, of Rockford, Ill.—Letters Patent No. 17,779, dated July 14, 1857; reissue No. 3,524, dated June 29, 1869.—Division A.

"Improvement in Harvesters."

Claim.—1. The combination, substantially as set forth, in a rear-cut harvester, of two main wheels; a frame vibrating about the main axle; a tongue, hinged within the periphery of the wheels; and a laterally-projecting finger-beam, vibrating with the frame.

2. The combination, substantially as set forth, in a rear-cut harvester, of two main wheels; a frame, arranged between said wheels, and vibrating about the main axle; a finger-beam, projecting laterally from said frame; and a tongue, hinged to said frame near the axle.

3. The combination, substantially as set forth, of two main wheels; a vibrating frame, arranged between the wheels, and projecting beyond their periphery at the rear end only; a laterally-projecting finger-beam, secured to the rear of said frame; and a tongue hinged to the forward end of said frame, near the axle.

JOHN P. MANNY, of Rockford, Ill.—Letters Patent No. 17,779, dated July 14, 1857; reissue No. 3,525, dated June 29, 1869.—Division B.

"Improvement in Harvesters."

Claim.—1. The combination, substantially as set forth, of a finger-beam, projecting laterally from a frame vibrating about the main axle, with a hinged supplementary frame supported behind said axle by a caster-wheel.

2. The combination, substantially as set forth, of two main wheels, a frame pivoted near the axle of said wheels in front, and supported by a caster-wheel in rear, and a vibrating frame, carrying a laterally-projecting finger-beam suspended from the caster-frame by flexible connections.

3. The combination, substantially as set forth, of two main wheels, a main frame, vibrating about the main axle, and carrying a laterally-projecting finger-beam, with a frame pivoted near the axle, supported at its rear end by a caster-wheel, and carrying devices for raising and lowering the finger-beam.

4. The combination, substantially as set forth, of two main wheels, a vibrating main frame, and a laterally-projecting finger-beam, with lifting-devices, and a driver's seat mounted on a vibrating frame behind the axle.

5. The combination of a laterally-projecting finger-beam, a frame, vibrating about the main axle, a supplementary frame, supported by a caster-wheel, a tension-spring and lifting-cord, the combination being and operating substantially as set forth.

6. The combination, substantially as set forth, in a two-wheeled rear-cut harvester, of a tongue, a frame carrying a laterally-projecting finger-beam, and a frame carrying lifting-devices, and a conductor's seat, the tongue and frames each being independently hinged near the main axle, and moving independently of each other.

JOHN P. MANNY, of Rockford, Ill.—Letters Patent No. 17,779, dated July 14, 1857; reissue No. 3,526, dated June 29, 1869.—Division C.

"Improvement in Harvesters."

Claim.—1. The combination, substantially as set forth, of two main wheels; a frame connected with the main axle in front, and supported by a caster-wheel in rear; a frame vibrating about the main axle; a laterally-projecting finger-beam, connected with the frame; and a platform vibrating with the finger-beam.

2. The combination, substantially as set forth, of a laterally-projecting finger-beam, vibrating about the main axle, with a platform, vibrating about the finger-beam, so as to raise the rear end of the platform as the finger-beam is lowered, and vice versa, to keep the platform horizontal.

3. The combination, substantially as set forth, in a two-wheeled harvester, of a laterally-projecting finger-beam, vibrating about the main axle, with reel-supports and a platform, both vibrating in unison with the finger-beam.

LYMAN F. MUNGER, of Rochester, N. Y.—Letters Patent No. 17,804, dated July 14, 1857; reissue No. 62, dated April 2, 1861.

"Improvement in Locks."

Claim.—1. A series of wheels, W, revolving on a common center and provided with teeth or indentations at their peripheries for changing their position relatively with other wheels, V, or their equivalents, when each of the wheels W aforesaid has a pin projecting from its side or sides, so placed as to interlock with similar pins in the wheel or wheels next adjoining it, to operate substantially as and for the purpose herein set forth.

2. The combination of the wheels W with the wheels V, or their equivalents, when the latter are arranged or placed on an adjustable axis or shaft, specifically as herein shown, for the purpose of connecting and disconnecting the wheels W and the wheels V, or their equivalents, as herein specified.

DANIEL PRATT, of Prattville, Alabama.—Letters Patent No. 17,806, dated July 14, 1857.

"Improvement in Cotton-Gins."

Claim.—The ledge e, secured or placed within the hopper or box E, as shown, so as to close the central portion of the lower end of the hopper or box and cause the cotton when fed into the box, as described, to be fed spirally to the saws from the center of the box toward each end, for the purpose set forth.

EDWARD F. WHITON, of Stafford Springs, Conn.—Letters Patent No. 17,814, dated July 14, 1857.

"Improved Centering-Machine."

Claim.—Arranging the laterally-adjustable notched holder d d in such a manner in relation to the longitudinally-adjustable spindle C and its pointed marker p as to enable the ends of shafts of various sizes to be centrally marked, substantially as herein set forth.

MARY J. KELSEY, of Brooklyn, N. Y., administratrix of WILLIAM S. GALE, deceased.—Letters Patent No. 17,855, dated July 21, 1857.

"Means for Rendering Joints Steam-Tight."

Claim.—The method herein described of causing steam to become a packing to itself in steam-cylinders, or other parts of steam machinery, by allowing the steam to act in one or more grooves, substantially as specified.

JOHN B. SLAWSON, of New York, N. Y.—Letters Patent No. 17,899, dated July 28, 1857; reissue No. 550, dated May 4, 1858; reissue No. 4,240, dated January 24, 1871.

"Improvement in Passenger-Fare Boxes."

Claim.—1. A fare-box, composed of two compartments so combined that the fare, on being deposited through an opening in one of them by the passenger, without the intervention of the driver or conductor, shall be temporarily arrested therein for examination and inspection by the driver or conductor, through an opening therein covered by a transparent medium, and then, when approved of, transferred directly to the second or general receiving-compartment, which, as well as the first, is made inaccessible, except by violence, to the driver or other unauthorized person, for the purpose set forth.

2. A fare-box, having two compartments, into one of which the fare is first deposited and temporarily arrested previously to its being deposited in the other, when the former is provided with openings covered or protected by transparent mediums or devices so arranged that the passengers can see through one and the driver or conductor through the other, in the manner substantially as and for the purpose set forth.

ISSUE OF JULY 25.

PATENTS.

117,237.—COUNTERSINK.—Sewall L. Abbott, Deering, Me.

Claim.—The countersink, constructed as herein described, that is, having the oval-shaped cutting portion, seen in section in Fig. 3, the tapering point, the inner cutting-edge *e*, the point *d*, and the gauges *f*, as herein set forth.

117,238.—STRAW-CARRIER FOR THRASHING-MACHINES.—Otis Abell, Witoka, Minn.

Claim.—The endless carrier H, provided with stripe E, the plate F, boards D, and side pieces C, when said parts are constructed, combined, and arranged for operation, substantially as and for the purpose set forth.

117,239.—PRINTING-TELEGRAPH APPARATUS.—George L. Anders, Boston, assignor to E. B. Welch, Cambridge, Mass.

Claim.—1. The method of operating one or more telegraph-printing instruments in a circuit by the transmission of electrical currents alternating in their direction to secure the selection of a character on the type-wheel, and subsequently taking an impression of the same by the transmission of a final, separate, and distinct current in the same direction as the one preceding, substantially as described.

2. The employment of one electro-magnet in a telegraph-printing instrument whose electro-motive force is applied to the selecting or impressing parts of said instrument through the agency of a permanent magnet, when said permanent magnet does not control an electrical circuit, thus avoiding the use of an automatic polarized or other circuit-breaker, and insuring a steady resistance in a circuit containing one or more instruments.

3. The plate B provided with the graduated slot or orifice C, and the plate E provided with pivoted guide X, in combination with the director D, as and for the purposes specified.

4. The plates B E provided with the rectangular lever O, pawl P, and arm T actuated by the vibrating armature, in combination with the type-wheel G having ratchet J, substantially as described.

5. The type-wheel G provided with arm L, in combination with one or more spring-detents or stops, N, operating, in connection with spring K, in such manner as to arrest the wheel in its backward motion and hold the same in any desired position, substantially as described.

6. The sliding plates B E, in combination with the rectangular lever *p* and pivoted feed-plates *r*, substantially as described.

117,240.—RECORD-BOOK.—Henry Arden, Brooklyn, N. Y., assignor to John C. Smith, same place.

Claim.—1 The arrangement in a book of two series of index-letters, *a b*, upon opposite sides of its leaves, substantially as and for the purposes specified.

2. The arrangement of a series of index-letters, *c*, upon the inside of one or both of the book-covers, as described, and for the purposes specified.

117,241.—TANNING COMPOUND.—Abel T. Atherton, Lowell, Mass.

Claim.—1. The process, as herein described, of making a tanning compound.

2. The tanning compound, as described, as a new article of manufacture.

117,242.—LEVER-STAFF FOR WATCHES, &c.—William E. Banta, Springfield, Ohio.

Claim.—The lever-staff *a* or its equivalent, constructed to operate in connection with the lever *c* and with a balance-wheel arranged to vibrate in the bend of said lever-staff, thus giving more length to the lever-staff *a* without taking up any more space in the watch than is allotted to the ordinary shorter lever.

117,243.—HORSE-RAKE TEETH.—Jonathan B. L. Bartlett, North Jay, Me.

Claim.—The perforated plate D, in combination with the rods *b'* and tooth A, constructed and arranged substantially as and for the purpose specified.

117,244.—WATER-WHEEL.—Joseph Bell, Carrollton, Mo.

Claim.—The spiral wheel B with the buckets F, in combination with the cylinder C and inclined chutes I I, when the same are constructed and arranged to operate substantially as and for the purposes described.

117,245.—GUN-LOCK.—William N. Bennett, Illyria, Iowa.

Claim.—The combination of the slotted arm C and lever D with the trigger A, substantially as shown and described.

117,246.—CONSTRUCTION AND MODE OF WORKING BLAST-FURNACES.—Henry Bessemer, London, England.

Claim.—1. The entirely enveloping the masonry or brick-work of a blast-furnace in a strong air-tight case or jacket, to admit of the gaseous products of combustion being retained under considerable pressure.

2. The inclosing the bosshes of blast-furnaces, so as to have the tuyere-holes opening externally into a large chamber accessible to workmen and containing air under pressure.

3. The inclosing the tap-hole of blast-furnaces in a large chamber capable of containing air under pressure, so that the pressure of air therein may, when required, prevent escape of flame thereat.

4. The providing outlets from a blast-furnace near the tuyeres for the escape of a portion of the gases in the state of carbonic acid.

5. The so arranging and operating, when a carburizing-vessel is used, that the metal may run continuously from the blast-furnace into the carburizing-vessel.

6. The smelting ores of iron in blast-furnaces, in which the gaseous products of combustion are retained throughout the furnace under a pressure considerably exceeding that of the external atmosphere.

7. The combining an air-engine and air-pump with a high-pressure blast-furnace in such manner that the gases issuing from such furnace are caused to pass through and work such engine, and thereby actuate the pumps which supply the blast to the furnace.

117,247.—FURNACE FOR THE MANUFACTURE OF MALLEABLE IRON AND STEEL.—Henry Bessemer, London, England.

Claim.—1. The employment of a vertical feeding-chamber for supplying scrap or other decarburized or uncarburized malleable iron or steel to reverberatory furnaces, where its fusion takes place under pressure of confined gaseous matters.

2. The arranging piles of scrap or other malleable iron or steel raised on supports on the hearths of reverberatory furnaces, in which the fusion of the metal is effected under high pressure of gaseous matters confined therein, and the forming such furnaces with a feeding-door at their ends to facilitate the introduction of such piles.

3. The constructing reverberatory high-pressure furnaces employed for the fusion of scrap or other decarburized or uncarburized malleable iron or steel with a movable roof or arch.

4. The cooling the outer shell or iron casing of reverberatory high-pressure furnaces employed for the fusion of scrap or other decarburized or uncarburized malleable iron or steel by water circulating in contact therewith.

5. The construction and employment of reverberatory furnaces for the fusion of scrap or other decarburized or uncarburized malleable iron or steel in such manner as to admit of fuel being burned on fire-bars by ordinary chimney-draught at the commencement of the process, and also to admit of the fuel being burned under a high pressure of confined gaseous matters toward the close of the fusing operation.

6. The employment of a movable double flue for changing the draught and opening the feed-hole of furnaces employed for the fusion of scrap or other decarburized or uncarburized malleable iron or steel, for the purpose of obtaining ingots or other masses of malleable iron or steel.

7. The decarburation or partial decarburation of molten pig or other carburet of iron on the hearths of reverberatory furnaces, and the subsequent fusion of scrap or other decarburized or uncarburized malleable iron or steel therein under the pressure of confined gaseous matters, for the purpose of obtaining malleable iron or steel by their fusion.

8. The general arrangement and combination of the several parts constituting the improved melting-furnace represented on Sheet C of the annexed drawing.

9. The employment of the combined cupola and reverberatory furnace, constructed as shown at Figs. 1 and 2 on Sheet D, and working under pressure of confined gaseous matters, for the purposes and in the manner described.

10. The employment of cupola-furnaces, constructed as shown at Fig. 3, Sheet D, such furnaces working under pressure of confined gaseous matter, for the purposes and in the manner described.

11. The means shown of protecting the mercury employed in gauges to indicate the pressure of gaseous matters in furnaces employed for the purposes described.

12. The constructing the peep-holes of high-pressure furnaces in the manner described.

13. The inclosing the orifices by which the products of combustion escape from furnaces used in the manufacture of malleable iron and steel, and working under high pressure in suitable tubes or passages to lessen the noise produced by the escape.

14. The forming the escape-apertures of high-pressure furnaces used in the manufacture of malleable iron and steel in metal, having water-passages formed therein to prevent their rapid destruction by heat.

117,248.—BESSEMER CONVERTER FOR CONVERTING CRUDE IRON INTO STEEL, &c.—Henry Bessemer, London, England.

Claim.—1. The constructing the Bessemer converting-vessel in such manner that the metal contained therein may have its temperature increased by being exposed to a considerable back pressure of gas during the converting process.

2. The conversion of molten pig or other carburet of iron into malleable iron or steel by passing atmospheric air through the fluid metal contained in vessels in which the gaseous products of combustion are retained above the surface of the metal at a considerable pressure in excess of the pressure of the external atmosphere.

3. The employment of movable rings or mouthpieces in vessels employed to convert molten pig or other carburet of iron into malleable iron or steel by the passing of atmospheric air through the molten metal.

4. Regulating the pressure of the gaseous products of combustion within the Bessemer converting-vessel, in the manner herein described.

5. The treatment of, or conversion into malleable iron or steel of molten pig or other carburet of iron by means of nitrate of soda or nitrate of potash, or by other oxygen-yielding salts or substances, when such treatment or conversion is carried on in vessels or chambers in which the gaseous products resulting from such treatment or conversion are retained under considerable pressure, as and for the purposes herein described.

6. The apparatus and methods herein described for effecting and regulating the pressure of the gaseous products within the vessels or chambers in which molten pig or other carburets of iron are treated, and converted into malleable iron or steel by the action of nitrate of soda, or nitrate of potash, or other oxygen-yielding salts or substances.

117,249.—APPARATUS FOR MELTING AND CASTING METALS UNDER PRESSURE.—Henry Bessemer, London, England.

Claim.—1. The fusion of malleable iron and steel and other refractory metals in high-pressure furnaces supplied with combustible gases or vapors generated under pressure sufficient to cause them to enter such furnaces by their own expansive force and without the employment of force-pumps or other gas-forcing machinery.

2. Casting or founding ingots and other masses or articles in iron or steel or in other metals or alloys of metals in molds contained in close vessels, in which great pressure is obtained by the evolution of aeriform matters from combustible matters either in the chamber containing the casting or in a chamber or vessel connected therewith.

3. Casting or founding ingots and other masses or articles in iron or steel or in other metals or alloys of metals in molds contained in close vessels, in which great pressure is obtained by the evolution of aeriform matters from liquids evaporated either in the chamber containing the casting or in a chamber or vessel in connection therewith.

4. The application of gases or vapors under high pressure generated in close vessels and acting by their expansive force on metals or alloys of metals in the process of casting or founding articles in such metals or alloys, substantially as herein described.

117,250.—CONSTRUCTION AND OPERATION OF METALLURGICAL FURNACES.—Henry Bessemer, London, England.

Claim.—1. The employment, for the fusion of scrap or other decarburized or uncarburized malleable iron or steel, of a cupola-furnace inclosed or partially inclosed in a chamber, into which the air for combustion is forced at a pressure much in excess of the external atmosphere.

2. The employment, for the fusion of scrap or other decarburized or uncarburized malleable iron or steel, of a reverberatory furnace inclosed in a chamber, into which the air for combustion is forced at a pressure much in excess of the external atmosphere.

3. The mode herein described of constructing and lighting the close iron chambers in which melting-furnaces for the melting of scrap or other decarburized or uncarburized malleable iron or steel are worked at high pressure.

4. The constructing-chambers, containing high-pressure furnaces, for the melting of scrap or other decarburized or uncarburized malleable iron or steel, with double inlet-doors, combined with inlet and outlet-pipes, as herein described.

5. The causing compressed air, in its passage into a chamber containing a high pressure furnace for the melting of scrap or other decarburized or uncarburized malleable iron or steel, to pass through suitable cooling apparatus to prevent the said chamber becoming unduly hot.

6. The general arrangement and combination of parts constituting the melting and casting apparatus shown in Figs. 1, 2, and 3 on Sheet B of the annexed drawing.

117,251.—Steam-Boiler. — Nathaniel L. Blanchard, Spuyten Duyvil, N. Y.

Claim.—1. The chimney-stack C, smoke-box D, smoke-tubes E, smoke-flue L, channels V W, and superheater F, combined, as described, with a series of water-chambers, separated by perforated diaphragms G H, for the purpose specified.

2. The diaphragms G H, arranged as partitions between several sets of tubes, to operate upon the circulation of water in the manner described, and for the purpose specified.

3. The valves O R, combined, as described, with the rod P in steam-drum F, for the purpose specified.

117,252.—Blower for Chimney-Stacks.—Nathaniel L. Blanchard, Spuyten Duyvil, N. Y.

Claim.—The top-closed chamber C D, the semi-cylindrical side and top-opened case B, the fan I J, and the top and bottom-opened case A N O, all arranged together between the fire-box and smoke-stack of an engine-boiler, and combined, as described, for the purpose of drawing the products of combustion from the fire-box through plate O into a close chamber, C D, which opens only into the sides of the fan-case, and of thence transferring said products directly into the smoke-stack, thus allowing no smoke or gas to reach the chimney without passing through the fan.

117,253.—Carriage-Spring.—Peter Broadbooks, Batavia, N. Y.

Claim.—The construction and arrangement of the elliptical spring A A′, rod D, cylinders E E′, rubber packings H H′, nuts B B′, and clevises F F′, when operating together, as and for the purpose described.

117,254.—Farmer's Boiler. — George H. Buckley, Quincy, Ill.

Claim.—1. The arrangement of the pendent caldron in braces *b b*, projecting from the furnace and within the jacket, as and for the purpose specified.

2. The movable bottom *c*, suspended from the trunnions of the caldron to be swung by the same, substantially as herein shown and described.

3. The pivoted caldron C, provided with the toothed segment or its equivalent, and with the projecting lugs *j*, as specified.

117,255.—Machine for Making Gutters for Buildings.—Albion K. P. Buffum, Gardiner, Me.

Claim.—The gutter-machine hereinbefore described, the same consisting of the series of platforms *a b c d e*, the guide *f*, the pressure-rollers *g h*, adjustable gauge *m*, the feed-and-pressure rollers I K N, the rotary cutter-stock R with its adjustable frame S, rotary cutter-stock W with its adjustable frame T, the cutter-heads X Y, and the cylinder Z, all the cutter-heads or cylinders being provided with cutters, and the whole being constructed and combined together and applied to the frame H, substantially in manner and so as to operate as and for the purpose specified.

117,256. — Preserving Cranberries. — James W. Campbell, Philadelphia, Pa.

Claim.—The described new article of manufacture, namely, uncooked fresh cranberries, so treated as to retain their natural qualities without drying, stewing, or admixing sugar, sirup, or other ingredient, substantially in the manner and for the purpose herein set forth.

117,257.—Wheeled Vehicle.—James F. Cass, L'Orignal, Canada.

Claim.—The arrangement of pivoted frame *d* and grooved wheel D centrally beneath an ordinary road-wagon, so that the latter may be let down upon a single rail E, and thus relieve the ordinary wheels of a large portion of the weight, as described.

117,258.—Harrow.—Joshua C. Center, Mason City, Ill.

Claim.—The combination of the handles F and braces G with the side bars C D of my improved harrow, substantially as herein shown and described, and for the purpose set forth.

117,259.—Sawing-Machine. — Cornelius Collins, Jonesborough, Ind.

Claim.—The machine herein shown and described, all the parts being constructed, combined, and arranged as and for the purpose specified.

117,260.—Lamp-Shade.—Michael H. Collins, Chelsea, Mass.

Claim.—A shade for a lamp or Argand burner having its body made of glass, porcelain, or paper, and of a frusto-conic, frusto-pyramidal, or frusto-polygonal form, and provided with a series of long tapering arms or springs, D, formed and applied thereto, substantially as shown and described.

117,261.—Stove-Leg.—James M. Corbin, Liberty, Mo.

Claim.—A stove-leg, having dovetailed base-plate C, with spring E and stops F, constructed, arranged, and applied as and for the purpose specified.

117,262. — Sewing-Machine. — Thomas Crane, Fort Atkinson, Wis., assignor to himself and Melvin A. Jones, same place.

Claim.—1. A sewing mechanism, composed of an eye-pointed needle receiving its motion from a crank coupled directly to the needle-bar, a self-adjusting cam-pulley upon the crank-shaft, and an oscillating bar carrying the crank-shaft, substantially as described, the combined action of which governs the feed, shuttle, and needle movements, in sewing the same form of stitch forward and backward, by reversing the motion of the machine, substantially as specified.

2. The crank-shaft E, when so arranged as to vibrate laterally simultaneously with a rotary movement of the same, whereby a vertical movement is imparted to the needle-bar, substantially as described.

3. The combination of the crank-shaft E, vibrating bar D, cam-pulley G, and rock-shaft K, the whole arranged to operate together, whereby a reciprocal movement is imparted to the shuttle-bar, substantially as described.

4. The combination of pulley G, stirrups I and J, rock-shaft K, oscillating bar D, and shuttle-bar L, the whole arranged to operate together, whereby the requisite reciprocating movement is imparted to said shuttle-bar by the rocking movement of the shaft K jointly with the oscillating movement of bar D, substantially as and for the purpose described.

117,263.—Gate.—Peter S. Crawford, Union, Ill.

Claim.—1. The pivoted lever *b*, connecting-link *b′*, rotating arm *b″*, link *b‴*, and eye *c*, when arranged with relation to the inclined guide-rail C′ of gate C, as herein described.

2. The plates E E, inclined or angular rails *e*, radial pickets *e′ e′*, guide-rail C″, rail C‴, braces *e″ e″*, and frame C, when constructed and arranged together, as described, to form the gate, as shown.

117,264.—Corn-Harvester.—John Crossland, Spencer Grove, Iowa.

Claim.—1. The arms H I, springs J, and jointed posts G, combined, as described, to enable the stalks to be gathered, substantially as specified.

2. The cutter K, combined with the weighted lever N, for the purpose specified.

3. The automatically-adjusting knife K, combined with weighted lever N and shoe M, as and for the purpose specified.

117,265.—Washing-Machine. — Sylvanus Decker and Frazee Ayres, Rahway, N. J.

Claim.—The combination of the dasher B with the movable side pieces D D, when both dasher and side pieces are attached to and operated by the lever, C, substantially as and for the purposes hereinbefore set forth.

117,266.—Molding-Machine.—John Demarest, Mott Haven, N. Y., assignor to himself and Jordan L. Mott, same place.

Claim.—1. In combination with sections D D′, the brackets E E and the two pairs of slides C C′, arranged as and for the purpose specified.

2. The combination of toggle-joint device F G, slides C C′, and brackets E E, arranged as described to form a convenient mechanism for reciprocating the sections, in the manner specified.

3. The combination of the sections D D′ with brackets E E, bolted firmly to one another at the bottom, but hinged loosely together at the top to allow the upper part of the mold to spread open a little, as and for the purpose specified.

4. The triangular gates arranged and operating in the manner specified and for the purpose set forth.

5. The construction of the core O in an oval form, with its shortest diameter in the line of movement of the sections D D′, as and for the purpose specified.

117,267. — Feed-Apparatus for Mill-Stones.—Alvah Dewey, Princeton, Ky.

Claim.—The combination of the disk or plate A with the tube C, bar E, and rods *a a*, as shown and described.

117,268.—Electro-Magnetic Instrument.—Lawrence L. Duerden, Brooklyn, N. Y.

Claim.—1. The arrangement of pin *i*, block A, spring *g*, pin *f*, arm *j*, and hammer K in the electric instrument, as and for the purpose specified.

2. The pillar B, bifurcated and arranged upon the bed-plate to hold the magnet between its forks, as described.

117,269. — Tobacco-Cutting Box.—William Theodor Farre, Montreal, Canada.

Claim.—1. The receptacle for tobacco and tobacco-cutter, consisting of the tube A, the tobacco receptacle F G H, the plunger I, the knife D, and the key K, substantially as described.

2. The match-box B, provided with a slit or mortise in its bottom for holding the knife for the tobacco-cutter, substantially as described and shown.

3. The tube in the center of the match-box, forming the seat for the key K when the instrument is out of use, substantially as described.

117,270, antedated July 18, 1871.—Kite.—Isaac Ferris, Cincinnati, Ohio.

Claim.—A kite, constructed of two parallel walls connected by a strip of the same material and properly stayed to keep the kite-shape, the space between the walls to be filled with gas lighter than common air, substantially as described.

117,271. — Process and Apparatus for Treating Rice, Wheat, Corn, &c.—R. Berkeley Fitts, Philadelphia, Pa., assignor to himself and George W. Waitt, same place.

Claim.—1. The process herein described for the treatment of rice, wheat, and other grain, consisting of the direct application of steam, followed by that of cold-air blast, as and for the purpose set forth.

2. The steam-chest D, steam-jacket C, and wire-cloth cylinder M, when all arranged and operating as and for the purposes specified.

117,272.—Wire-Blank for Napkin-Rings, Cruet-Holders, &c.—Charles W. Goodhue, Lowell, Mass., assignor to Edward P. Woods, Daniel Sherwood, and Cyrus H. Latham, same place.

Claim.—As a new and improved article of manufacture, the twisted wire-blank, Fig. 3, constructed substantially as described and specified.

117,273.—Pencil-Case. — Francis Robert Goulding, Boswell, Ga.

Claim.—The cone *e*, projecting from movable tube D, combined with swiveled tube F and wheel *d*, as and for the purpose specified.

117,274.—Barrel-Head.—Solomon S. Gray, Boston, Mass.

Claim.—A head for a barrel or cask, having a grooved perimeter in which a packing is laid and held while said head is being secured in an ordinary croze of a barrel, as and for the purpose described.

117,275. — Machine for Making Wire-Fencing.—Benjamin Greening, Hamilton, Canada, assignor to Samuel Owen Greening, same place.

Claim.—1. The arrangement and combination of the movable frame *a*, placed on a track with the mesh-regulating roller *j* and warp-drum *k*, arranged substantially as described.

2. The arrangement of the head-stocks and wrappers *d g* with bobbins *e* and friction-rollers, as described.

3. The arrangement and combination of the outer wrappers producing the turn-over motion, operated by the cams *s* and levers *t*, as shown.

4. The arrangement of the driving-gear crank *m*, endless chain *o*, bevel-gears *r r*, cog-wheels *n*, regulating-worm and gear r^4, all combined and operated substantially in the manner and for the purpose described.

117,276.—Fire-Place. — Joseph Hackett, Louisville, Ky.

Claim.—1. The ears *c c* formed at the front top corners of the fire-back for defining the width of flue and holding the tile in place, as set forth.

2. The hollow fire-back A provided with the concave inner corners, whereby air-passages *b* are formed between said corners and the masonry B, as shown and described.

117,277.—Camp-Stool.—Albert Hallowell, Edmund Elliott, and Charles A. Blodgett, Lowell, Mass.; said Elliott assigns his right to Charles A. Blodgett.

Claim.—1. The cleat H, slotted endwise on its

upper side to receive the legs A, B, and C, as and for the purpose set forth.

2. The combination of the seat G, the steps D, E, and F, the legs A, B, and C, and the cleat H, all constructed substantially as and for the purpose herein set forth.

117,278.—CORK-SCREW, CORK-PULLER, AND CAN-OPENER COMBINED.—John Harrigan, Fort Wadsworth, N. Y.

Claim.—The combination of the cork-screw, can-opener, and cork-drawer or cork-puller, substantially as set forth and described.

117,279.—CULTIVATOR.—Newton J. Harris, Meredosia, Ill.

Claim.—The frame D, constructed as described and having plow-beams O attached thereto, in combination with lever E and perforated bar H, as and for the purpose specified.

117,280.—METHOD OF CONVERTING RECTILINEAR INTO ROTARY MOTION.—Jacob G. Harroun, Sag Harbor, N. Y.

Claim.—The peculiar mechanism herein described, by which the pins *d* and *d'* are made to engage first with one side and then with the other side of the double rack A, substantially as and for the purpose specified.

117,281, antedated July 21, 1871.—INCENSE-BURNER.—E. Warren Hastings, Boston, Mass.

Claim.—A combined illuminator and incense-burner, constructed with the moveble lamp *h*, slide *k*, fuse *f*, covers *b* and *c*, guides *g* and *e*, and the portable lamp *n*, in a manner and for the purpose as set forth and described.

117,282. — ADJUSTABLE REFLECTOR FOR LAMPS, &c.—Augustus Hayo, New York, N. Y.

Claim.—The wall-plate A, rotary bar D, rack F, pawl H, bracket G, and reflector N, all arranged and operating substantially as and for the purposes described and set forth.

117,283.—MACHINE FOR POLISHING BOOT AND SHOE-HEELS.—Charles H. Helms, Poughkeepsie, N. Y.

Claim.—1. The semi-oval concave-faced curvilinear reciprocating heel-polishers, substantially as described, and for the purposes hereinbefore set forth.

2. The combination of the heel-polishers, as set forth, with the slide F, box Q, and springs S, all arranged and operating in the manner substantially as hereinbefore set forth.

3. In combination with the reciprocating polishers P and slide F, the tension-spring D, substantially as described.

4. In combination with the standard B and polishers P, the self-adjustable heel-rests N, all arranged and operating substantially as described.

117,284.—SWINGING CLOCK.—George Herrmann, Newport, R. I.

Claim.—1. The arm *l* on the hour-spindle, combined with the arms *n* on the arbor *m* for setting the striking apparatus, substantially as herein shown and described.

2. The adjustable fork or plate G, arranged on a vibrating clock, for the purpose of regulating the operation of the hammer F, as set forth.

3. The rotary date-disk I, arranged within the pendulum-ball of a clock and connected with the upper works, as specified.

117,285.—HYDRAULIC AIR-COMPRESSOR.—Michael Hey, Philadelphia, Pa.

Claim.—1. The communicating hydraulic cylinders A and B, in combination with their respective floats a^1 b^1, vertically-moving bars C C', and connecting-lever D, water-valves 7 7, and air-valves 6 6, all constructed and arranged to operate in relation to each other, substantially as and for the purpose hereinbefore set forth.

2. The water-cylinder c'', in combination with its vertically-moving bar C and pressure-cylinder A, arranged to operate together, substantially as and for the purpose hereinbefore set forth.

3. The sliding stem a^2, in combination with the float-lever a^1 and valve-way tube a^3, and the spring-catch 10, in combination with the vertically-moving bar *c* and water-vessel c'' in communication with the cylinder A through the flexible tubes 8 8, all constructed and arranged to operate substantially as and for the purpose hereinbefore set forth.

4. The sliding stem b^2, in combination with the float-lever b^1 and valve-way tube b^3, and the spring-catch 10, in combination with the vertically-moving bar C', piston 12, cylinder b^2, and air-passage way 13 in communication with cylinder B, all constructed and arranged to operate substantially as and for the purpose hereinbefore set forth.

117,286. — PAVEMENT. — Isaac H. Hobbs, Philadelphia, Pa.

Claim.—The construction of a wooden pavement by placing concrete moldings between each row of blocks of a size and shape corresponding thereto, and of any desired thickness, in combination with the cobble-stone, slag, or rock foundation, and the cement or concrete filling or layer thereupon, substantially in the manner and for the purpose hereinbefore set forth.

117,287. — MACHINE FOR TRIMMING AND BURNISHING SOLES.—Samuel H. Hodges, Lynn, Mass., assignor to himself, George A. Fullerton, O. B. Cooledge, and B. F. Larrabee, same place.

Claim.—1. The combination, in a machine for trimming or burnishing, or both trimming or burnishing boots and shoes, with a jack or support for the shoe, of a flexible or jointed tool-carrying frame, operating substantially as shown and described, and a trimming, burnishing, or other suitable tool mounted thereon, and actuated substantially in the manner herein set forth.

2. The combination, in a trimming or burnishing machine for boots and shoes, with the boot-jack or holder, of the sliding carriage, spring, and treadle or lever for adjusting the position of the same, substantially as shown and set forth.

3. The combination, with trimming or other tool, mechanism for imparting motion to the same, and the flexible or jointed tool-carrying frame, operating as described, of the boot-jack or support, and the adjustable or sliding carriage upon which the same is mounted, under the arrangement, substantially as herein shown and set forth.

4. The cutter herein shown and described, consisting of the cutting-sections adjustably connected with their supporting-flange, and combined with the shaft from which they receive motion by means of a sleeve and clutch *e*, substantially as specified.

5. The shoe-holding disk T, hinged to the pivoted plates S R, substantially as herein shown and described.

117,288. — BOOT-CRIMPER'S RUB-STICK.—Alonzo J. F. Howard, Milford, Mass.

Claim.—A boot-crimper's rub-stick, in which a metallic bar, D, provided with leaves E, is fitted to each of the rubbers, substantially as shown and set forth.

117,289. — RAILROAD-CAR VENTILATOR.—James L. Howard, Hartford, Conn.

Claim.—The ventilator, constructed, as before described, with a receiving-aperture at one side, two deflectors inclined vertically in opposite directions, a discharge-aperture between the ends of said deflectors, a directing guard for the discharge-aperture, and the outer plate.

117,290. — APPARATUS FOR EVAPORATING, CONCENTRATING, AND SUPERHEATING SALT-BRINE. — John Howarth, Salem, Mass.

Claim.—1. The arrangement of steam-coils B B', in combination with the partitions *m m m m*, for the purposes herein described.

2. The combination of injector S' with coils B B', partitions *m m m m*, and cylinders A A', substantially as shown and described.

117,291, antedated July 14, 1871.—CLOTHES-WRINGER. — Charles H. Hudson, New York, N. Y.

Claim.—1. The bars O and O', in which the bearings for the movable rollers of a clothes-wringer are formed, in combination with the slides P P' and the adjusting-bolts S and S', arranged and operating substantially as hereinabove set forth.

2. The auxiliary adjusting-wedges or blocks W W, applied to the opening T in the frame of a clothes-wringer, substantially as and for the purpose set forth.

3. The combination with the auxiliary adjusting-wedges W W of the wedges U U, substantially as set forth.

117,292. — BASE-BURNING STOVE.—George G. Hunt, Chicago, Ill.

Claim.—The plate P, when made substantially in the manner and for the purposes hereinbefore specified.

117,293. — KNITTING-MACHINE. — Leander B. Hunt, Hyde Park, Mass., assignor to himself and Roswell W. Turner, same place.

Claim.—The combination of an additional groove, *a*, with the main groove or grooves of a knitting-machine by means of oblique grooves and switches for the purpose of setting and throwing down the needles into operating positions, and of raising them out of said positions without dropping the stitches, substantially as herein set forth.

117,294.—MANTEL AND FRONT FOR FIRE-PLACES. — David K. Innes and Wesley W. Magill, Cincinnati, Ohio.

Claim.—1. Providing a cast-iron mantel with a shelf composed of slate, marble, or other suitable mineral, as and for the purpose explained.

2. The provision in a mantel of the separable cast-iron key C, for the object stated.

3. The combination of the mantel A *a*, separable cast-iron key C, screw-threaded shank D, and nut *d*, for the purpose set forth.

4. The detached and shiftable wall-plates E E', when arranged as herein described, and for the object explained.

117,295.—SEED AND PLASTER-SOWER.—Gilbert Jessup, Shortsville, and Dennis P. Sharp, Ithaca, assignors to "Ithica Agricultural Works," Ithaca, N. Y.

Claim.—1. The combination of slotted cars with the end of the seeder-box, so that, by means of bolts, the position of the box may be fixed and adjusted upon the axle, as set forth.

2. The combination of rod *p* with cam-lever W and stirrer-lever Z, as and for the purpose set forth.

117,296. — HAND CORN-HUSKER. — James Guthrie Johnson, Carthage, Ill.

Claim.—The hand corn-husker herein shown, consisting of the handle A, husking-horn B, finger-guard and rest C, recesses E F G, and the band H, constructed and arranged substantially as described.

117,297.—POST-HOLE DIGGER AND DITCHER.—Rollin L. Jones, Cleveland, Ohio.

Claim.—The machine for digging post-holes, transplanting, &c., when constructed and arranged in the form and manner substantially as specified.

117,298.—SUBMARINE EXCAVATOR.—Thomas Jones, Washington, D. C.

Claim.—1. The plow D, constructed as described—that is, of double mold-board form, having air-tight chambers G arranged between them, for the purposes described.

2. The movable portions of the mold-board, in combination with the main portions thereof and the rear planking I', as and for the purposes specified.

3. The chains J and J', rings J'', and windlass K, arranged to operate slides I, as set forth.

4. Chains N and N' and windlass M, arranged to raise and lower the plow, as and for the purposes set forth.

5. Rollers L and springs L', in combination with standard C, as and for the purposes specified.

6. Draft-chain O, roller O', and windlass O'', combined with the plow and the deck A, for the purposes described.

7. The air-tight cylinder Q, when arranged upon the draft-chain O and having united with it the chains R and R', as and for the purposes set forth.

8. The standards S' S'' and T, all arranged and operating as for the purposes specified.

9. The windlass M, chains N and N', chains *y*, chain Z, chains W, valve-rod W', and steam-chest X with its piston *x'*, all arranged to operate, in combination with the standard S' S'' and T, to raise the plow automatically, as herein set forth.

10. The windlass 1, roller 2, and chains 3, in combination with standard S' S'' and T, for restoring said standards to vertical position, as described.

11. The springs 5 on lower ends of the above standards, and the heavy bumper-spring 6 on the under side of the deck, as illustrated in Fig. 1, for the purposes described.

117,299, antedated July 21, 1871.—BUR FOR KNITTING-MACHINES.—Luke Kavanaugh, Waterford, N. Y.

Claim.—A knitting-bur having a series of wings, each formed with an inwardly-projecting dovetail or flaring shank at one end, and all secured by a follower and clamping device in an obliquely-slotted hub having at one end a shank-receiving recess, *h*, surrounded by an endwise-projecting slotted rim, *i*, substantially as herein set forth.

117,300. — WAGON-WHEEL. — Henry D. Keith and John T. Keith, Mansfield, Ohio.

Claim.—A wheel for vehicles, consisting of the fellies A, nuts B B', double-threaded screws C, spokes D, ferrules E, and nuts G, all constructed and arranged as described.

117,301.—PAINT.—Moses W. Kidder, Lowell, Mass.

Claim.—A paint compound, consisting of the ingredients in about the proportions herein mentioned, mixed together in the manner specified, and for the purpose set forth.

117,302. — TUMBLER FOR PERMUTATION LOCKS.—William Kock, Cincinnati, Ohio.

Claim.—The tumblers J, constructed with a series of concentric holes, *l'*, and concentric slots L, combined with a movable dog provided with nipple *j'* and set-screws, so that it may be adjusted without removing its holding-screw.

117,303. — FORGE. — Wladyslaw Theodore Kosinski, Philadelphia, Pa.

Claim.—The combination of the hot-air channel E contiguous to the bottom of the hearth, leading

to the blast-chamber, and the draught-tubes F connecting the blast-chamber with the hood, substantially as described.

117,304. — CRIMPING-CLAMP. — John Kunstler, Collinsville, Conn.

Claim.—A crimping-clamp, composed of the fork *a*, hand-screw *b*, springs *c c*, forming teeth *c' c'* over the ends of the fork, and compressed by thumb-nuts *e e* on the screw-pins *f f*, the whole arranged, constructed, and operated substantially as and for the purposes set forth.

117,305.—REGULATOR FOR GAS-BURNERS.—Edward Lawler, Hartford, Conn.

Claim.—The valve *e*, when constructed in the form shown, and nicked, as described, upon its upper and lower edges, in combination with the cap *b* and body *c*, all arranged and operating as and for the purpose described.

117,306.—DEVICE FOR DETACHING HORSES FROM VEHICLES.—George B. Lumpkin, Lexington, Ga.

Claim.—1. The ball-and-socket-joint connection between the single-tree L and the block U, including its pulleys X X, the openings *d*, the socket V', the ball V, and bar T, when constructed and operated substantially as and for the purposes specified.

2. The combination of the clips M M having the parts N N *f f*, open spaces *e e*, pins O P Q, spiral springs S S, card R, and the described block U having the ball-and-socket joint V and V', when constructed and arranged substantially in the manner and for the purpose specified.

117,307.—STEAM-CARRIAGE FOR PLOWS.—Mirabeau N. Lynn, New Albany, Ind., assignor to himself and Edward H. Mann, same place.

Claim.—1. The removable hollow section A^1 of the hollow frame, substantially as and for the purpose described.

2. The oscillating cylinders S with piston-rods *r*, when the rods are furnished with a coupling at each end, in combination with the steam-carriage, substantially as described, and for transmitting power from each end of cylinders, as described and set forth.

3. The pushing-legs, attached to the carriage by means of laterally and longitudinally-articulating joints, substantially as described.

4. The combination of jointed packing-legs with the jointed pushing-legs, substantially as described.

5. The combination of the described elevating and depressing devices with the jointed legs, substantially as described.

117,308.—LOCOMOTIVE.—Israel P. Magoon, St. Johnsbury, Vt.

Claim.—1. In combination with the insulator H, the coil F, the pipes I K, the smoke-box A, and chimney B, arranged as set forth, the pipe L arranged to lead from the upper part of the insulator down into the smoke-box, as shown, so as to discharge the waste steam from the heater directly into the said smoke-box or the chimney, in order to facilitate the draught of the latter.

2. The arrangement of the curved guides O O with the insulator, the main and auxiliary chimneys, and the openings P P, as described.

3. The coil, made in manner as described, whereby the water to be heated is caused to pass up in one and down in another helix thereof.

117,309. — HARNESS SADDLE-TREE. — John H. Martin, Columbus, Ohio.

Claim.—1. The guard-loop *d*, formed with the frame A or T, substantially as and for the purpose described.

2. The combination of the terret D, the plates C E, and the T-shaped pivotal heads *J*, substantially as described.

117,310.—STEAM-HEATER.—John McConn, Philadelphia, Pa.

Claim.—1. The construction of the sections E F G so that when placed edgewise the diaphragm A divides the sections into upper and lower chambers, in combination with the lateral joints T for the passage of the steam, as herein shown and described.

2. The construction of the joints T T^1 by the ring *v* on one face fitting into the rabbet formed between the rings v^1 and v^2 upon the opposite face, for the purpose herein described.

117,311.—SECTIONAL STEAM-BOILER.—John McConn, Philadelphia, Pa.

Claim.—The outside columns C, with communicating-apertures to the main sections, by which the ends of the main sections may be left whole, substantially as and for the purpose herein set forth.

117,312.—CRANK-GEARING. — Theodore J. McGowan, Cincinnati, Ohio, assignor to McGowan Brothers Pump and Machine Company, same place.

Claim.—The operating-gear, connected by cogs or endless chain, which communicate motion from the crank-shaft to the balance-wheel shaft when the diameters of said gear are so proportioned relatively that the counter-balance will always aid in carrying the crank past its dead-center, substantially as described.

117,313.—PRINTERS' INK. — Charles McIlvaine, Philadelphia, Pa.

Claim.—An improved black copyable printers' ink, composed of the ingredients, i. e., a black coloring matter in connection with glycerine, together with soluble gums, acid, and saccharine matter, substantially as specified.

117,314, antedated July 12, 1871.—COPYING INK FOR RULING AND PRINTING.—Charles McIlvaine, Philadelphia, Pa.

Claim.—A copying-ink for printers' and rulers' use, composed of the ingredients, i. e., a soluble coloring matter in solution in glycerine, alcohol, and water, together with soluble gums, an acid, and saccharine matter, substantially as specified.

117,315. — FOLDING SETTEE. — Henry T. Morse, Athol, Mass., assignor to Laban Morse and Leander B. Morse, same place.

Claim.—1. In a folding seat, the tie-brace E hinged to one leg at two or more points, in combination with hook-pins *c c* inserted in an opposite leg, substantially as described.

2. In combination with the tie-braces E hinged to one leg at two or more points, and hooking onto the hook-pins *c c* inserted in an opposite leg, one or more diagonal braces, F, applied and operating substantially as described, for the purpose specified.

3. In combination with a seat, the back of which is arranged to fold down upon the seat, a folding arm-brace, consisting of the parts G and G^1, and provided with the arm-rest G^2, when said parts are coupled together by means of a stop-joint and secured by the locking-pin H, all constructed and arranged substantially as herein described, for the purposes specified.

117,316.—PAVEMENT-WASHER.—Alfred C. Neall, Philadelphia, Pa.

Claim.—The folding water-pipe A B, in combination with the supply-pipe C and a box or case, D, constructed and arranged to operate substantially as and for the purpose hereinbefore set forth.

117,317.—FENDER FOR PLOWS.—Benjamin F. Neely, Yorktown, Ind.

Claim.—A plow-fender, having a series of elastic teeth, B, combined with a perforated bar, D, movable thereon, to adjust their distance apart and thus graduate the quantity of soil that passes therethrough.

117,318.—COVER FOR THE LENSES OF PHOTOGRAPHIC CAMERAS.—Oscar W. Noble, Darlington, Wis., assignor to himself and Luke Agur, same place.

Claim.—The arrangement of arm *a*, arbor *b*, cars *c*, crank *d*, rod *e*, crank *f*, and handle D, as described and for the purpose of operating cap C.

117,319. — FURNACE-GRATE. — Calvin M. Northrup, New York, N. Y.

Claim.—A furnace-grate, composed of alternating straight or plain bars and corrugated bars, as described, for the objects described, the same being tie-bolted together, whereby the buckling in degree and direction of the plain and corrugated bars is prevented, and the two kinds of bars restrain each other whether the alternation of the two styles of bars are one to one in succession or otherwise, as set forth.

117,320.—CHIMNEY.—Samuel Oakman, Boston, Mass.

Claim.—The arrangement of a separating-chamber, L, with proper flues, in connection with a furnace, for the purpose set forth.

117,321.—BOOT-RACK.—James K. Otis, East Cambridge, Mass.

Claim.—The cross-bars B C, with their friction-rollers *c c* and elastic cushions *d d*, substantially as and for the purpose described.

117,322. — LOADING AND DUMPING-MACHINE.—Moreau Phillips, Springfield, Ill., assignor to himself and Thomas Handy, same place.

Claim.—1. The lever E and its catch or hook, pulleys C C, and rod *e*, in combination with the chains *b b'*, scraper B, and frame A, substantially as described, and for the purpose hereinbefore set forth.

2. The plate L, trap-doors D D, rods *f f*, levers H H, in combination with the frame A and scraper B, substantially as specified.

117,323.—NEEDLE-WRAPPER.—James Pitzler, New York, N. Y.

Claim.—1. The outer case or wrapper of a needle-package, made by cutting and folding a sheet of paper, tin foil, or other material, substantially in the manner herein shown and set forth.

2. In combination with the above, the needle-holder B, made to slide in and out of the wrapper through the hole G of said wrapper, substantially as described and shown.

117,324.—NEEDLE-WRAPPER.—James Pitzler, New York, N. Y.

Claim.—The needle-holder A, having the cloth or other fabrics B secured thereto by said cloth being passed through slits cut crosswise to the length of the needles, which are stuck upon said cloth, substantially as set forth.

117,325.—FENCE.—Samuel S. Porter, Broad Ford, Pa.

Claim.—A fence composed of the panels A, bed-pieces D, braces E, and bolt F, arranged substantially as shown and described.

117,326. — SAP-SPOUT. — Charles C. Post, Hinesburg, Vt.

Claim.—1. A metallic sap-spout, provided with lips or catches, as shown, for the purpose of holding firmly into the tree, substantially as specified.

2. The combination of the hinged cover E with the hook C and spout A, as above specified.

3. The detachable bucket-hanger C, in combination with a metallic sap-spout, as described.

117,327, antedated July 13, 1871.—ROOF.—James Martin Price, Nether Providence, Pa.

Claim.—A roof, consisting of a cellular foundation, constructed as described, to which is applied a coating, *c*, of the ingredients specified, and an outer coating, *d*, of hydraulic cement.

117,328.—THILL-COUPLING. — Franklin B. Prindle, Southington, Conn.

Claim.—The bolt F, provided with the head *f* and nuts *f'*, and the friction-block G, (with or without the rubber H,) in combination with an ordinary carriage-shackle, substantially as and for the purpose specified.

117,329.—PARLOR-SKATE.—Chris Raitz, San Francisco, Cal.

Claim.—The combination of the plate B with its shoulder *c*, and standard D with shoulder *d*, and bar E with the spring F, the parts B E being provided with bearing-surfaces *a a'* for the purpose of relieving the rivet-pin *a*, as described.

117,330.—SULKY-HARROW. — Frederick P. L. Reimers and Hans Asbahr, Davenport, Iowa.

Claim.—The arrangement, with the rising and falling harrow G H connected with the axle by the bars Q Q, of the reversely-reciprocating toothed bars I I, operated by the rods J, crank-rods K L, and wheels N O, as shown and described, for the purpose specified.

117,331. — GAS HAND-LAMP. — Henry J. Rice, Cincinnati, Ohio, assignor to himself, John K. Love, James S. Smith, and William B. Smith.

Claim.—In combination with an air-tight reservoir and wick-tube B rising above it, and constructed as described, the adjustable copper tube E, surrounded by a lava burner and copper wings or bonnet F F, and provided with air-inlets and passages for descending currents, all as shown and described.

117,332. — DOVETAILING-MACHINE. — John B. Ritchey, Pomeroy, Ohio.

Claim.—1. The adjustable spacing blocks D, having a groove, L, in one side, and a spacing wedge, F fitted therein for holding said blocks against being raised, substantially as specified.

2. The spring-bar I, arranged for lateral adjustment at its connections with the table, and provided with the wedge-shaped stop-block K, and the adjustable spacing-blocks D having the studs N thereof arranged for operation in conjunction with the said wedge-shaped block K, all substantially as specified.

117,333. — SAFETY-COUPLING.—Francis W. Robinson, Richmond, Ind.

Claim.—Constructing a safety-coupling with the hub in halves, so that the pins E E may be inserted in the holes F F from the inside of the ring B, thereby having a smooth surface at the periphery, the whole being constructed as above described, and for the purposes specified.

117,334.—MACHINE FOR LAYING OUT MORTISES.—Jacob M. Rodkey, Indiana, Pa.

Claim.—The arrangement of the horizontal bars A and A', the adjustable marking-bits B and B', the frame D, treadle E, and shaft F, when constructed and operating together as described.

117,335. — PLOW. — Montgomery P. Rose, Napa, Cal.

Claim.—1. The lever D adapted to swing upon the arc F and thus change the relative position of the beam and share, as described.

2. The combination of the beam A and the share

with the lever D and its connections, and the projection C swinging on bolt B, as described.

117,336. — Carrousel. — Wilhelm Schneider, Davenport, Iowa.

Claim.—1. The carrousel, made in two stories, E and F, the lower embracing the upper, as specified.

2. The staircase H, applied to the stationary frame of the two-story carrousel, substantially as and for the purpose herein shown and described.

3. The post A, provided with the platforms *c d* and staircase H, to constitute the support of a carrousel, in the manner described.

117,337.—Truck for Moving Mounted Car-Axles.—Charles F. Scoville, Chicago, Ill.

Claim.—The single axle-supporting head F or double one G, rotating on the standard E of a two-wheeled truck, substantially as herein described, for the purpose specified.

117,338.—Medical Compound for Liver and other Diseases.—Cicero A. Simmons, Waldo, Fla.

Claim.—The above medical compound, substantially as described.

117,339. — Lifting-Machine. — Cicero A. Simmons, Waldo, Fla.

Claim.—The lifting-frame A, stand C, and cylinder F, combined and arranged substantially as specified.

117,340. — Sawing-Machine. — Aaron E. Smith, Libertyville, Ill.

Claim.—In combination, the shaft B, balance-wheel K, driving-wheel F, belt *d*, pulley G, shaft G′, saw H, platform J J′, crank-wheel C, connecting-rod D, treadle E, and brake L, the whole arranged to operate together, substantially as and for the purpose described.

117,341, antedated July 12, 1871.—Lamp-Chimney.—Daniel E. Somes, Washington, D. C.

Claim.—1. A vertical section of a lamp-chimney, hinged at its bottom, substantially as described.

2. A vertical section of a lamp-chimney, hinged at its top, substantially as described.

3. A vertical section of a lamp-chimney, hinged as shown in Fig. 3.

4. A vertical section of a lamp-chimney, hinged as shown in Fig. 3, and provided with a spring, *b*′ to hold it in position.

117,342. — Flax-Brake. — Mass. Branch Southwick, Mont St. Hillaire, Canada.

Claim.—The rolls A A, having rigid cogs B with angular denticulated surfaces, combined as described, for the purpose specified.

117,343. — Mold.—Daniel M. Sprogle, Annapolis, Md.

Claim.—The molds herein described, consisting of the hinged sides G, the top and bottom sections *a b*, constructed with tongues and grooves, all arranged and operating substantially as and for the purpose set forth.

117,344.—Braid-Guiding Attachment for Sewing-Machines.—Eleanor C. Sproul, Green Point, N. Y.

Claim.—The slotted and adjustable plates A *a*′ B *b*′ and spring C, when all are constructed and arranged as and for the purpose specified.

117,345. — Ship-Building. — Edward M. Strange, New York, N. Y.

Claim.—The hull a b C, when constructed and proportioned as described, and for the purpose specified.

117,346. — Automatic Fan. — Edward D. Swartwout, Chicago, Ill.

Claim. — In combination with a bedstead, the bearing-shaft B, supported at the head and the foot of the bedstead, and to which are attached blowers K, constructed and arranged to operate with the clock-work, substantially as shown, whereby the blowers are caused to revolve or to vibrate and agitate the air immediately over the bed, all constructed and arranged relatively to each other, substantially as shown and for the purpose set forth.

117,347. — Buckle and Loop.—Samuel C. Talcott, Ashtabula, Ohio.

Claim.—The bent plate J having prongs E attached to buckle A by the loop B, when constructed and arranged as set forth, to be attached to curtain or top K by prongs E and plate I, substantially as shown and described.

117,348.—Machine for Turning Keys.—James Terry, Jr., and Swift McG. Hunter, Terrysville, Conn., assignors to Eagle Lock Company, same place.

Claim.—1. The combination of the bed A, head B, sliding mandrel *a*, chuck D, lever *b*, weight *d*, socket C, frame F, chisels *k k*, rod G, collars *n n*′, treadle H, and springs *o p*, whereby a single movement of the treadle H causes the key to be first held by the chisels *k k*, next made to revolve by engaging with the chuck D, after which a further movement of the treadle causes the chisels to cut and turn the key, as set forth.

2. The combination of the bed A, adjustable post E, socket C, jointed frame F, chisels *k k*, with the head B and sliding mandrel and chuck *a* D, substantially as described, and for the purposes set forth.

3. The pointed center *e* and arm h of the chuck D, arranged on the end of the sliding and revolving mandrel *a*, in combination with the dies or chisels *k k* and their connecting mechanism, substantially as and for the purpose described.

117,349. — Pasteboard Packing-Box.—John W. Tuttle, Newton, Mass.

Claim.—The improved pasteboard packing-box, as provided with slots arranged through the sides or ends of its cover, as described, and with corresponding projections to enter such, arranged and formed on or from the body, as set forth.

117,350.—Paper Packing-Box.—John W. Tuttle, Newton, Mass.

Claim.—The box, as made with the slots in the ends or sides of its cover, and with the flexile metallic tongues or clasps fixed to the body of the box so as to extend into or through the slots, or be extended into or through them, and bent or turned downward relatively to them, substantially as represented and described.

117,351.—Reclining-Chair.—Luther Van Orden, Cincinnati, Ohio.

Claim.—1. A foot-piece, M, whether made in rocker-form or straight, when provided with guide N, in combination with the intersecting legs K and C, irrespective of the formation of that portion of the leg C which is above the seat of said chair, substantially as and for the purposes set forth.

2. The combination of ratchet *c*, wheel *b*, shaft Z, seat A, and legs *c c*′, irrespective of their formation above the seat, the whole as a device, in combination with an adjustable chair, substantially as and for the purposes set forth.

3. In combination with the seat of an adjustable reclining chair, the foot-piece E and the device for adjusting the said foot-piece, consisting of levers P and R, links Q and S, and stop W, or the equivalent of said device.

4. In combination with the back B of an adjustable reclining-chair, such as described, the legs C C′ when hinged at *c c*, and when the back is suspended between them.

117,352.—Machine for Cutting Cloth.—Ephraim B. Wells, New York, N. Y.

Claim.—The pivoted frame *c d*, rod F, spring *h*, frame B C, endless band-cutter D *f*, adjustable guide-plates *i i*, stationary table G, and movable table H, all combined, arranged, and operating as and for the purpose described.

117,353. — Washing-Machine. — Decatur Werst, South Bend, Ind.

Claim.—The cylinder B, having alternate loose rollers and radially-arranged bars or strips *b b*, in combination with the auxiliary cylinder C and case or receptacle A, constructed and arranged to operate substantially as shown, and for the purpose described.

117,354, antedated July 7, 1871.—Needle and Tool-Holder for Work-Tables.—Henry H. Wescott, Portland, Me.

Claim.—The arrangement of the drawer *a*, pins *n n*, and hole *m*, box *e* containing the needle-receptacles *f* and *i*, compartment *g*, compartment *h*, and circular holes *l l*, as herein set forth.

117,355, antedated July 20, 1871.—Wrapping-Paper. — Seth Wheeler, Albany, N. Y.

Claim.—The roll of wrapping-paper perforated as set forth, as a new article of manufacture.

117,356. — Culinary Boiler. — Ralph C. Whitehouse, Hodgdon's Mills, Me.

Claim.—A boiler, A *b b*, combined with an internal vessel, B *a a*, having the perforated bottom C, through which steam is admitted, and the side perforations *d* just below the cover for the exit thereof, in order to adapt the same culinary vessel either to the boiling or steaming of vegetables.

117,357.—Set-Screw for Sewing-Machine Attachments.—Elihu Wilder, Springfield, Mass.

Claim.—The thumb-screw A, provided with the screw-shank C having a neck, *a*′, and the washer B, constructed substantially as and for the purpose described.

117,358.—Sewing-Machine Cover.—Francis R. Wolfinger, Chicago, Ill.

Claim.—The solid front I, combined with the hinges *d f*, when the wings *f* are secured to the top E and are provided with joints or eyes coming even with the tops of the ends D D, when folded so that the said front I will fold flat on the said ends, as described.

117,359.—Sewing-Machine Table.—Francis R. Wolfinger, Chicago, Ill.

Claim.—The bed-pieces K L hinged to and combined with the case for swinging a sewing-machine below the top of case, as described.

117,360.—Furnace for Roasting Ores.—Stephen F. Ambler, Monitor, Cal.

Claim.—1. In combination with the furnace A having the carbonizing-chamber E and hot-air chamber F, the blast-pipes h and *i*, substantially as and for the purpose above described.

2. The reducing-tube K, connecting the hot-air chamber F and revolving roasting-cylinder M, substantially as and for the purpose above described.

3. The above-described process of feeding the wood into a closed chamber, where it will be subjected to a heat without air, and fed to the fire in the manner and for the purpose above described.

117,361.—Combined Seeder and Cultivator.—Michael Baer, Logansport, Ind.

Claim.—1. The arrangement of the pedal R and hinged door P for opening and closing the seed-box J, substantially as herein set forth.

2. The arrangement of frame A, standards G G, and cross-bar H with the crank-wheel I, pawl *g*, cord *e*, bar E, chains *b b*, arm *h*, rock-shaft E, and catch K, for the purpose of adjusting the cultivator beams C C, substantially as set forth.

117,362.—Steam-Engine.—George H. Bailey and Harvey H. Burritt, Newark, N. J.

Claim.—1. The piston-valve F, as described, with four pistons and cover F″ and F‴.

2. The combination of the rotating valve A with the piston-valve F, as described.

3. The valve-chest E, constructed with steam-induction port G, passages V Q Q′, and eduction-ports Z and Z′, arranged substantially as shown and described.

4. The regulating-valve T, as shown and described, for controlling the movement of valve F.

5. The combination of the piston-valve F, rotary valve A, and regulating-valve T, with the connections to the steam-piston Y, so that the latter cushions upon steam at each end of the stroke to a degree controlled by valve T.

117,363.—Desulphurizing and Treating Ores.—John W. Bailey, Hamilton, Nev.

Claim.—1. The process described of roasting ores, by exposing them to the action of a series of furnaces of gradually-increasing temperature, substantially as described.

2. The process described of treating ores, consisting in the employment of series of blasts, in connection with a series of furnaces of varying temperature, the ore being caused to come into contact with the products of combustion at the point of strongest blast, substantially as described.

3. The process described of treating ores, consisting in uniting in a fan-chamber an ore-laden current of air with a blast from the furnace, the combined elements being conveyed away to the receiving-chamber, substantially as described.

4. The arrangement of the fan-chamber and the furnace, the former being provided with central openings for receiving the ore-laden current and the products of combustion, as described.

5. The ore-chamber I, provided with the pipes H J and discharge-spout, constructed as described.

6. The arrangement of the pipe G, fans F F, and furnaces E E, pipes H H, chamber I, pipe J, and tank K, as described.

117,364. — Button-Holing Attachment for Sewing Machines.-Samuel J. Baird, Waynesborough, Va.

Claim.—1. The combination of the shaft *o* and the wheel D geared with said shaft, and consisting of two sections, each having an odd number of teeth and arranged with its teeth opposite the spaces between the teeth of the opposite sections, the whole being operated from a toothed slide, A, substantially as specified.

2. The shaft *o*, provided with a nut, P, and adapted to bearings so as to be detachable therefrom, for the purpose set forth.

3. The clamp adapted for attachment to the fabric, in combination with the sliding and vibrating bar H, and with the cam or its equivalent, for securing the clamp to the said bar, as specified, and secured to the operating-slide and lever so as to be detachable, substantially as and for the purpose described.

4. The combination, with the plate W, of the pins *f f*, arranged as and for the purpose described.

5. The combination, with the shaft *o*, its cam *s*, and the lever M, of the box K operated by the cam, and in which the lever is adjustable, as described.

6. The combination of the shaft *o*, nut P, and sliding bar H, carried by but vibrating independently of the nut, as described.

7. The combination, with the vibrating carrier, of a fulcrum-pin, *e'*, adjustable as described.

8. The arrangement described of the case T', containing the within-described devices, with its vertical portion below the horizontal portion, for the purpose set forth, and as illustrated in Fig. 10.

9. The combination, with the box K and lever M, of the plate L, its diagonal slot receiving a pin on the lever, and the lever N, or its equivalent, for operating the plate, as specified.

10. The combination of the lever M, adjustable laterally, the slide G, or its equivalent, adjusting the wheel D, and the lever N, connected to the lever M and slide G so as to adjust them simultaneously, substantially as set forth.

11. The combination of the lower and upper plates of the clamp and devices described, or their equivalents, for raising and depressing the upper plate while maintaining it parallel to the lower, as set forth.

117,365.—Machine for Cutting Tobacco.
John Gulick Baker, Philadelphia, Pa.

Claim.—1. In a machine for cutting tobacco, &c., an eccentric pinion, G, adapted to an inclined rack in the guided cross-head which carries the knife, and arranged so that the leverage increases as the knife descends, as and for the purpose set forth.

2. The base-plate, having a recess curved at the bottom and adapted for the reception of a strip, *n*, curved at the lower edge, and self-adjusting in the said recess, as and for the purpose described.

117,366.—Meter.—William Ball, New Vienna, Ohio.

Claim.—1. The combination and arrangement of the flanges I' I, plate K, ring F, rim B, floats H, tube D, opening L, and funnel A, as and for the purpose specified.

2. In a water-meter, the combination of the rectangular hinged floats or valves H with the annular channel-way, provided with the inclined plane I', and the swelling or packing M' on the inner side of the outer wall B, substantially as specified.

117,367.—Cap-Gun.—Jacob Christ Bandle and Engelbert P. Christner, Cincinnati, Ohio.

Claim.—The combination of plunger F, arm G, link H, spring J, catch K *k*, hinged trigger-guard I, and trigger L, M, the whole being connected and operating as and for the purpose described.

117,368.—Car-Coupling.—Peleg C. Barlow, Beverly, W. Va.

Claim.—In combination with the draw-heads constructed as described, and with the springs arranged as shown, the slotted and pivoted coupling-irons C, when provided on their under side with the recess or gain, *s*, so arranged that its front shoulder hooks over the casting *a* while its rear shoulder projects beyond the face of the draw-heads and operates as a buffer, substantially as described.

117,369.—Combined Corn-Planter and Fertilizer-Distributer.—Charles W. Barrick, Walkersville, Md.

Claim.—The adjustable frame A, in combination with the longitudinal semi-rotary cylinder *l*, operated by shaft *j* having universal joint, whereby the dropping mechanism is not affected by the adjustment of the frame, substantially as set forth.

117,370.—Mosquito Canopy-Holder.—Lyman M. Bates, Wooster, Ohio, assignor to himself, Edward P. Bates, and Ira H. Bates, same place.

Claim.—The combination of holders D D, sockets or cups A A, braces B B, and rods *g g*, all constructed and arranged substantially as and for the purpose described.

117,371.—Sucker-Rod Joint or Coupling.—James H. Beatty, Franklin, Pa., assignor to Sarah J. Beatty, Josiah B. Poor, and William McKee.

Claim.—The straps B, provided with projections C, in combination with rivets D and recesses in the rod E, constructed and arranged as herein described, and for the purpose set forth.

117,372.—Steam-Trap.—Robert Berryman, Hartford, Conn.

Claim.—In a steam-trap, the combination of the closed case A, the bell-float or bucket C open at bottom, induct *a*, and educt *b*, provided with stem *g* and double puppet-valves *e f*, arranged in the cylinder B, substantially as set forth and described.

117,373.—Base-Burning Stove.—William T. Black, Erie, Pa.

Claim.—1. The flue E, one or more passing through the combustion-chamber, as and for the purposes set forth.

2. The diaphragm F, registered or not, in combination with the flue E.

3. The heating-chamber G, as arranged above the combustion-chamber, and separated therefrom by the diaphragm F, and the same in combination with the deflection-plate L and register H.

4. The chamber G, plate L, flue E, diaphragm F, and register H, arranged and combined as and for the purposes set forth.

117,374.—Fanning-Mill.—Franklin E. Bowen, Knightstown, Ind.

Claim.—In combination with the shoes C and F and fan-shaft H, the knocker-shaft E, slotted arms J, spring-support G, and lugs *c*, all constructed and arranged to operate substantially as and for the purpose described.

117,375.—Box for Chalk-Lines.—Ephraim Braley, Carmel, assignor to himself and Luther C. Hastings, Ellsworth, Me.

Claim.—The arrangement of the chalk-clasps *d* slot *a* with its stop or check *e*, and box *a* having the reel *h* and coiled spring *f* contained therein, all constructed as herein set forth, for the purpose specified.

117,376.—Process for Producing Signs in Paint.—Alexander Brandon, New York, N. Y.

Claim.—The within-described mode of operation for producing signs on hard material, the same consisting of the employment of soft types with thick paint, and holding the hard-surfaced sign in a fixed position on the platen or analogous surface of a suitable press, and subjecting it to repeated impressions upon the elastic type, the latter being rolled or resupplied with paint between each impression, all substantially in the manner herein specified.

117,377.—Machine for Pressing and Molding Cigar-Bunches.—William D. Brewer, Charlestown, Mass.

Claim.—1. The within-described die or mold, the female portion of which is divided longitudinally into two parts, in combination with a mechanism for opening and closing the same, substantially as and for the purpose described.

2. The weights K, cord A, and plate I, connected and arranged substantially as and for the purpose set forth.

3. The plate I, projecting from one part, 7, of the female portion of the mold or die, in combination with the groove *k* in the opposite part 6, substantially as and for the purpose set forth.

117,378.—Transplanting Device.—James W. Brook, Lynchburg, Va.

Claim.—1. A transplanting device, consisting of a detachable bottom to be forced into the earth under the plant, and one or more detachable sides to be forced downward into the earth around the plant and rest upon the detachable bottom, substantially as described, for the purpose specified.

2. The transplanting device, consisting of the detachable bottom and sides A B and the sliding sides C C C, all constructed to operate substantially as described, for the purpose specified.

117,379.—Insect-Guard.—James William Brook, Lynchburg, Va.

Claim.—The case A, provided with a partition, *a'*, reservoir B, and the leg C *c*, constructed and arranged substantially as shown and described.

117,380, antedated July 20, 1871.—Sewing-Machine.—William H. Buker, Johnstown, N. Y.

Claim.—1. The combination, with the reciprocating shuttle-driver, of the pivoted arm or bar, the spring, and pad, when constructed and operated by a stationary pin, substantially as and for the purposes herein set forth.

2. In combination with the guide E, spring G, and pad *b*, the pins *e* and *f*, or their equivalents, arranged to operate substantially as and for the purposes herein set forth.

117,381.—Farm-Gate.—William D. Carlton, Morrisville, N. C.

Claim.—1. The arrangement of the slotted revolving post or bearing E, connecting-piece F, gate-post B, parallel slats C C and their end pieces, the slotted guide-bar K, and the knob and latch H, constructed substantially as set forth.

2. The loose pin or wedge *f*, revolving slotted post E, connecting-strap F, bars C C, slotted transverse guide-bar K, and latch H, constructed, arranged, and operating substantially as set forth.

117,382.—Furnace for Heating Metal Plates, Calcining Ores, and for other Purposes.—Henry Chess, Pittsburg, Pa.

Claim.—1. A furnace for heating metal plates and calcining ores, constructed and arranged substantially as herein described.

2. The central fire-place C and bridge-wall D, in combination with the vertical flues *t* and the inclined converging flues *n*, when constructed with reference to a furnace for heating metal plates and calcining ores, substantially as described.

3. The doors or openings *f f f* of a furnace for heating metal plates, arranged in a circular, elliptical, or polygonal form, in combination with a central fire-place, C, substantially as and for the purpose set forth.

4. The openings or doors *f f f*, in combination with the upright flues *t*, inclined converging flues *n*, and the central fire-place C, constructed and arranged substantially as and for the purpose set forth.

117,383.—Clamp for Entering Blind-Slats.—James Church, St. Louis, Mo.

Claim.—The clamp, composed of a number of holders, E H, upon a rod, D, substantially as and for the purpose set forth.

117,384.—Fire-Proof Roofing.—John B. Cornell, New York, N. Y.

Claim.—1. A fire-proof roof, formed of slate C and corrugated metal sheet A', applied to a building in the manner specified.

2. The slate C, sheet A, and plastering E, combined and applied as and for the purpose specified.

117,385.—Steam-Generator.—George H. Corliss, Providence, R. I.

Claim.—1. The within-described construction of the furnace for the purpose of protecting the outer portion of the tube-sheet from the heat thereof, substantially as set forth.

2. The combination of the cylinders F and G with the protected portion of the lower tube-sheet, the cylinder being so arranged as to deposit the earthy matter held in suspension in the water upon said protected portion, substantially in the manner shown and described.

3. The combination of a vertical steam-generator, having within it the cylinders F and G arranged as described, and a furnace constructed to protect the outer portion of the lower tube-sheet of such generator, substantially as and for the purpose set forth.

117,386.—Journal-Box.—George H. Corliss, Providence, R. I.

Claim.—A journal-box, the lower surface of lower section of which is semicircular or nearly so, when combined with an upper section, the upper surface of which is flat or of an equivalent form, and set-screws for preventing the lower section from turning in its seat, the parts being constructed and arranged in suitable pillow-block, substantially as and for the purpose set forth.

117,387.—Raft-Clip.—Isaac Corwin, Defiance, Ohio.

Claim.—The raft-clip A, constructed with tang C and shoulders *a a*, substantially as and for the purpose set forth.

117,388.—Metallic Cartridge.—John S. Crary, Salem, N. Y.

Claim.—A cartridge, composed of two separate charge-chambers, each filled with powder or its equivalent, and provided with fulminate or a cap, whereby it can be exploded in the ordinary breech-loading arms, substantially as set forth.

117,389.—Machine for Manufacturing Loom-Harness.—John H. Crowell, Providence, R. I., assignor to John Kendrick, same place.

Claim.—In machines for making weavers' harness, the combination of the stationary fingers *a* for gauging the length of the heddles, the side bands A to which the heddles are knotted, and the supplemental movable fingers *b* operating, as described, to temporarily hold the twine upon one side of the heddle while the knot is being drawn to the band for the purpose of increasing the length of the heddle-twine upon one side, substantially as herein set forth.

117,390.—Axle-Box.—David Dalzell, South Egremont, Mass.

Claim.—The combination of the tubular axle-box *a* and end piece *b* by means of a perfectly-fitting joint between the two, and a tapped hole made through both, and a threaded wire, *d*, screwed thereinto, as specified.

117,391.—Method and Apparatus for Molding Match-Plates.—John R. Davies, Racine, Wis.

Claim.—1. The process herein described for matching patterns for molding permanent match-plates, consisting, essentially, of the following steps: first, one part of the pattern is molded in plaster and removed therefrom; secondly, a plaster cast of that mold or impression is taken, which forms a temporary match-plate for the said part of the pattern; thirdly, the pattern is returned to the plaster mold, and with it forms the temporary match-plate for the other part of the pattern, from which temporary match-plates permanent match-plates may be molded, substantially as described.

2. The combination of the match-plate B, frame C, and removable cover B², substantially as described, for the purpose specified.

3. The pins O and clasps P, adapted for adjustment substantially as described, for the purpose specified.

4. The combination of the keys *d*, posts D, guides

E, and frame F, substantially as described, for the purpose specified.

117,392.—SPRING-SEAT FOR WHEELED VEHICLES.—Elijah F. Dunaway, Cincinnati, Ohio.

Claim.—In combination with the seat composed of the parts A B C D D' and feet E E', connected substantially as described, the rubber springs F F, as and for the purpose specified.

117,393. — PREPARED-WOOD SOUNDING-BOARD FOR PIANOS.—John B. Dunham, East Chester, N. Y.

Claim.—A hydrocarbonated sounding-board, made substantially as herein described.

117,394. — PRESSURE-GAUGE. — James B. Eads and Henry Flad, St. Louis, Mo.

Claim.—1. The provision in a pressure-gauge of a rod or tube, C, operating substantially as and for the purpose set forth.

2. In connection with the rod or tube C, the rod D, finger G *g*, guide or track F, and spring I, substantially as and for the purpose set forth.

117,395.—FLOUR-BOLT.—Elbridge V. Easley, Johnson City, Tenn.

Claim.—1. The rod *f* arranged within the hollow shaft A, and carrying a series of conical wedges, D D, in combination with the radiating arms B B and ribs C C of the bolting-reel, whereby the bolting-cloth is expanded or contracted as the conical wedges are operated, substantially as and for the purpose set forth.

2. The conical wedges D D, rod *f*, hollow shaft A, and arms B B, in combination with the ribs or bars C and cross-bars *c c*, and the bolting-cloth, substantially as described.

3. The flour-boards C C overlapping each other arranged concentrically within the flour-bolt, and having their bearings on the head F, and perforated board H, substantially as and for the purpose set forth.

117,396.—SHIELD FOR NAPHTHA-GAS BURNERS.—Henry H. Edgerton, Fort Wayne, Ind.

Claim.—A shield for naphtha-gas burners, made of glass, metal, or other material, with a neck to fit closely around or upon the burner so as to exclude air from below, and a broad or flaring upper air-deflecting portion following the general shape of the flame, and extending to or below the line between the illuminant and non-illuminant parts of the flame, as herein shown and set forth.

117,397. — CASTING CAR-WHEELS.—Josiah W. Ella, Pittsburg, Pa.

Claim.—Making cast-metal car-wheels by pouring a requisite quantity of molten metal into the lower open half of a properly-constructed mold, and then, before said molten metal has had time to set, bringing the upper half of the mold suddenly down upon it so as to drive the molten or semi-fluid mass with equal instantaneous force into the proper shape, substantially in the manner as heretofore set forth.

117,398, antedated July 13, 1871.—BREECH-LOADING FIRE-ARM.—Valentine Fogerty, Boston, Mass.

Claim.—1. The projections or shoulders *e e*, extending inward from the walls of the receiver for the purpose of locking the breech-bolt within the receiver, as set forth.

2. The combination, with the slot in the bottom of the receiver, of the lever for throwing out the cartridge and the cam on the sleeve C, as and for the purpose set forth.

3. The combination of parts herein described, whereby the lever L is caused to guide the cartridge into the barrel of the gun and to throw the shell from the receiver, as specified.

4. The combination herein described of the breech-bolt B and sleeve C, the parts being constructed and arranged in relation with each other as shown, and for the purpose specified.

5. The combination of the retractor D and the sleeve C when the same are connected together in the manner shown.

6. The long lands or projections on the breech-bolt for locking the bolt within the receiver, giving it a support against the wall of the chamber through the whole length of the chamber, guiding the breech-bolt as it is drawn back and pushed forward, and for preventing the operation of the lock to cock the gun when the breech-bolt is not locked in its place.

7. The sear-spring when combined with the breech-bolt B, as shown, so as to operate on the sear only when the breech-bolt is locked.

8. The combination of the lock-bolt, provided with the angular slot *t t'*, with the firing-pin and breech-bolt, when connected together for operation, in the manner and for the purpose described.

9. The slots *r* and *t* in the breech-bolt and lock-sleeve for allowing the lock-bolt to be drawn back independently of the breech-bolt to cock the gun.

10. The shoulder and projections on the lock-sleeve for closing the end of the receiver and preventing the rotation of the lock-sleeve.

11. The combination of the sear and the lock-sleeve.

12. The cap in the hand-piece for protecting the sear.

13. The safety-notch *w''* cut in the lock-bolt, when arranged, in the manner described, in relation to the branch slot *t'* of the lock-sleeve and the screw *s*, so as to catch the sear when the screw passes out of the branch-slot.

117,399.—LANTERN.—Frank M. Ford, Sebec, assignor to himself and Charles S. Pearl, Bangor, Me.

Claim.—The combination of the globe B and attached disks *b c* with the springs *f f'*, having stops *j j'* and slotted plate *i* or their equivalents, substantially as specified, for the purposes set forth.

117,400. — WASHING-MACHINE. — Charles Fortin, Poultney, Vt.

Claim.—1. The crank-shaft C, constructed as described, in combination with the shafts D D¹ D², beater E, and rubbers F F', arranged to operate substantially as shown and for the purpose described.

2. The receptacle A, cover B with the slot *g'* and bar or guide *g*, crank-shaft C, slotted shafts D D¹ D², beater E, rubbers F F', guides G G, springs A A, pinions *i i'*, and crank H, all combined and arranged to operate substantially as and for the purpose set forth.

117,401.—GATE-LATCH.—Charles H. Freitag, Springfield, Ill.

Claim.—The latch A, pivotal rod B, and knobs B', cast in one piece, and combined with the cap-plate D and keeper E, in the manner and for the purpose specified.

117,402.—WASTE-WAY STOPPER. — Joshua R. Gibson and James Powell, Cincinnati, Ohio, assignor to James Powell.

Claim.—1. A waste-way plug, composed wholly or in part of rubber, in combination with the seat or socket K, substantially as and for the purpose explained.

2. The elastic packing F, mole G, washers H I, and stem J, combined and arranged substantially as and for the purposes set forth.

117,403.—GATE. — Robert Gidley, Moore's Mill, N. Y.

Claim.—The combination of the gate K L, hinged post G, bracket C, bar A, sliding bar B, locking-bars N N, and the bars M M, all constructed and arranged to operate substantially as and for the purposes herein set forth.

117,404.—GANG-PLOW. — James H. Glass, McGregor, Iowa, assignor, by mesne assignment, to Louisa J. Glass.

Claim.—1. The box C, operated as described, and serving as a protection for the screw and studs *d'*, in combination with the flanged plate D, constructed and arranged substantially as specified.

2. The dog O, in combination with the chain M, shackle N, hinged beam E, axle A, and beam G, substantially as and for the purpose set forth.

117,405.—STILL FOR OIL. — John Gracie, Pittsburg, Pa.

Claim.—The still A, provided with a series of horizontal return-flues, B, communicating with fire-chambers and a smoke-flue or flues, substantially as herein described, and for the purpose set forth.

117,406.—STILL FOR OIL. — John Gracie, Pittsburg, Pa.

Claim.—A still, constructed with a series of flues arranged horizontally, or nearly so, a little above the bottom, and converging to a common center, so that its bottom shall be free from the direct application of a distilling or decomposing heat, substantially as herein described.

117,407.—CORPSE-PRESERVING CASE.—John Gravenstino, Philadelphia, Pa.

Claim.—1. The combination, with the detachable lid B having an opening *x*, of a detachable casing, D, detachable closed ice-box, perforated casing or partition F, and the cover H adapted to both the casing D and the opening *x*, as set forth.

2. The combination of the above, the case A with its shoulder *c* and gasket, and the plate J having a packing at its upper side, and constructed as specified.

117,408. — REFRIGERATING APPARATUS. — John Gravenstin, Philadelphia, Pa.

Claim.—1. A refrigerating apparatus, consisting of an ice-box, D, casings C and B, and passages F and F', all arranged substantially as set forth.

2. An ice-box, D, closed so as to retain the drippings in contact with the ice, arranged within a casket or chest, and having air-passages extending round the same, as set forth.

117,409, antedated July 14, 1871.—PITMAN-CONNECTION FOR HARVESTERS.—Squire J. Green, Syracuse, N. Y., assignor to himself and Dyer Williams, same place.

Claim.—The combination of the spring *g* with the conical bearing C, having the hollow A shouldered at S, the conical bearing D, pin P, and washer W, all arranged and operating substantially as and for the purpose herein specified.

117,410. — CONCAVE FOR THRASHING-MACHINES.—Charles S. Hall, Rochester, N. Y.

Claim.—A concave for thrashing-machines, constructed as herein described, consisting of the section or sections B, having the depressed longitudinal bars forming the grating *c*, and ledges D D' corrugated upon their upper surfaces, as shown, and provided with apertures *a b* for the insertion of removable teeth *d*, substantially as and for the purpose specified and set forth.

117,411.—CHEESE-VAT FASTENER.—Samuel P. Halleck, Oriskany, N. Y.

Claim.—The combination of the slotted plate D, bolt E, spring I, and slotted swinging standard F, the whole constructed and operating substantially as and for the purpose herein set forth.

117,412.—LAMP-BURNER.—Thomas F. Halley and John F. Livingston, Washington, D. C.

Claim.—As a new and improved article of manufacture, the burner herein described, provided with the water-tank *b*, which is of conoidal form, and divided by tube *c* and partitions *e e* into two compartments, *i i*, of like size and shape, having discharge and filling-orifices *d d*, as and for the purpose specified.

117,413. — DEVICE FOR CLIMBING TELEGRAPH-POLES, &c. — Jacob A. Hanger and George C. Hanger, Churchville, Va.

Claim.—1. The combination of two jaws embracing the opposite sides of the pole, for the purpose herein set forth.

2. The sandal *a*, provided with the jaw *b*, in combination with the serrated jaw *c*, connecting-rod *d*, and guide-bars *f h*, as specified.

3. The combination of the sandal, the rigid jaw *b*, and the movable jaw *c*, as specified.

117,414.—CLOTHES-DRIER.—Orrin H. Harding and Daniel G. Williams, Quincy, Mich.

Claim.—The clothes-drier herein described, consisting of the hollow post C with its windlass, the rope H, and removable sliding post B having the pulley D in its foot and supporting the reel A, substantially as shown and described.

117,415, antedated July 20, 1871.—POTATO-DIGGER.—Robert A. Haw, Bucksport, Cal.

Claim.—1. In a potato-digging machine, the combination of the fixed frame C with the supplemental frame E arranged above the fixed frame, as described, and hinged thereto at its rear end behind the axle, for the purpose of supporting at its forward end the shovel, cutters, and front end of the separator, substantially as herein set forth.

2. A separator adapted to be used in a potato-digging machine, when formed with a series of parallel rods, *e e e*, supported in whole or in part by having their points turned down and fastened to transverse bars *e e*, substantially as described, and for the purposes set forth.

3. The rods *e' e'*, when prolonged beyond the rods *e e* at the rear end of the machine, and bent around so as to discharge the vines at the side of the track, substantially as described.

4. The arrangement of the gear *n o r s v w*, in connection with the shafts B M, clutch and treadle *l V*, pitman *k k*, lever *j*, and longitudinally-vibrating separator J, substantially as described, and for the purposes set forth.

5. The arrangement of the cutters I I, shovel H, separator J, fixed frame C, movable hinged frame E, lever G, treadle *l*, and apparatus for vibrating the separator, substantially as described, and for the purposes set forth.

117,416.—WATER-HEATER.—Joseph Head, Andover, N. Y.

Claim.—The heating-vessel A provided with the air-chamber B, and the flame-passage C with its helical series of crossed pipes *d'*, substantially as specified.

117,417.—COOKING-STOVE.—Levi Hermance, Lansingburg, N. Y.

Claim.—Attaching a sheet-metal reservoir or water-tank to the rear of a cooking-stove by means of the detachable frame, when constructed and arranged to operate substantially as and for the purpose as herein set forth.

117,418.—GATE.—Edmund Higgins, Sacramento, Cal.

Claim.—1. The extended bed-timber C provided with the track *e*, and the gate D with its rollers *f*, in combination with the quadrants N N, chains *p p*, triple carrying-shaft I, bevel-wheel K, and pinion *l*, all constructed and arranged substantially as and for the purpose described.

2. The triple shaft I, with its bevel-wheel *k* for operating the pinion *l*, and vertical-toothed wheel *m*, in combination with the rack *s* on the under edge of the gate, substantially as above described.

3. The hollow quadrant N, connected with the shaft I by chains *p*, in combination with the arm *t*, substantially as and for the purpose described.

4. The spring R and chain *q*, in combination with the triple carrying-shaft I, constructed and arranged substantially as and for the purpose set forth.

5. The arm *t*, rigidly secured to the shaft *o*, in combination with the connecting-wire *u* and lever-bar *v*, substantially as and for the purpose above described.

117,419. — CANAL-BOAT. — Robert Hooper, Baltimore, Md.

Claim.—A boat, A, provided with the recess *a*, with a rounding and sloping upper side in its bow, and the chamber *b* leading into the same, as herein shown and described.

117,420. — SPIKE-EXTRACTOR.—William S. Hough, Johnstown, Pa.

Claim.—1. The clamps D having the lugs *d'*, in combination with the bar A slotted at *c*, and bolt E, as and for the purpose specified.

2. The claw G, as described, in combination with the bar A and clamp D.

117,421. — RAZOR-STROP.—Oliver B. Howard, Westbrook, Me.

Claim. — The arrangement and combination of the handle *d*, strap *a* composed of leather, and the metal band *b*, as described, plates *b* and *c*, rod *e*, shoulder *h*, screw *f*, and piece *i* with its threaded hole, as herein set forth.

117,422.—ELASTIC TIRE FOR TRACTION-ENGINES.—Oliver Hyde, Oakland, Cal.

Claim.—The wedge or stay-blocks *f* with their side plates *g*, provided with a lug or projection, *i*, in combination with the flange *e* or equivalent device, substantially as and for the purpose above described.

117,423.—PAPER BOX.—Gustav L. Jaeger, New York, N. Y.

Claim.—1. The herein-described paper box, the sides of which are provided with flaps *a*, so that when folded they interlock with each other and form self-closing heads, substantially as and for the purpose specified.

2. The paper box A, when the flaps *a* are so cut as to produce the aperture *c* in one or both ends of the box, in combination with the hinged lid *d*, substantially as and for the purpose set forth.

117,424.—BEDSTEAD.—Lawrence J. Johnson, Cleveland, Ohio.

Claim.—The arrangement of the extension and adjustable bedstead A with its lever P, hinges M, pulleys J and K, cords R R, and spring-bottom D, when combined as herein described, and for the purposes set forth.

117,425, antedated July 13, 1871.—APPARATUS FOR DISTILLING HYDROCARBONS. James J. Johnston, Allegheny, Pa.

Claim.—1. A still with a corrugated heating-surface, in which is a series of oil-chambers elevated one above the other, and so arranged with relation to each other that the oil shall flow from the upper chamber in a broad thin sheet over a convexed surface into the chamber next below it, and thus flow down from one chamber to the other through the whole series, substantially as herein described, and for the purpose set forth.

2. The still A, as described, combined with the still C, and a tank, E, provided with pipes *g*, and communicating with still C through the medium of pipe A, and still C communicating with still A by means of pipe *i*, substantially as and for the purpose set forth.

117,426, antedated July 13, 1871.—PROCESS AND APPARATUS FOR TREATING HYDROCARBON OILS.—James J. Johnston, Allegheny, Pa.

Claim.—The combination of the pipes C, D, and *e*, constructed and arranged with relation to each other and a condenser, substantially as herein described, and for the purpose set forth.

117,427.—BOILER FOR PREPARATION OF PAPER-STOCK FROM WOOD.—Morris L. Keen, Jersey City, N. J., assignor to Samuel A. Walsh, New York city.

Claim.—1. The elongated boiler A, capable of being revolved on its short axis, and provided with the double set of connections D^1 D^2 H^1 H^2, and the proper controlling means for admitting and discharging fluids through the trunnions in the manner specified.

2. In such boiler so operated, the annular sprinkler C, arranged as shown relative to the man-head F.

3. In such boiler so operated, the drain-pipe or discharge-pipe T and its controlling means, when the same leads out in line with the long axis of the boiler from the concave interior surface of the strainer B, as specified.

117,428.—BUTTER-WORKER.—Luke L. Kellogg, Leon, N. Y.

Claim.—1. The combination of the vibratory tray *a* and corrugated roller *k*, mounted in stationary boxes, as specified.

2. The combination of the tray *a*, supporting-frame *b c d*, shaft *e*, roller *f*, and frame A, as described.

117,429. — WASHING-MACHINE.—Ebenezar D. Kitchen, Pineville, Pa.

Claim.—1. The revolving barrel A provided with interior ribs *a a* running longitudinally in the barrel, and the barrel supported upon the hinged support or stand C, substantially as herein set forth.

2. The combination of the revolving barrel A with hinged lid D, strap E, latch G, vent *i*, and cover *b*, with the hinged supports C, provided with latch H and staple *d* on the head of the barrel, all substantially as set forth.

117,430, antedated July 5, 1871.—FURNACE FOR ROASTING ORES.—Richard F. Knox and Joseph Osborn, San Francisco, Cal.

Claim.—1. The ore-chamber B having the vertical arches *a b d e*, with the passages *c* at the base of each, when constructed to recede from each other, substantially as and for the purpose herein described.

2. The feeding device, consisting of the trough *g* suspended by the rods *i*, when constructed and operated substantially as herein described.

117,431.—GATE.—William H. Koaht, Ashland, Ohio.

Claim.—1. The hinge-arm O P P' P, provided with the two branches P P and the tang P', for the purpose of securing said arm to both the adjacent faces of the gate-post, and of supporting the inner corners of said branches to avoid lateral strain, substantially as herein specified.

2. The gate B A C D E F, having the notches *h* and *h* cut in the rails D and F, in combination with the gate-post K provided with the hinges Q Q N O P P' P and S T, the distances between the rails A, C, D, and F being made to correspond with the relative positions of the parts of the hinges, in the manner and for the purpose herein specified.

117,432.—TRIP-HAMMER.—John Krehbiel, Williamsville, N. Y.

Claim.—The spring D, cam or eccentric roller E', plate F', and pawl-lever F, when the same are so combined as to operate substantially as described.

117,433.—TABLET INDEX-BOOK.—James B. Bake, Jr., Baltimore, Md.

Claim.—As a new article of manufacture, an index-book made with leaves partly of common paper for permanent writing, and partly of erasive material for the reception of page-figures which may be readily expunged, as herein described.

117,434.—WINDMILL.—Leander Leach, Wilmington, Ill.

Claim.—1. The hinges *e'*, in combination with the wings E', rods F, ring E, rods *c*, collar F', sleeve G', lever I, and weight J, substantially as described.

2. The combination and arrangement of the rods G F', sleeve G', collar F', rods F, wings E', and hinges *e'*, substantially as set forth.

117,435. — PROTECTING SAFE. — S. Morris Lillie, Elizabeth, N. J.

Claim.—1. A safe or vault containing, in suitable pipes, chambers, or recesses, a quantity of highly-compressed or liquefied poisonous gas, such as ammonia or the like, substantially as and for the purpose set forth.

2. In a safe or vault constructed with pipes, chambers, or recesses for the reception of poisonous gas, as described, the branch pipes sealed with fusible plugs, substantially as and for the purpose set forth.

117,436.—PEG-WOOD.—William N. Linnell, Cambridge, assignor to Asa B. Keith, Braintree, Mass.

Claim.—As a new article of manufacture, a peg-wood ribbon or band, formed with one or both sides serrated, denticulated, or corrugated, substantially as described.

117,437.—PROPULSION OF CANAL-BOATS.—Frank M. Mahan, Memphis, Tenn., assignor of one-half his right to Primus Emerson.

Claim.—1. In a canal-boat, a funnel-shaped bow, as herein described, in combination with a central passage, C, for collecting and carrying backward both air and water, substantially as herein specified.

2. In a canal-boat, a self-adjusting smoother arranged in a channel extending from the wheel backward, substantially as and for the purposes herein set forth.

117,438. — STOP-COCK. — Peter E. Malmström and Paul Dummer, New York, N. Y.

Claim.—1. A stop-cock, composed of a shell, A, loose valve B, screw-spindle C, spout D, nipple F, and plug E, all combined and arranged substantially in the manner herein shown and described.

2. The collar *d* of the screw-spindle C, arranged within the seat *c*, combined and operating in connection with the packing-disks *f g*, plug E, and shell A, substantially as and for the purpose set forth.

3. The recess *i* in the inner end of the nipple F to operate in combination with the loose valve B, as described.

117,439.—HAIR-CURLER. — Charles Markley, New York, N. Y.

Claim.—1. The case B hinged to the handle A, substantially as described.

2. The stud D and spring E, in combination with the hinged case B and handle A, as and for the purpose described.

117,440.—INVALID BEDSTEAD.—Thomas A. McFarland, Erie, Pa.

Claim.—The side pieces B B, in combination with the sliding pieces *o o* and bed-frame *b a h* hinged at *c* and *d*, whereby the bedstead may be used as such, or converted into a chair with an adjustable back, substantially in the manner and for the purpose set forth.

117,441. — COMBINED DITCHER AND PIPE-LAYER.—James I. Mettler, Mendota, Ill.

Claim.—The mole A and stem A^1, constructed with a tubular duct, A^2, passing through both and opening at the rear of the mole, by means of which tile may be deposited in the hole made by the mole and immediately in the rear thereof, substantially as set forth.

117,442.—WATCHMAN'S TIME-CHECK.—Anton Meyer, Stuttgart, Germany.

Claim.—The stationary marking-die or dies, situated beneath a cam-shaped bridge, in combination with a suitable key or keys, and with a dial passing through between the marking-die or dies and the bridge, substantially as herein shown and described.

117,443. — CLOTH-MEASURING MACHINE.—Isaac Mills, Hamilton, Canada.

Claim.—The perforated basket K, measure-roller D, tension-rollers H I, and reel-board C having adjustable pins *s s*, when the same are combined and arranged so as to operate in connection with suitable measuring-dials substantially as described.

117,444.—BURGLAR-ALARM.—John Morgan, Jr., Wheeling, W. Va.

Claim.—The arrangement, herein shown, of the pendulum S, connected by wire 17 to the ground, clock-points T and U, wires 18 and 19, keys A B and C D, arm C, wires 22 and 23, relays L M and J K, battery Z, wires 24 and 25, magnets F F and M N, wires 26 and 30, local batteries A, wires 28 and 31, and pendulum G H, substantially as and for the purposes herein set forth.

117,445.—SPIRIT-STILL. — John E. Morris, Baltimore, Md.

Claim.—The combination, in each cup *a* of the columnar still-cap, of the doubling tubes *d e*, overflow-tube *g*, the perforated plate *f*, and a quantity of charcoal or other suitable material placed above it, as specified.

117,446.—CHURN-DASHER.—Henry Mulholland, Union Mills, Pa., assignor to himself and John Mulholland.

Claim.—The above-described dasher, provided with the series of fingers having broad faces on one side and narrow edges on the other for giving two different strokes to the cream, substantially as set forth.

117,447.—MANUFACTURE OF VULCANIZED RUBBER AND COMBINATION HOSE AND TUBING.—John Murphy, New York, N. Y.

Claim.—1. The improved method herein described of manufacturing vulcanized hose and tubing, the same consisting in inclosing it in a mold while subjected to the heat for vulcanizing.

2. The improved smooth-finish hose and tubing, produced by confining it in a mold and vulcanizing, substantially as set forth.

117,448.—BOILER FOR HEATING BUILDINGS. Thomas J. Myers, Philadelphia, Pa.

Claim.—A boiler, having its tubes constructed in a wide, oblong, flat form, and arranged diagonally parallel and lapping each other, as described, and for the purpose specified.

117,449.—RAILWAY TIE.—Willard A. Nichols, Mattawamkeag, Me.

Claim.—A railway tie, in which the bearing for the rail is formed by a piece of harder wood inserted therein, when the said piece is of rectangular section and set in an inclined recess, in the manner shown and described.

117,450.—SIPHON STEAM-PUMP. — Thomas O'Rorke, Pittsburg, Pa.

Claim.—A siphon steam-pump having a detach-

able and adjustable tube around the steam-pipe C extending forward and aft of its outlet, and arranged concentric to it and the outlet of the chamber B, substantially as herein described and for the purpose set forth.

117,451.—WATER-WHEEL.—Charles Watkins Parker, Genesee Forks, Pa.

Claim.—The water-wheel herein described, having the plane bucket B tangentially placed with reference to the shaft A, the curved end buckets C C, and the intermediate inclined planes *a a* tapering from the central portion of the wheel each way toward the shaft, substantially as specified.

117,452.—LAMP-CHIMNEY CLEANER.—Richard Pearson, Allegheny City, Pa.

Claim.—A new article of manufacture, viz., a cleaner for lamp-chimneys, constructed of strips B and C held together at the point where they cross each other by means of a thin metallic center-piece, D, and their ends secured in the handle A, said cleaner being expanded by the forward pressure of the handle, as herein described, and for the purpose set forth.

117,453.—CAR-COUPLING.—William Voorhees Perry, Beaver Dam, Wis.

Claim.—1. The stirrup D, constructed as described, and arranged within a draw-head, substantially as and for the purposes herein set forth.

2. The trip H, slide *e*, and iron *f*, operating in connection with the spiral spring *a*, link B, and pin C, substantially as and for the purposes herein set forth.

117,454.—APPARATUS FOR ACCUMULATING POWER.—Alfred C. Platt, Sandusky, Ohio.

Claim.—1. A machine for accumulating power, in which a series of springs, weights, or other equivalent devices is connected and disconnected with a shaft or other device for transmitting that power, substantially for the purposes herein set forth.

2. The disk A, provided with the arbor C, projection *a*, and pin or stop *b*, substantially as and for the purposes herein set forth.

3. The wheel H, working upon the shaft B, and provided with arms or spurs, substantially as and for the purposes herein set forth.

4. The beveled point *b* in combination with the beveled arms or spurs of the wheel H, substantially as and for the purposes herein set forth.

5. The lever I for operating the wheel H, substantially as and for the purposes herein set forth.

6. The wheel-catch *d*, upon the lever I, for the purposes herein set forth.

7. The spring *m*, arranged to act upon the lever I, substantially as and for the purposes herein set forth.

8. The wheel E, held in place by the spring *p*, and provided with the point *e* and toothed spurs *h h*, substantially as and for the purposes herein set forth.

9. The lever J, connected with the wheel E to operate the lever I, substantially as and for the purposes herein set forth.

10. The spring-brace *f*, arranged to operate upon the pin *e* on the wheel E, substantially as and for the purposes herein set forth.

11. The wheel G, provided with the point or pin *n* and placed upon the shaft N, substantially as and for the purposes herein set forth.

12. The lever K, operated by the pin *n* on the wheel G for connecting the next spring or weight, substantially as herein set forth.

13. The lever J', operated by the pin *n* on the last wheel G on one shaft for connecting the first power on the next shaft, as herein set forth.

14. The shafts N N, sustaining the wheels G G and geared together by the gear-wheels R R, substantially as and for the purposes herein set forth.

15. The spring-crank O to operate the shafts N N, substantially as herein set forth.

16. The index P, provided with catches for holding the shafts N N in position, substantially as herein set forth.

17. The keys S and T, arranged and operating substantially as and for the purposes herein set forth.

18. The main shafts B B, connected by gear-wheels W W for transmitting the power, substantially as herein set forth.

19. The application of weights, substantially in the manner and for the purposes herein set forth.

20. Disconnecting the spring D from the power winding it by its own action, substantially as and for the purposes herein set forth.

21. In a machine for accumulating power, constructed substantially as herein set forth, applying and releasing the power—*i. e.*, connecting and disconnecting each of the springs D D or other equivalent appliance with the shaft B either by its own action or that of some other in the system—as and for the purposes described.

117,455.—PROCESS OF SEPARATING TANNIN FROM SOLUTIONS.—Nathan C. Platt, Salisbury, N. Y.

Claim.—The process of obtaining tannic acid from leached liquors, infusions, or solutions of vegetable substances by the use of saline baths or solutions, substantially as described.

117,456.—DUSTING-BRUSH.—Thomas G. Porter, Louisville, Ky.

Claim.—The dusting-brush, composed of the handle F, the cap or socket B C, the wire D, the screw-loop *d*, and the brush material H H, in combination with each other and with the described composition, when constructed and arranged substantially as set forth and described, as a new article of manufacture.

117,457.—SAP-SPOUT.—Charles C. Post, Hinesburg, Vt.

Claim.—A notch or opening, *f*, on the top of the stem-flange *d* for the sap to flow over into the spout B, so that the tap or bore will be kept full and moist, as herein described.

117,458.—STEAM-ENGINE.—Elting Post, Boston, Mass.

Claim.—1. In combination with the cylinder A, its piston, and the main balanced valve B and its chest C, the auxiliary duplex-balanced valve E, its chest D, and the lateral ducts *q q*, the said main and auxiliary balanced valves and their chests being made and arranged with ports and passages of communication, and the valve-stem G being furnished with the collars to operate with the arm *t*, all being substantially as described.

2. The combination of the auxiliary valve-stem *v'* and its collars *w' x'* with the main balanced valve B, the chest C, the piston P, cylinder A, arm *t*, the auxiliary balanced valve and chest, the rod G, and its collars *r s*, all arranged and combined or applied together in manner and to operate as set forth.

117,459.—SEWING-MACHINE.—Jonathan Ramsay, Jr., Middletown, Conn.

Claim.—The arrangement of the cam *b*, strap *c*, lever *d*, rock-shaft *f*, rod *h*, adjustable link *k*, oscillating lever *l*, sleeve *v*, levers *t w*, cam *x*, spring *u*, and the feed-bar and driving-shaft, as herein shown and described, for the purpose specified.

117,460.—HARVESTER.—Solomon Rawson and Isaac Rawson, Almond, N. Y.

Claim.—The socket *d* provided with two or more orifices, the spring *f h*, and standard *b* rigidly connected with the shoe *a*, all arranged as shown and described.

117,461.—REVOLVING FIRE-ARM.—Charles B. Richards, Hartford, Conn., assignor to "The Colt's Patent Fire-Arm Manufacturing Company," same place.

Claim.—1. The flange *s* of the ejector-case when shaped and adapted, substantially as described, to fill the recesses in the barrel made for the rammer and its lever.

2. The outlet *s* in the ejector-case when located, as herein described, so as to prevent the removal of the ejector-rod head while the ejector-case is in place, substantially as and for the purpose set forth.

3. The projection *p* on the breech-plate, in combination with the firing-pin and the recess in the pistol-frame for the hammer, as set forth.

4. The removable bit *t* applied to and forming part of the pawl *h*, when operating substantially as and for the purpose specified.

117,462.—COMPOUND FOR PREVENTING INCRUSTATIONS IN STEAM-BOILERS.—William T. Rickard, New Monitor, Cal.

Claim.—An anti-incrustator for steam-boilers, prepared from the ingredients specified, in about the manner and proportions above given.

117,463.—PUMP.—William F. Robinson, Bellaire, Ohio.

Claim.—The combination and arrangement of the pump-stock or barrel, the plungers D and E both working in contact with the inner surface of the barrel—the former operated by the rod C and the latter by the rods C^2 C^2—cross-head, rod C^1, and lever B to which the rods are connected on each side of the fulcrum, all substantially as and for the purpose set forth.

117,464.—PORTABLE OVEN.—William S. Robinson, Oskaloosa, Iowa, assignor to himself and Martin Morris, same place.

Claim.—The within-described cooking-oven, having the fire-box D, dampers *a a b d*, escape-pipe G, smoke-pipe E, and slides *f f*, all arranged substantially in the manner and for the purpose set forth.

117,465.—PILE-DRIVER.—Henry Roehrs, Washington, D. C.

Claim.—1. The shifting-rod L provided with the stationary arm N and the movable arm O, operating as described, in combination with the sliding head D or its equivalent, said shifting-rod being connected to the winding mechanism substantially as described, whereby the latter is automatically thrown in and out of gear by the rising and falling of the weight at different heights, as set forth.

2. The drum F with its gear-wheel *i*, and shaft G with its sliding pinion *h*, in combination with the rock-shaft K having one arm connected with the pinion and the other arm connected to the rod L, all constructed and arranged for joint operation, substantially as set forth.

117,466.—STOP-VALVE.—Robert P. Ross, Bethlehem, Pa.

Claim.—1. A valve-chest, having a longitudinal passage and two vertical and parallel valve-seats, in combination with a yoke sliding vertically and carrying independent flat valves adapted to the said seats, and forced apart by an intervening spring, *m*, all as described.

2. The combination of the valve-chest, its seats, the yoke carrying the valves *f f'*, connected to the yoke so that they may be turned, as described.

117,467.—SCHOOL-DESK.—James Russel, Plymouth, Ind.

Claim.—The combination of the end pieces A B, back C, bisected seat D, box E, lids G, strip H, rubber blocks *b b'*, and straps *d*, all constructed and arranged substantially as and for the purposes herein set forth.

117,468.—SCREW-PRESS.—Mark Safford, Melrose, assignor to Jonathan Holbrook, Sherburne, Mass.

Claim.—The improved arrangement, herein shown, of the bar D, the two reversed screws E E, the nuts thereof, the worm-gears F F, the worm H' and its shaft I, the press-box A, the bar C, and the nut-supporter or plate H, all constructed and operating as and for the purpose set forth.

117,469.—WATER-WHEEL.—Daniel Sandoe, Orangeville, Ill.

Claim.—1. The ring R provided with teeth *s'*, working in connection with the pinions S and toothed slides U, substantially as and for the purpose specified.

2. In combination with the windlass D, the penstock A, shaft K, wheel K'', chutes V, ring R, pinions S, and the toothed slides U, as and for the purpose specified.

117,470.—STREET-LAMP.—William G. Schmidlin, Hoboken, N. J., and Jeremiah W. Driscoll, New York, N. Y.

Claim.—The inclined back *h* and frame for the plate *g*, applied above an opening in the portion *f* of the lamp-frame, as and for the purposes set forth.

117,471, antedated July 24, 1871.—MACHINE FOR MAKING BLIND-SLATS.—Paul Schumacher, San Francisco, Cal.

Claim.—1. The box A, provided with the rails *a*, in combination with the sliding box or frame C and knives *f* and *i*, substantially as and for the purpose above described.

2. The horizontal double-edged knife *f*, in combination with the double row of vertical knives *i*, for cutting the slats to the proper width and thickness at each movement of the block, substantially as above specified.

3. The revolving box *p*, with its ratchet-wheel *r*, arms *s*, and pawls *t*, in combination with the screw-rods I for feeding the presser-blocks downward, as described.

4. The slides *u*, arranged to be operated by the sliding box C, in combination with the arms *s*, pawls *t*, and ratchet-wheel *r*, substantially as and for the purpose above described.

117,472, antedated July 18, 1871.—WASHING-MACHINE.—Charles T. Shadbolt, Attica, N. Y.

Claim.—The arrangement of the vertically-ribbed inner surface B B of the tub, the actuating mechanism J M N O Q, the revolving bearings D D', and independently rotating rollers C C, as hereinbefore set forth.

117,473.—DEVICE FOR PULVERIZING THE SOIL.—Gillum Shelton, Normal, Ill.

Claim.—The triangular drag A, provided with holes *a a* and grooves *b b*, and used with the auxiliary drag C and chain B, substantially as and for the purposes herein set forth.

117,474.—MACHINE FOR SHEETING DOUGH.—John H. Shrote, Baltimore, Md.

Claim.—1. The combination of the receiver *a*, follower *c*, plate *b* provided with the slot *e*, and adjustable angle-bar *f*, as shown and described, whereby the dough is pressed out in sheets and their thickness simultaneously regulated, as specified.

2. The brush o^1, arranged on the shaft *o* to operate in combination with the sieve *q* and the other devices of the fifth clause of the claim, substantially as specified.

3. The combination of the plate *b*, knife m^4, arms m^3, rod m^1, and levers *m* m^2 with the carriage D, as set forth.

4. The combination of the arms *i* i^2, rock-shaft i^3, and clutch *j* with the carriage, as explained.

5. The sieves *q q'*, shaft *o*, pitman o^2, rods *p* p^2, links p^1 p^3, connecting-bar p^4, and stationary bar p^5, combined, as specified.

117,475, antedated July 13, 1871.—CAR-COUPLING.—Theodore Warren Sparks, Rochester, N. Y.

Claim.—1. The notched, pivoted, and grooved

block E and stop G, in combination with the coupling-pin C and bumper-head A, substantially as herein shown and described, and for the purposes set forth.

2. The swinging bar H *h'*, step I, pivoted, weighted, and jointed lever J L, and arm or trigger K, in combination with the coupling-pin C and bumper A, substantially as herein shown and described, and for the purpose set forth.

3. An improved car-coupling, formed by the combination of the coupling-pin C, block E, stop-block G, swinging bar H *h'*, step G', weighted and jointed lever J L, and arm or trigger K with each other and with the bumper A, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

117,476.—Cooking Apparatus.—Ebenezer Sperry, Chicago, Ill.

Claim.—1. The non-conducting chamber A, provided with a glass covering, D, and the dark sheet-metal plate C for absorbing and concentrating the sun's radiant heat and utilizing the same for culinary and other purposes, substantially as described.

2. The construction and arrangement, with relation to the heat-concentrating chamber A, of the re-heating chamber G, provided with a glass covering, H, and containing an oven, F, said oven being connected with the chamber A by the hot-air pipe E, and to the channel *b* in the bottom thereof by the condense-pipe K, as and for the purpose set forth.

3. The arrangement, within the oven F, of shelves I J, diaphragm *e*, exhaust-pipe M, provided with sleeves *g g'* and valve *f* at its several openings, and the exit-flue M', as and for the purpose set forth.

4. The boiler N, arranged in the upward flue of chamber A, as and for the purposes herein specified.

5. The door L', in a stove-oven, when provided with a collar, as herein described, for the purpose of connecting a pipe so as to convert any ordinary stove-oven into an air-furnace.

6. In combination with the air-heating chamber G, the inclined reflecting sides herein described, for the purpose of concentrating a greater amount of heat on the oven F.

7. The corrugated sash, when constructed as herein described, for the reception of a greater or lesser number of thicknesses of glass, for the purposes set forth.

117,477.—Machine for Turning Spiral Moldings.—Edward A. Stockton, San Francisco, Cal.

Claim.—The wheel F having its journal *q* provided with a square hole, in combination with the hollow auger A, nut C, and gouge *f*, all constructed and operated substantially as and for the purpose set forth.

117,478.—Permutation Lock.—Emory Stockwell, Stamford, Conn.

Claim.—1. The bell-crank lever C H, turning on a pivot at *s*, in combination with the fence-lever D pivoted at *t* to the lever C, and the bolt B having a diagonal slot, H, all arranged and operating substantially as herein described, whereby, in an attempt to force the bolt, the strain is thrown upon the lever C and the pivot upon which it turns, as set forth.

2. In a combination-lock, a fence with one or more eccentric rollers revolving thereon in contact with the peripheries of the tumblers, substantially as described.

3. The lever D, having the hooked end *h*, and provided with the eccentric rollers D' on the fence P and the roller E on the part K, in combination with the tumblers *g g* and the cam F, having the angular recess h which receives the roller E, and by which the fence is raised, all arranged and operating substantially as described.

4. The curved rib R, in combination with the lock-case and with the fence-lever D *h*, fence P, eccentric rollers D', roller E, tumblers *g*, and cam F with angular recess *h*, all arranged and operating substantially as described.

5. The part I with conical and fitting an enlarged socket of similar form, in combination with the part S' having the enlarged head *w* secured within the door, as shown.

6. The combination of the angular slotted bolt B, bell-crank lever C H *s*, pivoted fence-lever D *h*, fence P, eccentric rollers D' E, tumblers *g*, cam F, and rib R with a casing, *c*, and a spindle, all arranged and operating substantially as herein described.

117,479.—Churn-Dasher.—Benjamin F. Stover, Ladoga, and Isaac W. Warner, Crawfordsville, Ind.

Claim.—The improved churn-dasher herein described, composed of the socket A, perforated conic frustum B, and imperforate flaring rim C, combined and arranged substantially as shown, for the purpose set forth.

117,480.—Hand-Hole Stopper for Steam-Boilers.—Daniel Sullivan, Bangor, Me.

Claim.—A hand-hole stopper, composed of the four parts *a a' a'' a'''*, expansible by means of the wedge-shaped bolt *f* and nut A, and having the cup *g* and packing-rings *c* and *i*, substantially as and for the purposes set forth.

117,481.—Blacking-Box Holder.—Nathaniel H. Talbot, North Easton, Mass.

Claim.—The blacking-box holder made as described, viz., of a wire, W, bent in the form as shown and explained, and provided with cars C C' fixed to and arranged with its jaws, in manner substantially as specified.

117,482.—Cigar-Machine.—George W. Tanner, Providence, R. I.

Claim.—The gauge-rod E, provided with a disked head, a knob, and a frictional device, in combination with the main shaft and the several rollers of a cigar-machine, substantially as described, for the purposes specified.

117,483.—Saw-Filer's Vise.—Theodore Terrell, Yonkers, N. Y.

Claim.—1. The combination of the pivots *a a* on the jaw B with the bearings *c c* on the jaw A, and the interposed spring G, when said spring is arranged relatively to said pivots and bearings and to the screw S, substantially as and for the purpose herein described.

2. The combination, with the circular base-plate P and holding-down screw E, of the clamp C, constructed with a slot and a series of step-like notches, *g g*, substantially as and for the purpose herein set forth.

117,484.—Ventilator for Ships.—William Fitz James Thiers, New York, N. Y., assignor to Universal Ship-Ventilator, Alarm, and Bilge-Pump Manufacturing Company, New York city.

Claim.—1. The method and apparatus herein described for ventilating vessels, by means of chambers B B^1 B^2 B^3 communicating at their lower parts with the water in which the vessel floats, and at their upper parts with air-pipes controlled by valves, substantially as explained.

2. The air-chamber G, in the described combination with the water-chamber B, employed in connection with the valve *g* to prevent the reflux of air into the said water-chamber, or for use, in connection with a horn, F, to sound a continuous alarm.

117,485.—Garden-Tool for Trimming Sods.—Adolphe Tournier, Barnville, N. Y.

Claim.—The gardener's tool, composed of frame A with box H attached, shaft B with cutter F and guide-roller O, and provided with the auxiliary rollers I I on arms K K, the whole to be used by hand for the purpose of trimming the outside edges of sod or of the lawn, as specified.

117,486.—Globe for Gas-Lights.—Toussaint Trudeau, Ottawa, Canada.

Claim.—A shade or globe for gas-burners, having its bottom opening or throat at its narrowest part about two-thirds the diameter of its top opening, and so arranged as to bring the narrowest part of its lower opening on or nearly on a level with the tip of the burner for regulating the in-flowing currents of air and preventing the flickering of the flame, substantially as described.

117,487.—Fluting-Machine.—Theodore M. Tucker, Newark, N. J.

Claim.—The cam *a*, constructed and operating as described, and in combination with the frame B and lever *w* operating as described, and for the purposes set forth.

117,488.—Windmill.—Thomas S. Van Devort, Ypsilanti, Mich.

Claim.—1. The sails D D, rods *h* A, wheel K, and thimble *m*, with spiral slot therein, all combined substantially as and for the purpose set forth.

2. The thimble *m*, with slot *s* and pin *s'*, in combination with the rods *n n*, wheel I, and lever H, substantially as and for the purposes herein set forth.

117,489.—Fly-Trap.—Edward Victor, Fort Branch, Ind., assignor to himself and Jacob D. Skelton, same place.

Claim.—The combination of the cylindrical vessel *a*, notches *b*, flat glass cover *c* laid horizontally upon the top of the cylinder, and the truncated cone *d* having the opening *f* at its top, and so placed that its bottom is above the notches *b* and its top below the cover *c*, and the reservoir *e* is formed between it and the vessel *a*, as specified.

117,490.—Tournure.—Adolph Waldmann, Philadelphia, Pa.

Claim.—The combination of the curved double rib B, constructed substantially as described, with the bows C and waistband A, substantially in the manner and for the purpose set forth.

117,491.—Cotton and Hay-Press.—George P. Webster, Jr., Cross Bridge, Tenn.

Claim.—The combination of the double ratchet-bars H, head-block E, castings I I', pawls *b*, links *d d'*, and levers L, all constructed and arranged substantially as and for the purposes herein set forth.

117,492.—Spark-Arrester.—William A. West, Bellefontaine, Ohio.

Claim.—In combination with the chimney A, the cylindrical screen C, cap or chamber F, screen S, conducting-pipe K P, and tank T, constructed and arranged substantially as described, for the purpose specified.

117,493.—Cut-off for Rain-Water Pipes.—Cyrus Avery and Jerome W. Wetmore, Erie, Pa.

Claim.—1. The combination of the box, the inlet-pipe, and the outlet-pipes, arranged as described, the vibrating chute formed as described, and the partition with its sides inclined in opposite directions, forming a fulcrum as well as a stop to limit the vibration of the chute, these parts being constructed for joint operation, substantially as and for the purpose specified.

2. The combination of the partition with the vibrating chute fulcrumed thereon, and forked to embrace both sides of the partition, as set forth, so that the partition limits the movement of the chute in either direction.

117,494.—Mode of Reducing the Diameters of Tubings.—Elbridge Wheeler, Philadelphia, Pa.

Claim.—The process of reducing hollow objects of metal by the use of soap-stone, asbestus, or plumbago, as described.

117,495.—Bolt-Cutter.—John Whittaker, Sandusky, N. Y.

Claim.—1. In combination with the bar A, provided with opening *b*, the double-edged cutter B arranged to act in either direction, substantially as described.

2. In combination with the bar A, provided with an opening, *b*, the knife B and lever C, pivoted to the former and connected by the link D, arranged to operate substantially as set forth, whereby a compound-lever movement is imparted to the cutter.

117,496.—Mode of Transporting Eggs.—Henderson Willard, Grand Rapids, Mich.

Claim.—The vessel herein described, or its equivalent, when filled with water and eggs, for the purpose of transporting eggs without mechanical injury.

117,497.—Land-Roller.—William Wimer, Freeport, Ill.

Claim.—The within-described land-roller and corn-marker, consisting of the bar A, frames B and C C, rollers D D with bands *a a*, bars *b b* with cords and weights *c c*, and the tongue G, all constructed and arranged to operate substantially as and for the purposes herein set forth.

117,498.—Elastic Car-Wheel.—James A. Woodbury, Boston, Mass.

Claim.—A car-wheel made in two or more parts, with two or more elastic cushions between each two of said parts, said cushions being arranged between inclined surfaces, as at *b* and *c*, placed at opposite angles to the axis of the wheel, substantially as described.

REISSUES.

4,479.—Division A.—Process for Treating Coffee.—John Ashcroft, Brooklyn, N. Y., assignor to Sarah Jane Ashcroft, same place.—Patent No. 113,832, dated April 18, 1871.

Claim.—1. The process of maturing and browning coffee, to increase its commercial and other value, by subjecting it to the direct action of steam.

2. The process of maturing and browning coffee, to increase its commercial and other value, by subjecting it to the sweating and expanding action of steam and the drying action of heat.

3. In the process of producing a yellow, brown, or golden color, to increase the commercial and other value of coffee, subjecting it both to the action of steam and heat while in sacks, and thus greatly lessening the labor and expense of the process, and increasing the rich aroma of the coffee.

4. In the process of maturing and coloring raw coffee, to increase its commercial and other value, the method of subjecting a series of sacks to the action of sweating steam and drying heat by arranging sacks in tiers, one above another, and having free communication one tier with another, so that the sweating steam will pass into said tiers of sacks so arranged, by means of coils of pipe or otherwise, as described.

4,480.—Division B.—Treating Coffee.—John Ashcroft, Brooklyn, N. Y., assignor to Sarah Jane Ashcroft, same place.—Patent No. 113,832, dated April 18, 1871.

Claim.—1. In apparatus for coloring and matur

ing coffee, to increase its commercial and other value, a perforated sweating-box or a series of such boxes, in combination with an inclosing-chamber or oven and inlet steam-pipes, as described.

2. In combination with closed sweating-boxes in which steam is admitted directly upon coffee, the external drying-chamber into which steam or other heat is admitted to heat the ovens of the sweating-boxes, as described.

3. In apparatus for coloring and maturing coffee, the perforated sweating-boxes having a surrounding steam-chamber, and an inclosing oven having a surrounding heating-chamber, as described.

4,481.—Boot and Shoe-Heel Trimming-Machine.—Eben J. Beane, Providence, R. I.—Patent No. 43,082, dated June 14, 1864.

Claim.—1. The combination of a cutter, substantially as described, with a ridged or gauging-roller, d, and a yielding center-stud, g, substantially as described, for the purpose specified.

2. The combination of the rotating cutter G with the gauging-roller d and the movable pattern-plate I, substantially as and for the purpose herein set forth.

3. The combination of the rotating cutter with the gauging-roller d, the pattern-plate I, the center-stud g, and the centering-pin p, substantially as and for the purpose herein set forth.

4,482.—Hat-Lining and Tip.—Thomas W. Bracher, New York, N. Y.—Patent No. 110,891, dated January 10, 1871.

Claim.—1. A hat-lining, A, provided with a backing of paper, cloth, or woven material where the embossing is to be applied, with size interposed between said backing and lining, substantially as and for the purpose described.

2. The face of the hat-lining A, provided with metallic foil, as set forth, when the same is subjected to pressure between embossing-dies, as and for the purpose herein shown and described.

3. A hat-lining, provided with impressions illuminated with two or more colors by placing leaves of different colors upon the lining where the different impressions are to be produced.

4,483.—Revolving Fire-Arm. — William C. Dodge, Washington, D. C., assignor to Horace Smith and D. B. Wesson, Springfield, Mass.—Patent No. 45,912, dated January 17, 1865.

Claim.—1. The combination of the chambered cylinder, connected with the frame of the fire-arm by means of the journal, or its equivalent, that permits said cylinder to be revolved on its axis, and the retractor with its stem, adapted to withdraw several cartridge-cases simultaneously from said cylinder, the whole constructed and arranged substantially as described.

2. The combination of a single barrel, a revolving-chambered cylinder connected to the frame by a journal or its equivalent, and a retractor with its stem adapted to operate upon the exterior of the cartridge-cases and withdraw them from said cylinder, the whole constructed and arranged substantially as set forth.

3. The combination of the revolving-chambered cylinder-retractor, retractor-stem, and retractor-spring, the whole constructed and arranged substantially as before set forth.

4. The combination of the revolving-chambered cylinder and retractor with a retractor-stem extending through said cylinder and projecting therefrom so as to be operated from the end of the cylinder opposite that at which the retractor is arranged, the whole constructed and arranged substantially as before set forth.

5. The combination of the revolving-chambered cylinder, retractor, lock-frame, and hinge-pivot, whereby the end of the cylinder may be uncovered to permit the cartridge-cases to be retracted from the revolving cylinder without disconnecting it from the lock-frame, the whole constructed and arranged substantially as set forth.

4,484.—Harvester.—Ketchum Harvesting-Machine Company, Buffalo, N. Y., assignee, by mesne assignments, of William F. Ketchum, deceased.—Patent No. 20,719, dated June 29, 1858.

Claim.—1. The combination, substantially as described, of the driving-wheel A with the frame for supporting the finger-bar and the mechanism for operating the cutters, said frame being suspended from the axle in the position described, substantially as and for the purpose set forth.

2. The combination of a driving-wheel, A, frame D, draft-pole E, and finger-bar F with the mechanism for operating the cutters, the whole arranged substantially as and for the purpose specified.

4,485.—Corn-Cultivator. — Alonzo Kinyon, Amboy, Ill.—Patent No. 45,503, dated December 20, 1864.

Claim.—1. The rounded standard J, having a shovel, L, attached thereto, and secured to the frame or beam of a cultivator by means of an eye-bolt, substantially as described, whereby the shovel may be adjusted, as set forth.

2. In combination with the foregoing, the brace-rod K, arranged to operate as set forth.

3. The tubular shaft G, provided with the lever U, and connected, by the straps T, to the beams I, whereby the shovels may be elevated at will, as set forth.

4. The sliding rod R, provided with the rigid arms p and H, the latter being connected loosely to the beams I, and the former, by straps q, to a pulley, V, having a foot-lever, I*, attached, all arranged to operate as set forth, whereby the beams, with their standards and shovels, may be moved laterally at will, as set forth.

4,486.—Melodeon.—El Dora Louis, New York, N. Y., administratrix of La Fayette Louis, deceased.—Patent No. 16,094, dated November 18, 1856; reissue No. 2,493, dated February 26, 1867; reissue No. 2,944, dated May 26, 1868; extended seven years.

Claim.—1. In combination with the reeds of a melodeon, (or that class of instruments in which the air is drawn through the reeds by the exhaust-action of a bellows,) a tremolo-valve, fan, or beater, substantially as specified.

2. A tremolo-beater, actuated by independent mechanical devices, substantially as specified.

3. A tremolo-beater or fan, arranged to vary the length or sharpness of the pulsations by means of a stop, while playing.

4. A wind-wheel or equivalent motor for actuating tremolo mechanism, substantially as specified.

5. Pulsating mechanism, adapted, without cutting off the continuous flow of air past the pulsator, to produce in bellows instruments the tremulous note.

4,487.—Building for Preserving Fruits and other Substances. — Benjamin Markley Nyce, Cleveland, Ohio.—Patent No. 31,734, dated March 19, 1861; reissue No. 3,252, dated January 5, 1869.

Claim.—1. A metallic floor, supported by blocks or narrow edges of metal in an insulated house, with ice above and a preserving chamber below, substantially as described.

2. The use of a vestibule or anteroom, in combination with an insulated house, substantially as described.

3. The metallic floor, as in the first claim, in combination with absorbents, applied and operating substantially as described.

4,488.—Permutation Lock.—George Rosner, Rochester, N. Y., assignor to Halbert S. Greenleaf, same place.—Patent No. 30,092, dated September 18, 1860.

Claim.—1. In a permutation lock, in combination with a set of wheels consisting each of an outer ring or rim and a central disk or hub, a set of fastening devices or bolts, r r, which is made to fasten or unfasten said parts composing the wheels by the insertion of a key through each or all of the wheels, whereby the combination of the lock may be changed, substantially as herein specified.

2. In connection with the fixed stud K, the annular bearings M M, provided with horizontal bearings m and vertical flanges n n, which are slipped upon said stud to hold the wheels, as described.

3. The combination of the disk U and lever V with the lock-bolt and case of the lock for the purpose of covering the key-hole when the bolt is protruded, as herein described.

4. The disk E attached to the spindle C, when combined with the dog F and the wheels N N N, so as to support said dog from said wheels when the spindle is engaged with the wheels, and to allow said dog to fall when disengaged, substantially as specified.

4,489.—Cultivator.—William S. Weir, Jr., Monmouth, Ill.—Patent No. 46,285, dated February 7, 1865.

Claim.—1. The cross-bar F, when pivoted to the draft-pole of a walking straddle-row cultivator in rear of the axle or truck-frame, and connected with the draft in manner substantially as and for the purpose set forth.

2. The plates h h secured to the forward ends of the plow-beams, and blocks g g and journals f, constructed and operating substantially as described, for the purpose of hinging or pivoting the plow-beams to the axle by brackets I or their equivalent, as set forth.

3. The pivoted rods M having the hooked ends k, in combination with the bars d d, levers O, and draft-pole C, substantially as and for the purpose set forth.

DESIGNS.

5,133.—Hand-Stamp.—Robert B. Carsley, Chelsea, Mass.

Claim.—The design for an embossing hand-stamp, substantially as described and shown.

5,134.—Paper-Box Cover.—John W. Carter, South Orange, N. J.

Claim.—The design for the covers of paper boxes, as shown.

5,135. — Hand-Stamp. — Simon P. Cooper, Cincinnati, Ohio.

Claim.—The design for a printing-stamp, as shown.

5,136. — Cattle-Horn Knob. — Henry J. Frantz, Metamora, Ill., assignor of one-half his right to William B. Whiffen, same place.

Claim.—The design for cattle-horn knobs, substantially as shown and specified.

5,137.—Hand-Stamp.—William B. Gorham, Boston, Mass.

Claim.—The design for a hand-stamp, as shown.

5,138. — Garment-Measure. — Emma F. Harmon, Conneaut, Ohio.

Claim.—The design for garment-measure, as shown.

5,139. — Carpet-Pattern.—William Kerr Philadelphia, Pa., assignor to John Gay, same place.

Claim.—The design for a carpet, as shown.

5,140.—Hollow Tile.—Balthasar Kreischer, New York, N. Y.

Claim.—The design for a hollow tile, as herein shown and described.

5,141.—Cooking-Range or Stove.—Apollos Richmond, Brooklyn, and Sampson G. Richmond, Norwich, Conn.

Claim.—1. The design for a cooking-range, as shown.

2. The general form and construction of hot closet and connection.

3. The corner of range, the leg, and the ornamentation of the doors and panels, substantially as set forth.

5,142.—Group of Statuary.—John Rogers, New York, N. Y.

Claim.—The design for a group of statuary, as shown in the above specification.

5,143.—Group of Statuary.—John Rogers, New York, N. Y.

Claim.—The design for a group of statuary, as shown in the above specification.

5,144.—Spider-Grate.—Nathaniel H. Talbot, North Easton, Mass.

Claim.—The design for spider-grate, as represented and hereinbefore described.

5,145.—Car Basket-Rack.—Morton Tower, Boston, Mass.

Claim.—The herein-described design for brackets of car basket-racks.

TRADE-MARKS.

387.—Medicine.—Henry M. Billings, New York, N. Y.

388.—Ink.—Carter Brothers & Co., Boston, Mass.

389.—Whisky.—Julius Dorn, Louisville, Ky.

390.—Candle.—Charles Harkness, Cincinnati, Ohio.

391.—Nets and Lace Goods.—Abraham G. Jennings, New York, N. Y.

392.—Nets and Lace Goods.—Abraham G. Jennings, New York, N. Y.

393.—Nets and Lace Goods.—Abraham G. Jennings, New York, N. Y.

394.—Nets and Lace Goods.—Abraham G. Jennings, New York, N. Y.

395.—Nets and Lace Goods.—Abraham G. Jennings, New York, N. Y.

396.—Medicine.—John Q. Kellogg, Brooklyn, N. Y.

397.—Shawl.—F. Steffan & Co., Philadelphia, Pa.

398. — Mineral Water. — The Congress and Empire Spring Company, Saratoga Springs and City of New York, N. Y.

399.—Sewing-Machine.—James H. Whitney, Paterson, N. J.

400.—Tobacco.—Thomas C. Williams and James Thomas, Jr., Richmond, Va.

401.—Beverage.—Edward J. Williamson, St. Louis, Mo.

402.—Tobacco.—Winfree & Loyd, Lynchburg, Va.

ISSUE OF AUGUST 1.

PATENTS.

117,499. — Washing-Machine. — Isaac H. Adams, Montana, Iowa.

Claim.—1. The combination, with the movable rubbing-board I, of the board C D, the latter being made in two parts, one of which is permanently attached to the tub and the other hinged to the first, and arranged to work in conjunction with the board I, all substantially as specified.

2. The part D of the lower board connected to the bars H of the board I by the curved slotted arms F and studs M, all substantially as specified.

3. The board I, having the studs M arranged in the curved grooves N in the ends of the tubs, all substantially as specified.

117,500.—Lamp-Chimney.—Edward David Ashe, Brompton, England.

Claim.—A section, D E, formed of radiating metal, and horizontally studded or annularly flanged at H, combined with the converging neck C of the glass section A, for the purpose specified.

117,501.—Awl. — Samuel Babbitt, Braxil, Ind.

Claim.—In awls that open and close the eye for the thread automatically, the arrangement, in relation to the slide, of the hollow ferrule K, spiral spring I, and lug H, for the purpose specified.

117,502.—Seed-Planter.—Barney Baker, Hopkinton, Iowa.

Claim.—1. The combination of the swinging frame A, which carries the furrow-openers M, with the yoke-axle E, rope *d*, and lever H, all arranged to operate substantially as herein shown and described.

2. The hopper L, provided with the grate-bars or rods *m* in the bottom, for the purpose of protecting the seed, in the manner specified.

3. The combination of the valve *p* with the chamber *n*, seed-slide *l*, and hopper L, all arranged to operate substantially as herein shown and described.

117,503.—Apparatus for Transmitting Motion.—Edward H. Bancroft, Syracuse, N. Y.

Claim.—1. The connection of the cranked wind-wheel shaft to the reciprocating and transmitting-rods G H, substantially as described, said rods being arranged in the axis of rotation of the wind-wheel support, substantially as specified.

2. The arrangement of one of the said transmitting-rods within the other, and the driving-shaft L relatively thereto, substantially as specified.

3. A mechanism for transmitting rotary motion from one crank-shaft to another, consisting of reciprocating and transmitting-rods G H and the connecting-rods M, when the shaft to which motion is imparted, and the connecting-rods therefor, are arranged or geared back relatively to said sliding rods, all substantially as specified.

117,504.—Hydraulic Motor.—Arthur Barbarin and Joseph Albrecht, New Orleans, La.

Claim.—1. An injector, in which there is combined with the surrounding water-conduit a steam-passage, which, at the point where the steam is discharged upon the water, has the form of an elongated parallelogram, so that the continuous broad and thin flat sheet of steam may be projected against the water, substantially as and for the purposes herein shown and described.

2. The water jacket or box C, provided with the narrowing passage or throat *b*, and a two-way opening or channel, *b'* and *b''*, in combination with the steam-injector, as and for the purposes herein described.

3. The feed-pipes B and B', when connected with the water-jacket C and with the channel A, as described, for the purposes set forth.

4. In an apparatus organized and operating as herein described, the arrangement of the self-acting gates 1 and 6, and shoulders *g* and *g'*, or their equivalents, secured and operating in the manner described, for the purposes herein stated.

5. The reversible interior gate *d*, in connection with the exterior lever *d'*, when the same is applied in the center of the two-way opening or channel *b'* and *b''*, immediately under the narrow or contracted passage *b* of the box C, for the purpose of changing the flow or current of water, as described.

6. The hydraulic motor, as a whole, constructed and arranged to operate as herein described.

117,505.—Hydraulic Motor.—Arthur Barbarin and Joseph Albrecht, New Orleans, La.

Claim.—1. The compound or double-acting steam-injector, provided with the elongated steam-discharge slits, and otherwise constructed and arranged to operate as herein described, for the purposes set forth.

2. The combination, with the compound or double-acting steam-injector, of the channel surrounding the same, provided with narrow throats J J', and arranged to operate as herein stated, for the purposes described.

3. The combination, with the double-acting injector and narrow-throated channel surrounding the same, of the gradually-expanding sectional channels B^2 B^3, with or without water-tight gates, when the same are constructed and applied as herein described, for the purposes set forth.

4. The combination of the stop-cock for regulating the supply of steam with the compound injector and the steam feed-pipe, as and for the purposes herein mentioned.

5. The hydraulic motor, as a whole, constructed and applied to operate as herein stated.

117,506.—Hat-Ventilator.—Samuel Beatty, Norwalk, Conn.

Claim.—1. The within-described hat-ventilator, consisting of a plain strip or band of thin metal or other suitable material, to determine the head-size, combined with flexible attaching-pieces projecting from the band and forming part thereof, substantially as and for the purpose described.

2. The sweat, combined with and attached to the ventilator above described, so as to form a ventilator-sweat ready for sale and use by hatters.

3. The ventilator, consisting of the flat band and projecting attaching-pieces, substantially as described, in combination with the hat and sweat, so as to make a ventilated hat capable of being accurately adjusted to the head size.

117,507.—Process and Apparatus for the Treatment of Crude or Pig-Irons.—Henry Bessemer, London, England.

Claim.—1. The carburation or further carburation of molten pig-iron after it leaves the blast-furnace and prior to its solidification, by subjecting such iron in close vessels or chambers to the action of incandescent carbon or carbonaceous matters, the combustion of which is not kept up by a supply of oxygen.

2. The carburation or further carburation of remelted pig-iron, and of molten malleable iron and steel, and of refined or finery iron, by subjecting such iron in close vessels or chambers to the action of incandescent carbon or carbonaceous matters, the combustion of which is not kept up by a supply of oxygen.

3. The combined process of further carburating molten carburets of iron, by subjecting such iron in close vessels or chambers to the action of incandescent carbon or carbonaceous matters, the combustion of which is not kept up by a supply of oxygen, and the conversion of such carburized iron into malleable iron or into steel by the action thereon of atmospheric air, as in the Bessemer process.

4. The simultaneous carburation and partial purification of molten iron, by the means and in the manner substantially as herein described.

5. The general form and arrangement of apparatus for carburizing or further carburizing molten iron, substantially as herein described.

117,508, antedated July 29, 1871.—Machine for Turning Calks of Horseshoes.—Alonzo T. Boon, David M. Orsborn, and George Geer, Galesburg, Ill.

Claim.—1. The combination of the adjustable head P and vibrating arm L, arranged to operate in conjunction with holding-dies, substantially as set forth.

2. The combination of oscillating arm L, adjustable head P, jaw D, and die C, operated as and for the purpose substantially as set forth.

3. The arrangement of frame A, constructed as described, calk-die C, jaws G, arm L, and actuating devices K J H and O M N, as and for the purpose set forth.

117,509, antedated July 26, 1871.—Folding Chair.—Henry E. Braunfeld, Philadelphia, Pa.

Claim.—1. The supplemental legs D, in combination with the folding seat C and the legs B of the chair, substantially as described, for the purpose specified.

2. The folding chair, constructed, as described, of the back A, legs B, adjustable seat C and its supplemental legs D, the extension G and its adjustable legs H, and the hinged and pivoted legs and arms E F, as herein shown and described, for the purpose specified.

117,510. — Powder-Box. — Benjamin F. Brown, Boston, Mass.

Claim.—As a new article of manufacture, a package or case for bluing-powder, &c., constructed of a can or box, A, and head-plate C, adapted to fit over box A, when said head-plate C is made of rigid material and has perforations *a* closed by paper sheet *b*, all as herein described, for the purpose specified.

117,511.—Music-Leaf Turner. — Arthur W. Bush and Marshall McComb, St. Cloud, Minn.

Claim.—1. The arms C, cords G, springs I, frame L, lever M, and bell-crank P, arranged to operate substantially as and for the purposes described.

2. The slide-plate T, substantially as and for the purposes described.

3. The slots *y*, in combination with the frame L, substantially as described.

4. The detachable plate D and slide E, substantially as and for the purposes described.

117,512.—Marbleized Oil-Cloth.—Thomas Carson, Brooklyn, N. Y.

Claim.—As an improved article of manufacture, oil-cloths for tables, &c., having marbleized surfaces applied, substantially as specified.

117,513. — Universal Slide-Rest for Lathes.—Ernest George Chormann, Philadelphia, Pa.

Claim.—A rest for lathes and similar machines, formed of the base A, composed of the parallel connected plates B B, the screws C, the bearing D, the shoulder E, the stationary disk F, the movable disk F', the shear G, the screw H, the slide proper I, the screw K, the feed-screw L, and the slide M, consisting of the angle-plates 1 2, the screw N, the movable cap O, the guide P, the bearing Q, the set-screw R, the slot S, the temple-plate T, the semicircular slots U U', the adjusting-screw V, the adjustable screw W, the temple or tool-holder X, and the tool Y, or their equivalents, arranged, constructed, and operating in the manner and for the purposes substantially as described.

117,514, antedated July 21, 1871.—Harvester.—Charles Clapp, Trumansburg, N. Y., assignor to Erastus C. Gregg and Chauncey P. Gregg, same place.

Claim.—The brace-chain O, attached to the frame or tubular projection F and to the pole T, and supporting the flange E of the sleeve D by means of the loop *p*, substantially as and for the purpose herein specified.

117,515, antedated July 29, 1871.—Composition Sad-Iron Holder.—William Baily Coates, Philadelphia, Pa.

Claim.—1. The Manila paper *e* or its equivalent, put through the fire-proofing preparation, as described, for the construction of an iron-holder.

2. The hickory-strips B or their equivalent, with holes near the ends and one in the middle, as described, put through the fire-proofing preparation, as described, for the purpose of covering, in whole or in part, the under side of an iron-holder.

3. The sad-iron-holder body A, as described, the hickory-strips B, as described, or their equivalent, put through the fire-proofing preparation, as described, in combination.

117,516.—Horse-Power.—John F. Collins, Lodi, Miss.

Claim.—1. A horse-power wheel, having its levers relatively arranged, substantially as described.

2. The wheel described, with its levers, stanchions, and brace-rods arranged as described, for the purpose set forth.

117,517.—Nut-Lock. — James M. Connel, Newark, assignor to himself and William Sturgeon, Delaware county, Ohio.

Claim.—1. The washer-plate E perforated at *h* for the passage of the bolt, lipped at *e* so as to be turned up or against the nut, and slitted as at *g* to prepare it for being readily depressed, and made to form a split tenon for entering a longitudinal groove in the fish-bar, substantially as shown and described.

2. The combination of the fish-bar B, longitudinal V-shaped groove *b* of the fish-bar, perforated washer-plate E and *h*, split tenon at *g* of the washer-plate, which enters the groove *b*, and the turned-over lip e^1, nut G, and screw-bolt C, all in the manner substantially as described.

3. The within-described nut and bolt-fastenings *c e E h g e*, in combination with the pair of longitudinally-grooved fish-bars B *b* B *b*, as and for the purpose set forth.

4. The washer-plate E, with lips *e*, splits *g*, and legs e^2, substantially as described.

117,518.—Battledoor. — Mickail Cregen, Chicago, Ill., assignor to himself and Andrew Damedion, same place.

Claim.—The band or hoop C, provided with a bent-wire handle, E C F, in combination with the frame A and leather D, as described and shown.

117,519.—Steam-Generator.—Edwin Day, Rockford, Ill.

Claim.—1. The generator described, consisting of the top plate *a*, bottom plate *b*, inner shell *c*, and outer shell D, the parts being constructed substantially as described.

2. The outer shell D with its flanges *d'*, in combination with the top and bottom plates with flanges a' b^1, as described.

3. The combination of the bottom plate, having its depressed chamber b^2, with the tube f^4, as described.

117,520.—SIZING FOR WINDOW-SHADES.—William Devine, Philadelphia, Pa.

Claim.—The introduction of alum as one of the component parts of the sizing to be applied to window-shades, which causes the sizing to set and congeal readily and properly at the highest natural temperature or in a damp atmosphere, and also when dried by artificial heat, whereby the manufacture of window-shades can be carried on at all times of the year and in all temperatures.

117,521. — FEED-CUTTER.—Carles R. Donner, Sonora, Cal.

Claim.—1. The rock-shaft *f*, with its arms *g g'* and curved springs *j*, in combination with the bar *l* and adjustable clamping-bar *m*, substantially as and for the purpose above described.

2. The wheels 5, secured to the front legs by a crank-axle, and connected with the pivoted rear legs 1, at some point above the bolt 2, by a connecting-rod 4, substantially as and for the purpose above described.

117,522.—WATER-WHEEL.—Frank C. Doran and Benjamin F. Sortman, Knightstown, Ind.

Claim.—1. The water-wheel B, consisting of the parts B, C, C^1, and C^2, all being constructed and arranged substantially as and for the purpose set forth.

2. The combination of the gates or valves A^1 and E^2, they being arranged with reference to each other and to the wheel, substantially as and for the purpose set forth.

3. The combination and arrangement of the trunk or chute A, the wheel B, and the guide D, substantially as and for the purpose set forth.

117,523.—SHUTTLE DROP-BOX MECHANISM.—John Dyson, Philadelphia, Pa.

Claim.—1. The series of levers B B' B'' B''', operated at one end by the eccentric C, and connected at the other end to the attachments of the box-motion, in combination with the rod D' and the drop-box chain A, the parts being constructed and arranged to operate in the manner and for the purpose set forth.

2. The rod D', as arranged with the auxiliary levers B' B''', in combination with the principal levers B B'', the box chain A, and the attachments of the box-motion, the parts being constructed and operating substantially in the manner and for the purpose set forth.

3. The pieces E F and set-screws *a a*, in combination with the levers B B' B'' B''' and with the box-chain A, rod D', and the attachments of the box-motion, substantially as and for the purpose described.

117,524. —CULTIVATOR.—Daniel Edelman, Madison, Ind.

Claim.—The interchangeable side hoes *c c*, provided with teats or projections, as described, for adjusting the angle of their position, and with reversible blades or shears, when arranged in combination with the harrow-teeth *a a' a''*, in the manner and for the purpose herein set forth.

117,525. — PRUNING-SHEARS.—Charles H. Eggleston, Marshall, Mich.

Claim.—The pruning-shears, composed of the two pivoted disks A and B, indented, recessed, or cut away to form the cutting-blades *b b'*, and resisting guide-sections *c* and *c*, substantially as and for the purpose set forth.

117,526. — SEWING-MACHINE.—John V. D. Eldredge, Detroit, Mich.

Claim.—1. The combination of the presser-bar D provided with globular head I, and the hollow thumb-screw J provided with a corresponding socket, when each part is constructed and arranged substantially as described and shown, for the purpose of permitting movement of the presser-foot away from the needle.

2. The combination of the hinged presser-bar D provided with inclined surface *e*, and the needle-bar C provided with hook N, when each part is constructed, arranged, and operated as described and shown, for the purpose of bringing the presser-foot back to the needle.

3. The combination of the presser-bar D provided with foot G and inclined face *e*, the needle-bar C and its hook N, and the feed F, when each part is constructed and arranged as described and shown, for the purpose of moving the material being sewn to said presser-foot, as set forth.

117,527.—MACHINE FOR HEADING BOLTS.—Philip Eley, New York, N. Y., assignor of one-half his right to Thomas W. Bartholomew, same place.

Claim.—The combination of the two dies A A, plunger B, griping-dies *g g'*, and mechanism for forcing the dies A forward against the blank twice alternately with the movement of the plunger, and combination being substantially as described and shown.

117,528.—CARPET-STRETCHER.—Samuel Elliott, Sonora, Cal.

Claim.—An improved carpet-stretcher, consisting of the bar A, box B, shaft C, crank D, ratchet-wheel E, spring-pawl F G H, rope I, guide-pulleys J K M, sliding toothed bar L N, and extension bar O, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

117,529.—DEVICE FOR HANGING PICTURES, MIRRORS, &c.—Albert A. Fielding, Boston, Mass.

Claim.—The combination of the rod B with the grooved sockets A A and the cord D, as and for the purpose specified.

117,530. — GLOVE-FASTENER. — Monroe B. Foote, Northampton, Mass.

Claim.—A fastening for gloves and other articles, consisting of the disk C and studs E, said disk having the eccentric slots F arranged as described, and the studs being attached to the glove or other article, all substantially as specified.

117,531. — GRAIN-SPOUT.—John O. Frost, Candor, N. Y.

Claim.—In combination with a grain-spout, the sliding sleeve B, the eccentric *c* or its equivalent, and collar F, substantially as and for the purpose described.

117,532.—HEATING-STOVE AND FURNACE.—Stephen J. Gold, Cornwall, Conn.

Claim.—1. The combination of the open side flues or pockets A, constructed substantially as described, with the openings *f f* in the base-plate, substantially as hereinbefore set forth.

2. In combination with the open side flues or pockets A and the openings *f f* in the base-plate, the arrangement of the fire-pot within the combustion-chamber, substantially as hereinbefore set forth.

3. The combination of the open side flues or pockets A, the openings *f f*, and the plate J, substantially as hereinbefore set forth.

117,533.—LOOM.—Robert Burns Goodyear, Wilmington, Del.

Claim.—The shuttle-boxes, when constructed in a series of two or more, in combination with the single picker *d* and the picker-spindles *e* and *f*, which have a free motion in their bearings, all to prevent breakage of the shuttle-boxes when the picker is left accidentally in their way, substantially as set forth.

117,534.—COAL-HOISTER AND CONVEYER.—Joseph Green, New York, N. Y., assignor to himself and George Stancliff, same place.

Claim.—1. The combination of the spear-head *s*, funnel-plate *t u*, slotted movable plate *v* having pin *x*, springs *y*, pivoted hook *w*, weighted lever G, lever H, and strap *z*, all constructed and arranged as and for the purpose described.

2. The hook *w* connected with the weighted lever G and operating so as to draw and hold the plate *v* back, as set forth.

3. The bolt s^2 having leg s^3, combined with lever I having lip s^4 to unlock the plate *v* at the time specified.

4. The buckle swiveled to the strap *h*, and provided with the locking-sleeve *i*, to be dumped in either direction, as specified.

117,535.—ROLLING-STOCK OF RAILWAYS.—John William Grover, Westminster, England.

Claim.—1. Railway carriages, each provided with two swiveling bogie-trucks, whereby they are supported at or near their ends only, such trucks being coupled by diagonal rods or chains, and having appliances independently of the carriage-framing above for closely and rigidly connecting them to the contiguous truck of the next carriage, in such manner as practically to form one single truck, substantially as and for the purposes set forth.

2. Bogie-trucks, arranged as set forth in the first claim, with a central close coupling, in combination with lateral buffers, all arranged on the bogie-trucks, substantially as and for the purposes set forth.

117,536.—BARREL-HEAD.—Alexander Harvey, Steubenville, Ohio.

Claim.—A barrel-head, provided with sectional metallic circles, when constructed in the manner and for the purpose substantially as herein set forth.

117,537.—MEDICAL COMPOUND FOR KIDNEY DISEASES.—Robert Hawkins and Albert Addison Hill, Beallsville, Pa.

Claim.—The above-described medical compound, substantially as set forth.

117,538.—MITER-BOX.—George E. Hedges, Ashland, Neb.

Claim.—1. The saw-back H, having arms I J from which the saw is suspended between its guides, as and for the purpose specified.

2. A saw sliding with its guides G G, when suspended by springs, as and for the purpose specified.

117,539.—BEE-HIVE.—William M. Henry, Leo, Ind.

Claim.—The arrangement of the frames B, or dropping down the upper rail of each alternate frame, substantially as and for the purposes shown and described.

117,540, antedated July 18, 1871.—MORTAR-MACHINE.—Samuel H. Hinsdell, Camillus, N. Y.

Claim.—1. The mortar-mill, composed of the screen S, conveyer D, cylindrical box B, and cylinder C, constructed, arranged, and operating as described, and provided with feeding, connecting, and discharging devices, as set forth.

2. The process of making mortar by machinery, substantially in the manner above set forth.

117,541.—HORSE HAY-FORK.—Jacob Huy, Bakerstown, Pa.

Claim.—1. The combination of tube A, rod C, springs L, and shouldered prongs B b', when arranged for joint operation, substantially as specified.

2. An improved hay-fork, consisting of the pointed tube A, pivoted prongs B b', rod C, loop or ring D, pivoted lock and trip-arms G H, spring-catch J K, and springs L, said parts being combined and operating in connection with each other, substantially as herein shown and described.

117,542. — EARTH-BORING AUGER. — William Wheeten Jilz, Hamilton, Mo.

Claim.—A semicircular auger, flattened at B to admit air, combined with bit C having the horizontal lip D to support the core of earth, as and for the purpose specified.

117,543. — CARPET-BEATING MACHINE.—Thomas Jordan, Brooklyn, and Waldo H. Jordan, New York, N. Y.

Claim.—Arranging the sections of rope *e e e e* so that the several ends thereof will be secured to the center of the short sections of chains 1 2 3 4 $4'$, in combination with the separate parts A A and B B, rollers R R', and head-ropes *r r*, secured with grommets, for the ostensible purpose substantially as above set forth and shown in the drawing.

117,544.—OIL-CAN.—Michael S. Kavanagh, Detroit, Mich.

Claim.—The combination of the can A, spout B, seat C, valve D, rod E, tube F, spring H, valve J, and bell-crank K, when the several parts are constructed, arranged, and operated substantially as described and shown, for the purposes set forth.

117,545.—GRAIN-SEPARATOR.—Ebenezer L. Kelly, Reading, Mich.

Claim.—The improved construction and arrangement of the head H, fingers G, slide E, rocking bar I, rods R, K, O, and L, shoe D, bell-crank M, crank N, and saddle P provided with lateral bars *d*, substantially as described and shown, for the purposes set forth.

117,546.—COMBINED RUBBER AND COPPER-WIRE JOINT FOR PIPE-COUPLINGS.—Frederick Kibler, Baltimore, Md.

Claim.—The rubber plate D, whether single or double, and the copper wire E, arranged in connection with each other to form a joint, substantially as herein shown and described, and for the purpose set forth.

117,547.—CULTIVATOR.—Henry P. Kynett, Lisbon, Iowa.

Claim.—1. In a cultivator, the devices for attaching the front of the beams to the frame, consisting of plates A, with hinges B, screw-bolt *c*, and support swivel-standard B, substantially as described.

2. The devices for raising and lowering the cultivators and allowing them to have the required lateral movements, consisting of the bar D, lever F *e*, and catch *h*, all constructed and arranged substantially as described.

117,548, antedated July 18, 1871.—GOVERNOR FOR STEAM-ENGINES. — Clark M. Langley, Lowell, Mass.

Claim.—The combination and arrangement of the rods M and *h* with the wheels *f* and *g*, substantially as herein set forth.

117,549.—APPARATUS FOR DISTILLING TURPENTINE.—Archibald K. Lee, Galveston, Tex.

Claim.—1. The still H, divided into the compartments, as stated, and the pipe *i*, so combined and arranged that the latter shall act both in the vaporizing-chamber *g* and the bleaching and purifying-chamber D, substantially as described.

2. The receiver and charger A and still H, each constructed as stated, and the pipes *i* and *j*, the

same combined and arranged so as to operate substantially as described.

2. The receiver A, still H, and vessel h, each constructed as stated, and so connected with each other and the condenser by pipes *j i* as to operate substantially as described.

117,550.—TREMOLO FOR ORGANS AND MELODEONS.—John R. Lomas, New Haven, Conn., assignor to B. Shoninger, same place.

Claim.—The tremolo-wings C D, connected with the opposite cranks of the wind-wheel shaft so that they balance each other, substantially as herein shown and described.

117,551. — BRICK-MACHINE. — William H. Machen and Henry P. L. Machen, Jr., Toledo, Ohio.

Claim.—1. In rotary brick-machines, the levers D h h', spring-pawl m'', in combination with the wheels J, ratchet-wheel *j*, axle A', and hollow cylinder B', when the parts are constructed, arranged, and operated substantially in the manner and for the purposes set forth.

2. In combination with the foregoing-named parts, the arms s' and press-bar t', when arranged to operate substantially as and for the purposes herein set forth.

117,552. — BREECH-LOADING FIRE-ARM.—Joseph Manton, Montreal, Canada.

Claim.—1. In combination with cock B and recessed breech-block C, the lever H and tumbler-cam F, arranged as described, between them, so that the descent of the breech-block raises the hammer, in the manner specified.

2. The arrangement of the breech-block, lever H, cam F, and hammer, whereby the hammer, being operated by them, is yet capable of working independently of the breech-block for putting it at half-cock, or full-cock, or falling, at option, and whereby said breech-block may be worked independently of the hammer when cocked, all substantially as specified.

3. The combination, with the frame, of the lever-guard D, constructed as described, whereby the mortise through the frame is closed and all dirt excluded, substantially as set forth.

117,553. — RAILWAY-CAR SEAT.—Mark M. Martin, Cochran, Ind.

Claim.—1. The combination, substantially as described, of the base A, seat B, pivoted body C *c*, bars E *e*, spring-bolts F F, and operating devices *f* h i J or their equivalents, for the purpose set forth.

2. The combination of the rails M, beam N *n*, casters O *o* P, springs R, bolt S *s*, slotted plate T *t t'*, lever U, cam *u*, rack Q, and pins *n' n''*, for the object stated.

117,554. — WASHING-MACHINE. — Joseph Matthias, New York, N. Y.

Claim.—A metallic border, provided with bearings B¹ and B², crank C, and faucet *f*, constructed and arranged substantially as and for the purpose set forth.

117,555.—CHIMNEY.—Samuel M. McCord, Springfield, Ohio.

Claim.—The combination of the piping B with a chimney-flue A, ventilator C, and air-ducts *a a*, in the manner and for the purpose herein set forth.

117,556.—SPINDLE FOR LOOM-SHUTTLES.—Albert Morton, Salmon Falls, N. H.

Claim.—The flat lever B pivoted at C in a long slot, A, of the spindle, and having one arm, E, heavier than the other, D, when applied as and for the purpose specified.

117,557. — ATTACHMENT FOR SEWING-MACHINES. — Herman Moschcowitz, New York, N. Y.

Claim.—A sewing-machine attachment, formed and shaped as shown, with the opening or entrance upon the side, having a solid or closed channel, D, as shown, in combination with the lip or lips *c*, for the purpose set forth.

117,558, antedated July 21, 1871.—BEARING AND PACKING.—Eliza D. Murfey, New York, N. Y.

Claim.—A material for bearings and packings, consisting of animal skin, retaining the fleece or hair, and impregnated with plumbago or its equivalent.

117,559.—TOY.—Samuel Patterson, Newark, N. J.

Claim.—1. An improved toy, consisting of the uprights A B, inclined grooved boards D *d'*, grooved cap F *f'*, and grooved and hinged receiving-block G *g'*, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

2. The combination of one or more spirally-grooved conical pieces, I *i'*, with the grooved cap F *f'*, inclined grooved board D *d'*, uprights A B, and grooved and hinged receiving-block G *g'*, substantially as herein shown and described, and for the purpose set forth.

117,560.—DEVICE FOR POINTING HORSE-SHOE-NAILS.—Charles H. Perkins, Providence, R. I., assignor to The American Horse-Nail Company, same place.

Claim.—In combination with the die-plates and the angular punch, mechanism to reciprocate said punch rectilinearly, mechanism to adjust the gauge, and a blast-tube or blow-pipe, substantially as and for the purpose specified.

117,561.—HAY-TEDDER. — John G. Perry, Kingston, R. I.

Claim.—1. The combination of the fork-stocks *c* and jointed connecting-pieces *l l* with two parallel crank-shafts, *v y*, substantially as described, and for the purpose set forth.

2. The combination of the double-toothed rings with the pinions *r r'*, crank-shafts *v y*, and arms *n* on the axle, substantially as and for the purpose set forth.

117,562.—HAY-TEDDER. — John G. Perry, Kingston, R. I.

Claim.—1. The screw or threaded pin *c* for holding the tines, substantially as herein set forth.

2. The combination of the band or ring *a* with the stock A, tine *c*, and holding-pin *c*, with or without a screw-thread, as and for the purpose stated.

117,563.—HOSE-CLASP.—Thomas J. Pettit, Brooklyn, N. Y., assignor to himself and Thomas H. Combs, same place.

Claim.—The combination of two frames, A, and a circular spring, B, substantially as and for the purpose hereinbefore set forth.

117,564. — BUTTON. — George W. Phillips, Fresh Pond, N. Y.

Claim.—The front piece A having a recess, B, gradually enlarged toward the bottom, the shank D having diverging prongs upon its head, and the flanged nut E, all combined, constructed, and arranged, as described, to form an improved detachable button.

117,565. — COMBINED CHAIR AND BED.—Jonathan E. Pitcher, Louisville, Ky.

Claim.—The combination of the folding bed, susceptible of being converted into a chair by folding up from the ends, as herein described, consisting of the chair-frame A, back fold B, front fold or chair-seat C, the arms and back E, the cushion D, upholstery F, and hinges G G, when arranged, constructed, and operated substantially as and for the purpose herein before set forth.

117,566.—GRIPER FOR PRINTING-PRESSES.—Thomas J. Plunket, New York, N. Y., assignor to Victor E. Mauger, same place.

Claim.—The adjustable gripers, applied to the printing-cylinder, substantially as herein shown and described.

117,567, antedated July 27, 1871.—BORING-MACHINE.—William Penn Powers, North La Crosse, Wis.

Claim.—1. The traversing chain or belt F, for the clearing of a hollow auger.

2. The stationary tube U, in combination with the chain F and cutting device B, substantially as and for the purposes described.

3. The forked clamping and turning stand, operating as and for the purpose, substantially as described, in combination with a boring-auger.

117,568.—DISH-WASHING MACHINE.—Harriet C. Robertson, East Saginaw, Mich.

Claim.—The box or vessel A, washing-wheel B, racks F, and trays H, constructed and arranged substantially as and for the purposes described.

117,569.—STEAM-GENERATOR. — Henry M. Rulon and Jesse F. Rulon, Monmouth, Ill., assignors to themselves and William C. Clark, same place.

Claim.—The cylinder A, spiral B, and casing D when constructed substantially as described, and arranged to operate with the pipes C, I, and J, and with the tank H, substantially as described and for the purpose set forth.

117,570. — VALVE-GEAR OF PUMPING-ENGINES.—Horace See, Pottsville, Pa.

Claim.—1. The combination of the tappet-arm, rock-shaft, and valve-rod, substantially as and for the purpose hereinbefore set forth.

2. The combination of the tappet-arm, quadrant, and dash-pot arm, substantially as set forth.

3. The combination of the quadrant and dash-pot arm, substantially as set forth.

117,571.—BLOW-OFF PIPE FOR STEAM-BOILERS. — Nehemiah Sherman, Cincinnati, Ohio.

Claim.—The arrangement of blow-off pipes for steam-boilers, herein made known.

117,572.—REFRIGERATING AND VENTILATING APPARATUS. — Benjamin F. Smith, New Orleans, La., assignor of one-half his right to G. L. Langhland, same place.

Claim.—The receptacle A with stop-cock D, when placed within the vessel B which is provided with a siphon, C, in combination with the diaphragm F having openings *g g'*, when said diaphragm is so placed as to leave an air-space between it and the receptacle A, as and for the purposes described.

117,573. — JAR MOVEMENT FOR ROCK-DRILLS.—Hugo Sontag, Osnabrück, Germany.

Claim.—1. The drill-shank A, sleeve B, and slotted tubular shell C, combined to operate in the manner described.

2. A drill-shell, C, having elastic prongs, combined with a sliding ring, *c*, which rests upon a shoulder, *d*, to lock the shank and shell together, and is moved up therefrom to allow them to be separated.

3. The wings *a a* on a sliding and swiveled sleeve, B, combined with the incline and recess on upper end of slotted shell, and the projection *h* to lock the shank and shell, as described.

4. The sliding plate E and rods having inclined cams *i j*, combined with the ears *b* on the wings of swiveled sleeve B to form a tripping device for unlocking the shank and shell, as described.

117,574.—PLOW. — Patrick Henry Starke, Richmond, Va.

Claim.—The plow-standard A, having projection *a'* overlapping the top of the beam, and the arc-slotted projection F, combined with a beam, E, having the studs G H, to enable the said beam to be turned on a center at G, and thereby regulate the depth of the plow.

117,575.—TOOL FOR ROUNDING LEATHER.—Le Roy A. Sweatt, San Francisco, Cal.

Claim.—As a new article of manufacture, the tool described, consisting of the handle A, curving rod B terminating in the semi-cylinder C, and cutting-blade, all constructed and arranged as described, for the purpose set forth.

117,576, antedated July 21, 1871.—MANUFACTURE OF IRON.—Francis Daniel Taylor, Brady's Bend township, Pa.

Claim.—The combination, with the belly-pipe of the tuyere of a blast-furnace, of a supply-pipe opening into the belly-pipe, and of such height as that the pressure of the column of oxide shall prevent the blowing out of the contents of the pipe otherwise than through the tuyere into the furnace, substantially as described.

117,577. — CAN FOR NITRO-GLYCERINE.—Jacob Taylor, Petroleum Centre, Pa.

Claim.—The nitro-glycerine can, balanced by two rows of elastic straps or springs within the case or shell B, substantially as herein shown and described.

117,578. — FLUTING-MACHINE. — Charles Wesley Thompson, Chicago, Ill.

Claim.—1. The open-ribbed and lantern-gear-shaped roller B, to work upon a corrugated bed-plate A, substantially as and for the purpose described.

2. The combination of the roller B, when constructed as described, with the corrugated bed-plate A, substantially as and for the purpose described

3. The forked frame D, provided with the hook F and projection G, in combination with the roller B provided with its pivots C, substantially as and for the purpose described.

117,579.—TELLURIAN.—Joseph Troll, Belleville, Ill.

Claim.—1. The earth-globe T, arranged to rotate upon the axis-rod, jointed so as to incline as shown in Fig. 7, for the purpose specified.

2. The improved tellurian herein described, composed of the several parts, all constructed, combined, and arranged as shown and described.

3. The pulley F and collar *z*, in combination with the shaft *e*, lunar globe L, wheel H, and intermediate connecting parts, as specified.

117,580.—MOVEMENT-CURE APPARATUS.—David Wark, Montreal, Canada.

Claim.—1. The combination, in the movement apparatus, of seat *a* with arm or leg-receptacle *c*, pivoted at its upper end, to which motion is given by the disk *f* and hinged arm *e*, substantially in the manner and for the purpose described.

2. The combination, in the frictional movement-cure apparatus, of frame *g*, disk *f*, shaft f^1, connecting-rod *e*, crank-pin e^1, pin f^2, lever f^3, rock-shaft *h*, arms h^1, extension h^2, rubbers h^3, and elastic band h^4, as applied horizontally or vertically to the arm or leg.

117,581. — AXLE-LUBRICATOR. — Henry S. Weaver, Irwin Station, Pa.

Claim.—In axle-lubricators, the diaphragm C, concaved on top and centrally perforated, when combined as described with the oil-tube B that rises above the oil in reservoir A, so that at each revolution of the wheel a small portion of oil will be thrown upon the concavity of the diaphragm and transferred by gravity through the tube to the axle.

117,582.—TRIMMING-JACK FOR SHOES AND BOOTS.—James Webb, Jr., Portland, Me.

Claim.—1. The combination of the last L, standards G and H, spindles I and K, and the plate A, as herein set forth, for the purpose described.

2. The arrangement of the last L, the standards G and H with their spindles I and K, the plates A and B, thumb-screws E and F, and hinge D, as described, for the purposes set forth.

117,583.—HAIR-DYE AND COSMETIC.—John J. Wild, Bay City, Mich.

Claim.—1. The combination of fatty substances with nitrate of silver and ammonia as a hair-dye and cosmetic.

2. A hair-dye and cosmetic, composed of the ingredients and substantially in the proportion as set forth.

117,584.—MACHINE FOR POINTING HORSE-SHOE-NAILS.—Harry A. Wills, Vergennes, Vt.

Claim.—1. The notched intermitting rotating disk A, guards D and E, and the hammer-dies, arranged and operating substantially in the manner described.

2. The notched intermittingly-rotating disks A and N, guards D and E, the hammer-dies, stationary disk O, anvil P, die T, and punches Q and S, arranged and operating substantially in the manner specified.

117,585. — BASE-BURNING FIRE-PLACE HEATER.—William E. Wood, Baltimore, Md.

Claim.—1. The rotary or oscillatory top plate F, perforated or slotted on one side of its diameter, as described, and pivoted to the heater so as to be readily operated in relation to the fire-board *x y*, substantially as and for the purposes hereinbefore set forth and described.

2. The arrangement of appropriate water-evaporating vessels E E, in positions, respectively, on the top of the horizontal side-flues B B and between and in contact with the sides of the ash-pit C and the down-draught flues D D, substantially as and for the purpose hereinbefore set forth and described.

117,586. — MOLDING-MACHINE.—James A. Woodbury, Boston, Mass.

Claim.—The rotary cutter-heads B D E F G, frame A, and bed X, and the adjusting devices specified, or their equivalents, when arranged and operating in the manner and for the purpose substantially as shown and described.

117,587. — ORGAN.—George W. Woodruff, Hartford, Conn., assignor to John Farris, same place.

Claim.—1. The connecting-cords 1′ 2′, arranged as herein described, for communicating motion from the key-board to the valves.

2. The combination of one set of valves, *c c* sharp, &c., with two sets of keys, C C sharp, &c., and C′ C′ sharp, &c., on the same key-board by means of the cords 1′ 2′, &c., and the levers 1 1, &c., substantially as herein described.

117,588.—RIPPING-TOOL.—Justus O. Woods, New York, N. Y.

Claim.—1. The combination of the cutter *a*, guide *b*, and guard *c*, so arranged that the line of cutting may be kept on the cutter and out of the eye or apex between the cutter and guard *c*, all substantially as specified.

2. The eye *d*, arranged with the cutter and guard *c*, substantially as specified.

3. The extension-guide *b*, arranged with the cutter, substantially as specified.

4. The above-described ripping instrument, provided with the wrench *f*, hook or point *g*, and the niche *h*, all substantially as specified.

5. The ripping-tool, constructed and operating as above described, as a new article of manufacture.

117,589.—MACHINE FOR SLICING CANDY, &c. — John Price Anderson, Philadelphia, Pa.

Claim.—1. The combination of a cross-head, J, arranged to reciprocate in guides, with a knife attached to but arranged to slide on the said cross-head, and controlled by a stationary inclined plane, all substantially as set forth.

2. The combination of the cross-head J, knife K, and its projection *i*, guided in a recess of the cross-head, and the spring *q* or its equivalent.

3. The combination of the cross-head and knife, arranged to operate in the manner described, with the sliding bed M, and the devices herein described, or their equivalents, for causing the cross-head to feed the bed forward.

117,590. — PRUNING-SHEARS. — George W. Ansley, Marengo township, assignor to himself and Samuel P. Wormley, Marshall, Mich.

Claim.—The jaw-hook B, constructed with the retaining-spur *e*, constituting a continuation of the cutting-edge of the hook, as shown, in combination with the cutting-jaw A pivoted at *i*, in line with said spur *e*, whereby the latter becomes a bearing-guide for the blade A, and also enables said blade, by means of a sharpened edge, *n*, to prune by the opening movement of the handles, as herein described.

117,591.—PEAT-WRINGER.—Aimé Nicholas Napoleon Aubin, Portland, Conn., assignor to Aubin Peat-Fuel and Machine Company of Connecticut, assignor to American Peat-Fuel Company of New York.

Claim.—An apparatus to separate from freshly-dug peat a portion of its water, and which I call a peat-wringer, consisting in a box or cylinder, A, with a hopper, B, piston C, compressors F, and strainers G, the whole constructed and operating substantially as set forth.

117,592. — FLAT-IRON. — Amos Bachelder, Pelham, N. H.

Claim.—1. The two spring-bolts D D and their operative bar E, arranged together and with the handle and its mortises, as set forth.

2. The movable body A and its tenons *a a*, in combination with the mortised handle B, as described, and the spring-bolts D D and their operative bar E, arranged with the handle A, as shown.

3. The mortised wooden handle B, the spring-bolts D D, the operative bar E, the guard C, and the tenoned body A, all constructed and arranged substantially in manner and to operate as explained.

117,593. — HAND-STAMP.—Everett H. Barney, Springfield, Mass.

Claim.—1. The arrangement, in a hand-stamp, of a number of carriers, C, each containing a series of punches, *a*, guide-plates *d*, and counter-punches or dies *e*, the punches to be acted on by a plunger which extends transversely across said carriers, substantially as herein shown and described.

2. The end punches *b*, in combination with the carriers C, punches *a*, and plungers D, all constructed and operating substantially as described.

3. The carrier-bars, provided with gauge-racks G and scales F, as described, in combination with the punches *a*, guides *d*, and plunger D, substantially as set forth.

4. The side punches *b*, with their dies *t* and clearers *t′*, when said dies and clearers are made in one piece, and the clearers *t′* form a stop for the plunger D, substantially as described.

5. The plates *e*, provided with chambers *m*, each having an opening, *n*, at the bottom, the same operating to free the machine from the minute pieces punched out, substantially as described.

117,594.—DEVICE FOR RESETTING OLD AUGER-BITS. — Charles W. Beals, Greig, N. Y.

Claim.—For the purpose of renewing auger-bits, in the manner herein described, the straight three-cornered punch with a perfectly smooth face, as herein described and substantially set forth.

117,595, antedated July 28, 1871.—HARROW.—John Benson, Belle Plains, Iowa.

Claim.—The harrow-frame herein described, having beams A, A^1, and A^2, bars B and B′, braces *c*, draw-bar C, cross-bars Y, and nuts and screw-threads Z, constructed and arranged substantially as and for the purpose specified.

117,596. — SEWING-MACHINE FOR BOOTS AND SHOES. — Lyman R. Blake, Fort Wayne, Ind.

Claim.—1. The reciprocating bender and griper, having a forward motion, governed partially by a spring, in combination with an unyielding hook-gauge.

2. The bender and hook-gauge, moving in the arc of a circle in the vertical plane of the needle and seam or line of feed.

3. The frame p^2, rocking on a shaft or pivotal axis right-angular to the vertical plane of the feed.

4. In combination with a hook-gauge and bender, the channel-foot, made adjustable as to its extent of positive movement relatively to the hook-gauge shank, between which and said foot the work is held for the passage of the needle.

5. A channel-foot, b^1, and hook-gauge *m*, moving together vertically, substantially as described.

117,597.—BEARING FOR VERTICAL SHAFTS. Martin Briggs, Rochester, N. Y.

Claim.—The capped supported oil-box C, formed with the hub *d* and bottom *f*, and inclosing the rollers G G, journaled between the rings *h i*, all constructed and arranged as described, so that the said step will be relieved from the weight of the shaft, substantially as set forth.

117,598, antedated July 20, 1871.—AUTOMATIC SIGNALING APPARATUS FOR RAILWAYS.—Daniel W. Brown and Charles A. Campbell, Woodbridge, N. J.

Claim.—The combination and arrangement of the obliquely-set crank or arm *c* or *c′* with its bumper *b* or *b′*, the vertical shaft *d* or *d′*, the upper crank or arm *f* or *f′*, the slotted wire or rod *g* or *g′*, and the spring *h* or *h′*, relatively with the track and floor of the cars, as described, whereby the gong may be sounded or the flag waved by each car in the train in succession, substantially as specified.

117,599.—ADJUSTABLE SEAT FOR RAILWAY CARS.—Chauncey S. Buck and James Lovett, St. Louis, Mo.

Claim.—The combination of the reversible link or shackle E, seat-back F, arms H *i* i^2 i^3, and studs J K, arranged substantially as set forth.

117,600. — RAILWAY CATTLE-GUARD.—Charles Caton, Boyd's Mills, Ohio.

Claim.—The cattle-guard described, consisting of the frame A A′, beam B, bars *c c* resting in pairs in the sockets of beam B, and stay-bar *d*, all constructed and arranged specifically as and for the purpose set forth.

117,601.—FIRE AND WATER-PROOF ROOFING.—Charles W. Chaffee, Des Moines, Iowa.

Claim.—1. The roofing composition, prepared in the manner described, and of the materials and proportions specified.

2. As a new article of manufacture and commerce, the flexible artificial shingle or slate, as set forth.

117,602.—SEALING DIP-PIPE OF GAS APPARATUS.—Rufus B. Chapman, Waltham, Mass., assignor to John C. Chapman, same place.

Claim.—The within-described combined valve and dip-pipe, the valve being provided with one or more passages, *c*, through which the gas may pass without pressure from the retort to the hydraulic main when the valve is open, and a plug, D, having an aperture, *b*, which opens a communication between the retort and the hydraulic main through the dip-pipe C when the valve is closed, substantially as and for the purpose described.

117,603.—WASHING-MACHINE. — James M. Clark, Lancaster, assignor to Franklin L. Clark, Clarksville, Pa.

Claim.—1. The series of wheels M, as arranged on the one shaft L, and so constructed as to press down, or raise and let drop, the beaters A A, when required, at each revolution of the wheels, and when combined and operating with the beaters A and rollers V, as set forth.

2. The revolving flanged platform D, with its revolving tub, and combined with the upright shaft H and bevel-wheels J and K, when operated by the gearing G underneath the platform, as described.

3. The series of hinged catches R R, for locking one or more of the beaters A, when arranged and attached to the cross-tie *j* of the frame S, as set forth.

117,604.—HEMMER FOR SEWING-MACHINES. Asa F. Colby, Bath, Me.

Claim.—The hemmer attachment for sewing-machines, constructed substantially as herein described—that is to say, having the two slotted vertical plates A A′, the two horizontal plates I N, and the folding plate M, all constructed, arranged, and operating as herein set forth.

117,605.—METALLIC ROOFING. — Harry D. Cook, Normal, Ill.

Claim.—1. The shingle L provided with its overlapping flange and lugs, constructed and applied to the roof in the manner described.

2. The series of shingles provided with lugs and flanges, the lugs being perforated, as shown, and attached by the headless nails, all as set forth.

117,606.—SUPPLY AND WASTE-COCK.—William Samuel Cooper, Philadelphia, Pa., assignor to Cooper, Jones & Cadbury, same place.

Claim.—1. The combination, in a supply and waste-cock, of a rotating nut, E, having at the lower end an annular recess, *n*, and open rings *i i*, the waste-pipe *m* arranged as described, and a vertically-moving valve, *d*, between the stem of which and the casing is an annular passage through which, when the valve is closed, the water can flow directly from and through the casing around and above the valve, as specified.

2. The combination of the above and the loose ring or disk *n′* and the packing arranged between the same and the nut.

117,607. — CORN-SHELLER. — Harmon W. Cornell, Owego, N. Y.

Claim.—1. The combination of the spring-bar H,

the vertically-operating toothed cylinder C, and the beveled wheel B having shelling-ribs on its periphery as described, all constructed and arranged to operate substantially as set forth.

2. The within-described corn-sheller, consisting of the toothed cylinder C, ribbed and beveled wheel B, spring-bar H, driving-wheel A, pinions *e e*, bevel-gears *e g*, and shafts E F, all mounted upon a suitable frame, and arranged to operate substantially as and for the purposes herein set forth.

117,608.—PLOW.—Simon A. Cummins, Vienna, N. J.

Claim.—1. The arrangement of the slotted frame B, adjustable plows A A, adjustable colters D D, bars *c c*, guards M M, and bars *e e*, substantially as and for the purpose set forth.

2. The adjustable bars *c c* and curved guards M M, in combination with the slotted main frame B and plows A A, combined and operating substantially as set forth.

3. The tongue E, cross-bar F, and thill-irons *f*, in combination with the plows A A, frame B, and adjusting-bars K K, substantially as and for the purpose set forth.

4. The tongue E, cross-bar F, coupling *f*, and braces h h, in combination with the plows A A, main frame B, and adjustable bars K K, substantially as and for the purpose specified.

117,609.—MALLET.—John B. Davids, New York, N. Y.

Claim.—The rings or nuts D and shells or case C C, when made in two or more parts and applied to mallets, for the purpose as herein specified.

117,610.—GAS-RETORT. — Darius Davison, New York, N. Y.

Claim.—1. The elongated dome-shaped extension E of the return-pipe C at the rear end thereof, in open communication throughout the whole length of its base with the top of the retort A, substantially as described.

2. The horizontal opening for the passage of the gas and vapor from the dome-shaped extension E into the return-pipe C, essentially as specified.

3. In a horizontal gas-retort, the arrangement of the outlet-passage of the gas and vapor from the front half of the coal in the retort into the return-pipe C at or near the middle of the retort, substantially as described.

4. The combination of the dome-shaped extension E, the return-pipe C having a horizontal communication therewith, the retort A, and the stand-pipe D, when the whole is arranged substantially as herein described.

117,611.—COMBINED CIRCULAR AND ELLIPTICAL CUTTER.—William S. Deeds, Baltimore, Md., and John P. Bradway, Philadelphia, Pa.

Claim.—1. The combination of the adjustable standard F, tramway E, pivots K K′, with clamps J J′, oscillatory clamp-holder H, and guide G, substantially as described.

2. In combination with the subject-matter of the above, the shears C C, substantially as described.

3. The combined elliptical and circular cutting-machine, constructed substantially as described.

117,612.—QUILL FOR SILK.—Ira Dimock, Boston, assignor to The Nonotuck Silk Company, Northampton, Mass.

Claim.—The method herein described of putting up silk or other thread by winding it on a quill and then passing its loose or outer end through slits in its opposite ends of and on opposite sides of and directly across the quill, and longitudinally over the latter, substantially as specified.

117,613.—STEAM-GENERATOR.—Samuel W. Emery and Erasmus P. Doyen, Portland, Me.

Claim.—The arrangement of the boiler A, fire-box B, and U-shaped heating-tubes D extending below the surface of the fuel, substantially as specified.

117,614.—BRUSH FOR CLEANING TUMBLERS.—Adolph Fischer, New York, N. Y.

Claim.—1. The flanges *i*, of rubber or other suitable flexible and elastic material, in combination with the annular brush A, substantially as described.

2. The annular brush A, when made in two or more sections, substantially as and for the purpose set forth.

3. The central brush B, when made in sections and applied in combination with the annular brush A, substantially as described.

4. The extension arms *j* on the frame C, supporting the annular brush A, substantially as set forth.

117,615.—REAMER FOR OIL-WELLS.—William Forker, Rockland, Pa.

Claim.—1. The guide C, provided with pivoted arms *f f* having projections *g g* on their outer face, and made operative through the medium of the springs *i i*, as herein described.

2. In combination with the above, the case A, provided with the spiral grooves *e* for projections *g g* of the pivoted arms *f f*, and openings D D for the drilling-points *m m* of the drill B, as herein described, and for the purpose set forth.

117,616.—LOOM. — Jacob G. Frick, Pottsville, Pa.

Claim.—1. The plates D provided with apertures as shown, and adapted to retain the warp wires, substantially as and for the purpose set forth.

2. The combination, in a loom for weaving wire cloth, of a lathe and a reed having in it plates or dice in which are formed apertures adapted for the reception of square wires, said apertures being so arranged as to cause the wires to be held in such a position that one of the corners shall be upon the top thereof and one upon the bottom, substantially as and for the purpose set forth.

117,617.—TEA-KETTLE AND OTHER VESSELS.—John Gibson, Jr., Albany, N. Y.

Claim.—1. In tea-kettles, stove-pots, and other hollow-ware vessels, the "resting-face" *a*, or its equivalent, when made on the pit of such kettle or other vessel, substantially as and for the purpose set forth.

2. In tea-kettles, stove-pots, and other hollow-ware vessels, the "resting-face" *a′*, constructed substantially as shown, or equivalent projecting horns, points, or bearings, substantially as described, for the purpose set forth.

117,618.—OX-BOW PIN.—Ives Glover, Newtown, Conn.

Claim.—The segmental plate A having pivoted thereon the pin B, combined with the spring C, covering-plate D, and thumb-piece E, as and for the purpose specified.

117,619. — DASH-BOARD FOR VEHICLES.—Henry L. Godwin, Windsor, N. C.

Claim.—A dash-frame for carriages, consisting of the frame A, and the frame B made to fit therein whereby the body C is held in place and has its edge covered, substantially as described.

117,620.—COMPOUND FOR DYEING.—Frank Graupner, Evansville, Ind.

Claim.—1. The combination of the sulphate of copper, muriatic acid, and zinc, by the process and for the purpose substantially as specified.

2. The dyeing compound herein described, formed of the materials and in the proportions substantially as specified.

3. The process, herein described, of dyeing fabrics by the means substantially as specified.

117,621.—RAZOR-STROP.—William Martin Green, Gallatin, Tenn.

Claim.—A razor-strop, having a series of straps attached permanently at one end of the body A, and arranged to be attached separately at their opposite end to the adjustable block B, substantially as described, whereby either strap may be adjusted for use at will, as set forth.

117,622. — HEDGE-PLANTER. — Nathan L. Griffith, South Plymouth, Ohio.

Claim.—The plow G, in combination with plates H H, wedge I, beam A, and side beams J J, substantially as described, and for the purpose set forth.

117,623, antedated July 21, 1871.—SCYTHE-FASTENING. — Cornelius Hamler, Newton, N. J., assignor to Andrew Shiner, same place.

Claim.—The plate B having circular ratcheted projection C, the apertured plate D having ratcheted projection E, and the bolt G, combined, as described, with the sneath A and scythe E, for the purpose specified.

117,624. — ROOFING-BRACKET. — William Hancock, Gosport, Ind.

Claim.—The post D pivoted to the clamp B, and provided with the studs J and thumb-screw K, in combination with the bench G, thumb-screw I I′, and bed-piece A, substantially as specified.

117,625.—TRUNK.—Thomas Hanvey, Elma, assignor to The Hanvey Barrel Manufacturing Company, Rochester, N. Y.

Claim.—As a new article of manufacture, a cylindrical trunk, formed by bending two or more thin strips of wood around a mandrel so that the joints of each will break with each other, and then clinching the parts together by rivets, and providing the ends with heads of two or more thicknesses of wood, with the grain crossing each other, and then sawing across the whole to form the body and the cover of the trunk, and uniting them together by hinges, as and for the purpose herein shown and described.

117,626. — SUPPLYING WATER TO AIR-PUMPS. — John F. Haskins, Fitchburg, Mass.

Claim.—The process herein described of injecting water into the cylinders of air-pumps, by using a part of the air compressed on the up-stroke as a motive power to the injector, so that the supply of water will be in direct ratio to the pressure generated, substantially as described.

117,627.—APPARATUS FOR CRIMPING THE STIFFENINGS OF BOOTS AND SHOES.—Jesse W. Hatch, Rochester, N. Y.

Claim.—1. In an apparatus for crimping the stiffenings of boot and shoe-heels, the heel-form B made adjustable in position, and provided with the rubber or equivalent springs *d d* for producing the necessary elasticity, as herein described.

2. In combination with the heel-form B, the clamping-strap D, operated by the toggle-arms E F and cross-head G or equivalent, in the manner and for the purpose specified.

3. In combination with the heel-form B and clamping-strap D or its equivalent, the crimping-jaws I I, operating in the manner and for the purpose specified.

4. The arrangement of the heel-form B, clamping-strap D or its equivalent, jaws E E, and gauge-plate M, substantially as and for the purpose set forth.

5. The combination as a whole, consisting of the heel-form B, clamping-strap D, and crimping-jaws I I, operating conjointly in the manner and for the purpose specified.

117,628. — FLUID-METER. — Henry B. Hebert, New York, N. Y.

Claim.—The fluid-meter, consisting of the annular cylinder A, the tappet *g*, and the double concave pistons B, hung upon the circular wire C, and formed with sharpened edges and with exterior grooves *e*, as herein set forth and shown, for the purpose specified.

117,629. — CHURN. — Henry Hensel, Moon township, Pa.

Claim.—The arrangement of the pedestal B C, churns A A, dasher-staffs *l l*, walking-beam D, ball-weights J J J mounted on rods *h i*, and pivoted operating-handle *k*, the whole constructed and arranged as herein described, and for the purpose set forth.

117,630.—CLOTH-BEAM FOR LOOMS.—James P. Hillard, Fall River, Mass.

Claim.—The longitudinal slot or groove formed in the roller A, with the hinged tongue B, the whole being constructed and arranged to operate as herein shown and described.

117,631.—SECURING LIDS TO GAS-RETORTS.—Stephen Holman, London, England.

Claim.—1. The lids or covers of gas-retorts attached to the cross-bars, the whole being hinged to the mouth-pieces, substantially as hereinbefore described and illustrated by the drawing annexed.

2. The eccentric adjusting and hinge-pins *b* and *c*, in combination with the cross-bars B, substantially as and for the purpose hereinbefore described.

3. The mode of lifting the cross-bar B out of its catch by means of a cam or eccentric, *d*, on the hinge-pin *c*, acting upon an anti-friction roller or stud, *e*, carried upon the under side of the cross-bar, substantially as hereinbefore described and illustrated by my drawing.

117,632. — DESK AND BED COMBINED.—Fredrich Hopf, Chicago, Ill.

Claim.—In a combined desk and bed, the combination of the parts A A′, partition B, frame E, spiral spring *d*, bed or folding mattress G, cover H, and door J, all arranged to operate substantially as specified.

117,633.—SCHOOL-DESK.—A. Ogden Huffman, Springfield, Ohio.

Claim.—The school-desk herein described, having frame A, leaf C, arm D, slot E, pin *a*, and book-case G, constructed and arranged substantially as specified.

117,634.—PEAT-ELEVATOR.—Edwin James Hulbert and Aimé Nicholas Napoleon Aubin, Portland, Conn., assignors to The Aubin Peat-Fuel and Machine Company of Connecticut, assignor to American Peat-Fuel Company of New York.

Claim.—The instrument for elevating crude peat herein described, consisting of a series of propelling screw-blades, b^1 b^2, in combination with the reciprocating combs C D, the whole constructed and operating substantially as described.

117,635.—SLOP-HOPPER.—John G. Ils, San Francisco, Cal.

Claim.—The combination of the hinged strainer A, trap-chamber B, and pipe D, as herein recited, as and for the purpose set forth.

117,636. — WASHING-MACHINE. — Edmund Jennings, Sherman, N. Y.

Claim.—1. The combination and relative arrangement of the frame A, rollers B C C and their spring mechanism, cross-beam A′, stirrup-clamp E, wedge H, and fastening F, all constructed and op-

erating substantially as and for the purpose set forth.

2. In combination with the above, the recessed side clamp I, arranged substantially as and for the purpose set forth.

117,637. — STANDARD FOR WAGONS.—Jens Jensen, Racine, Wis.

Claim.—A standard or strap for securing the side boards of a wagon-bed to the bottom of the same, constructed substantially as herein described, the part B being either swaged to the part A or made of a separate piece, so that the width of the fork can be adjusted to side boards of varying thicknesses.

117,638. — VELOCIPEDE.—Sidney Johnson, West Croydon, England.

Claim.—1. The crank-foot axle P carrying the pulley-wheel N, arranged in front of the operator's seat upon brackets *a a*, as set forth, in combination with the pulley-wheel M of the axle O, and the belt Q, the several parts arranged and operating in relation to each other and to the frame and driving-wheels, substantially as and for the purpose set forth.

2. The steering mechanism, consisting of the wheel B, pivoted fork I, piece D, lever K and its reacting spring and steering-reins, the several parts constructed and operating as herein shown and described.

3. The velocipede herein shown and described, when the several parts constituting the same are arranged and operate substantially as and for the purpose set forth.

117,639. — HARVESTER. — William Nevins Johnson, Oxford, Wis., assignor to C. H. McCormick & Bro., Chicago, Ill.

Claim.—1. The combination of the rake-post, the radius-bar oscillating thereon, the guide, the tension-pulley, and the adjustable extension rod connecting the pulley and main frame, all these members being constructed and operating, substantially as hereinbefore set forth, to adjust the position of the tension-pulley.

2. The combination of the frame, the shoe, the rake-post, the pivoted brace, the radius-bar, the sprocket-wheel and pulley, the driving-chain, the extension rod, and the tension-pulley, all these members being constructed to operate in combination, substantially as hereinbefore set forth, to allow the driver to rock the guard-fingers while reaping without interrupting the working of the reel and rake.

117,640.—SEWING-MACHINE.—John T. Jones, Ilion, N. Y.

Claim.—1. The eccentrically-placed intermediate, between the motor-shaft and the cam, in combination with said cam, roller, and needle-bar or arm, substantially as specified, to communicate a differential movement to the needle, as specified.

2. The thread-tension clamp, made of two parts revolving together but at an inclination to each other, and provided with the notched barrel and fingers, as and for the purposes set forth.

3. The adjustable shoe *v*, in which the feed-bar *u* slides, in combination with the arm *v'*, sleeve and crank *x* acted upon by the cam 21, as and for the purposes set forth.

4. The shaft *w* and arm *y* to the feeding-bar *u*, in combination with the arm *v'* and crank swinging upon said shaft *w* to press the feed-bar up to the cloth, substantially as set forth.

5. The rocking shaft *w*, links 25 and 27, block 26, and lever *z*, with a slide for the said block 26 and the clamping-screw 28, the parts being constructed and arranged as and for the purposes specified.

117,641.—OIL-PRESS.—Agur Judson, Newark, N. J.

Claim.—1. The arrangement of the bolts *g*, bent flanges H, arms *d'*, collar E, and rod F, applied to an oil-press, and constructed substantially as and for the purpose specified.

2. The arrangement of the rack I, weighted pawl I', lever I'', spring K', and rod J' with the bolts *g* and plates B, when constructed substantially as and for the purpose specified.

3. The notched or double-ended dog L' and spring M, arranged as specified, in combination with the rack I and pawl I', as and for the purpose described.

4. The arrangement and application of the latch K, in combination with the rod J', pawl I', rack I, bolts *g*, and plates B, substantially as set forth.

117,642.—STOVE-PIPE CLEANER.—James F. Kellogg, North Bridgewater, Mass.

Claim.—The removable trough B, in combination with the cap D and the funnel A, constructed and applied substantially in the manner and for the purpose set forth.

117,643.—PARLOR-SKATE.—David Kerr and Asa E. Hovey, San Francisco, Cal.

Claim.—The arrangement of the frame, consisting of the perforated plate B having the legs, feet, and fork, as described, with the solid piece, shown by Fig. 3, as and for the purposes herein set forth.

117,644.—TENSION APPARATUS FOR WAX-THREAD SEWING-MACHINES.—John Kimball, Boston, Mass.

Claim.—1. The spool-tension apparatus, as composed of the spring B, the friction-roller *b*, and the adjustable gauge D, its nut *d*, and slotted plate E, constructed, arranged, and combined together and for use with a sewing-machine thread-spool, as set forth.

2. The combination and arrangement of the sponge-supporter or bow F with the roller *b*, and the spring B arranged and provided with the adjustable gauge D, and its nut and slotted plate, as explained.

3. The combination of the sponge *f*, or its equivalent, and the carrier or bow F, with the roller *b* and the spring B provided with the adjustable gauge, all being arranged and for use substantially in the manner as specified.

117,645.—MANUFACTURE OF ILLUMINATING-GAS.—Ferdinand King, Washington, D. C.

Claim.—1. The process of manufacturing illuminating-gas by passing a current of pure hydrogen and steam through a red-hot retort in which heavy carbureted gas is being generated from a liquid hydrocarbon, substantially as herein described and illustrated.

2. The retort A, containing coke or equivalent material, with an induction-pipe for introducing liquid hydrocarbon into the same, and the steam-cylinders D D (one or more) containing iron-turnings or equivalent material, so combined with a furnace that the said retort and steam-cylinders, with their contents, will be kept at a red heat, and so constructed, arranged, and connected that steam from said cylinders, after passing over or through the iron turnings or equivalent material therein, and becoming partially decomposed, shall be conducted into one end of the retort and forced rapidly through the same, while the liquid hydrocarbon is at the same time being introduced into the same retort, substantially as described.

117,646.—CORN-PLANTER.—James A. Knetzer, Fillmore, Ind.

Claim.—The combination of wheel *h*, can *f*, spout *j w*, thimble *k*, and wires *i*, as and for the purpose specified.

117,647.—COMPOSITION FOR COATING SHINGLES.—Thomas J. Langley, East Cambridge, assignor to himself and C. P. Conant, Boston, Mass.

Claim.—The compound herein described, composed of the ingredients set forth.

117,648. — APPARATUS FOR ARRANGING HAIR. — Gustav Lieberknecht, Wismar, North German Confederation.

Claim.—The process herein described for arranging hairs by means of the apparatus substantially as described.

117,649.—BLIND-FASTENING.—Augustus S. Lesuer, Milltown, Me., assignor to himself and G. M. Wentworth, same place.

Claim.—The combination of the bolt D, supported underneath the blind A by staples, and having its rear end bent, as described, and held by a staple F, the catches I K and spring M, when all are constructed and arranged in the manner and for the purpose set forth.

117,650.—PAPER-CUTTING MACHINE.—John Levinees, Brooklyn, N. Y., assignor to Joseph S. Sanborn, New York city.

Claim.—1. The combination, with the knife-bar D, of the links F, boxes D^2, toggle L, lever K, and movable yoke J, constructed and operating substantially as and for the purposes specified.

2. The back gauge P, when combined with the hinged front plate P, set-screws S, and screw W, as and for the purposes set forth.

117,651.—ATOMIZER.—Hamilton D. Lockwood, Charlestown, Mass.

Claim.—1. A liquid-containing cup or bottle for an atomizer, having a recess or cavity in its side, substantially as and for the purpose described.

2. The combination, with the bulb and atomizing-tubes, of a cup or bottle having a recess or cavity in the side, substantially as shown and described.

117,652.—COMPOSITION FOR JOURNALS AND BEARINGS. — Maxime J. Marcotte, St. Louis, Mo.

Claim.—The metallic composition, substantially as described.

117,653.—MARKET-STALL, &c.—James McCandless, New York, N. Y.

Claim.—The iron-framed market-stand A B C D, constructed in the manner substantially as herein set forth.

117,654.—BOOK-HOLDER AND LEAF-TURNER.—Andrew McFall, Yonkers, N. Y.

Claim.—The frame *b*, spring *f*, spring *v*, rod *g*, rod *k*, key *h*, and thumb-bar *e*, when arranged and operating together as herein described.

117,655.—STEAM AND WATER-JET ROTARY ENGINE. — John McGowan, Lebanon Church, Pa.

Claim.—The combination of the wheel *a*, case *b*, steam-pipe *d*, and water-pipe *c*, substantially as herein shown and described, for the purpose specified.

117,656.—ROTARY ENGINE.—John McGowan, Mifflin township, Pa.

Claim.—The inner rings *c' c'*, valve E with radial eduction and induction-ports, and the side pipes *c'' c''*, constructed and arranged as shown and described.

117,657. — DEVICE FOR LOCKING-BOLTS.—Almeron McKenney, Maumee City, Ohio.

Claim.—The combination of the double-headed bolt A with its beveled shoulders, as described, with the slotted or forked spring-washers, through which the head of the bolt is passed and turned to clamp the parts, substantially as shown and described.

117,658. — RAILWAY-RAIL. — Almeron McKenney, Maumee City, Ohio.

Claim.—1. A railroad rail made in two parts, A and B, each in arch form, with perpendicular sides, forming an interior air-passage, and the inner part A having a base inclined on its under side, all substantially in the manner and for the purposes herein set forth.

2. The chair E, constructed as described, with arch *e*, perpendicular sides e^1, horizontal base e^2, and flanges e^3, all substantially as and for the purposes herein set forth.

117,659.—EXTENSION TABLE.—John J. McKnight, Tarrytown, N. Y.

Claim.—As an improved apparatus for operating extension tables, the racks D D^1, pinions E^1 E^2, spring-catch H, switch I, and retracting-flange F, combined and arranged substantially as and for the purposes set forth.

117,660.—PRESERVING ANIMAL SUBSTANCES. Henry Medlock, No. 22 Tavistock Square, and William Bailey, Wolverhampton, Great Britain.

Claim.—1. The use of solution No. 1 for preserving animal substances.

2. The preservation of joints of meat, animals from which the skin or feathers have been removed, fish, and hides, by means of solution No. 2, in manner hereinbefore described.

3. The preservation of animals without removing the skin, by means of solution No. 3, in manner hereinbefore described.

4. The preservation of fish, game, and poultry by means of solution No. 4, in manner hereinbefore described.

5. The preventing and arresting of decomposition in animal substances by means of solution No. 4, in manner hereinbefore described.

117,661.—PUMP-VALVE.—David Metz, Mahanoy, Pa.

Claim.—The combination of the tapering wooden shell A, internal metallic rings B B, valve C, studs *a a*, washers *d* and *i i*, collar *b*, and nuts *e e*, all constructed and arranged substantially as and for the purposes herein set forth.

117,662. — PLOW.—James G. Miner, Nashville, Tenn.

Claim.—1. The mole A, longitudinally arched from front to rear, with its under surface recessed at rear, and having a mortise, a^3 b'', on top and in front of its greatest sectional area to receive and surround the tenoned foot of the colter B, which is secured thereto by the bolt b^3, substantially as represented and described.

2. The combination and arrangement, in a subsoil or mole-plow, of the beam C and colter B, enabling the latter to be shifted forward or backward, and secured by means of the vertical holes *c c c* in said beam, and bolts passing perpendicularly therethrough, so that said plow can be used either as a one-horse or two-hose plow, substantially as specified.

117,663.—WOOD-BENDING MACHINE.—Levi E. Minott, Sheboygan, Wis.

Claim.—1. The combination of the sliding frame B and the eccentric revolving form H, both constructed and arranged substantially as described and shown, and operating to give shape to said wood without lateral compression, as explained and set forth.

2. The combination of the sliding frame B, screw C, rack-bar G, and eccentrically-pivoted pinion E, substantially as specified.

3. The vertical adjustable shaft F for supporting the pinion carried in the sliding frame, consisting of the top and bottom pieces *t u* and the vertical pieces *v v*, arranged in a wood-bending machine, as specified and shown.

117,664.—RETAINING-STRAP FOR BENDING TIMBER. — Levi E. Minott, Sheboygan, Wis.

Claim.—1. The strap A for bending wood, notched

substantially in the manner described, and bent longitudinally at right angles.

2. The combination of two interlaced straps, A with the canvas covering D, substantially as specified.

117,665.—BLACKSMITH'S HARDY.—Charles F. Moore, Snedikerville, Pa.

Claim.—The herein-described blacksmith's hardy, consisting of a base, A^1, vertical arm A^2, helve B^1, spring C, and swedges or cutters which are formed upon the base A^1 and helve B^1, the base portion resting upon the anvil throughout its entire length, except that part which enters a recess formed therein for receiving it thereon, and the spring being made to bear upon the rear end of the helve B^1 and the point or projection *b'*, to prevent its being thrown too far back, the parts being constructed substantially as and for the purpose set forth.

117,666. — TREMOLO ATTACHMENT FOR REED INSTRUMENTS.—Elias P. Needham, New York, N. Y.

Claim.—1. The attachment of the tremolo-valve to a flexible diaphragm arranged to form the valve-seat, and which is free to vibrate in common with the valve, essentially as herein set forth.

2. The combination of the perforated diaphragm F with the valve G, the perforated portion E in the wind-passage A, and passages or openings arranged to conduct the air through the reeds or pipes, substantially as specified.

117,667. — GRINDING-MILL. — Addison H. Nordyke and Daniel W. Marmon, Richmond, Ind.

Claim.—1. The combination of a case or tube having in it a fixed receptacle for the upper end of the spindle, and the oscillating or swinging tube or case B, substantially as and for the purpose set forth.

2. The downwardly-projecting flange upon the cylindrical portion of the case or tube A, in combination with the swinging tube B, substantially as shown.

3. The tube B, when provided with the projections B^1 B^1 and the pockets B^2 B^2, for the purpose set forth.

4. The combination of the case or tubes A and B and the cross-arms D' of the spindle, the parts being constructed and arranged substantially as and for the purpose specified.

117,668. — GRINDING-MILL. — Addison H. Nordyke and Daniel W. Marmon, Richmond, Ind.

Claim.—1. In combination with the stationary or non-revolving stone of a grinding-mill, an oscillating cross-bar and cock-head, whereby the face of such stone may be set and kept parallel with that of the revolving one, substantially as and for the purpose set forth.

2. The combination and arrangement of the cross-bar, the pin or cock-head which passes through its center, the spring which surrounds and holds said pin, and the stationary stone of a grinding-mill, it being substantially as and for the purpose set forth.

3. The cross-bar D, constructed with an aperture for the reception of the oscillating cock-head and with a socket for the spring.

4. The arrangement herein shown of the shaft C, the vertical shaft B, and the shoe A^4, the parts being constructed as and for the purpose set forth.

5. The cock-head pin, the spring which encircles it, the cross-head D, and the nut for regulating the stiffness of the spring, in combination with the stationary or non-revolving stone of a grinding-mill, the parts being constructed and arranged, substantially as and for the purpose set forth.

117,669.—HEMMER FOR SEWING-MACHINES. Thomas K. Ober, Philadelphia, Pa.

Claim.—1. The plate *j* and its rods *k l*, in combination with the plate A, its scroll and pin, and its set-screw *m*, all constructed and arranged substantially as set forth.

2. The combination, with the recessed plate A, of a scroll-plate, B, extending into a recess in the plate A and adjustable therein, as set forth.

3. The adjustable tongue C, made in the form of a set-screw, adapted to a threaded opening in the plate A and arranged in respect to the scroll-plate B, substantially as herein described.

117,670. — HAND CORN-HUSKER.—Charles Melsom O'Hara, Cincinnati, Ohio.

Claim.—The improved husking-pin herein described and shown, consisting of the handle A, point *b*, finger-loops C, and spring thumb-guard D, when said parts are constructed and arranged substantially as and for the purpose specified.

117,671. — DISINFECTING COMPOUND.—Oscar Oldberg, Washington, D. C.

Claim.—1. In a disinfecting compound, boric acid as an agent for arresting decomposition or the generation of noxious gases in the decay of organic matter, as described.

2. In a disinfecting compound, the combination, with boric acid, of carbolic acid, sulphate of iron, and slum, as and for the purpose described.

117,672.—LOOM.—Edwin Oldfield, Norwich, Conn.

Claim.—1. The arrangement of the reciprocating toothed rack of the shuttle-motion, stationary shuttle-race, reciprocating reed-carrier and its actuating mechanism, all constructed and operating as herein shown and described.

2. The yielding fingers *t*, in combination with the bar K, stationary shuttle-race, and the reciprocating reed-carrier, as herein shown and described, for the purpose specified.

3. The combination of the bar K with the yielding fingers *t*, constructed and operating as shown and described.

117,673.—APPARATUS FOR LOADING SHIPS. Francis Paterson, Montreal, Canada.

Claim.—The combination of the cradle *g* A, beam *e*, and sheer-legs *f* or their equivalents, blocks *k*, double line *i*, single line *i'*, friction-drum *l*, weight *m*, break *r*, and tilting-line *q*, all working together substantially in the manner and for the purpose set forth.

117,674. — UPHOLSTERY SPRING. — Charles E. Patric, Springfield, Ohio.

Claim. — In combination with the link D, the yoke E and cap F, or equivalent, substantially as described.

117,675.—STEAM-HEATER.—John L. Peake, New York, N. Y.

Claim.—1. The casting A, made in a single piece with tubes B set therein, adapted to serve in the manner and for the purposes herein specified.

2. In a hollow casing, formed in a single casting with vertical tubes, as specified, the swells or large hollow beads at the top and bottom to allow for expansion and contraction, in combination with the stays *a* cast therewith and connecting across the space between the tubes, as specified.

3. The casting A, tubes B, drain-cock N, and pipe *m*, the latter opening into the steam-space near the top, as specified, the whole adapted to serve as a steam-heater and hot-water reservoir with the advantages herein specified.

4. In combination with a heater-casting, A, and tubes B, constructed and adapted to serve as specified, the sub-casting or pedestal D having registers *e g* controlling the communication with the external air and with the air of the apartment, as specified.

117,676. — SPINNING-RING. — Horatio L. Peirce, Taunton, Mass.

Claim.—1. A spinning-ring, the interior of which is made substantially as herein shown and described—that is to say, by first forming it so that it shall present a smooth unbroken surface from end to end, and then welding on the inner flange of the traveler-rail, as set forth.

2. In combination with the traveler-rail and the bolster-flange, formed and combined with said rail, as specified, the furse-stripper, constructed and applied to the upper face of the said bolster-flange, as herein shown and set forth.

117,677. — FILE-HANDLE. — David Pfouts, Empire Mills, near Wineaburg, Ohio.

Claim.—The application of the spirit-level and the mirror or reflector in combination with the file-handle.

117,678.—ROCK-DRILLING ENGINE.—George Phillips, Alleghany, Cal., assignor to The Burleigh Rock-Drill Company, Fitchburg, Mass.

Claim.—The spring or spring-fork for arresting or preventing irregular movement of the valve, substantially as described.

117,679. — WRENCH. — George B. Phillips, Cleveland, Ohio, assignor to Joshua E. Hall, George J. Levake, William Norville, and A. Ward Fenton, same place.

Claim.—1. The grooves in the bar, made dovetailing or otherwise, to receive the pieces of wood J J to form the handle, substantially as described.

2. In combination with the traversing-jaw, the cam I on the end of the pin A, to lock the jaw in position when required, substantially as described.

117,680. — CLOD-CRUSHER AND PULVERIZER.—John W. Pollock, Bryan, Ohio.

Claim.—The combination of the platform A B C, arms D E, connected by the hooks *b b* and rods *d d*, and the rollers G G', all constructed to operate substantially as set forth.

117,681.—MACHINE FOR CLEANING GRAIN.—Nehemiah Reece, Hemlock township, Pa.

Claim.—The hoppers E and L, revolving screen G, perforated revolving cylinder M, and fans P, when said parts are constructed, combined, and arranged for operation, substantially as and for the purpose described.

117,682. — BEARING FOR MACHINERY. — Charles B. Richards, Hartford, Conn.

Claim.—1. The combination, with the moving parts of machinery, and with the stationary parts on which these rub, of a heat-indicator or thermostat, and an alarm-bell, or its equivalent, substantially as and for the purpose set forth.

2. The combination, with the moving parts of a machine and the adjacent stationary parts thereof, of a heat-indicator and an alarm apparatus in such a manner that the moving parts of the machine will be brought into connection with the alarm apparatus and produce the movements thereof at times determined by the action of the heat-indicator, as described, for the purpose specified.

117,683.—DISINTEGRATING VEGETABLE FIBERS FOR PAPER-PULPS, &c.—William Riddell, London, England.

Claim.—1. The apparatus for reducing the wood to small filaments, shavings, or pieces, constructed and operating substantially as set forth.

2. The extraction of coloring matter and other substances from filaments of wood and vegetable fiber by subjecting the same to the action of steam in a removable cage, A, having a perforated bottom fitted within the closed cylinder B, with packing *c* interposed between the cage A and cylinder B, arranged and operating as herein shown and set forth.

3. The steam-pipe K with its bent arm K', in combination with the dome J, removable cage A, and cylinder B, substantially as and for the purpose set forth.

4. The water-pipe L provided with the arm L', in combination with the dome J, removable cage A, and cylinder B, substantially as and for the purpose set forth.

5. The intermediate spaces between the casing J B and removable cage A, in combination with the pipes L K, dome J, and open central permeating-pipe I, arranged and operating in relation to the inlet and exit-pipes, substantially as and for the purpose set forth.

6. The process of bleaching fiber, by subjecting and passing through the mass a stream of carbonic-acid gas and atmospheric air combined, substantially as and for the purpose set forth.

7. The process of bleaching fiber, by subjecting the same to the action of chlorine gas or salts, in combination with carbonic-acid gas and atmospheric air, substantially as and for the purpose set forth.

117,684. — MANUFACTURE OF MALLEABLE IRON AND STEEL.—James Cartmell Ridley, Newcastle-upon-Tyne, England.

Claim.—The use of metallic lead in the manufacture of malleable iron from molten pig or cast-iron, when the same is applied after the charge of molten or pig-iron in the furnace is completely melted, as herein described.

117,685.—WOOD AND CONCRETE PAVEMENT Edward A. L. Roberts, Titusville, Pa.

Claim.—1. The composition of salt, gypsum, and sand or fine pebbles as a filling for wood pavements, substantially as hereinbefore described.

2. The T-shaped blocks having a rectangular groove, *c*, on each side, and with a head of greater width than the base, in combination with the rectangular T-shaped strips fitting into the grooves of the blocks, substantially as hereinbefore described.

117,686.—MACHINE FOR TENONING SPOKES. Jesse Henry Rook, John S. Rook, and Thomas S. Rook, York, Ill.

Claim.—1. In a machine for tenoning spokes, the guide-bars, constructed with the curved grooves F', when arranged for vertical adjustment at each end, substantially as and for the purpose set forth.

2. The combination of the curved guides F', the frame E^1 and its knife E^2, with the vertically-moving tool-stock, all arranged with reference to one another to operate substantially as and for the purpose set forth.

3. The combination of the sliding frame E^1, knife E^2, and curved grooves or guide-pieces F'.

117,687. — HARVESTER-RAKE. — John M. Rosebrook, Hoosick Falls, N. Y.

Claim.—In combination with the chain and a rake driven thereby, the rake-pin B and arms or shields D hinged thereto and riding on a chain, for the purpose of preventing straw or grass from winding on said rake-pin, substantially as described.

117,688.—PAPER-FILE.—George Rowe, London, England.

Claim.—1. The levers E H, combined and operating in connection with the covers A B, substantially as and for the purpose set forth.

2. The metallic plates C G provided with pins *e* and openings *e* and secured upon the cover A, and operated upon by the pivoted levers D E, as described, in combination with the lever H of the cover B, and the reacting spring *g*, substantially as and for the purpose set forth.

117,689.—STOP-VALVE.—Edmund Russell, Brooklyn, N. Y.

Claim.—1. The within-described stop-valve, having the slip-ring D arranged as represented to guard the soft material C, and stand with its lower edge flush with the working surface thereof under all conditions, so long as the soft material remains.

2. The within-described combination and arrangement of the soft packing C, protecting-ring D, and the ridge *b* on the main body B, arranged to serve relatively to each other and to the seat *a* of a stop-valve, as and for the purposes herein set forth.

117,690.—BEE-HIVE.—William K. Sawyer, Three Oaks, Mich.

Claim.—The construction and arrangement of a hive provided with door B, inclined ledges *c*, bottom board C provided with sector C′, and screen *b*, guide-wires E, and comb-frames D, in the manner and for the purpose set forth.

117,691.—SPRING-HINGE.—Nathaniel Sehner, Hagerstown, Md.

Claim.—The plate A, when constructed with a bar, A^2, the beveled edge a^3 of which forms a throat with the beveled edge a^3 of the plate, and a vertical head, a^4, all substantially as and for the purpose set forth.

117,692.—HARVESTER.—John F. Seiberling, Akron, Ohio.

Claim.—1. The combination of the single reel-post, the lever pivoted behind the post in a bracket projecting from the post, and the bearing for the reel-shaft mounted on the lever in front of the post, all these members being constructed and operating substantially as hereinbefore set forth.

2. The combination of the reel-post, the lever pivoted to the bracket on the post, the reel-shaft mounted on the lever in front of the post, the guide-arm secured to the bearings of the reel-shaft, and the guide mounted on the lower end of the reel-post, all these members being constructed and operating substantially as hereinbefore set forth.

3. The combination of the reel-post, the lever pivoted to the bracket on the post, the reel-shaft mounted on the lever in front of the post, the guide-arm secured to the bearings of the reel-shaft, the guide mounted on the lower end of the reel-post, the tension-pulleys on the guide-arm, and the driving-belt, all these members being constructed and operating substantially as hereinbefore set forth.

4. The combination of the reel-post, the lever pivoted thereon, the reel mounted on the lever, and the cut-off mounted on the reel-bearings, all these members being constructed and operating substantially as hereinbefore set forth.

5. The combination of the lever, the reel mounted thereon, the cut-off pivoted to the reel-bearing, the pivoted arm of the lever linked to the cut-off, the dropping-platform also linked to the pivoted arm, and the mechanism for tilting the platform, all these members being constructed and operating substantially as hereinbefore set forth.

6. The combination of the grain-wheel and the double-cranked rock-shaft pivoted to the arm on the main-axle, all these members being constructed and operating substantially as hereinbefore set forth.

7. The combination of the grain-wheel, its horizontally-swinging arm, the catch on the arm, and the rocking crank-arm fitting therein to lock the grain-wheel when reaping, all these members being constructed and operating as hereinbefore set forth.

8. The combination of the two bevel-pinions on the crank-shaft, the two independent loose bevel-gears, the countershaft sliding endwise through the gears, and the locking-pin on the countershaft, alternately engaging with one or the other of the gears, all these members being constructed, arranged, and operating as set forth.

117,693.—FLUX FOR THE MANUFACTURE OF IRON AND STEEL.—Lorenzo Sibert, Staunton, Va.

Claim.—1. The combination of ammonio-chloride of iron or its equivalent, with the flux heretofore patented by me, as above specified, in the manner and for the purpose set forth.

2. A flux consisting of ammonio-chloride of iron, hydrated peroxide of iron, or perchloride of iron, with or without other flux, and applied during any stage of reduction of the ore or refining of the metal.

117,694.—SLIDE FOR SUSPENDERS.—John E. Smith, Waterbury, Conn.

Claim.—In a slide composed of the two parts A B, each provided, respectively, with slots *c d*, the slots *f f*, and the lugs *b b* extending through the said slots *f f* to secure the two parts together and limit their motion, substantially as described.

117,695. — CLOTHES-DRIER. — Edward E. Stedman, Randolph, Ohio.

Claim.—1. The slotted link D, in combination with the frame-post A and pivoted clothes-reel arm G, the several parts being connected and arranged substantially as and for the purpose specified.

2. The reel-base J and revolving head K, when constructed with the interlocking ratchet-faces *d*, and used in combination with the pivoted reel-arm G and the revolving clothes-reel L L^1 M N, substantially as and for the purpose specified.

117,696.—BASE-BURNING STOVE. — James W. Tefft, Des Moines, Iowa, assignor to himself, Henry Le Bosquet, and Perry C. Rude, same place.

Claim.—1. The draught-chamber P extending into the fire-chamber M and provided with a slot, S′, across its whole end or base, as and for the purposes described and shown.

2. The combination of the draught-chambers P and F, when constructed and arranged substantially as shown and specified.

3. The apertures *t* in the draught-chamber P, arranged relatively to the apertures in the door A, as and for the purposes shown and described.

4. The detachable base of draught-chamber P, as shown at Fig. 7, when provided with a slot across its whole base or end.

5. The reservoir R, filling the entire capacity of the device below the plate A′ and in front of the plane of the front surface of the chamber P, and being of greater depth at its base than at its top, substantially as shown and described.

6. The combination of the chambers P and F, constructed and operating as shown and described, with the reservoir R, substantially as shown and described.

117,697.—BOOK-COVER PROTECTOR.—Mortimer Thomson, New York, N. Y.

Claim.—In a book-cover, consisting of the two envelopes A B, providing the former with a projecting flap, a^3, and the latter with the flap *f*, whose edge extends to and coincides with the joint or hinge h of the book-cover, substantially as and for the purposes specified.

117,698.—WEFT STOP-MOTION.—Frederick O. Tucker, Westerly, R. I., assignor of two-thirds his right to Thomas Isherwood and Amos Mallory, Stoughton, Conn.

Claim.—1. The combination of the weft-fingers E′ and shaft G with the shaft E, the bar H provided with the toothed rack h, and the pinion I, substantially as and for the purpose specified.

2. In combination with the sley A, the barred frame D, the shaft E, the pivoted fingers E′, the shaft G provided with the arms *g* and O, the bar H, the levers L and P, the bar N, the springs K and M, the lug Q, the lever R, and the rod S, substantially as and for the purpose shown and described.

117,699. — FAUCET. — Charles Utter and George E. Bruster, Newark, N. J.

Claim.—The secondary or waste-outlet *e* of the faucet A, in combination with the knob C, coiled spring *a*, rod *b*, and ball-valve *d*, constructed, arranged, and operating as herein shown and described.

117,700.—SAFETY-SHAFT COUPLING.—James Valleley and Franklin A. Wise, Canton, Ohio.

Claim.—1. The coupling-sleeve A L having the angular cavity *d* therein, and the short coupling-shaft E secured in the sleeve A L by the rivet F or its equivalent, and having an eye, H, or hook H′, when used in combination with the shaft B having the angular end D, and the shaft C having an eye, K, or a hook at its end, the several parts being arranged and operating substantially as herein specified.

2. The stop-pin or carrier G, secured in the inside of the sleeve A L, and fitting in the angle formed by the eyes H and K, or equivalent hooks on the coupling-shaft E, and main shaft C, substantially as and for the purpose specified.

3. The combination of the main-shaft B with angular end D, coupling-sleeve L A with angular cavity *d* and carrier G, coupling-shaft E with eye H or hook H′, and main shaft C with eye or hook K, the several parts being arranged and operating substantially as and for the purpose herein specified.

117,701. — STEAM-ENGINE. — Herbert Voeper, Southsea, England.

Claim.—The hollow piston G and its stuffing-box with the piston and rod *d* and *e*, lever H, and rod I, whereby the motion of the main piston is made to operate the valve D, substantially as described.

117,702.—DRILL-BAYONET.—Fredrik Wahlfelt, Stockholm, Sweden.

Claim.—Small arms for drill having the bayonet sliding on the inside or outside the entire length of the gun-barrel, and provided with a spring to operate the bayonet, substantially as described.

117,703.—WATCHMAKER'S CHUCK.—Albion K. P. Walker, Richmond, Me.

Claim.—The centering device for watch-wheels, consisting of the plate A, the follower B, and the friction-springs C C, substantially as specified.

117,704.—VALVE.—John Warren, Weston, assignor to himself and John C. Chapman, Waltham, Mass.

Claim.—1. The valve or stop-cock A, having a perforated metal ball-valve, B, working loosely in its seat, and constructed and operated substantially as and for the purpose set forth.

2. The cock A, having the globular projection A′, in combination with the perforated ball-valve B working loosely in its seat, as described, and having the projection *b*, on which fits the key-rods C, substantially as shown, and for the purpose set forth.

117,705. — MACHINE FOR REMOVING RUNNERS FROM STRAWBERRY VINES.—Samuel H. Warren, Weston, and William H. Defrees, Newtonville, Mass.

Claim.—The combination of the guide-wheels *c d*, the cutting mechanism, the runner-finger *f*, and the leaf-guide *e*, substantially as shown and described.

117,706. — SPHERICAL GEAR.—Theophilus Weaver, Harrisburg, Pa.

Claim.—1. Running-gears, when they are made in spherical form, as a new article of manufacture, substantially as hereinbefore set forth.

2. The combination of one or more ecliptics or ecliptic tablets, either on an oblique or on a right sphere, with one or more trunnions in a matrix, or its equivalent, substantially as and for the purposes hereinbefore set forth.

3. The combination of the sectional mask or cover with spherical gears, substantially as and for the purposes hereinbefore set forth.

4. The relievo cuttings in the matrix, as shown in Fig. 4, plate 1, substantially as and for the purposes hereinbefore set forth.

5. The combination of stud L^2, ring *n*, and groove *f*, shown in Figs. 2 and 3, plate 4, for the purpose set forth.

6. The matrix or circulator, when it is used as a hemispherical socket interiorly and as a pulley or fly-wheel exteriorly, substantially as hereinbefore set forth.

7. The matrix or circulator, when its rim is used as a toothed wheel to increase speed or effect a multiplied radiation of axes, substantially as herein set forth.

8. The combination of a toothed major matrix, K, minor matrix K′, pinion O O′, hemispherical standard X X′, and a channeled hemispherical driver, shown in Fig. 10, plate 3, substantially in the manner as and for the purposes hereinbefore set forth.

9. The arrangement of two or more trunnions in the matrix by which the speed is modified, substantially as hereinbefore set forth.

10. The combination and arrangement of the parts K K′ of the locking-matrix shown in Fig. 2, plate 3, substantially as and for the purposes set forth.

117,707.—GANG-PLOW.—Lewis T. Webster, Northfield, Mass.

Claim.—1. The circular revolving beveled furrow-guide *a*, as herein shown and described, in combination with the adjustable arm *b* and brace *f*, as recited.

2. The arrangement of the draft-rod A in relation to the axle or shaft and beam, as and for the purpose set forth.

3. The arrangement of the adjustable springs *m* and *n* in relation to the plows, as described.

117,708. — SEWING-MACHINE. — Elliott P. West, Jersey City, N. J.

Claim.—1. The combination, with the loose driving-pulley F and main shaft C, of a clutch and disengaging mechanism, constructed and combined with devices connected with the presser-foot, so that on disengaging the shaft from the pulley the presser-foot is simultaneously released from its hold on the cloth, substantially as specified.

2. The arrangement of the disengaging mechanism and the presser-foot lifting devices connected therewith, relatively with the needle or its operating devices, whereby the main shaft is disengaged from the driving-pulley and presser-foot released when the needle is down in the cloth, essentially as described.

3. The disengaging finger-pin J, arranged to project through the cloth-bed or table, in combination with the sliding tripping-bar I and spring *i*, substantially as specified.

4. The combination of the key H, the spring *d*, the clutches G G′, and the tripping-bar I, or nose *h*, essentially as described.

5. The combination of the sliding cam *p*, or sleeve carrying the same, the main shaft C, the lever M, and the tripping-bar I or arm P thereof, substantially as specified.

117,709. — SEWING-MACHINE FOR BOOTS AND SHOES.—William Wickersham, Boston, Mass.

Claim.—1. The needle-plate, with the curved edge and without a hole or slot for the needle to pass through, in combination with a presser, substantially as shown and as described.

2. In combination with the above, the awl A, constructed and operating as described.

3. The plate *a*, having a curved edge, *a′*, without a needle-slot or hole, and with the projection *c d*, as and for the purpose set forth.

117,710.—STOVE-PIPE OVEN.—Roswell D. Wilcox, Buffalo, N. Y.

Claim.—1. In combination with an oven or shelf, having the hooks *c*, a stove-pipe, provided with the movable concentric bands A B, separated by a narrow space, into which the said hooks are inserted, substantially as specified.

2. The stove-pipe oven herein described, having

rails D, stay z, and perforated semicircular recess a, substantially as specified.

117,711.—GANG-PLOW.—Samuel A. Worthen, Thomson, Ill.

Claim.—The curved bar M, axle I, cams L, lever N, and segment R, for the purpose of operating the plow-beams B, in the manner and for the uses and purposes shown and described

117,712. — LIQUOR-COOLER. — Edmund Wright, Philadelphia, Pa.

Claim.—The perforated casing C, adapted for the reception of a bottle, in combination with a dish, A, forming an ice-receptacle which surrounds and incloses the casing, substantially as and for the purpose described.

117,713. — ELECTRO-MAGNETIC SAFE-PROTECTOR.—William Duncan, Lebanon, N. H., assignor to himself and Calvin C. Rowell, same place.

Claim.—1. In combination with a safe, an electric circuit and an alarm apparatus, the safe (or an inclosing-case) being so constructed and connected with the circuit, and the circuit with the alarm, that a break or perforation through the plate or plates of the safe or case, or the opening of the door of such safe or case, breaks the circuit and operates the alarm.

2. In combination with a safe and with an electric circuit and an alarm apparatus, the air-chambers, air-exhaust pipes, and expanding and collapsing disks, arranged and operating substantially as described.

3. The specific construction and arrangement of the circuit-closing and breaking mechanism shown at A and B.

117,714.—MANUFACTURE OF COKE.—Walter McPheeters and Charles Pearce, Harmony, Ind.

Claim.—1. The improved coking-oven, consisting of the vertical brick or stone walls A and wood-flues B C, substantially as specified.

2. In combination with the subject-matter of our first clause of claim, the vertical flues D made in the slack, in the manner and for the purpose described.

3. The improved process for making coke of bituminous slack, consisting in burning the slack packed over wood-flues with vertical flues formed in it, and covered with earth or clay, all substantially as specified.

117,715. — FANNING-MILL. — John Goetz, West Bend, Wis.

Claim. — 1. The combination of the inclined troughs G of the series of sieves 1, 3, and 5, and the vertical adjustable trough H with the series of sieves 2, 4, and 6, and conveying-boards a, the said sieves and conveying-boards having such angular relations one to another as that they will cause cleaned grain to be delivered at both ends of the machine, as herein shown and described.

2. The combination, with the inclined troughs G, of the vertical trough H, when made adjustable to accommodate the change of angle of the sieves and conveying-boards in cleaning different kinds of grain, as herein shown and described.

3. The deflecting-board I, the sieves 1, 2, 3, 4, 5, and 6, each alternate sieve provided with the inclined trough G, the adjustable vertical communicating-trough H, and the conveying-boards a, when said parts are arranged in the manner herein shown and described.

REISSUES.

4,490. — WAGON-TONGUE SUPPORT.—William Beers, Milan, Ohio.—Patent No. 116,016, dated May 23, 1871.

Claim.—1. The slotted segment E, as arranged in relation to and in combination with the tongue D, substantially in the manner as described, and for the purpose set forth.

2. The tongue D, when constructed with lugs K, head I, and neck J, and arranged in combination with the segment G and journal-seats H, in the manner as and for the purpose specified.

4,491.—METALLIC CARTRIDGE.—Hiram Berdan, New York, N. Y., assignor to The Berdan Fire-Arms Manufacturing Company, same place.—Patent No. 82,567, dated September 29, 1868.

Claim.—1. The combination of the drawn brass shell with the patched bullet, substantially as described.

2. The combination of the metallic shell with a paper-patched bullet and a re-enforce cup, all constructed and arranged to operate as set forth.

3. The combination of the metallic shell A with the paper-patched bullet, and a cap or primer applied exteriorly, substantially as described, whereby the same shell may be repeatedly used, as set forth.

4,492.—OIL-TANK AND RESERVOIR.—William J. Brundred, Oil City, assignor of one-half his right to George W. Glass, Pittsburg, Pa.—Patent No. 110,953, dated January 17, 1871.

Claim.—1. The tubular casting K, its opening being greater in diameter than the diameter of the valve D, so that it may be withdrawn from the tank A without the necessity of entering the tank or drawing off the oil, as herein described.

2. The valve-rod or stem F, provided with an adjustable collar, N, as herein described, and for the purpose set forth.

3. The tubular castings K and L arranged on the upper side, and the casting B arranged on the under side of the tank A, with openings of said castings arranged concentric to each other, and combined with the valve D and its stem F, substantially as herein described, and for the purpose set forth.

4,493.—DOUBLE-CIRCUIT INSTRUMENT FOR RAILROAD SIGNALS AND OTHER PURPOSES. — Thomas S. Hall, West Meriden, Conn.—Patent No. 97,505, dated December 7, 1869.

Claim. — 1. The method, substantially as herein described, of continuing the action or effect produced by closing the circuit through an electro-magnet by means of a stop, F, which serves to lock the armature-lever C of such magnet in its closing position after the circuit through its electro-magnet has been opened, substantially in the manner set forth.

2. The combination of a reversing-magnet, E, and armature D with the stop F and armature-lever C, substantially as and for the purpose described.

4,494.—RAILROAD-CAR VENTILATOR.—Marcus T. Hitchcock, Springfield, Mass., assignor to John W. Laberee.—Patent No. 74,534, dated February 18, 1868; reissue No. 4,005, dated May 31, 1870.

Claim.—1. The hub b of the sliding valve, when constructed as described, so that both a sliding and an oscillating motion can be imparted to the valve, as set forth.

2. Providing the case or shell A, in which the sliding valve D moves, with elastic abutments F F, which are so arranged that the valve when striking against one of the abutments will be brought into an inclined position, substantially as and for the purpose herein shown and described.

3. The shell or case A, when provided with elastic abutments F F, in combination with the sliding oscillating valve D and with the channel b, all made so that the lower edge of the valve does not come in contact with the bottom of the shell, and all operating substantially in the manner herein shown and described.

4. The shell or case A, formed substantially as described, in combination with the channel B, and the deflector in front and the deflector in rear of said channel, substantially as described, the whole combination operating to separate the pure air from the impure substances contained therein, and cause the pure air to enter the car, as described.

4,495. — FRUIT-DRIER. — John P. Miller, Somerville, N. J.—Patent No. 109,234, dated November 15, 1870.

Claim.—An improved fruit-drier, consisting of the wooden box or case A, sheet-metal lining B, holes C, sliding plate D, ribs or flanges E, and racks or grates F, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

4,496. — REPEATING FIRE-ARM. — William Hopkins Morris, New York, and Charles Liston Brown, Sing Sing, N. Y., for themselves, and Rollin White, Lowell, Mass., assignees of said Morris and Brown.—Patent No. 26,919, dated January 24, 1860.

Claim.—1. In combination with a many-chambered cylinder, having its chambers extending right through it, a movable breech or its equivalent for the purpose of adjusting and holding the cylinder in its desired position, substantially as herein set forth.

2. The arrangement and combination of the revolving pin I, bolt or breech-piece H, hammer G, and cartridge-shell extractor F, substantially as herein described.

3. The combination, with a single barrel and a circular series of chambers for containing separate charges of powder and ball, of a corresponding series of passages, a a, starting from the said chambers and converging so as to discharge into the barrel, substantially as and for the purpose herein set forth.

4. In combination with a many-chambered cylinder, a, a cartridge-shell ejector to withdraw simultaneously two or more cartridge-shells from the cylinder, substantially as and for the purpose herein set forth.

5. In combination with a many-chambered cylinder, either movable or fixed, a cartridge-shell extractor having a pin or stem entering the cylinder and extending through the same, substantially as herein described.

6. In combination with a many-chambered cylinder and a cartridge-shell extractor fitted thereto with a pin or stem, the fitting of the pin or stem into the cylinder with a flat and spline or their equivalent, substantially as and for the purpose herein set forth.

4,497. — WASHING-MACHINE. — Sidney W. Palmer and Charles Coventry, Auburn, N. Y., assignees of Munson C. Cronk and Sidney W. Palmer.—Patent No. 40,330, dated October 20, 1863.

Claim.—1. The rubbers A and E provided with the radial ribs D, and the standards C and G in combination with each other, the levers H and I, the collar K, and with a common wash-tub, substantially as and for the purpose specified.

2. In combination with the rubber E and with the standards C and G, the lever H, fulcrum-bar I, and collar K, substantially as and for the purpose described.

3. The fulcrum-bar I and i, constructed as described, and combined with the standard C, the lever H, and the collar K, substantially as and for the purpose shown.

4. In combination with the longitudinal channels d cut within the ribs D, the lateral openings d', substantially as and for the purpose specified.

5. In combination with the rubber E and the buttons or guides F, the vertical openings f, substantially as shown and for the purpose described.

6. In combination with the rubbers A and E, the spring L, substantially as and for the purpose shown.

7. In combination with the rubber A and its operating mechanism, the standard C, permanently attached to and extending upward from the center of said rubber, substantially as shown, and for the purpose set forth.

8. In combination with the rubber E and standard C, the stud M and recess m, substantially as shown, and for the purpose described.

4,498.— STOCK-CAR. — Amos Rank, Henry King, and Joel Sharp, Salem, Ohio, assignors to The National Cattle-Car Company, same place.—Patent No. 111,873, dated February 14, 1871.

Claim.—1. In a stock-car, the combination of the reservoir arranged beneath the floor of the car with the watering-troughs arranged above the reservoir, substantially as hereinbefore set forth.

2. In a stock-car, the combination of a water-reservoir and a watering-trough arranged relatively to one another, as above mentioned, and an atmospheric pump for supplying water to the trough in regulated quantities while an excess of pressure is maintained on the surface of the water in the reservoir.

3. In combination, with a stock-car, of troughs arranged on each side of the car, a reservoir located below the troughs, and pipes connecting the troughs and reservoir, substantially as hereinbefore set forth.

4. The combination, with a stock-car, of the reservoir beneath the car, the atmospheric pump, and the pipe issuing from the bottom of the reservoir, as set forth.

4,499. — GRAIN-DRILL. — Lyman Wight, Whitewater, Wis.—Patent No. 112,663, dated March 14, 1871.

Claim. — 1. In a seeding-machine, the seed-box, whose ends are cast with axles for the reception of the driving-wheels, substantially as described, for the purpose specified.

2. The combined broadcast-seeder and coverer, in which all the parts are supported from the driving-wheels by means of axles cast upon the ends of the seed-box, substantially as described, for the purpose specified.

3. The metallic ends of the seed-box, cast with axles for the driving-wheels of the machine, and with grooves in their proximate faces to receive the front, bottom, and rear boards of said box, substantially as described, for the purpose specified.

4. The seed-box, consisting of the grooved ends B cast with axles, the vertical front board, and inclined bottom and rear boards, all the parts being arranged and suitably clamped together, substantially as described, for the purpose specified.

5. The combination of the hollow axles F with the seed-box and rod N, substantially as described, for the purpose specified.

6. The beveled washers R, arranged between and secured to the beams S S so as to clamp the eye of the drag-tooth between them, the whole being held together by the bolt T, substantially as described, for the purposes specified.

7. The arrangement of the cone-pulleys D' E' and endless chain F' with the traction-wheel G and screw-rod N, substantially as described, for the purpose specified.

8. In combination with the chain F' by which motion is communicated from the driving-wheel to the screw-rod, a yielding support and guide, substantially as described, for the purpose specified.

9. In combination with the pivoted spring-lever H', the rod J', and lifting-bar A', and suitable machinery for connecting the spring-lever to the driving-wheel, substantially as described, for the purpose specified.

10. The hollow axles F, cast solid with the ends B of the seed-box A, substantially as herein shown and described, for the purpose specified.

11. The combination of the rock-shaft W and pivoted lever X with the brackets or supports V,

chains Y, cross-bar A′, and beams S, substantially as described for the purposes specified.

12. The spring l′, pivoted lever H′, and pulley-block G′, combined, as described, with the chain F′, for the purpose of holding the latter in sufficient frictional contact with the pulleys to rotate the screw.

13. The rod J′, passing loosely down through bar A′, and collared at K′ above it, combined, as described, with the lever H′ to allow the elevation of said bar A′ to raise the end of the lever, slacken the chain, and stop the rotation of the screw, substantially as set forth.

4,500.—PRESSER AND SWITCH-DIVIDER FOR SEWING-MACHINES. — Alfred S. Woodward, Brooklyn, N. Y. — Patent No. 110,945, dated January 10, 1871.

Claim.—1. The combination, with a sewing-machine, of a stitch-divider, adapted to be automatically forced into the notches between the stitches; as the work passes from the needle, for dividing said stitches, substantially in the manner specified.

2. The stitch-divider combined with the presser, and the latter provided with the groove G in the heel, substantially as specified.

DESIGNS.

5,146. — STEAM-ENGINE.—Chilion M. Farrar, Buffalo, N. Y.

Claim.—The design for a steam-engine, substantially as shown.

5,147. — SETTEE. — Joseph W. Fiske, New York, N. Y.

Claim.—The design for a settee, as shown.

5,148.—CASTER.—James L. Haven, Cincinnati, Ohio.

Claim.—The design for a furniture-caster, as herein represented and specified.

5,149.—FLOOR OIL-CLOTH PATTERN.—Jeremiah Meyer, Newark, N. J., assignor to D. Powers & Sons, Lansingburg, N. Y.

Claim.—The design for floor oil-cloths, as shown on said drawings and herein described.

5,150.—MEDALLION HEAD OF WASHINGTON. James H. Miller, Philadelphia, Pa., assignor to himself and Charles Kripe, same place.

Claim.—The design for a medallion head of Washington, substantially as described, and as represented in and by the accompanying drawing.

5,151. — SHOE-CLASP. — George Oldham, Youngstown, Ohio.

Claim.—The design for a shoe-clasp, as shown.

5,152. — FLOOR OIL-CLOTH PATTERN.—Charles L. Pierpont, Salem, N. J., assignor to Samuel W. Dunn, same place.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, herein set forth.

5,153. — FLOOR OIL-CLOTH PATTERN.—Charles L. Pierpont, Salem, N. J., assignor to Samuel W. Dunn, same place.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, herein set forth.

5,154. — FLOOR OIL-CLOTH PATTERN.—Charles L. Pierpont, Salem, N. J., assignor to Samuel W. Dunn, same place.

Claim.—The design or pattern for floor oil-cloths, carpets, or other fabrics, herein set forth.

5,155.—SEWING-MACHINE LEG.—Jerome B. Secor, Chicago, Ill.

Claim.—The design for sewing-machine legs or supports, as shown.

5,156.—COOKING-STOVE.—Nicholas S. Vedder and Francis Ritchie, Troy, N. Y., assignors to Nicholas S. Vedder.

Claim.—1. The compound panel ornament A, shaped and arranged as herein described.

2. The combination of the panel ornament A and corner border ornaments B, shaped and arranged as herein set forth.

3. The compound ornament C, shaped and arranged as herein described.

4. The combination of the panel ornament C and border ornaments B′, arranged together as herein specified.

5. The design for the leg D, as herein described.

6. The design for the ash-pit cover H, as herein described.

7. The design for the front side of the ash-pit, as distinguished by the combined straight and curved portions *m n*, as herein set forth.

5,157.—HEATING-STOVE.—Nicholas S. Vedder and Francis Ritchie, Troy, N. Y., assignors to Nicholas S. Vedder.

Claim.—1. The design for the urn N, as herein described.

2. The design for the urn-base Q, as herein described.

3. The design for the cover R, as herein set forth.

4. The design for the top rim U, as herein described.

5. The design for the upper section X, as described.

6. The design for the rim Z, as shown.

7. The design for the door-frames C, as described.

8. The design for the rim-plate F, as shown.

9. The contour of the section I J, as herein described.

10. The ornamental open-work *h* in the part I, as shown.

11. The ornamental open-work *i* in the part J, as shown.

12. The design for the base-rim M, as shown.

13. The design for the base P, as described.

14. The design for the damper-frame S, as set forth.

15. The design for the leg T, as shown.

5,158.—HEATING-STOVE.—Nicholas S. Vedder, Troy, and Tobias S. Heister, Lansingburg, N. Y., assignors to Nicholas S. Vedder.

Claim.—1. The design for the foot N, as shown.

2. The design for the columns P P, as herein described.

3. The design for the capitals Q Q, as herein specified.

4. The design for the arch V, as herein set forth.

5. The design for the door A, as described.

5,159.—COOKING-STOVE.—Nicholas S. Vedder, Troy, and Tobias S. Heister, Lansingburg, N. Y., assignors to Nicholas S. Vedder.

Claim.—1. The ornament M, shaped and arranged as herein described.

2. The ornament or ornaments N, shaped and arranged as herein set forth.

3. The design for the panel-border O, as herein specified.

4. The design for the plates R, S, and T, as herein described.

5. The design for the leg Y, as described.

5,160.—COOKING-STOVE.—Nicholas S. Vedder, Troy, and Tobias S. Heister, Lansingburg, N. Y., assignors to Nicholas S. Vedder.

Claim.—1. The panel ornament J, shaped and arranged as herein described.

2. The panel ornament K, shaped and arranged as herein set forth.

3. The ornament L, shaped and arranged as herein described.

4. The ornament M, shaped and arranged on the corners of moldings, as herein set forth.

5,161.—COOKING-STOVE.—Nicholas S. Vedder, Troy, and Tobias S. Heister, Lansingburg, N. Y., assignors to Nicholas S. Vedder.

Claim.—1. The ornamental surface C, composed as herein described.

2. The design for the front plate F, as herein specified.

3. The design for the leg J, as described.

5,162.—COOKING-STOVE.—Nicholas S. Vedder, Troy, and Tobias S. Heister, Lansingburg, assignors to Jasper Van Wormer, and Michael McGarvey, Albany, N. Y.

Claim.—1. The ornament A, shaped and arranged on a door or plate of a stove or range, as herein described.

2. The ornament B, shaped and arranged as herein described.

3. The ornamental border C, shaped and arranged as herein described.

4. The combination of the ornament A and border C, shaped and arranged as described, with or without an intervening molding, d.

5. The combination of the ornament B and border C, shaped and arranged as herein set forth.

6. The combination of the ornamental border C and central ornament E, shaped and arranged together as herein described.

7. The design for the foot or leg F, as described.

5,163.—CARRIAGE-DOOR HANDLE.—Edward Wells, New Haven, Conn., assignor to Wells, Cruttenden & Co., same place.

Claim.—The design for carriage-door handle, as herein described and shown in the accompanying drawing.

TRADE-MARKS.

403.—BLACKING AND LEATHER-DRESSING.—B. F. Brown & Co., Boston, Mass.

404.—BLACKING AND LEATHER-DRESSING.—B. F. Brown & Co., Boston, Mass.

405.—BLACKING AND LEATHER-DRESSING.—B. F. Brown & Co., Boston, Mass.

406.—UMBRELLAS AND PARASOLS.—Elwell, Fiske & Worth, New York, N. Y.

407.—UMBRELLAS AND PARASOLS.—Elwell, Fiske & Worth, New York, N. Y.

408.—MEDICINE.—John L. S. Hall, Wheeling, W. Va.

409.—TEA.—Kwong On Cheong, San Francisco, Cal.

410.—WHISKY.—J. A. Monks & Sons, St. Louis, Mo.

411.—WHISKY.—J. A. Monks & Sons, St. Louis, Mo.

412.—WHISKY.—Thomas E. Moore, Shawhan, Ky.

413.—PICTURE-FRAMES, BRACKETS, &c.—Matthias Joslyn Rice, Boston, Mass.

414.—SEWING-MACHINES. — The Domestic Sewing-Machine Company, Norwalk, Ohio.

415.—JEWELRY.—John P. Turner, Birmingham, England.

EXTENSIONS.

WILLIAM M. FERRY, of Grand Haven, Mich. Letters Patent No. 17,829, dated July 21, 1857; reissue No. 542, dated April 6, 1858.

"Improved Sawing-Mill."

Claim.—1. The particular means and their arrangement, as described, for accomplishing that end.

2. Effecting, by means of an eccentric, the combination of the log-carriage and automatic reversing mechanism, thereby rendering the saw-mill capable of self-feeding and self-gigging, as set forth.

3. So adjusting the ganging-incline d^3 that its hinge or pivoted joint, and its opposite end or terminus, shall always be at the same and equal distances from the set-shaft F, as described.

4. The application, in the manner described, of the adjustable self-fastening trip *z* to a saw-mill, which operates with a continuous rapid motion back and forth, in combination with the vibrating reversing stop w^2, substantially as and for the purpose set forth.

JAMES R. FLOYD, of New York, N. Y.—Letters Patent No. 17,854, dated July 21, 1857.

"Improvement in Retort-Covers."

Claim.—The constructing gas-retort covers of malleable iron, in the manner and for the purposes set forth.

G. HENRY HULSKAMP, of New York, N. Y.—Letters Patent No. 17,838, dated July 21, 1857.

"Metallic Bridge for Piano-Fortes."

Claim.—1. The sounding-board bridge cast of metal, with two bearings above the strings, one on each side of the bottom supports, substantially as and for the purposes specified.

2. The rod or wire *k*, or its equivalent, inserted in the bridge to form its bearing-surface, for the uses and purposes above set forth.

3. The construction and arrangement of the cast-metal bridge *i i* in such form that it may be detached and yet firmly held in its place, in the mode above set forth, or other form substantially the same.

JOSHUA B. PROUTY, of Cincinnati, Ohio, administrator of LUCIAN FAY, deceased. Letters Patent No. 17,874, dated July 28, 1857; reissue No. 889, dated January 24, 1860.

"Improved Machine for Seaming Sheet-Metal Roofs."

Claim.—1. A suit of seaming-rollers, mounted in a carriage and operating by the described continuous movement to produce a standing seam of even height on stationary sheets of metal.

2. Adapting a seaming-carriage, substantially in the manner set forth, to produce a standing seam without other guide than the upturned edges upon which it operates.

3. In the described combination with the seaming mechanism, the "pioneer" rollers *a a′*, operating in the manner and for the purposes set forth.

4. The described arrangement and application of a folding roller, C, operating to turn or fold the edge of the metal from a right to an acute angle

preparatory to the action of seaming or closing rollers, as set forth.

5. The burring, folding, and seaming-rollers, constructed, arranged, and operating substantially as set forth, to complete a single or double standing seam at one operation.

6. Arranging the seaming-rollers against yielding bearings, substantially as and for the purpose set forth.

7. Making the operative mechanism of a seaming-carriage adjustable in height for the successive operations of a single and double seaming, as set forth.

8. The operator's seat, applied to a seaming-carriage, substantially as and for the purposes set forth.

9. The stirrup *t*, constructed and applied substantially as and for the purposes set forth.

CHARLES PERLEY, of New York, N. Y.—Letters Patent No. 17,940, dated August 4, 1857; reissue No. 1,345, dated October 7, 1862.

"*Improvement in Compound Capstans for Ships.*"

Claim.—1. A removable heaver on a vertical shaft, sustained and rotated from below said heaver, in combination with a second shaft and capstan or capstan-head, and with gearing between the said shafts, substantially as and for the purposes specified.

2. A capstan on a vertical shaft that can be connected or disconnected from the shaft, in combination with a chain-wheel or heaver on a separate vertical shaft, the two shafts being connected by gearing, substantially as set forth, whereby the capstan can be used separately from the heaver, or both heaver and capstan can be rotated in either direction to take in or give out chain-cable, as set forth.

3. The adjustable bearing-block *o*, in combination with the chain-heaver *m*, to relieve the vertical shaft from strain and friction that would result from the weight of the chain, or the strain on the same while the vessel is lying at anchor, as set forth.

4. The combination of the power capstan *n*, coupling *g*, and heaver *m*, for the purposes and as specified.

WILLIAM M. WELLING, of New York, N. Y. Letters Patent No. 17,949, dated August 4, 1857.

"*Improvement in Factitious Ivory.*"

Claim.—Forming artificial ivory by thoroughly mixing and combining the articles specified, or others having equivalent properties, while under the operation of heat, substantially as specified.

ISSUE OF AUGUST 8.

PATENTS.

117,716.—ATTACHMENT FOR SEWING-MACHINES.—Jacob S. Alter, Leavenworth, Kan.

Claim.—The plate M having upward hook N, and the plate O having lugs P, combined with and applied to plates A, K, E, and G, as and for the purpose specified.

117,717.—FOG-HORN.—John R. Anderson, Brooklyn, N. Y.

Claim.—1. The combination of the curved and plain leaves *a* and *b*, whereby a compound double reed and air-pipe is provided, substantially as and for the purposes described.

2. The compound reed and air-pipe, in combination with the hollow screw-nut, substantially as set forth.

3. The combination of the compound reed and air-pipe, hollow screw-nut, and conical trumpet, substantially as set forth.

117,718.—FEEDER FOR ORE-ROASTING FURNACES.—John P. Arey, Georgetown, Col. Ter.

Claim.—1. A feeder for an ore-roasting furnace, which is composed of grated plates which have a shearing feeding operation, substantially as described.

2. The hopper B, provided with a subdivided bottom and arranged over grated distributers, substantially as described.

3. The combination of a hopper, B, and a circulating cooling-tank, *b*, substantially in the manner described.

117,719.—FISH-HOOK HOLDER.—Levi Arnold, Belchertown, Mass.

Claim.—The sliding ring C, in combination with the tapered stem B provided with a groove or grooves, as shown and described, for the purpose of holding one or more fish-hooks, as specified.

117,720.—WASH-BOILER.—Isaac Atyeo, North Fairfield, Ohio.

Claim.—The gutters D and perforated bottom A, in combination with the conduits F, arranged in relation to each other, substantially as shown and described, for the purpose set forth.

117,721.—PORTABLE BUILDING.—Francis M. Bain, Delaware, Ohio.

Claim.—1. Hook-bolts *h*, substantially as and for the purpose hereinbefore set forth.

2. Hook-bolts *h*, in combination with holes *e* or grooves *e'*, strip W, washer *e*, and nut *n* or its equivalent, substantially as and for the purpose hereinbefore set forth.

117,722.—SOAP.—George Baker and Isaac Bullock, Lima, Pa.

Claim.—The within-described soap, compounded of the ingredients in the manner and about the proportions set forth.

117,723.—LADLE FOR CANNING FRUITS.—Rush D. Baker, Syracuse, N. Y.

Claim.—The dipper or ladle A, having one open side or dipping-lip, *a*, with a tunnel or guide, BC, and handle D, as constructed.

117,724.—BEDSTEAD.—Thomas B. Baldwin, Marshall, Tex.

Claim.—1. The links H attached to the bedstead, chains D, and centrally placed rope M, combined with the elevating-frame K placed across the top of the bed, as set forth.

2. In combination with the chains D of a pendent bed, the spring F arranged on the ceiling E to give elasticity to said bed.

3. In combination with chains D, the elastic connections Q to take up the slack therein as the bed rises, and to fold them inwardly in the bed.

117,725, antedated July 26, 1871.—SAD-IRON AND RUFFLER.—William Banzett, Williamsburg, N. Y.

Claim.—1. The combination of a sad-iron with fluting-rolls, as specified.

2. The combination of the iron *a*, standard *b d*, handle *c*, rolls *f f*, and lug *h*, as described.

117,726.—HARVESTER-DROPPER.—J. J. Barnhill and D. N. Barnhill, Vincennes, Ind.

Claim.—1. The combination of the angle-irons E, sliding bar F, slotted bent lever G, and connecting-rod or bar H, with the pivoted slats D, pivoted bar B, guard-bar A, and lever C, all arranged and operating substantially as herein shown and described, and for the purpose set forth.

2. The combination of the stay-rods I with the pivoted slats D and angle-irons E, substantially as herein shown and described, and for the purpose set forth.

117,727.—RANGE-SETTING.—Andrew F. Barry, New York, N. Y.

Claim.—A cast-metal plate adapted for setting up kitchen-ranges, substantially as herein described.

117,728.—SHOULDER-BRACE.—Aurelia W. Beaman, Boston, Mass.

Claim.—The independent braces A B, provided with the elastic straps *b c* and front and back straps *f f* and *k k*, all arranged and constructed substantially as and for the purpose set forth.

117,729.—RAFTER-HOOK.—John Newton Bebout, Oberlin, Ohio.

Claim.—In combination with a long-shanked pole-hook, A, and a short-shanked clutch-hook, B, which rests on top of the beam, the lever D, bifurcated to straddle the shank of the former, pivoted to the shank of the latter at *e*, and having pulley-hook *f* on the outer end thereof, as and for the purpose specified.

117,730.—CARRIAGE-AXLE AND BOXING.—Joseph W. Beer and Absalom W. Beer, Rural Valley, Pa.

Claim.—The axle, made up of ordinary shaft A having square stem A', and the sleeve B having collar *i*, all constructed as and for the purposes set forth.

117,731.—SPRING-VENT FOR CASKS.—Edmund James Bennett, Port Huron, Mich.

Claim.—The vent herein described, composed of the cylinders A, B, and C, the valve D, spring E, and rod *k*, all constructed, arranged, and operated substantially as described and shown.

117,732.—DENTAL DRILL.—Greene V. Black, Jacksonville, Ill.

Claim.—1. The arrangement of the horizontal shaft H upon a rigid arm, K, thereunder, and both in the same swivel-sleeve I, resting upon standard A, to sustain the shaft-and-gear mechanism firmly at the altitude required.

2. The double and reversed coil spring described and shown in Fig. 6 of drawing, when constructed and applied as and for the purpose specified.

117,733.—UNIVERSAL JOINT FOR SHAFT-COUPLINGS.—Greene V. Black, Jacksonville, Ill.

Claim.—1. A universal joint for revolving shafts, composed of coiled springs G H arranged one within the other, and with the shafts, and coiled in opposite directions, all substantially as specified.

2. A universal joint for revolving shafts, composed of coiled springs G H and the forked and jointed connection E, all arranged substantially as specified.

117,734.—WHEEL-PLOW.—Andrew J. Borland, Charlestown, Iowa.

Claim.—1. The slotted bar A and bar J, combined, as described, with the beam E to adjust the plow laterally at the point for taking more or less land.

2. The combination of the axle A, wheel B, tongue C, and brace D, forming one part, with the rock-shaft G, seat I, and rod A, forming the second part, and with the plow-beam E and lever H of the third part, all arranged substantially as herein shown and described.

117,735.—CARPET-STRETCHER AND TACK-HAMMER COMBINED.—William Brown, New York, N. Y., assignor to William M. Evans, same place.

Claim.—1. Combination of the swinging-hammer E E, fulcrum-arm or projection G, handle A A, with a carpet-stretcher, substantially as and for the purpose hereinbefore set forth.

2. A compound pivoted, lever-expansive, and gravitation-closing tack-holder, substantially as and for the purpose hereinbefore set forth.

3. Combination of tack-conductor C with the tack-feeder and cut-off D, substantially as and for the purpose hereinbefore set forth.

4. Combination of the fulcrum-arm G, the fulcrum-axle G^2, the hammer E E, the tack-conductor C, tack-holder I I, connecting-line B B, handle A A, base H, guard J, teeth J^2, to form a compound carpet-stretcher, tack-conductor, tack-holder, and tack-driver, substantially as and for the purpose hereinbefore set forth.

5. Combination of handle A A, conductor C, feeder and cut-off D, base H, teeth J^2, guard J, tack-holder I I, hammer E E, fulcrum-arm G, fulcrum-axle G^2, and connecting-line B B, to form a compound carpet-stretcher, tack-conductor, tack-feeder, tack-holder, and tack-driver, substantially as and for the purpose hereinbefore set forth.

117,736.—GRAIN-THRASHER AND STRAW-CARRIER.—Richard Bryan, Penn Yan, N. Y.

Claim.—1. The straw-carrier G supported upon the pivoted standard H I, arranged to operate in connection with the thrasher A provided with the cross-piece E, windlass F, and rope Q, when said parts are constructed and arranged as and for the purpose set forth.

2. The arrangement of the shafts B and C with their bevel-gearing, pulley X, guide-rollers D D, belt R, and pulley Y, as and for the purpose herein described.

3. The combination, in the thrashing-machine A, of the crank-wheel L, adjustable connecting-rod M and O, with the hinged screens N and P, all constructed and arranged as herein shown and described, for the purpose set forth.

117,737.—IRONING-TABLE.—Frank A. Byram, Germantown, Pa.

Claim.—The combination of the board A, hinged legs E E', brace F with the stand B, drawer C, and board D, all made and operated substantially as described.

117,738.—PHARMACEUTICAL STILL, STEAM, AND WATER-BATH.—Ralph P. Buckland, Jr., and Gustavus A. Gessner, Fremont, Ohio.

Claim.—1. The combination of the heater, the steam or water-bath, and the still, with their connecting pipes, substantially as set forth.

2. The circular pipe i^2, whereby the hot-water or steam is made to enter the bath at from four to eight or more different points simultaneously.

3. The joints d^1 e^1 and d^2 e^2.

4. The arrangement of pipes *f*, f^1, and f^2, with the vessel J, substantially as set forth.

5. The corrugated cap with surrounding vessel, in combination with the small condenser.

117,739.—DUMPING-CAR.—Norman W. Camp and Charles William Camp, Saratoga Springs, N. Y., and Norman H. Camp, Wilkesbarre, Pa.

Claim.—1. The combination of the catches or hooks C and C, and spring A operated by a lever, with the frame and body of a dumping-car, substantially as and for the purposes set forth.

2. The guides F F, in combination with the tilting or rocker-frame G and the body or box E of a dumping-car, substantially as and for the purposes set forth.

3. The rocker or tilting-frame G, as described, constructed and arranged in relation to the dumping-car, in combination with the guides F F, and the frame *c* and box E, substantially as and for the purposes set forth.

4. A dumping-car, arranged and constructed

throughout substantially as shown and described and for the purpose set forth.

117,740.—WASHING-MACHINE.—William Clack, Prairie du Chien, Wis.

Claim.—1. The cylindrical box D with its mechanism, constructed as herein shown and described, to adapt it for attachment to the frame of a cart, substantially as and for the purpose set forth.

2. The combination of the box D, rollers G I, uprights H, and gear-wheels F E, with each other and with the wheels C, axle B, and thills or frame A a' of a cart, substantially as herein shown and described, and for the purpose set forth.

3. The double netting J and guide-rollers K, in combination with the box D, rollers G I, uprights H, gear-wheels F E, wheels C, axle B, and thills or frame A a', substantially as herein shown and described, and for the purpose set forth.

117,741.—LAMP-CHIMNEY CLEANER.—Cullen B. Clark, Armada, Mich.

Claim.—The cleaning-pads, springs, or plates e e and springs f f, attached to the outer end of the spindle B so as to project toward the post A, as specified.

117,742.—TRACE-BUCKLE.—Isaac Clark, Dryden, Mich.

Claim.—The trace-buckle described and shown, consisting of the loops A, B, C, and D, rigid tongue K, hooked studs L, and cam-latch E, when the several parts are constructed and arranged substantially as set forth.

117,743.—INKSTAND.—Stuart D. Clark, Minneapolis, Minn.

Claim.—The well A, supplied with transverse socket F and smooth rim-surface B, in combination with the curved lever D, lid E, and pin G, so that by turning the lever a center pressure will be given to the lid by the knuckle H and the well be closed tightly, on the principle of the wedge, all substantially as and for the purpose described.

117,744.—TUYERE.—Thomas S. Clark, Chicago, Ill.

Claim.—The combination of the blast-pipe, the blast-chamber, the detachable ring, and the ball, all these members being constructed and operating in combination, as hereinbefore set forth.

117,745.—WHEEL-PIT FOR SPOKING CARRIAGE-WHEELS.—James Collins, Crawfordsville, Ind.

Claim.—1. The guide-staff or bar E, constructed and operating in connection with the standards F, pin G, and end of the hub, substantially as herein shown and described, and for the purpose set forth.

2. The adjustable supporting and gauge-pin H, nuts I, lever J, and spring K, constructed and operating in connection with the adjustable guide-staff or bar E and outer ends of the spokes, substantially as herein shown and described, and for the purposes set forth.

117,746.—CORN-STALK CUTTER.—John W. Cornell, Lawn Ridge, Ill.

Claim.—The upright frame D, constructed as described, with hinged levers E E for carrying the rotary cutter, screw *i*, and spring *k*, connected by rods F F with the said levers, the said frame being attached to the axle of a wagon, substantially as set forth.

117,747.—VARIABLE CUT-OFF FOR STEAM-ENGINES.—William B. Cross, Sacramento, Cal.

Claim.—A right-and-left screw K, sliding blocks J J, and levers D D, arranged together, as and for the purpose specified.

117,748.—PENCIL.—Henry T. Cushman, North Bennington, Vt.

Claim.—As an article of manufacture, a lead-pencil covered with flock, as herein shown and described, for the purpose specified.

117,749.—PORTABLE FIRE-SHIELD.—Aaron Dean, Ann Arbor, Mich.

Claim.—The construction of a portable fire-shield, wherein the frame A, axle B, bounds C, circle-plate D, traction-wheels E G, guys F, draft-pole I, sockets J, and metallic chamber or chambers K, provided with filling-tunnels L, are arranged to operate in the manner and for the purpose set forth.

117,750.—SUCTION-SIPHON.—Edouard de Lagillardaie, Lorient, France.

Claim.—The combination, with a siphon-pipe, *c*, of a small reservoir, *a*, and pipe *b*, provided with a cock for the regulation of the admission of air, the reservoir and siphon-pipe communicating by an air-tube, *e*, in the manner and for the purposes herein set forth.

117,751.—ANIMAL-POKE.—Nicholas Denny, Saranac, Mich.

Claim.—The arrangement of the bow A, roller B, bar C, pivoted, curved, and pronged plate D *d'*, spring E, stop F, and key G, in connection with each other, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

117,752.—RAFTING-DOG.—George E. Dowling and Salmon F. Cone, Montague, Mich.

Claim.—The wedge-shaped dog A, having a hole, *b*, through it, in combination with a rope, C, or its equivalent, substantially as and for the purposes set forth.

117,753.—RAILWAY JOURNAL-BOX.—Isaac Dripps, Altoona, Pa.

Claim.—1. The plate E, constructed with recess c^1, flanges c^2, and groove c^3, combined with brass D, constructed with projections d^1 d^2, as and for the purpose specified.

2. In combination with the journal-box, the flap K concaved on its upper edge, and the bolts I I passing therethrough to prevent the sediment or coarser particles from working between the inner annular flange of the box and the journal.

117,754.—ICE-PICK.—William T. Eames, New York, N. Y., assignor to Leonard J. Hans, same place.

Claim.—As an improved article of manufacture, an ice-pick, composed of the hammer A, steel point C, socketed handle B, and the steel instrument E, all combined and arranged substantially as specified.

117,755, antedated July 20, 1871.—FLEXIBLE HAND-CARD.—George F. Ells, Douglas, N. Y., assignor to M. G. Goodwin, Saginaw, Mich.

Claim.—A curry-comb or hand-card having staple-like metallic teeth T set in and through a body, B, of leather, and retained therein by a backing, C, of leather, fastened to the body and furnished with a hand-strap, S, all as shown and described.

117,756, antedated July 25, 1871.—COAL-SHOVEL.—John H. Farmer, Detroit, Mich.

Claim.—The construction of a small shovel, having for its bottom a combination of parallel bars with intervening slots, and a central strengthening cross-bar, and also a retaining cross-bar at the front, the shovel to be made either of cast or pressed iron, or other metal, and to be used, in connection with the burning of coal, for the purpose of easily and conveniently saving the coal and coke, in the manner substantially as described.

117,757.—FIRE-KINDLER.—John E. Finley, George H. Hurd, and Benjamin F. Tatem, Memphis, Tenn.

Claim.—A fire-kindler, composed of fire-clay, pumice-stone, sawdust, and corn-meal, as and for the purpose described.

117,758.—CLUTCH-GEARING.—Lemuel Scudder Fithian, Brooklyn, N. Y.

Claim.—The ratchet-disks A A A, made fast upon the carrying-wheels, in combination with the cupped, slotted, and sleeved disks B B B, (with dog C with spring and shoulder in slot,) and made fast upon the axle-tree, with sleeved disk D D D sliding upon the sleeve of B, and operated by any convenient device.

117,759, antedated August 2, 1871.—STEERING APPARATUS FOR ROAD-STEAMERS.—George W. Fitts, Oberlin, Ohio.

Claim.—The steering apparatus, consisting of the concave circle attached to the frame, combined with the geared convex circle, the latter revolving within the former and having its axle attached thereto, substantially as described.

117,760.—RUBBER-BLOCK TIRE FOR TRACTION-WHEELS.—George W. Fitts, Oberlin, Ohio.

Claim.—1. The combination of the spokes C with the rims A B, nuts 1 2, and hub D, all arranged and acting as and for the purpose set forth and described.

2. The outer rim of a wheel perforated with slots or pockets for the reception of rubber blocks and metal caps, as and for the purpose described.

3. Separate blocks of rubber inserted into slots or pockets in the rim of a wheel, as and for the purpose described.

4. The metal cap for covering separate blocks of rubber inserted into the rim of a wheel, as and for the purpose described and set forth.

117,761.—DRAWING-BOARD.—John B. Franklin, New York, N. Y.

Claim.—1. The metallic strips C C, applied to a drawing-board between the edge-pieces B B and the body of the same, substantially as herein shown and described.

2. The hard-wood cross-piece D, let into the grooved face of the drawing-board and combined with the metallic strips E, substantially as herein shown and described.

117,762.—STOVE-PIPE DAMPER.—Bridget French, Rochester, N. Y.

Claim.—The damper A, provided with the projecting conical nipples *a a*, distributed over the surface, arranged as described, and operating in the manner and for the purpose specified.

117,763.—HOLDER FOR WAX CANDLES OR TAPERS.—Josef Fritsch, Carlstadt, N. J.

Claim.—The construction of holders for wax candles or tapers, substantially as herein described.

117,764.—LOCK FOR RAILROAD CARS.—Charles T. Gibson, Baltimore, Md.

Claim.—The slide E, constructed and arranged as described, the inwardly-hooked dogs F F pivoted to the plate D at *g g* and to the slide E at *f f*, and the tumblers *e* arranged as described, and the bolt C operating by direct pressure upon the slide, substantially as set forth.

117,765.—TABLE-CASTER.—John Gibson, Jr., Albany, N. Y.

Claim.—1. Forming the bases of bottles or cruets for table-casters with a more extensive diameter than the contracted portion of the same at their shoulder-bearings *b*, substantially in the manner set forth, for the purpose specified.

2. In table-casters, the combination of the projection *f* or its equivalent with the recesses *c*, substantially as and for the purpose set forth.

3. In table-casters, holding and retaining in place the cruets or bottles D by means of the projections *f* or *f'*, or by their equivalents, substantially in the manner set forth.

4. In table-casters, the combination of wheels *g* with the base A, substantially as described, for the purpose set forth.

117,766.—SAUCER, DISH, &c.—John Gibson, Jr., Albany, N. Y.

Claim.—In saucers and other vessels for containing an upper vessel, the recesses or pockets B B, cavities C' or equivalent depressions, when sunken below the central or supporting plane *a*, substantially in the manner set forth, for the purpose specified.

117,767.—SAP-SPOUT.—Weller S. Gilmore, Chester, Ohio.

Claim.—The herein-described sap-spout, consisting of the two tapering sections, A B, connected to each other at the base, in the manner as set forth.

117,768.—LET-OFF MECHANISM FOR LOOMS.—Frederick W. Graichen, Olneyville, R. I., assignor to Edward Barrows and Joseph Clayton, Dracut, Mass.

Claim.—My new yarn-beam friction or tension apparatus, as composed of instrumentalities as described, arranged, and combined as set forth, such instrumentalities consisting of the crutch O, the bent lever P, spring L, the lever K, the pawl I, the ratchet-wheel H, the wheel G, frame E, the shaft F, the bands M N, guide-wheels O O, levers D D, and friction-bands C C, all being applied together and to the yarn-beam and loom-frame, substantially in the manner and to operate as described.

117,769.—SAW-FRAME.—John H. Graham, Brooklyn, N. Y.

Claim.—The combination of two side bars, B and C, of a saw-frame with a tightening-rod placed exterior to and at the end of the saw-frame, substantially as shown and described.

117,770.—SOLDERING APPARATUS.—Jacob Gulden, Key Port, N. J.

Claim.—The combination of the box F and hinged bar G with the spring *h* and adjustable standard *g*, all arranged to operate substantially as herein specified and described.

117,771.—TELEGRAPH APPARATUS.—Isaac Hall, New York, N. Y., assignor to himself and George B. Walter, same place.

Claim.—1. The metallic cylinder d^1, slotted at equal intervals and in parallel lines on its periphery, having metallic strips d^2, hard rubber (or non-conductor) d^3, and stops d^4 d^5, all arranged thereon, as and for the respective purposes specified.

2. The combination of the adjustable lever H, spring I, and gearing E F G, or equivalent gearing, for imparting a reciprocating movement to the contact-drum or roller D, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the spring-pawl J K, ratchet wheel L, and stop Z' with the contact-roller or drum D and shaft C, for the purpose of operating the feed-roller I' from the said contact-roller D, substantially as herein shown and described.

4. The combination and arrangement of the springs M' N' O' with the lever Y, frame or bar K', tension-roller J', and set-screw P', substantially as herein shown and described, and for the purposes set forth.

5. The adjustable screw Z and armed bar F', whether provided with an adjustable screw, G', or

not, in combination with the lever Y, guide-bracket C', and punch D', for the purpose of operating the punch by the movements of said lever Y, substantially as herein shown and described.

6. The magnet Q', applied through an insulated platinum-pointed screw-cup, V', and an oppositely-arranged platinum-pointed arm W', to assist in raising the lever Y', in the manner described.

7. The key-levers Q q^1 q^2 S s^1 s^2, constructed and arranged in connection with each other and with the contact-roller D, substantially as herein shown and described, and for the purpose set forth.

117,772.—APPARATUS FOR REMOVING SAND-BARS FROM RIVERS. — John Halliday, New Orleans, La.

Claim.—The boays A A, ropes *b b*, chain or rope *c*, and diggers or agitators *d e*, so combined and arranged as to operate substantially as described.

117,773.—FIRE-ESCAPE.—John C. Hancock, Charlestown, and Edward P. Richardson, Somerville, Mass.

Claim.—1. The two cranes A A' provided with connecting-bars G I, pivoted to one and detachably fastened by pins H K to the other, to admit of their being separated, carried, and applied easily and conveniently, as specified.

2. The combination, with the carriage and the suspending-ropes, of the tubes Q, clamping-levers, and a button or other fastening device, U, substantially as specified.

117,774.—CLIPPING-SHEARS. — Charles F. Harlow, Boston, Mass.

Claim.—1. The bolt D' having square seat H', and arm H having correspondingly-shaped socket, in combination with the cutter-head consisting of plates A B C, substantially as and for the purpose set forth.

2. The combination of the shafts L S having grooves *N l* and slot U, with pivoted plate P having lugs R R, and shaft W having eccentric portion X, substantially as described.

3. The reciprocating shaft L, operated as described, and provided with arm M in combination with bolt D', arms H G, and serrated plate A, substantially as described.

4. The tubes I K journaled on the angular tube J, in combination with shaft L S W and plate P, substantially as described.

117,775.—EXTENSION LOUNGE. — Volkert O. Hart and John Benjamin, Naples, N. Y.

Claim.—The extensible lounge or settee, with boxed ends D D open on the front to receive the extensible sliding ends C C, and provided with grooves *l l* on the inside to receive the end slats S' S', the whole constructed and arranged in the manner and for the purpose as herein shown and set forth.

117,776.—BLOWER.—Samuel H. Hartman, Allegheny, Pa.

Claim.—In combination with the valves of a blowing-cylinder that are closed by a spring or other similar acting device, a mechanism for alternately opening said valves independent of the pressure that may be upon them, substantially as described.

117,777.—BOOT-STRETCHER.—James Hoffman, Belvidere, N. J.

Claim.—As an article of manufacture, the boot-stretcher, constructed as described, when composed of caps D, H, and J, and levers E, I, and K, all applied as and for the purpose specified.

117,778.—HOISTING APPARATUS. — Joseph Hoffmann, Tewksbury, N. J., assignor of one-half his right to S. H. Sweetland, Washington, D. C.

Claim.—1. In hoisting apparatus, having trunk B for such apparatus to move upon, so that the same apparatus or mechanism can be used to raise any weight or body, and also to carry or move such body, when raised, in different directions.

2. The elevating-pulley and the weight-ropes *n e*, the hooks *m m* or their equivalent, in combination with the lever *o s* and incline *r* for disengaging the pulley, substantially as and for the purposes set forth.

3. The arrangement of the hook or lever catch *f* and movable block *k*, in combination with the catch-rods *m m*, lever *o s*, and frame A, as and for the purposes described.

117,779.—LIFT-OFF MECHANISM.—William H. Howard, Philadelphia, Pa.

Claim.—The arrangement of the shaft *c*, arm A, strap *e*, pulley *f*, and weighted lever *g*, when combined as herein described, with the beam *s*.

117,780. — COMBINATION APPARATUS FOR GAMES.—Charles N. Hoyt, Providence, R. I.

Claim.—1. The inclined frame D and its adjustable props H, in combination with the bed B, as and for the purpose specified.

2. The removable pockets, as shown in Fig. 3, adapted for the recess *m*, in combination with the frame and balls, substantially as described.

3. The adjustable frame D with its swinging ball I or its equivalent for driving the ball *e*, substantially in the manner specified.

117,781. — WATER-GATE. — William Penn Hubbard, Farmland, Ind., assignor to himself and James H. Fegans, same place.

Claim.—The flood-gate or fence, pivoted in sections to the down-stream side of a sill, A, and provided with the pivoted bars C, which serve as levers for holding the sections upright and as floats on the water, as set forth.

117,782.—STEM-WINDING WATCH.—Samuel Jaccard and Justin Jaccard Jaques, St. Croix, Switzerland, assignors to D. Constant Jaccard, St. Louis, Mo.

Claim.—The combination of the lever E with the catch *c* and spring-lever D, to operate by the action of the sliding stem, substantially as herein shown and described.

117,783.—BELLOWS.—Alfred F. Jones, New York, N. Y.

Claim.—The bellows or air-pumps, constructed with metallic sheets *a* turned over at the edges, and the similar metallic sheets *b* reversely turned over on their opposite edges, and together forming a projecting flange, *c*, when combined with and applied between the wooden parts A B and flexible parts C, as and for the purpose specified.

117,784. — HOLLOW AUGER. — Silas Katz, Bossardsville, Pa.

Claim. — The rotary tube A having notched scroll-collar B D N, the series of cutter-slides E, cutters F, guides G, obliquely-slotted plates H, and pivoted spring-dog K L *m*, and the piston R and rod P, all combined, arranged, and operating together as and for the purpose specified.

117,785. — GLASS-MOLDER'S PRESS.—Frederick Klinck, Philadelphia, Pa., assignor to John Weidig and Charles Yockel, same place.

Claim.—1. In a glass-molder's press, the combination consisting of the solid disk-shaped end 3 of the arm *d'*, the slot 2 in the stem of the cross-head, and the sliding bearing-block *b''* in the said slot, the said parts being arranged to operate together, substantially as and for the purpose hereinbefore set forth.

2. In a glass-molder's press, the combination of the two arms *d'' d'''*, having their respective disk-like ends made with the slots or grooves 4 4, as described, with the respective studs 5 5 on the outer sides of the slotted stem *b'* of the cross-head B, the said parts being arranged to operate together, substantially as and for the purpose hereinbefore set forth.

117,786, antedated July 24, 1871.—PLUG-CUTTER FOR WOOD-WORKERS.—Daniel S. Kniffen, West Camden, N. Y.

Claim.—The tool for cutting plugs, herein described, consisting of the body A, center B, spring C, screw *d*, and cutters D D', when all the parts are constructed and arranged as and for the purpose specified.

117,787. — APPARATUS FOR DEFECATING AND BLEACHING CANE-JUICE, &c.—Marcelin Landry, Iberville Parish, La.

Claim.—The combination of receptacle A, conduit *a*, and trough B with the receivers or defecators F and D, and shaft *d* with one or more spiral plate-screws C, openings *e*, and guard *g*, arranged, as described, and for the purpose set forth.

117,788. — TREMOLO FOR REED-ORGANS, &c.—John R. Lomas, New Haven, Conn., assignor to B. Shoninger, same place.

Claim.—The rotary prism A, applied to an organ or melodeon as a tremolo attatchment, as specified.

117,789. — ELEVATOR. — Gilbert B. Lowe, Jamesville, N. Y.

Claim.—In connection with the elevating-buckets D D, the chain-belt C, driving-wheels B *b*, guide-rollers E E, and ribs or tracks F *f*, all constructed and operating substantially as and for the purpose described.

117,790. — METHOD OF CONSTRUCTING SIEVES.—Robert J. Mann, Burlington, Iowa.

Claim. — The process of securing the wire or sieve-cloth to a metallic sieve, substantially as above described.

117,791.—DIGITORIUM.—Myer Marks, London, England, assignor to William A. Pond, New York city.

Claim.—The series of pivoted and spring-keys arranged within box A, the wrist-support G H, the rounded forefinger-plates I I, and the intermediate finger-plate J, when all are constructed and combined in one digitorium, as and for the purpose specified.

117,792.—WASHING-MACHINE.—Thomas A. Massie, Plattsburg, Mo.

Claim.—The beater H, dovetailed arm I, lever L, operating-lever M, socket or plates N, pivoted socket-plates P, pawl or tongue Q, lever O, and rake R S, constructed and arranged in connection with each other and with the stationary rack G, angular ribs J, ribs or ways K, and box A, substantially as herein shown and described, and for the purposes set forth.

117,793. — HORSESHOE-NAIL CLINCHER.—Daniel Mater, Jr., Bellmore, Ind., assignor to himself and Ira Mater, same place.

Claim.—The lever-jaw A, the curved jaw B, curved lever F, fulcrum G, and connecting-bar I I, combined and arranged to operate substantially as and for the purposes described.

118,794. — COTTON AND HAY-PRESS. — Alexander McGowen, Houston, Tex.

Claim.—1. The combination, with the screw D, of the elongated nut E provided with chilled flange F and sleeve G, and sleeve J provided with chilled flange K, all constructed and arranged to operate with anti-friction balls L L, as and for the purpose herein set forth.

2. In the press herein described, the arrangement of the nut E and sleeve J with the screw D, follower C, cross-beams M, and levers N, all constructed and operating as and for the purposes specified.

117,795, antedated July 28, 1871.—ENVELOPE. — Charles E. McMahan, Elizabeth, N. J., assignor to Albert G. Crane, same place.

Claim.—The extra pocket-piece C with the folding edges *d d d*, when used in connection with an envelope constructed substantially as shown and described, and for the objects herein set forth.

117,796.—APPARATUS FOR BLEACHING FABRICS. — Leopold Mendelson, New York, N. Y.

Claim. — The arrangement and application of chlorine-generator A, purifier B, and fabric-steep E with pipe B and cocked pipe D *e*, as and for the purpose specified.

117,797. — SEWING-MACHINE. — Nicholas Meyers, Buffalo, N. Y.

Claim.—1. The appliances made use of for imparting a vibratory movement to the arm H, consisting of the spherical eccentric C on shaft A, annular strap D, connecting-plate E, and shaft F, when arranged and operating together, as described.

2. The combination of the rock-shaft I, vibrating slotted arm H, connecting-rod, clamp-screws, and ball-and-socket joint, all constructed and operating together, as and for the purpose described.

3. The combination of the vibrating slotted arm H, vibrating lever K, connecting-rod P, and shuttle carrier L, as herein set forth.

4. The arrangement and combination of the rock-shaft I, connecting-rod *a*, crank Z, adjustable cylinder X, disk Y, and looper W, when operating together, as described.

5. The looper-hook W pivoted to the bottom of the adjustable cylinder X, in combination with the disk Y, when operating as and for the purposes described.

6. In combination with the bed-plate, the rotary cylinder X provided with the pin *d*, as herein described.

7. The shuttle-race, shuttle-carrier, and adjustable cylinder, so arranged as to form an opening in the race-face, or leave it continuous to admit of the reciprocation of the looper or shuttle.

117,798. — JOIST-HOOK. — James S. Miller, Terre Haute, Ind.

Claim.—The standard A, lever B, hook C, and arm D *e'*, said parts being constructed and arranged in connection with each other, substantially as herein shown and described, and for the purpose set forth.

117,799.—SOCKET FOR CONNECTING SPOKES AND FELLIES.—Samuel Mitchell, Lima, N. Y., assignor to himself and Stephen B. Tidd, same place.

Claim. — The socket C, when formed with the slits *f f* for the insertion of a wedge, whereby the double effect of expanding the spoke in the socket and the socket in the felly is produced, substantially as herein shown and described.

117,800, antedated August 2, 1871.—BURIAL-CASKET.—J. Owen Moore, Albany, N. Y.

Claim.—The ends C and C', sides B B, covers B D, and bottom A, connected and arranged to form an improved coffin, in the manner herein shown and described.

117,801.—PLOW.—Samuel D. Morrison, Dennis A. Morrison, and Joseph B. Morrison, Fort Madison, Iowa.

Claim.—The arrangement of beam C and handles D D' with slotted plate H, standards G G', bolts I I, rod E, and nuts J J J, constructed and operating substantially as and for the purpose specified.

117,802.—DEVICE FOR CONNECTING BLOCKS OF WOOD PAVEMENTS.—David H. Mulford, Saratoga Springs, N. Y.

Claim.—The hook shown in Fig. 2, when applied to the blocks, as shown in the upturned point F, fitting in the groove C in the bottom of the blocks, as set forth.

117,803.—CULTIVATOR. — Anthony H. Myers, Hermon, Ill.

Claim.—The plates L, chain N, and pulley P, when arranged to operate with the double-tree K and draft-pole A, as and for the purpose specified.

117,804. — ICE-ELEVATOR. — John J. Neuman, Middletown, Ohio.

Claim.—The arrangement of hinged frames A, B, C, and I, in combination with an endless carrier having the projections H thereon, as and for the purpose specified.

117,805.—APPARATUS FOR GENERATING CARBONIC-ACID GAS.—James D. O'Donnell, Washington, D. C.

Claim.—1. The stationary acid-chamber, molded of lead or any other suitable material, and of any desirable shape, with opening in bottom of lugs on outside at top, and securely affixed to under side of top of generator, with an intervening space for the equalization of pressure on generator and chamber, constructed and affixed substantially in the manner hereinbefore described.

2. The horizontally-working acid-valve, operated by handle turning it half-round and back in its seat without raising it from same, the valve-seat secured in position by nut working on end of stem to same, which forms a perfectly tight joint by compression of bottom of acid-chamber, all constructed, arranged, and operating substantially in the manner before described.

3. The leaden pipe, with funnel-shaped termination, permanently attached to end of stem of valve-seat, and extending nearly to bottom of generator, and operating substantially as herein described.

4. The discharge-valve on inside of generator at bottom of same, constructed, affixed, and operating substantially in the manner and for the purpose before described.

117,806.—TRUNK-LOCK.—James H. Oliver, Baltimore, Md.

Claim.—The bolt A, having long and short beveled projections *a* and *a'*, in combination with the tube D, spring *m*, plates E and F, and hasp B, all constructed substantially as and for the purpose set forth.

117,807.—POULTRY FOUNTAIN. — John S. Orndorff, Virginia City, Nev.

Claim.—1. The covered water-vessel B for young chickens, having one or more apertures, b^3, through which they may drink without wetting themselves, as described.

2. The drinking-vessel B b^2 b^3, provided with perpendicular neck b^1, as and for the purpose specified.

117,808. — BALANCE-VALVE FOR STEAM-PUMPS.—James V. Pangburn, Galesburg, Ill., assignor to himself and James T. Clark, same place.

Claim.—The rods M M and valves G and L, constructed substantially as described, and arranged to operate in combination with the ports N N', substantially as and for the purpose specified.

117,809.—CRADLE. — David Otho Parker, Liverpool, Nova Scotia.

Claim.—The construction of a cradle, having the parts A B and A B, composing its sides, and the parts C C composing its bottom, each and all combined as indicated in Fig. 2 of the drawing, substantially as described, and for the purposes set forth.

117,810.—COMBINED CHAIR AND CANE.—David Otho Parker, Liverpool, Nova Scotia.

Claim.—A combined chair and cane, consisting of the detachable staff A, three detachable hinged pieces, B *b'*, and three pivoted strips, C, said parts A B *b'* C being constructed and arranged substantially as herein shown and described.

117,811. — MANUFACTURE OF SEAMLESS SHOES.—Charles W. Peeler, Chicago, Ill., and Norman C. Johnson, Springfield, Mass.

Claim.—1. The former or mold A, having the groove or channel C therein, in combination with the clamps F hinged at *i*, and secured together in said groove by the lever *f*, substantially as and for the purpose described.

2. As a new article of manufacture, a seamless shoe upper made from a woven or textile fabric, substantially in the manner and by the process herein described.

117,812.—THRASHING-MACHINE. — William M. Pratt, Chicago, Ill.

Claim.—1. The combination of the fan-beater B and tight casing A, constructed with teeth *e*, as and for the purpose described.

2. The combination of the fan-beater B, tight casing A, air-chamber M, tube or tubes N, and supply-openings H, as and for the purpose described.

3. In combination with the fan-beater B and tight casing A, the valve and feed-rollers C C', constructed as and for the purpose described.

4. In combination with the fan-beater B and tight casing A, the straw-discharge tube D provided with perforated false bottom, as and for the purpose described

5. In combination with the fan-beater B, tight casing A, and sieve E, the hood G, as and for the purpose described.

6. In combination with the straw-discharge tube D, the stacker-tube, as and for the purpose described.

7. The fluted roller R, when employed in the connection and for the purpose specified and set forth.

117,813.—DITCHING-PLOW.—Robert M. Primner, Vinton, Iowa.

Claim.—The mold-boards K K and plates Q Q, combined, constructed, and relatively arranged as and for the purpose specified.

117,814.—HOT-AIR FURNACE.—Henry Randall, Quincy, Ill.

Claim.—The arrangement of the flue-pipes 4, in combination with the construction of flues 1 in the body of the furnace and the opening 2 in rear of furnace, with rear shaft 3, side flues 4', and damm 5, as a combination to generate heat, substantially as and for the purposes hereinbefore set forth.

117,815, antedated August 3, 1871.—BEE-HIVE.—Oliver P. Reeve and Christopher C. Parker, Central City, Mo.

Claim.—A bee-hive, consisting of the casing A, partitions *a*, a^1, and a^2, doors B B and a^2 a^3, honey-boxes D D, supports *d d'*, moth-traps C C, feeding apparatus F, surplus honey-boxes D' D', and comb-frames E E, all constructed and arranged substantially as described.

117,816.—CORNER-POST FOR WAGON AND CARRIAGE-SEATS.—Joseph Roberts, Worcester, Mass.

Claim.—1. A metallic corner-post for wagon and carriage-seats, provided with a supporting-foot and a socketed head to receive the extremities of the back and end rails.

2. The upright metallic corner-post A, provided with the rectangular sockets D F, substantially as and for the purpose set forth.

117,817.—LIFE-BOAT.—Robert I. Robeson, Oskaloosa, Iowa.

Claim.—The hollow buoys C, provided with partitions D and valves F, in combination with the boat A, when the said buoys are made attachable and detachable, in the manner shown and described, substantially as specified.

117,818.—CARD-ENVELOPE.—Charles Rowland, Washington, D. C., assignor to James A. McCrea, Augustus L. McCrea, and Harry Cox, same place.

Claim.—The combination and arrangement of a stiff or rigid back, A, with a flexible flap, B, substantially as herein described and shown.

117,819.—SPRING FOR VEHICLES.—Cyrus W. Saladee, St. Catharine's, Canada.

Claim.—1. Elliptic springs, when applied to vehicles, and so arranged and operating as to leave the one end jointed together and the other end unjointed, and the said dislocated ends operating independently of each other, substantially as shown and described.

2. The upper half of the spring A or its equivalent, in combination with the body-loop E (or bottom of the body F) and stirrup B, substantially as and for the purpose shown and described.
